In order to analyze the applicability of the "5E" teaching model in basketball teaching, 40 students were grouped and the changes in skill scores before and after the experiment were observed in the control group and the experimental group, and the comparative analysis of basketball special skill scores in the control group was constructed as shown in Table 1. The data test of the basketball scores before and after the experimental group showed that the  $T$  value was 4.138 and the  $P$  value was 0.000, and it can be concluded that the basketball scores before and after the experiment were extremely significant, while the  $T$  value was 3.681 and the  $P$  value was 0.025 in the control group before and after the experiment, and the basketball scores before and after the experiment were not significantly different. The main reason is that in the process of passing and catching the ball, each investigation group chose their own members to help pass the ball to test, and they were more familiar with each other's passing and running characteristics, which reflected the characteristics of basketball project group, so the results were extremely significant. The difference in scores was extremely significant compared to the pre-experimental period.

**Table 1.** Comparative analysis of basketball specific skill scores

Indicators	Group	Before the experiment		After the experiment		<i>T</i>	<i>P</i>
		<i>N</i>	<i>M ± SD</i>	<i>N</i>	<i>M ± SD</i>		
V-line passing and catching layups Indicators	Experimental group	20	31.26±2.10	20	24.52±2.42	4.138	0.000
	Control group	20	30.48±1.68	20	29.85±1.73	3.681	0.025

### 3.2. COMPARATIVE ANALYSIS OF SPORTS INTERESTS

The comparative analysis of physical education interest of the experimental group before and after the experiment is shown in Table 2. The mean value of students' positivity was 16.62 before the experiment and 22.15 after the experiment, the mean value of negativity was 18.57 before the experiment and 21.28 after the experiment, the mean value of skill learning was 17.81 before the experiment and 21.02 after the experiment, and the P-value of the above five groups was less than 0.01, indicating that the application of "5E" teaching mode made the above five indexes <0.01 before and after the experiment. The P-value of the above five indicators before and after the experimental group was <0.01, which was a highly significant difference, indicating that the "5E" teaching mode had a highly significant effect on improving students' interest in physical education.

**Table 2.** Comparative analysis results of sports interests of experimental groups before and after the experiment

Indicators	Pre-experiment		After Experiment		<i>T</i>	<i>P</i>
	<i>N</i>	<i>M ± SD</i>	<i>N</i>	<i>M ± SD</i>		
Motivation	20	16.62±1.87	20	22.15±2.03	-5.617	0.000
Negativity	20	18.57±2.17	20	21.28±1.94	-9.39	0.000
Skill learning	20	17.81±2.47	20	21.02±2.62	-6.928	0.000
After-school activities	20	16.94±2.07	20	20.88±2.70	-5.429	0.000
Sports attention	20	17.07±2.31	20	21.48±2.84	-4.381	0.000

## 4. CONCLUSION

In basketball class teaching innovation, we must conduct in-depth thinking and analysis to really highlight the entry point of basketball class innovation teaching. In practice, it is important to make basketball class innovation reasonable and effective based on the current physical and mental characteristics and cognitive rules of young students. For basketball class innovation, it should meet the characteristics and needs of different basketball class teaching contents, so that the whole teaching quality can be better guaranteed and improved.

The 5E teaching model, as a new teaching model, still needs time and social testing in the field of education, especially physical education. The traditional teaching mode has already achieved public recognition, so it cannot be directly replaced, but the advantages of both should be combined with a dialectical perspective, complementing each other and taking advantage of each other's strengths and weaknesses, and working toward the best teaching effect.

## ABSTRACT

This paper demonstrates the applicability of three-dimensional realistic models in the design of rural landscapes through the analysis of artificial intelligence technology and the application of three-dimensional realistic models to the design of rural landscapes. The overlay method technique is used to layer the design elements in landscape garden planning to highlight the three-dimensionality of the design. By comparing rural landscape design with landscape garden planning, the significance of the fusion of the two is analyzed. The work of landscape gardening after the fusion of the two conveys a sense of belonging of 50%, a sense of integration of 30%, and a sense of identity of 20%.

## KEYWORDS

Artificial intelligence; 3D realistic model; Overlay method technology; Rural landscape design; Landscape garden planning

## 1. INTRODUCTION

With the improvement of people's living standard in recent years, people's demand for tourism has also increased, and rural tourism has become an important tourist place chosen by tourists nowadays, therefore, the development of rural landscape resources has gradually tended to be commercialized [1-3]. The loss of the naturalness and special culture of rural landscape due to the unreasonable development has caused the rural landscape to fail to develop to a high level [4]. In order to protect the special culture and environmental optimization of rural landscape and make the pattern of rural landscape more multifunctional, scientific rural landscape assessment methods need to be used in the development of rural tourism landscape resources, which can effectively plan rural landscape resources to avoid unreasonable over-exploitation of rural tourism landscape, so it is a very important thing to combine rural landscape design and landscape garden planning by using the relevant technology of artificial intelligence [5-7]. This paper promotes the further development of landscape planning by integrating rural landscape design with landscape garden design through 3D realistic model and overlay method.

## 2. RURAL LANDSCAPE DESIGN BASED ON ARTIFICIAL INTELLIGENCE TECHNOLOGY

### 2.1. ARTIFICIAL INTELLIGENCE TECHNOLOGY

#### 2.1.1. THREE-DIMENSIONAL REAL-WORLD MODEL

As a new model that has emerged in recent years, the 3D realistic model has been applied to different degrees in various industries. First, in terms of environmental realism, 3D realistic

model has the real characteristics of highly restoring the environment of the site itself. Second, in terms of information coverage, the 3D reality model has many types of information about the site environment, and through the browsing and measuring of the 3D reality model, more scientific and accurate site information can be obtained. Thirdly, in terms of multi-source application, the 3D realistic model is also a data format, and the visualization and analysis of the target site with one data to interface with multiple platforms realizes the multiple applications of the 3D realistic model.

### **2.1.2. THE APPLICABILITY OF 3D REALISTIC MODEL IN RURAL LANDSCAPE DESIGN**

Through the study of the characteristics and key technologies of the 3D realistic model, it is found that the realistic characteristics of the 3D realistic model can complement the problem of insufficient information of site analysis in the traditional rural landscape design method. The rich and diverse landscape types, spatial levels and fragile ecological landscapes of the mountainous countryside make it more difficult for designers to accurately assess the current situation of the mountainous countryside. The 3D realistic model has the real characteristic of highly restoring the environment of the site itself, so the designers can browse and analyze the 3D realistic model to objectively complete the assessment of the current situation information of the mountainous countryside landscape, and at the same time, they can use the format of the 3D realistic model for multiple applications, and cooperate with the panoramic experience platform to collect the user groups to design. Therefore, the use of 3D reality model in rural landscape design greatly improves the rationality and efficiency of the design.

## **2.2. THE USE OF THE OVERLAY METHOD IN LANDSCAPE GARDEN PLANNING**

### **2.2.1. OVERLAY METHOD TECHNIQUE**

The overlay method mainly involves the layering of landscape elements and the superimposition of drawings, with the final superimposed drawing being a thematic drawing reflecting the degree of influence of environmental factors. Therefore, in landscape planning and design, the overlay method can be defined as a comprehensive technique of drawing by layering and overlaying thematic drawings containing changes or effects of a single landscape element to reflect the common effect of all elements. The above definition contains three main points, the first is layering, breaking down the overall landscape into single elements such as terrain, water bodies, vegetation, roads, etc., and studying the role of each element in depth. The second is superimposition, which re-integrates the thematic map of each element in a specific way. Lastly, co-action, which emphasizes that the purpose of overlay is to integrate the respective effects of different elements on the overall landscape.

### **2.2.2. ADVANTAGES OF THE OVERLAY METHOD IN LANDSCAPE GARDEN PLANNING**

The decomposition of complex landscape systems into topography, hydrology, vegetation and other elemental units is a fundamental mode of thinking in landscape planning and design practice. One of its vehicles is the stacked map method, characterized by the technique of element layering and superimposed reorganization, which originated at the end of the 19th century and has been continuously updated and iterated by several generations of landscape architects, and has now become a mature tool in the professional field. The advantages of the overlay method in landscape planning are shown in Figure 1, with the advantages of three-dimensionality, element division, strong integration and reasonable design. The percentage of three-dimensionality is 50%, element division is 20%, integration is 20% and rationalization is 10%.

**Figure 1.** Advantages of overlay method in landscape architecture planning

### 3. THE SIGNIFICANCE OF RURAL LANDSCAPE DESIGN IN LANDSCAPE GARDEN PLANNING

#### 3.1. THE INFLUENCE OF RURAL LANDSCAPE ON MODERN LANDSCAPE GARDENING

##### 3.1.1. ARTISTIC REPRODUCTION OF RURAL LANDSCAPE

It is a common phenomenon for modern landscape architects to draw design language from rural landscapes. In addition to directly reproducing a pastoral landscape in park design, as Olmsted did, many designers also use artistic techniques to abstractly process and reproduce rural landscapes in the city. In the urban park practice, he also wants to bring this rural idyll into the city, reproduce this kind of rural landscape, and express the idea that the city and nature can be combined with each other.

##### 3.1.2. DESIGN ELEMENTS REFLECTING REGIONAL CHARACTERISTICS

The formation of rural landscape is mostly formed after decades, centuries or even thousands of years of accumulation and precipitation, and is the final expression of the material form of the local people who are compatible with the regional climate and the natural and humanistic processes on the land. Landscape garden designers consciously extract these landscape elements with regional characteristics from the rural landscape and reflect them in the garden works. The advantages of the integration of rural landscape and garden planning are shown in Table 1, and the landscape garden planning before the integration of the two has the characteristics of single style, lack of innovation and low integration, accounting for 50%, 40% and 10% respectively. The works of landscape gardening after the integration of the two tend to also convey a sense of regional belonging, integration and identity.

**Table 1.** The advantages of the integration of rural and garden planning

Integrate the characteristics of the former landscape planning	Single style	Lack of innovation	Fusion stiffness
proportion	50%	40%	10%
After the fusion of the two	regionalism	High fusion	Strong sense of identity
proportion	50%	20%	30%

### 3.2. THE SIGNIFICANCE OF RURAL LANDSCAPE DESIGN IN LANDSCAPE GARDENING

#### (1) Reflecting cultural heritage and geographic and historical values

The combination of natural development and historical development of rural landscape, the use of rural landscape not only helps to spread its own cultural characteristics, but also enables people to feel the cohesion and crystallization of history. Improve human identification and understanding of history and inherit the excellent Chinese culture back. In the process of rural landscape construction, the differences of different regions need to be highlighted. Show the cognition of different regions in order to reflect the cultural history and value cognition of the region as much as possible in the process of rural landscape construction.

#### (2) Promoting the long-term coordinated development of landscape garden planning and the countryside

When constructing landscape gardens, the expandability of landscape gardens should be fully guaranteed, and certain landscape gardens with greater external effects but also more capital investment should be paid attention to, designed and constructed. In the creation of rural culture, we should take a historical and developmental perspective to avoid the formation of a social atmosphere and group consciousness that is quick to get things done and restless, and create a more stable and heavy rural heritage.

### 4. CONCLUSION

This paper uses three-dimensional realistic model and overlay technology to combine rural landscape design and landscape garden planning, and through the interaction of the two, it is concluded that rural landscape design integrated into the landscape garden can reflect certain cultural heritage and geographical value. The integration of the two can, to a certain extent, promote the long-term coordinated development of landscape garden planning and rural areas, thus creating a more stable and heavy rural heritage.

# THE CURRENT SITUATION OF “HEAVY PENALTIES” IN CHINA’S CRIMINAL LAW IN THE CONTEXT OF INTERNET+

---

Zhen Gou\*

Law School, Northwestern University, Xi'an, Shaanxi, 710127, China

[gouzhen@163.com](mailto:gouzhen@163.com)

---

## ABSTRACT

This paper analyzes the current situation of “heavy penalty” in the field of criminal law in China, analyzes the idea of heavy penalty in the field of criminal law, and architects a two-layer LSTM-Attention end-to-end key element extraction with four parts: word vector training, word annotation, semantic information acquisition, and key element extraction, by ablating Experiments are conducted to verify the effectiveness of LSTM+Attention experiments. The experiments on test datasets of different sizes show that this paper’s method is better than that without fused Attention and with only fused Attention in performing key element extraction, especially in terms of accuracy rate and F1 value. Based on the processing and construction of the corpus in the context of Internet+ and how to efficiently extract the key elements in the case descriptions become particularly important.

## KEYWORDS

Criminal law field; Felonious ideology; Word vector training; LSTM-Attention; Key element extraction

## 1. INTRODUCTION

Crime management has always been an important aspect of social governance in every country, especially when rapid economic development and rapid changes in the social environment, the deterioration of social security conditions will certainly make the state pay great attention to crime management [1]. Economic construction has made brilliant achievements and people’s living standards have been improving. Along with the rapid economic development, the social transformation is accelerating. An important social phenomenon that can accompany the economic and social transformation is the soaring crime rate [2-3].

The control of heavy penalties and the prudent use of the death penalty is not a stopgap measure under the complex situation we face at home and abroad; it is an important step in the field of criminal law to safeguard human rights and gradually adjust the current criminal policy thinking in China to meet the requirements of social development [4-5]. Neither policy adjustment nor control of the application of the death penalty can proceed alone; it must be based on and supported by the transformation of the values of the whole society and the conversion of the social regulation model [6]. In this sense, it is also a social system project that requires overall planning, overall promotion and continuous construction [7-8].

In this paper, based on the two-layer LSTM end-to-end key element extraction method, we perform lexical annotation, and then obtain the word vector of each word in the case description as the input of LSTM through the word vector model to obtain the semantic information

representation of the case description text.

## 2. THE CURRENT SITUATION OF “HEAVY PENALTIES” IN THE FIELD OF CRIMINAL LAW IN CHINA

### 2.1. THE IDEA OF HEAVY PENALISM IN THE FIELD OF CRIMINAL LAW

#### 2.1.1. THE VALUE OF PENAL PREVENTION

A major feature of Chinese criminal legislation is the introduction of quantitative factors into the general concept of crime, and the allocation of specific quantitative factors such as “aggravating circumstances,” “aggravating circumstances,” and “large amount” in the sub-articles. “The specific quantitative factors, so that Chinese criminal law, at least in the legislation, has the function of narrowing the scope of application of criminal law “crime”. However, due to the excessive abstractness of the sub-paragraphs of the criminal law and the vagueness of the specific crime standards, resulting in the criminal law of this orientation function is greatly reduced. With the seriousness of the crime phenomenon, the “severity” of the penalty is still inevitable. Thus, the concept of crime, which combines qualitative and quantitative factors, is both a strength and an Achilles’ heel of Chinese criminal law.

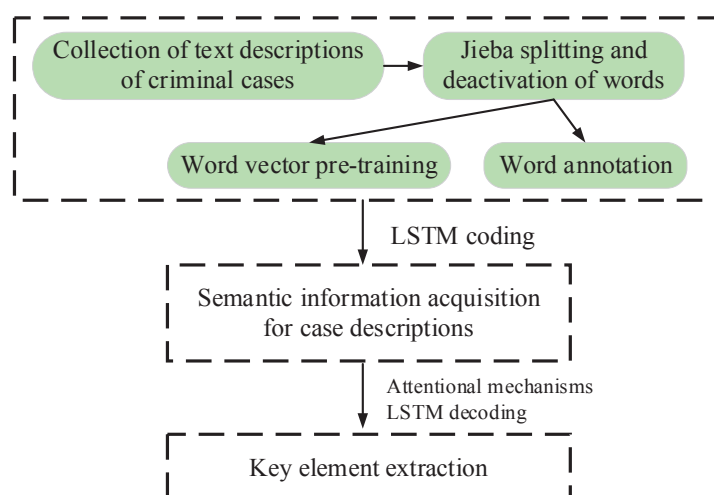

#### 2.1.2. CRIME STATISTICS

Currently, crime statistics in China are still mainly stuck in the general calculation of crime rates. This is not only difficult to explain, but also very likely to mislead people to make a wrong estimation of the real security situation. First of all, can the increase of crime rate indicate the increase of crime caused by the lenient punishment? This seems difficult to determine both in theory and in practice. Because crime is a comprehensive product of the interaction of many social factors. We do not have corresponding tracking surveys and studies on offenders, especially recidivists, repeat offenders and the so-called “chronic offenders”, so we cannot really grasp the specific reasons for the increase in crime in a comprehensive and scientific manner.

## 2.2. TWO-LAYER LSTM-ATTENTION BASED END-TO-END KEY ELEMENT EXTRACTION

### 2.2.1. KEY ELEMENT EXTRACTION

The proposed end-to-end key element extraction method based on two-layer LSTM-Attention mainly includes four parts: word vector training, lexical annotation, semantic information acquisition, and key element extraction, and the structural framework diagram of the method is shown in Figure 1:

**Figure 1.** Two-layer LSTM-Attention based end-to-end key element extraction method

## 2.2.2. LEXICAL ANNOTATION

Since the key elements of the corpus in this paper are the defendant's actions and locations in the case description, i.e., a series of verbs and nouns in the case description, in order to better obtain these key information, we lexically annotate the experimental corpus to better obtain the words corresponding to the verbs and nouns lexically as the key elements through the model of this paper.

## 3. EXTRACTION AND ANALYSIS OF KEY ELEMENTS OF FELONY CASE TEXTS

### 3.1. ABLATION EXPERIMENTS

In order to verify the performance of the proposed method in this paper, and to demonstrate the importance of the Attention mechanism and lexical information to the model in this paper, the corresponding ablation comparison experiments were done using the constructed corpus of different sizes as the test set, respectively, and the results of the ablation experiments are shown in Table 1. The experiments on test datasets of different scales show that the method in this paper is better in performing key element extraction than that without fusing Attention and when fusing Attention only, especially in terms of accuracy rate and F1 value. Although Attention can solve this limitation and the mechanism can focus the important information, and it is also proved by LSTM+Attention experiments that it is somewhat better than LSTM, but this is not yet able to extract the verb and noun words in the case description we want, which can be well extracted by the idea of word recognition in this paper.

**Table 1.** Comparison results of ablation experiments

Method	Small_data			Big_data		
	P	R	F1	P	R	F1
LSTM	69.8%	73.2%	70.8%	69.7%	78.2%	73.6%
LSTM+Attention	73.8%	80.5%	78.2%	78.3%	78.7%	75.5%
Methodology of this article	78.7%	76.3%	79.2%	82.7%	78.9%	81.3%

### 3.2. DEEP LEARNING KEYWORD EXTRACTION

In order to verify that the key element extraction method proposed in this paper is feasible than the existing deep learning based keyword extraction methods in the field of case fact description, this paper uses different scale of case description test corpus for corresponding experimental comparison, and the results of deep learning keyword extraction method comparison experiments are shown in Table 2. On case description test sets of different scales, by replicating the parameters of the baseline method in line with the method in this paper, according to the experiment shows that the method in this paper works better, analyzing the reason, CRF extraction keyword method fails to obtain important semantic information well although it extracts contextual information, while RNN extraction method improves its extraction results compared with CRF despite the integration of semantic information.

**Figure 2.** Comparison experimental results of deep learning keyword extraction methods

Method	Small_data			Big_data		
	P	R	F1	P	R	F1
CRF	50.2%	47.9%	47.3%	47.9%	43.8%	52.6%
RNN	61.7%	42.8%	54.8%	61.6%	52.6%	69.3%
GRU	67.3%	72.6%	64.8%	69.3%	68.3%	71.7%
LSTM+CRF	71.2%	76.9%	69.4%	72.4%	70.7%	78.4%
Methodology of this article	77.5%	77.1%	72.6%	84.4%	74.8%	80.2%

#### **4. CONCLUSION**

There are many factors that influence serious crime rates, and this study draws some conclusions from the study of penalties and serious crime rates in China, some of which are consistent with the expected hypotheses. Also some findings contrary to the impression were found at the same time. And it is hoped that these findings will lead to some suggestions for the prevention of crime and the improvement of criminal policies.

Penalties can only have the effect of preventing crime and reducing crime to a limited extent, and the idea of hoping to deter crime by heavy punishment is actually a misconception in the concept of punishment. The fundamental way to fight crime lies in the progress and improvement of economy, politics, culture and morality, and in the improvement of human values. Therefore, it is important to create an excellent social environment through the implementation of various social policies, and to form a social mechanism to curb crime.

## ABSTRACT

In this paper, the stability performance of micro titanium implant orthodontic support was investigated by analyzing the application of micro implant support in orthodontic treatment. Based on previous orthodontic clinical data, the healing period of micro titanium implants was analyzed. The role of micro implant support resistance in orthodontics was demonstrated by comparing the probability of adverse events occurring in common treatment. The results showed that micro-implant bracing facilitated the restoration of healthy dental function. After 6 months of treatment, the t-value for masticatory function was 5.879, for speech function was 7.669, and for fixed function was 5.611 in the experimental and control groups. Micro-implant braces reduced the occurrence of dental adverse events. The overall probability of adverse events in the experimental group was low, with only 2 adverse events.

## KEYWORDS

Micro-implants; Orthodontic treatment; Probability of adverse events; Dental health function; Clinical data

## 1. INTRODUCTION

In the past two years, with the progress of medical technology, the level of hospital medical services has been improving. The update of various medical materials has also improved the treatment level of physicians accordingly [1-2]. Orthodontic treatment is a common form of oral treatment, mainly through the correction of malformed teeth in the patient's mouth to improve dental aesthetics and further enhance dental function and protect oral health [3-4]. With the increasing concern for dental health, the number of people receiving orthodontic treatment is also increasing, and micro-implant supports are easy to operate, small in size, and convenient to implant, which have been gradually used in clinical treatment in recent years [5].

This paper focuses on the application of micro-implant bracing in orthodontic treatment and compares micro-implant braced orthodontics with general orthodontic treatment, thus demonstrating its value of micro-implant bracing.

## **2. MICRO IMPLANT SUPPORT IN THE CONTEXT OF BIG DATA**

### **2.1. MINIATURE IMPLANT SUPPORT SYSTEM**

#### **2.1.1. APPLICATION OF MICRO-IMPLANT SUPPORT**

MIA is the direct use of miniature titanium screws tapped into the bone cortex to obtain orthodontic support, which are generally 2-3 mm in diameter and 7-14 mm in length. Currently, miniature titanium screws have become a hot topic in the orthodontic community and are widely used in experimental and clinical practice because they are relatively easy to implant and can be applied almost instantly after implantation, and there is almost no restriction on where they can be implanted. Therefore, miniature titanium screws can be used in a wide range of orthodontic treatments, such as gap closure, orthodontic openings, and upright posterior teeth. However, because the micro titanium screw mainly relies on the mechanical embedding force between itself and the alveolar bone to fix, some scholars believe that the micro titanium screw and the alveolar bone will not form an osseointegration, and the diameter of the micro titanium screw is small, so the biggest problem of the micro titanium screw support system is easy to fall off and break when withstanding large orthodontic force. The factors that affect the success of micro titanium screws include the amount of bone at the implantation site, the length and diameter of the screw, the magnitude and direction of the orthodontic force applied to the screw, etc.

#### **2.1.2. STABILITY OF ORTHODONTIC SUPPORT FOR MICRO TITANIUM IMPLANTS**

Micro titanium implants are used for orthodontic tooth movement and are a stable support. According to previous orthodontic clinical data, microtitanium implants are clinically stable supports, but they do not remain absolutely stable when subjected to orthodontic forces. In the present study, the healing period of the microtitanium implants was 2 weeks. Obviously, 2 weeks is enough time for adequate soft tissue healing but not enough time to achieve osseointegration. Histological studies have shown that a layer of fibrotic tissue forms between the bone and the implant when pressure is applied early. When the fibrous tissue is compressed, the threads of the micro-implant then mechanically embed into the surrounding bone.

## **2.2. ORTHODONTIC TREATMENT**

### **2.2.1. OCCURRENCE AND DEVELOPMENT OF MISSHAPEN COLLAR DEFORMITY**

Orthodontics is the study of the etiological mechanism of malocclusion, diagnosis and analysis, as well as its prevention and treatment, and is a branch of dentistry. The World Health Organization defines malocclusion as “dental-facial anomalies”, which includes not only misalignment and misalignment of teeth, but also various deformities caused by misalignment between teeth and jaws, craniofacial relationship. In the process of children's growth and development, dental, jaw and craniofacial anomalies are common due to congenital genetic factors or acquired environmental factors, such as misalignment of teeth, abnormal jaw relationship between upper and lower dental arches, abnormal jaw size and morphological position, etc. The damage caused not only affects the appearance but also the function. Studies have pointed out that the occurrence and development of malocclusion is very closely related to human evolution.

With the evolutionary development of human history for more than one million years, the production and lifestyle of human beings have changed, as well as their eating habits, and with it the gradual unbalanced degeneration of human chewing organs. Therefore, a series of malocclusions such as crowded teeth and misaligned teeth were gradually produced. The evolution of malocclusion from nothing to something, from simple to complex, is the result of

human evolution.

### 2.2.2. FIXED ORTHODONTIC TREATMENT

The orthodontic treatment method that is currently considered to have the best efficacy both domestically and internationally is fixed orthodontics, and fixed orthodontics includes many types, with the straight wire fixed orthodontic example now commonly used. The process of this fixed orthodontic treatment is divided into approximately initial preparation, follow-up visits to discuss treatment planning, the straight wire fixed aligner treatment phase, and the maintenance phase. The steps in the straight arch fixed aligner treatment phase are: affixing the full mouth fixed aligner, ligating the archwire, monthly follow-up visits lasting 18-36 visits, fixed retention, and active retention. Many factors can lead to prolonged orthodontic sessions or unsatisfactory orthodontic results if the orthodontic process is not followed up on time, or if the aligners fall out frequently [6].

Due to the developmental characteristics of human physiology, the adolescent period is the best time for orthodontics, and the special physiological developmental characteristics and psychological developmental characteristics of adolescents make the cooperative behavior of adolescent orthodontic patients the biggest problem troubling orthodontists and nursing students.

## 3. EFFECTIVENESS OF MICRO IMPLANT SUPPORT IN ORTHODONTIC TREATMENT

### 3.1. FUNCTIONAL ANALYSIS OF DENTAL HEALTH

The differences were not statistically significant when comparing the scores of masticatory function, speech function and fixed function between the two groups before treatment by comparing the micro implant support in orthodontics with normal orthodontics [7]. After 6 months of treatment, the masticatory function, language function and fixed function scores of both groups were higher than before treatment, and the experimental group was higher than the control group, and the difference was statistically significant. Inclusion of implant support can facilitate orthodontic treatment and accelerate the recovery of healthy dental function.

**Table 1.** Comparison of dental function scores before and after treatment

Group	Number of cases	Six months after treatment		
		Masticatory function	Language function	Fixed function
Experimental group	36	8.33±1.77	8.24±1.18	
Control group	36	6.05±1.51	6.34±0.98	6.68±0.97
t		5.877	7.669	5.611
P		0.000	0.000	0.000

### 3.2. PROBABILITY OF ADVERSE EVENTS

During the follow-up period, the incidence of adverse events in the test group was lower than that in the control group, and the difference was statistically significant, i.e.,  $P < 0.05$ . The probability of adverse events after treatment is shown in Table 2. The overall probability of adverse events in the test group was low, with only two adverse events, while more adverse events occurred in the control group with eight occurrences. This indicates that the incorporation of micro-implant support reduces the probability of adverse events during the orthodontic procedure.

**Table 2.** Probability of adverse events after treatment

Group	Number of cases	Gum infection	Tooth loosening	Gum swelling	Adverse event
Experimental group	36	1(2.81)	0(0.00)	1(2.79)	2(5.55) <sup>a</sup>
Control group	36	2(5.58)	3(8.36)	3(8.31)	8(22.26)

Note: Compared with the control group,  $\chi^2=4.181$ , <sup>a</sup>P=0.041.

#### 4. CONCLUSION

In this paper, we investigated the use of micro-implant braces in orthodontic procedures. By comparing the treatment without micro-implant braces, we demonstrated that micro-implant braces ensure healthier dental function compared to other orthodontic treatments, with t-values of 5.879 for masticatory function, 7.669 for speech function, and 5.611 for fixed function in the experimental and control groups after 6 months of treatment, as well as The probability of adverse events was also reduced.

## ABSTRACT

This paper analyzes the limitations of the current financial working model of manufacturing enterprises by exploring the application of the financial shared service model. The financial working model of manufacturing enterprises is optimized by using digital intelligence technology. The digital transformation of the enterprise finance shared model is realized by improving the level of enterprise functions as well as the utilization rate of departmental functions. The results show that the organizational structure of the enterprise is mainly transformed into networked, flat and standardized, in which the networked structure of the enterprise needs to reach 70% and the standardized structure needs to reach 80%. The business processes of the enterprise mainly develop into digital, intelligent and simple, and 75% of the business processes need to reach the level of intelligence.

## KEYWORDS

Digital intelligence; Enterprise finance model; Functional transformation; Digital transformation; Enterprise organizational structure

## 1. INTRODUCTION

Nowadays, the rapid development of modern information technology has provided a broader operating space for various industries and fields, but it is accompanied by unprecedented market pressure and challenges [1-2]. The deepening and improvement of the financial sharing service model has also accelerated the digital transformation and upgrading of modern enterprises to some extent, which can maximize the efficiency of financial data utilization and value-added revenue without losing time and labor costs [3-4]. Therefore, the digital transformation of enterprise finance under the financial sharing model has a non-negligible prospective role in the innovation and upgrading of enterprise management model and long-term development. Li, L et al. analyzed the problems of financial shared services under big data auditing and proposed relevant solutions [5]. Jiang, S established a framework for service model auditing process by fuzzy hierarchical analysis to improve the efficiency of financial auditing [6]. Pflaum, A. A et al. proposed a reference process for digital transformation of companies using IoT technology, which provides a reference method for corporate transformation [7].

This paper mainly relies on digital intelligence technology to develop strategies related to the transformation of manufacturing enterprises by analyzing the financial shared service model.

## 2. RESEARCH ON FINANCIAL SHARING MODEL UNDER DIGITAL INTELLIGENCE TECHNOLOGY

### 2.1. OPTIMIZATION OF ENTERPRISE FINANCE WORK BY FINANCIAL SHARED SERVICE MODEL

#### 2.1.1. FINANCIAL SHARED SERVICES MODEL STUDY

The financial sharing business model began to emerge in the 1980s. A financial sharing center can be understood as a center for task assignment, processing and archiving, mostly starting with a company's long-term development strategy, supplemented by a special organizational structure, system construction and cost savings. The financial shared service model is a distributed management model that promotes synergy and cooperation between business and finance through computer information technology. The financial shared service model is a product of the development of network finance and network technology to a certain stage, and is an inevitable trend of the development of the times. Unlike the traditional financial management model, the most important feature of the financial shared service model is that it simplifies the business processes of internal finance, allowing finance personnel to detach themselves from the complicated processing procedures. It also promotes the transformation of financial functions.

#### 2.1.2. LIMITATIONS OF THE FINANCIAL WORKING MODEL OF MANUFACTURING ENTERPRISES

Although more and more companies are focusing on building financial shared services models and attaching importance to the digitization of financial data, they have not established management systems to match them, leading to loose management and inefficient execution. The same is true for manufacturing enterprises, where the traditional financial work model has many problems and drawbacks. The limitations of the financial working model of manufacturing enterprises are shown in Figure 1, which has the problems of incomplete system, lack of technology, manualization and low business level. The biggest problem is that the financial system is not complete, accounting for 30% of the problem, and the business level is also limited to 30%.

**Figure 1.** Limitation of financial working mode of manufacturing enterprises

## **2.2. FINANCIAL SHARED SERVICES MODEL OPTIMIZES FINANCE FOR MANUFACTURING COMPANIES**

### **2.2.1. INTELLIGENT LEVEL ENHANCEMENT**

In the intelligent environment, cross-border talents with “finance + IT” thinking are especially important. Only financial expertise cannot support the rapid change and development of enterprises, and the original financial personnel may face changes such as job cancellation and work content adjustment. It is suggested to strengthen the diversified knowledge learning of economic management and information technology, and promote part of the financial personnel to transform to composite positions, starting from system operators, and through accumulating experience and expanding skills, realize the secondary transformation to technical personnel of financial sharing center, with a view to achieving greater development.

### **2.2.2. FINANCIAL DEPARTMENT FUNCTION TRANSFORMATION**

Under the financial sharing model, the application of big data and Internet technology effectively reduces the workload of traditional accounting positions. Therefore, enterprises should transform most accounting positions into management accounting positions responsible for budgeting, report analysis, performance assessment, etc., so that accounting financial personnel can gradually participate in enterprise management and decision making, and continuously provide assistance to improve enterprise operation. For example, enterprises can arrange some cost accounting personnel in cost budgeting, cost variance analysis and other management-oriented positions, mainly responsible for analyzing the impact of changes in corporate costs, the reasons for differences in the implementation of the cost budget, to provide a basis for the enterprise management to improve the cost management process. Secondly, the establishment of financial risk analysis positions. This position is mainly responsible for collecting and mastering the relevant information in the market that affects the business management of the enterprise, and by analyzing the data generated in the daily business activities of the enterprise, digging out the potential financial risks and providing the enterprise with financial risk warning and solutions, so as to enhance the value of the enterprise financial management and promote the healthy and stable development of the enterprise.

## **3. ENTERPRISE FINANCIAL TRANSFORMATION BASED ON FINANCIAL SHARED SERVICE MODEL**

### **3.1. ANALYSIS OF ENTERPRISE FINANCIAL ORGANIZATION STRUCTURE**

In the process of financial digital transformation under the financial sharing model, in addition to requiring the participation of finance department personnel, a more complete organizational structure must be formed with the cooperation of other organizational departments to standardize the transformation development process and lay a good foundation for the long-term development of the enterprise. The organizational structure of the transformed manufacturing enterprise based on the financial shared service model is shown in Table 1. The organizational structure of the enterprise is mainly transformed into networked, flat and standardized, in which the networked structure of the enterprise needs to reach 70% and standardized needs to reach 80%. The business process of the enterprise mainly develops to digitalization, intelligence and simplification, and 75% of the business needs to reach the level of intelligence.

**Table 1.** Manufacturing enterprise organization structure

<b>Corporate organizational structure trends</b>	<b>networked</b>	<b>flattening</b>	<b>normalize</b>
degree	70%	50%	80%
Enterprise business process optimization	digitization	intelligentize	simplify
degree	70%	75%	60%

### **3.2. ANALYSIS OF CORPORATE FINANCE FUNCTIONS**

Under the financial sharing model, enterprise financial management not only needs to analyze financial data, but also needs to organize and analyze various non-financial data. Therefore, the construction of financial sharing center has very high requirements for the professionalism of staff, who need to master both accounting expertise and computer technology, and the construction of financial sharing center is also inseparable from system development and operation managers. Therefore, in order to actively promote the transformation of enterprise financial management, it is necessary to build a professional financial management staff team. First, it is necessary to strengthen personnel exchange. This includes the exchange of staff of each business module of the sharing platform, the exchange of personnel between the sharing platform and the finance of the operating enterprise, and the short-term exchange between the finance personnel and the business. Through exchange and adjustment, the business integration can be maximized and the comprehensive business level of the finance personnel can be helped to improve. Second, strengthen the comprehensive training of enterprise financial management personnel. Regularly educate and train enterprise financial management personnel and form a long-term education and training mechanism to continuously improve the professional level of enterprise financial management personnel.

## **4. CONCLUSION**

This paper explores the limitations of the financial work model of manufacturing enterprises and digitally transforms the financial work of manufacturing enterprises based on the financial shared service model. The first step in the transformation of the financial work of manufacturing enterprises is to improve the intelligence of the enterprises. The organization structure of enterprises should be networked, flattened and standardized, of which 70% should be networked and 80% should be standardized.

## ABSTRACT

This paper combines big data analysis as well as correlation analysis to explore the relationship between both hotel management and tourism experience. By analyzing the factors that affect the tourist experience, the development direction of hotel management is formulated. Combining the common influence aspects of hotel management and tourism experience, effective strategies for the coordinated development of both are proposed. The results show that hotel service has the largest share in influencing tourist experience degree, with 80% influence, followed by hotel after-sales service with 75% influence. Among the factors influencing tourists' sense of experience, the degree of influence of humanized hotel management is 40%, and the degree of influence of both standardized as well as personalized hotel management is 30%.

## KEYWORDS

Big data analysis; Correlation analysis; Hotel management; Tourism experience; Coordinated development strategy

## 1. INTRODUCTION

Hotels have a strong function as a place to provide accommodation and food for tourists, and quality hotel services can make tourists' body and mind relaxed [1-2]. Make tourists get a good travel experience. However, in terms of the current development of hotels, the management mode of some hotels is relatively backward. Many hotels do not focus on providing tourists with quality services. Only the pursuit of creating more economic benefits. In addition, the hotel management lacks humanization [3-4]. Tourists do not get a better stay experience. Scientific management is an important guarantee to improve the service level of the hotel, in the face of the increasingly competitive market environment. If the hotel wants to continue to develop, it must keep pace with the times and innovate the hotel management mode [5].

Gao, B et al. investigated the correlated factors affecting hotel ratings by surveying hotel reviews in different cities. The ratings of hotel product features were illustrated through robustness tests [6]. Lin, Y. X et al. investigated the positive relationship between ITA and hotel performance through traditional and dynamic panel regression models [7].

In this paper, we use big data technology to analyze the correlation between hotel management and tourism experience, and on this basis, we propose a strategy for the

synergistic development of both.

## 2. ANALYSIS OF THE ASSOCIATION BETWEEN TOURISM EXPERIENCE AND HOTEL MANAGEMENT

### 2.1. TOURISM DEVELOPMENT MODEL UNDER TOURISM EXPERIENCE

#### 2.1.1. TRAVEL EXPERIENCE

Tourism experience is considered to be the culmination of a specific experience formed when tourists visit a specific tourist destination, a combination of multiple complex factors, and the impressions of tourists' feelings and attitudes toward the destination. There are many studies on tourism experience, but this paper is biased to believe that tourism experience should be the psychological feelings that tourists have during the tourism process, mainly in the form of emotions. Tourism experience can be distinguished in terms of intensity, validity and length of memory.

#### 2.1.2. EXPLORING THE INFLUENCING FACTORS OF TOURISM EXPERIENCE

##### (1) Entertainment projects and interaction

The main purpose of tourists' tourism is to experience various amusement facilities and to watch performing arts projects. The appearance, function and entertainment of various facilities, the audio-visual effect, theme and content of performing arts activities, the various interactions with service and performing arts personnel, and the cultivation of other customers' speech and behavior, all these factors will stimulate the visitors' vision, hearing, touch and emotion, so that they can obtain a variety of sensory functional experience and emotional experience.

##### (2) Hardware facilities and environment

Visitors gain direct experience through the use of supporting hardware in the hotel, the cruise ship decoration and the atmosphere of the space environment, generating the five senses, thinking and judging, and generating experience.

### 2.2. INTERACTION OF HOTEL MANAGEMENT AND TOURISM EXPERIENCE

##### (1) Hotel management can improve tourists' travel experience to a certain extent.

As mentioned above among the factors affecting tourists' experience, the management of hotel in-store facilities and the attitude of hotel attendants can affect tourists' tourism experience. The influence of hotel management on tourism experience is shown in Table 1. Hotel management mainly includes hotel facility management, hotel service management, and hotel after-sales management. Among them, hotel service is the most influential to tourists' experience degree, with the influence degree of 80%, followed by hotel after-sales, with the influence degree of 75%.

**Table 1.** The impact of hotel management on travel experience

Hotel management	Hotel facilities	Hotel service	Hotel after-sales service
Standard	perfect	good	good
Tourist experience degree	preferably	normal	No good
Tourist experience degree	70%	80%	75%

##### (2) The requirements of tourists' experience further promote hotel management

As the saying goes, if there is a demand, there will be a market, and the demand of tourists for hotels will push the hotels to make changes to a certain extent. For example, if tourists need to watch the starry sky at night, the hotel will transform the hotel bed according to the

tourists' demand and replace the roof of the room with glass material.

### 3. ANALYSIS OF STRATEGIES FOR THE COORDINATED DEVELOPMENT OF HOTEL MANAGEMENT AND TOURISM EXPERIENCE

#### 3.1. ANALYSIS OF THE INTEGRATION OF THE CHARACTERISTICS OF STANDARDIZED AND PERSONALIZED SERVICES

Hotel management affects the visitor experience to a certain extent. The management requirements of hotels are shown in Figure 1, which mainly include personalization, standardization and humanization. Among them, humanized hotel management can well improve tourists' experience. Among the factors affecting tourists' experience, humanized hotel management accounts for 40%, and standardized and personalized hotel management accounts for 30%.

**Figure 1.** Hotel management requirements

Travel is a recreational and leisure activity for tourists, and accommodation is the most basic need of tourists during the travel process. Hotel managers must design and provide professional services from the tourists' point of view. Hotels that are able to provide personalized services are able to create a brand effect and gain the favor of customers in the market, thus forming a good reputation. Personalized service work is essential for tourists. Therefore, the design of the hotel service plan, the designer must consider the actual needs of tourists, to provide the most intimate service for tourists. Specifically, it is necessary to understand the purpose of tourists to come to the hotel city, and provide them with the corresponding tourist guide and other services.

#### 3.2. HOTEL INFORMATION TECHNOLOGY IMPROVEMENT ANALYSIS

Information technology has gradually penetrated into various industries, the tourism industry and the hotel industry is no exception, and the whole area of tourism is the level of information technology for the hotel has put forward the corresponding requirements. With reliable network technology support, hotel information, tourism products and traffic information of the surrounding tourist attractions can be fed back to consumers at the first time, while consumers can complete online transactions with the hotel through information technology, and the promotion and marketing of the hotel also need to use information technology. From the perspective of using experience, the level of information technology of the hotel will to a certain extent affect the experience of consumers, so the development of convenient

information technology services has become an important strategy for the development of hotel management innovation under the whole area of tourism. How to determine the development tendency and development focus of the hotel in this aspect of information technology depends on consumer feedback, so the hotel in the process of information technology development also need to collect consumer feedback in a timely manner, and effective analysis and processing, and thus help the hotel to find the correct, humane direction of information technology development, to meet the basic needs of consumers, and to provide consumers with personalized information technology use experience This is undoubtedly an important role for the long-term development of the hotel.

#### **4. CONCLUSION**

This paper analyzes the relationship between tourism experience and hotel management by using the method of big data analysis. It is believed that tourism experience can, to a certain extent, force the reform and innovation of hotel management, and the improvement of hotel management ability can also improve the experience of tourists. Hotel service is the most influential to tourists' experience degree, with the influence degree of 80%, followed by hotel after-sales, with the influence degree of 75%. In the percentage of factors affecting tourists' sense of experience, humanized hotel management accounts for 40%, and standardized as well as personalized hotel management both account for 30%.

## ABSTRACT

In order to explore the innovative teaching mode of college education, this paper analyzes automotive information technology and combines it with college education innovation in the context of deep learning. By exploring the connotation of deep learning of automotive information technology in colleges and universities, the sudden review of teaching atmosphere under deep learning constructs a new model of integration teaching in colleges and universities with four teaching dimensions such as relationship orientation, integration orientation, context orientation and emotion orientation. After teaching practice, students' attendance increased by 0.13, students' satisfaction and concentration increased by 0.18, students' class participation increased by 0.23, and students' class concentration increased by 0.18, based on the deep learning context of integrated teaching is feasible.

## KEYWORDS

Automotive information technology; Deep learning; Relational vector; Integration vector; Situational vector; Affective vector

## 1. INTRODUCTION

Automotive information technology is widely used, and the traditional college automotive information technology teaching mode can hardly meet the diversified development needs and personalized learning needs of modern college students, so it is imperative for colleges and universities to carry out automotive information teaching reform work [1-2]. College education is a key component of China's talent cultivation system, and in the new era of education reform, the traditional college education model has exposed more and more drawbacks, while the concept of quality education is getting more and more attention from the society [3-4]. Therefore, how to effectively innovate the college education model to strengthen the quality education results of students becomes an important teaching task faced by the majority of college educators [5].

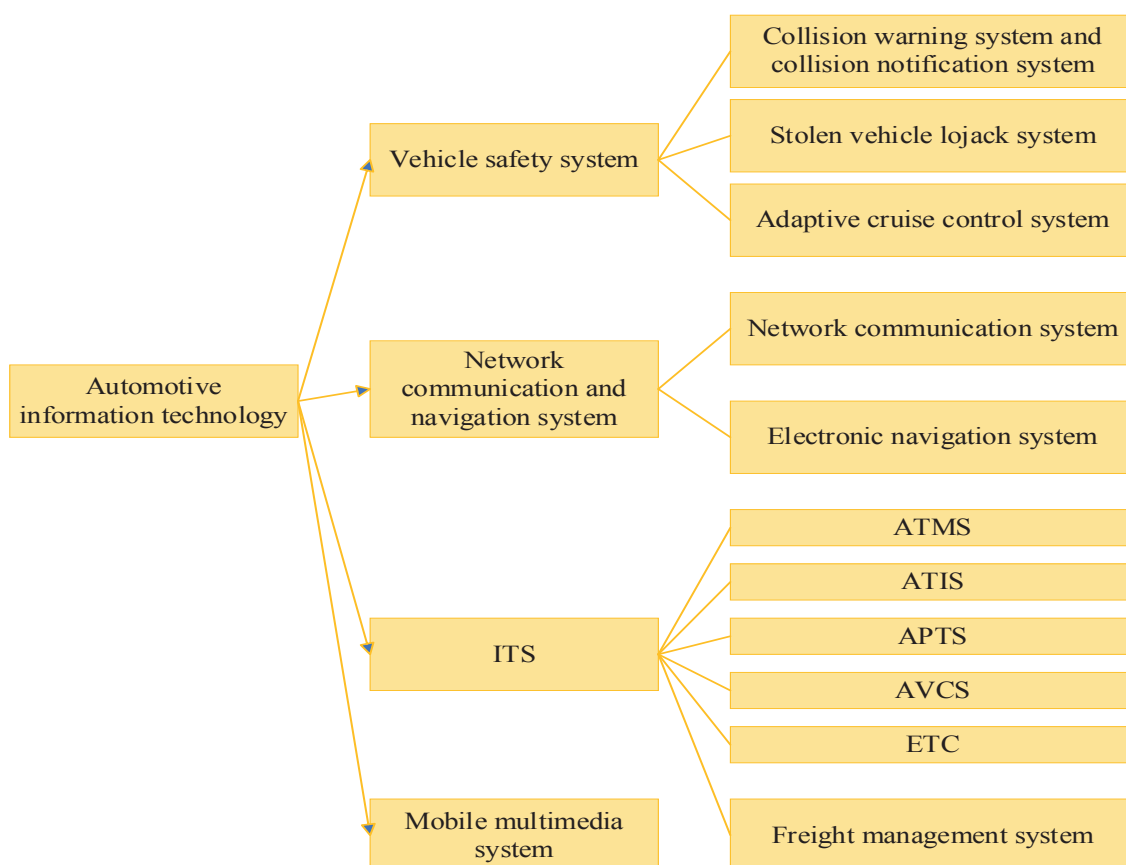

Deep learning means that students build on their learning of traditional knowledge understanding to critically understand what they have learned [6]. Students have to integrate their newly learned knowledge into the old knowledge structure and look for connections between the new knowledge and the old knowledge, so that deep learning can transfer the old

knowledge to a completely new context and allow students to better solve the problems they encounter [7-8]. Deep learning is characterized by understanding, criticism, communication, and reconstruction, and it is problem-oriented to better analyze and solve problems, so that “deep learning” can be applied throughout the efficient classroom teaching, which can trigger students’ deep thinking and improve their problem-solving ability [9].

In this paper, we will first analyze vehicle safety information technology, network, communication and navigation information technology, intelligent transportation system and mobile multimedia system information technology in the field of automotive information technology. The goal of university education innovation is to lead students to actively participate in activities, experience pleasure and happiness, and achieve healthy and comprehensive development. Under the concept of deep learning, the “ecological environment” of college atmosphere is built with the drive of automotive information technology innovation, the “leading effect” of college education atmosphere is brought into play with the appeal of real teaching situations, and the “emotional rationality” of college education atmosphere is nurtured with the aim of emotional experience education. The “emotional rationality” of college education atmosphere is based on the real teaching situation.

## 2. AUTOMOTIVE INFORMATION TECHNOLOGY

The current application items of information technology in the field of automobile and transportation are quite a lot, which can be roughly summarized into four aspects, and the application areas of automotive information technology are shown in Figure 1. That is, vehicle safety system, network, communication and navigation system, intelligent transportation system and mobile multimedia system.

**Figure 1.** Application of automotive information technology

## **2.1. VEHICLE SAFETY INFORMATION TECHNOLOGY**

Vehicle safety systems include the Collision Warning System and Crash Notification System, Adaptive Cruise Control, and Stolen Vehicle Recovery System. Collision warning systems and crash notification systems use radar, sonar, and laser beams to scan for potential obstacles and send warning signals to provide precise vehicle location information to aid agencies (120) in the event of an impending collision. Adaptive cruise control systems scan the road ahead with radar, sonar or laser beams by controlling the vehicle after setting a desired lower driving speed. Stolen vehicle recovery systems use the Internet to set an alert zone for the car and put it into an anti-theft state.

## **2.2. NETWORK COMMUNICATION AND NAVIGATION AND INTELLIGENT TRANSPORTATION INFORMATION TECHNOLOGY**

The network communication system receives network news, e-mail and other information through portable computers and cordless phones without the driver's eyes leaving the forward direction and hands leaving the steering wheel, and communicates the results to the driver by voice control, which can be activated by touching a button on the steering wheel. Car electronic navigation system is a new technology developed on the basis of GPS, the principle is a device that can receive positioning satellite signals, calculate the precise longitude and latitude where the car is and the speed and direction of the car through microprocessor, and display it on the monitor. The intelligent transportation system is divided into ATMS, ATIS, APTS, AVCS, ETC and mobile cargo management system.

## **2.3. MOBILE MULTIMEDIA INFORMATION TECHNOLOGY**

Mobile multimedia technology is embodied in smart wireless products, telecommunication devices and information processing products, including the provision of voice recognition systems. The system allows the driver not to manually operate the entertainment system, it can also be integrated into the Internet functions in the vehicle, so that people in the car can browse the Internet, send and receive e-mail and stock trading, while using the "plug and play" approach so that car consumers can easily and quickly replace their multimedia products to enjoy more. The "plug-and-play" approach allows car consumers to easily and quickly replace their multimedia products and enjoy a wealth of new services.

## **3. EXPLORATION OF INTEGRATED TEACHING MODE IN THE CONTEXT OF DEEP LEARNING**

Deep learning needs the echo of classroom teaching practice to gain lasting vitality. Deep learning has received great attention in the field of classroom teaching research, which not only triggers heated discussions in the academic field, but also becomes an important issue at the level of classroom teaching practice. The integration of automotive information technology and university education innovation model cannot be achieved without the support of deep learning concept.

### **3.1. THE CONNOTATION OF INNOVATION MODEL IN HIGHER EDUCATION**

Teachers should create a teaching atmosphere suitable for deep learning and deep learning based on the core content, so that students can be in a real and appropriate teaching atmosphere, which can promote their deep understanding and constructing the meaning of teaching, and then optimize the cognitive structure and enhance their core literacy. Secondly, deep learning should focus on students' learning process, in which teachers should create a teaching atmosphere for deep learning, lead students to actively participate in activities,

experience pleasure and happiness, and obtain healthy and comprehensive development, so as to realize deep learning in classroom teaching.

### **3.2. A REALISTIC REVIEW OF THE TEACHING ATMOSPHERE UNDER DEEP LEARNING**

Teaching atmosphere is one of the elements of teaching and learning, which directly or indirectly affects teaching effectiveness. Teachers do not pay enough attention to creating teaching atmosphere, mainly from the emotional field of deep learning, spatial and temporal field, life field and psychological field, etc., to examine the real-world dilemma of classroom teaching atmosphere. Teacher-student interaction is the key to improve the effectiveness of teaching, teaching atmosphere variables, information technology applications have an important impact on students' interest in learning, and optimizing the teaching atmosphere with information technology is the key to the effective use of information technology in college teaching. Teaching context is emotional and cognitive, and creating real teaching context has extremely important value and significance for college teaching.

### **3.3. CONSTRUCTION OF INCLUSIVE EDUCATION UNDER DEEP LEARNING**

Based on the concept of deep learning, the purpose of optimizing the educational atmosphere is to make the classroom in colleges and universities become the best occasion for active thinking and emotional resonance, and we mainly discuss the appropriate direction of optimizing the educational atmosphere in colleges and universities from the dimensions of relationship, integration, context and emotion. With the logic of collaborative development of teachers and students, the "common governance subject" of education atmosphere is adjusted. With the innovation of automobile information technology as the driving force, the "ecological environment" of university atmosphere is constructed. With the real teaching situation as the demand, the "leading effect" of college education atmosphere is brought into play. With the purpose of emotional experience education, the "emotional rationality" of college education atmosphere is cultivated.

## **4. APPLICATION AND ANALYSIS OF INTEGRATED TEACHING IN THE CONTEXT OF DEEP LEARNING**

In order to investigate the feasibility of the integration of automotive information technology with the innovative model of college education in the context of deep learning, the integrated teaching model was applied to college teaching for one semester, by comparing the attendance rate, student satisfaction, class participation, and class concentration between the new model of teaching and the traditional model. The comparison was conducted by first excluding the factors of individual students' influence on teaching differences. Figure 2 shows the results of the comparison between using the traditional instructional mode and the integrated instructional mode. In the new teaching mode, students' interest increased greatly, students' attendance increased by 0.13, students' satisfaction increased by 0.18, students' class participation increased the most, by 0.23, and students' class concentration increased by 0.18. Integrated teaching is feasible based on the deep learning context.

**Figure 2.** Comparison between traditional teaching methods and new teaching methods

## 5. CONCLUSION

This paper analyzes automotive information technology and aims to integrate automotive information technology with the innovation model of university education in the context of deep learning. With the logic of collaborative development of teachers and students, it adapts the “common governance subject” of education atmosphere. With the innovation of automotive information technology as the driver, the “ecological environment” of college atmosphere is constructed. With the real teaching situation as the demand, the “leading effect” of college education atmosphere is brought into play. With the purpose of emotional experience education, the “emotional rationality” of college education atmosphere is cultivated. After the application of the constructed teaching, the students’ attendance, class participation, concentration, and satisfaction are all improved, so the integrated teaching in the context of deep learning is feasible.

## ABSTRACT

This paper first examines the intrinsic mechanism based on deep learning and the logistics development of the Guangdong-Hong Kong-Macao Greater Bay Area (GBA) in a setting of the integration of logistics with the value orientation of improving the region's overall competitiveness, the development objective of creating a contemporary logistics service system, as well as the inherent necessity of encouraging the growth of geographically associated sectors. Then the features of the talent demand are used to examine the need for talent in the logistics growth of the GBA. The logistics composite talents are cultivated in terms of repositioning the talent training objectives, building internationalized logistics professional curriculum and teacher training groups and international logistics laboratories and modern logistics training bases, and carrying out logistics practical training projects in GBA.

## KEYWORDS

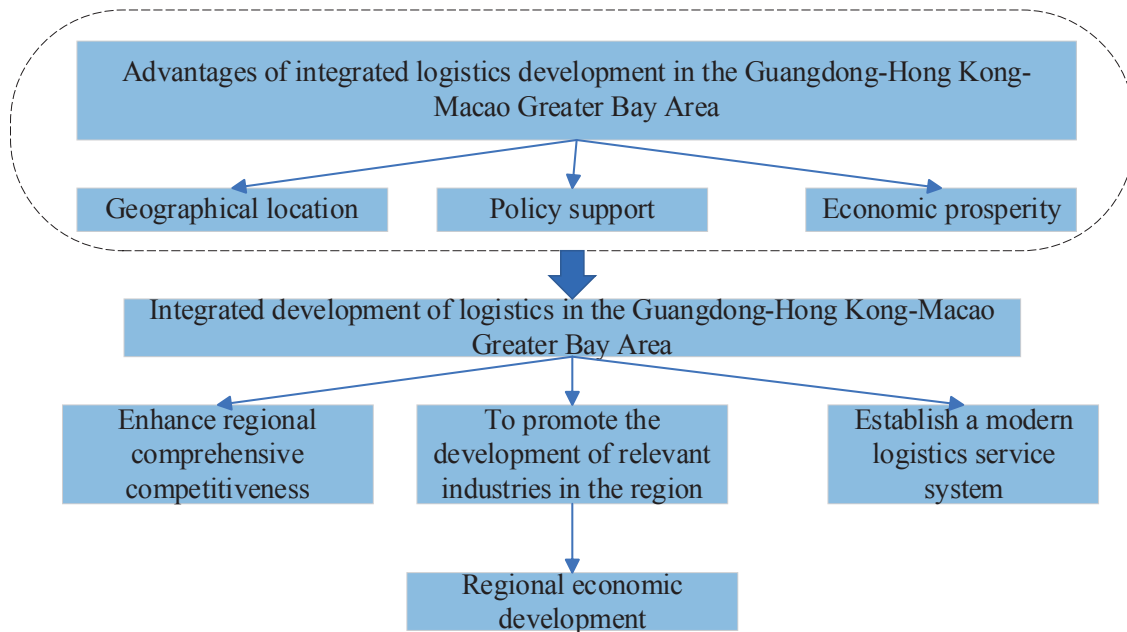

Deep learning; Logistics integration; Guangdong-Hong Kong-Macao Greater Bay Area; Logistics talents; Logistics services

## 1. INTRODUCTION

Due to its obvious position, strong economic power, concentration of creative components, priority internationalization level, and solid basis for collaboration, the GBA has inherent growth advantages [1-2]. The GBA 's interconnected infrastructure has increased the scale of infrastructure construction as well as constantly optimized and enhanced the information infrastructure, thereby encouraged the smart and environmentally friendly development of port logistics [3-4]. The development of port logistics in China has been greatly aided by the strengthening of infrastructure building in the GBA, which has decreased port logistics costs and can handle the long-distance transportation of heavy cargo. By creating an essential buffer region for the Silk Road Economic Belt and the 21st-century maritime Silk Road by virtue of the region's two-way opening, the GBA offers chances and circumstances for the further growth of China's "One Belt, One Road" initiative [5-6]. Building a GBA is an important strategic initiative to support reform and opening up in the modern period, a project to develop a completely new model of comprehensive opening up, and a new strategy to promote the development of "one country, two systems." [7]. The support of talent is essential to the GBA's economic growth, and the expansion of the region's port and shipping logistics sector will increase need for qualified port and shipping management personnel, which urgently needs a large number of practical talents with strong social adaptability and high comprehensive quality [8]. How to implement talent reform in port and marine logistics management and produce high-caliber practical talent for the growth of GBA is a crucial component of higher vocational education's practical curriculum to support the national strategic development strategy, which has significant theoretical research and practical application value [9]. Using deep learning and a foundation in logistics integration, we study in this work how to educate logistics composite skills in GBA.

## 2. INTRINSIC MECHANISM OF LOGISTICS DEVELOPMENT IN GBA

The GBA's logistics development, which is based on deep learning and a background in logistics integration, has an inherent structure of the value introductions of enhancing the region's overall competitiveness, the intrinsic requirement of fostering the growth of related industries in the region, and the long-term objective of creating a modern logistics service system, among other things. Figure 1 depicts the fundamental framework for the growth of logistics in the GBA according to deep learning and logistics integration.

**Figure 1.** Internal mechanism of logistics integration development

### 2.1. VALUE ORIENTATION OF ENHANCING REGIONAL COMPREHENSIVE COMPETITIVENESS

The GBA realizes the change of transportation for logistics to logistics services, fosters the change of conventional logistics scattering to the path of modern supply chain integration, and fosters the change of urban local logistics to market-led regional transportation by optimizing the structure of logistics resources, making it advantageous for the creation of a modern, efficient regional logistics system. In order to achieve the informatization, synergy, and internationalization of the GBA city cluster, as well as to improve the region's overall competitiveness, it is crucial that regional logistics are developed in an integrated manner.

### 2.2. THE INHERENT REQUIREMENT OF PROMOTING THE DEVELOPMENT OF REGIONAL RELATED INDUSTRIES

The logistics sector, which is a cross-regional, cross-industry, and cross-sectoral complex modern industry, realizes cluster development in Guangdong, Hong Kong, and Macao by fully utilizing the industrial correlation effect. It also realizes interaction with the logistics supporting industries in the three locations in terms of service information collection and exchange, supply and demand of value-added logistics services, etc., thereby fostering business cooperation between the three locations. Encourage cross-border and regionally integrated logistics industry clusters, utilize the agglomeration and symbiosis effects, and promote the growth of complementary sectors in the Greater Bay Area alongside the logistics sector.

### 2.3. THE DEVELOPMENT GOAL OF ESTABLISHING A MODERN LOGISTICS SERVICE SYSTEM

Become aware of the logistics industry's "chain" evolution. The GBA's "chain" can make logistics operations and logistical methods more effectively connected and encourage a more appropriate spatial layout of the logistics service system by governing the growth of the logistics sector in the areas of distribution, handling, circulation, and processing, loading and unloading, packaging, and logistics data exchange. Recognize the industry's clever

development. Using the Internet of Things, big data, AI, blockchain, and other new information technologies, as well as the global synchronization of technical norms in the logistics business, the informatization of logistics operations, and the improvement of related supporting infrastructure, it is possible to achieve the integrated growth in logistics in the GBA.

### 3. DEMAND FOR TALENTS IN LOGISTICS DEVELOPMENT IN GBA

In GBA, logistics companies and regional economic growth have proposed greater standards for training of logistics professionals and provide beneficial help to regional financial growth via talent training. This is based on deep learning and integration of logistics background. The features of the talent need for logistics development in GBA are shown in Table 1. The GBA, and the demand characteristics for logistics talent are used to examine the need for talent.

**Table 1.** Characteristics of talent demand for logistics development

Supply chain as the core of warehousing talent demand	Supply chain as the core of warehousing logistics is the key link of the GBA logistics
Demand for foreign language talents	Recognition of cultural diversity and mastery of foreign languages is very important for relevant staff to participate in the logistics of the GBA
Logistics information talents	The logistics industry needs to strengthen the connection with the Internet, and strengthen cloud computing, big data and mobile Internet in the logistics industry Application needs logistics information personnel.
Logistics finance talent demand	The financial industry and the logistics industry intermingled, creating Logistics finance, a financial model, is in urgent need of logistics financiers Only.

#### 3.1. THE DEVELOPMENT OF LOGISTICS INDUSTRY CONTINUES TO INCREASE THE DEMAND FOR TALENTS

The logistics sector is a subset of the service sector that offers support for both social and economic development, and the expansion of this sector is directly correlated with economic expansion. The expansion of the GBA, the "Belt and Road" project, economic transformation and upgradation, and the growth of the logistics industry have recently captured the attention of the whole public and governments at all levels. E-commerce, chain management, logistics delivery, cross-border e-commerce, and other novel distribution techniques are all emerging quickly at the same time, and the demand for logisticians is rising quickly as well. The need for logistics skills in information technology is growing as a result of the growth of big data, the Internet of Things, and blockchain technology.

#### 3.2. THE CONSTRUCTION OF GBA URGENTLY NEEDS LOGISTICS COMPOSITE TALENTS

For GBA, which is essential in the construction of the "One Belt, One Road" plan, the Pan-Pearl River Delta serves as a vast development hinterland. The economic openness of China begins in these areas. To effectively support the expansion of the GBA's economy and society, the GBA plans to create a global logistics hub, a modern service industry system, with a focus on the growth of shipping logistics, a vigorous expansion of outside logistics as well as cold chain logistics, and advancement of the development of Guangdong-Hong Kong-Macao logistics collaboration.

#### 3.3. LOGISTICS COMPOSITE TALENT GAP IS OBVIOUS

GBA are all tightly entwined with the "Belt and Road" and have grown to be a crucial part of its support system. GBA all have robust digital economies and have amassed a number of distinct advantages in the growth of digital trade, including "innovation + manufacturing + logistics + financial services," the benefits of the Bay Area, a developed supply chain and production chain system, and a thorough integration of industry and digital technology, all of which provide significant support for the growth of the international e-commerce sector. Cross-border e-commerce is revolutionizing trade, and in order for it to expand, business, information, finance, logistics, and talent migration must all be integrated. The cross-border e-commerce business needs talent to expand in a high-quality way, and there is a growing demand for cross-border composite logistics specialists.

#### 4. LOGISTICS COMPOSITE TALENT TRAINING

In GBA, colleges and universities are the primary places to create logistics composite skills based on deep learning and background in logistics integration. Figure 2 shows the cultivation measures and percentage of logistics composite talents. a1 is to reposition the goal of talent cultivation, a2 is to internationalize the logistics professional curriculum, a3 is to internationalize the teacher training group, a4 is the need to build an international logistics laboratory, a5 is to carry out the GBA A6 is to organize students to participate in various forms of logistics skills competitions, A7 is to build a joint applied talent training model, A8 is to build a modern logistics training base, A9 is to understand the actual needs of logistics talents and carry out misalignment training, A10 is to position the school itself, and building a modern logistics training base is among the top priorities.

Figure 2. Training measures and proportion of logistics compound talents

#### 5. CONCLUSION

Based on deep learning and background in logistics integration, this article examines the fundamental needs for the growth of logistics in the GBA. Additionally, it determines the training route for logistics composite talents and assesses the labor market need for labor based on the features of the GBA labor market. In addition to creating a globalized logistics professional curriculum and training for teachers group, it repositions the purpose of talent development. It builds a contemporary logistics training facility and an international logistics laboratory and conducts actual logistics training projects in GBA. It establishes a collaborative application talent training approach to position the school itself, conducts out misalignment training, arranges students to compete in various types of logistical skills contests, and recognizes the real demands of logistics talents.

## ABSTRACT

This paper uses big data technology to analyze contemporary college students' view of national interests and sort out the view of national interests of contemporary college students who agree that both individual and society are important but are still at the stage where individual interests are the most important. In order to channel and guide this view of national interests, it is combined with the ideological education of colleges and universities to integrate teaching on the view of national interests of college students. In addition, the ideological and political education in colleges and universities builds a platform of benign communication for college students to guide them to properly safeguard legitimate interests, soothe hostility, shape value rationality and enhance the unique utility of interest pursuit. The quality of the constructed integration education will be evaluated, and the evaluation results show that the number of good quality of integration education is above 80%.

## KEYWORDS

Big data analysis; Profit view education; Civic education; Integrated teaching; Quality assessment

## 1. INTRODUCTION

During the period of the planned economic system, the state managed the national economy according to a unified plan, so ideological and political education was mainly focused on solving single-interest relationships, and its existence of interest problems was not reflected [1-2]. In the middle and late last century, leaders carried out the reform of the economic system and implemented the socialist market economy, which led to rapid economic development, but the development also brought many problems, the most prominent of which was the issue of interests [3-4]. Under the conditions of market economy, people realize that the pursuit of their own interests is reasonable and legitimate, not to mention that the pursuit of interests is also the nature of human beings, and interests seem to be the most concerned topic, which makes the issue of interests in ideological and political education work more and more obvious [5]. Everyone speaks of interests and revolves around them constantly, and once they are related to their own interests, they will trigger the most sensitive nerves in people's bodies [6]. The Marxist view of national interests is philosophically based on dialectical materialism, with human liberation and the free and comprehensive development of human beings as the ultimate goal, and promotes the realization of the ultimate goal through the social practice and construction of the people [7]. Based on the Marxist view of national interests, the theoretical and practical basis of the principle of interests in ideological and political education is fully

argued, with emphasis on the essence of the Marxist view of national interests, which recognizes the interests of individuals as a basic value orientation of social life [8]. However, it does not start from the abstract individual, but places the individual and his pursuit of interests in the reality of social history, seeking to achieve the fundamental interests of the broadest number of people [9]. This paper also discusses how to apply the principle of interests in ideological and political education and how to correctly deal with the issue of the relationship between individual, collective and national interests to make changes to ideological and political education work in the new era of socialist market economy [10-11].

## 2. THE PROFIT VALUES OF COLLEGE STUDENTS BASED ON BIG DATA ANALYSIS

### 2.1. COLLEGE STUDENTS' VIEW OF NATIONAL INTERESTS UNDER BIG DATA ANALYSIS

Using big data technology, we analyzed the discourse on the mirror image of socialist core values of contemporary college students, the choice of interests of contemporary college students, and the views of contemporary college students on the interests of scholarships, merit assessment, party membership, employment and marriage, respectively. Figure 1 shows the channels from which contemporary students learn about socialist core values, and the answers are 34% from books, 30% from classroom, 18% from computer, 11% from TV and 4% from newspaper in order, indicating that contemporary college students have insufficient basic knowledge of socialist core values. Contemporary college students are patriotic and responsible occupy the mainstream, care about the construction and development of the Party and the country, expect the society to be clean and clear, and have certain plans and goals for individual ideal pursuit. Some college students do not know enough about the connotation of interests and are not very clear about the natural connection between interests and struggles. College students do not recognize their own and others' attitudes toward interests, and expect to develop toward a view of national interests that gives equal importance to social interests and personal interests. Contemporary college students give priority to factors such as salary and hobbies in employment. The employment benefits they value are firstly material benefits and at the same time get spiritual satisfaction, and few of them choose purely material or spiritual benefits.

**Figure 1.** How do contemporary students learn about core socialist values

### 2.2. CHARACTERISTICS OF CONTEMPORARY COLLEGE STUDENTS' VIEW OF NATIONAL INTERESTS

Through the analysis of big data, we get that contemporary college students, under the joint action of family, school, society and individuals, tend to have a better overall ideological outlook, and have their own unique orientation in the view of national interests, showing distinctive

characteristics. Contemporary college students agree with the view of national interests of both individuals and society, but they are still at the stage of personal interests, agree that personal interests and interests of others are mutually beneficial, choose to fight for interests in a legal and reasonable way, generally pay attention to personal interests, and tend to develop spiritual interests and material interests in a coordinated way. There is still a disconnect between knowledge and action among contemporary college students, and the contrast between theoretical cognition and improvised behavior is obvious.

### **3. THE PATH OF INTEGRATION EDUCATION OF PROFIT VIEW AND CIVIC SCIENCE**

#### **3.1. INTEGRATION OF INTEREST-BASED EDUCATION AND CIVIC EDUCATION**

In the process of social construction and development, various social relations are inevitably touched, including the relations between individuals, between individuals and groups, between groups and groups, and between groups and the state, and all these relations are inextricably linked with “interests”. The integration of ideological and political education and Civic Education is mainly in the scope of interests, the origin of interests, the basis of interests and the principles of interests.

##### **3.1.1. THE SCOPE OF INTEREST AND THE ORIGIN OF INTEREST IN CIVIC EDUCATION**

The emergence and development of ideological and political education coincides with the process of human history. Ideological and political education arises due to human needs, and needs are indeed the premise and basis of interests. Ideological and political education is rooted in the value relationship and value activities of the subject and the object, and the motivation and activities of the subject to consciously meet its needs and interests are the deep value roots of the emergence and development of ideological and political education.

##### **3.1.2. THE INTEREST BASIS OF CIVIC EDUCATION**

We study the basic theory of interest in the field of philosophy, explore the status and role of interest in Marx’s historical materialism, and clarify the relevant discussions on “interest” and “ideological and political education” by classic Marxist writers, so as to enrich the Marxist theory of interest and enrich the foundation of interest in ideological and political education. At the same time, the basis of interest in ideological and political education will be enriched. In this regard, we would like to highlight the internal logic between the basic theory of Marxist interests, ideological and political education and the construction of a socialist harmonious society.

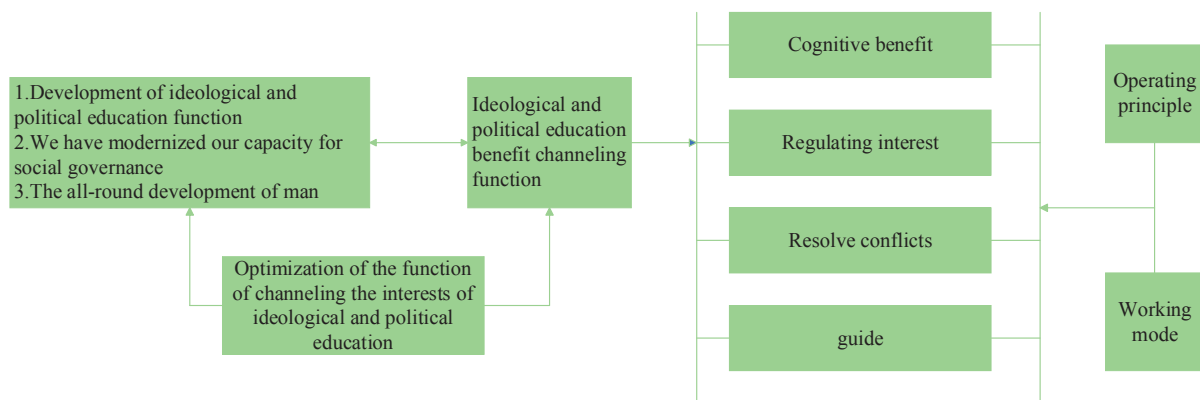

##### **3.1.3. INTEREST PRINCIPLE OF CIVIC EDUCATION**

Only by following the law of interests, ideological and political education work can achieve better educational effects. The theoretical basis of the interest principle as the basic principle of ideological and political education is explored, and the education-oriented role of the interest principle is clarified. In the process of ideological and political education, it is necessary to pay attention to the legitimate interest demands of education subjects and adhere to the principle of interest of fair, just, harmonious and developmental ideological and political education in order to enhance the effectiveness of ideological and political education to the greatest extent.

#### **3.2. INTEREST DIVERSION UNDER CIVIC EDUCATION**

The function of interest diversion function of ideological and political education needs to form a reasonable and scientific professional process, including four links of recognizing interest, regulating interest, channeling interest and guiding direction, and the interest diversion of ideological and political education is shown in Figure 2. Each stage and each link of the process contains rich contents, which are related to each other and interact with each other to

jointly ensure the optimal value of the function of interest diversion of ideological and political education.

**Figure 2.** Process analysis model of ideological and political education benefit channeling function

### 3.3. OPTIMIZATION STRATEGY OF INTEREST-VIEW DIVERSION UNDER INTEGRATED EDUCATION

The actual process of ideological and political education interest diversion function is not the independent operation and sequential development of each work process, but the process of interconnection and interaction between each process. Therefore, this study focuses on optimizing the mechanism of ideological and political education, with the aim of optimizing the mechanism of ideological and political education, so that the work processes can be connected more smoothly and closely, and the effectiveness of the function of interest diversion can be enhanced. The encounter given to the ideological and political education interest diversion function in the era of big data will be more practical and specific to optimize the process of playing the function, so that the various elements of the ideological and political education interest diversion function are more compatible with each other, the articulation between each link is more smooth, and the working mechanism is more coupled, thus promoting the system of ideological and political education interest diversion function to be perfected and effectively played. "People create the environment, likewise, the environment also creates people." People and the environment are interlinked, and the environment is the external condition for human survival and development, which directly or indirectly gives people positive or negative influence. Ideological and political education is to do people's work and optimize its interest-redirection function, first of all, to optimize the environment.

### 4. QUALITY ASSESSMENT OF INTEGRATED EDUCATION

Through literature review and target decomposition, the quality evaluation indexes of integration of profit view education and ideological and political education were decomposed into 2 first-level indicators of education work and education effectiveness, and the first-level indicators in general were not detailed enough. Through argumentation, the education work is again decomposed into 3 secondary indicators of total education, whole process education and all-round education, and the education effectiveness is decomposed into 3 secondary indicators of direct effectiveness, indirect effectiveness and overflow effectiveness. The secondary indicators are still not specific enough to be directly observed, so the secondary indicators are further decomposed into 10 tertiary indicators. The multi-layer fuzzy comprehensive evaluation method was applied to evaluate the three-level indicators, and the evaluation results are shown in Table 1. The overall evaluation results show that the teaching quality of profit view education and Civic Education of college students based on big data analysis is excellent.

**Table 1.** Teaching quality evaluation results

Secondary index	excellent	good	In general	poor
Educate all staff	0.32	0.48	0.15	0.05
Whole-process education	0.40	0.45	0.11	0.04
All-round education	0.42	0.44	0.08	0.06
Direct effect	0.38	0.43	0.12	0.07
Indirect effect	0.46	0.44	0.09	0.01
Spillover effect	0.40	0.51	0.07	0.02

## 5. CONCLUSION

In this paper, we use big data to analyze the interest value education of college students and get the characteristics of contemporary college students' profit view. Since ideological and political education arises due to human needs, and needs are indeed the premise and basis of interests. Ideological and political education is rooted in the value relations and value activities between subjects and objects, and the motivation and activities of subjects to consciously meet their needs and interests are the deep value roots of the emergence and development of ideological and political education. Therefore, this paper combines ideological and political education to channel the values of interests of college students, and constructs an optimal strategy for channeling values of interests under integration education applied to university teaching for evaluation, with good quality of integration teaching.

## **ABSTRACT**

In this paper, a detailed study of the discontinuous differential system is done by combining the matrix manifold optimization algorithm. By transforming the Grassmann manifold into a linear eigenvalue problem, the Riemannian manifold and the Riemannian metric are studied respectively for the solution of this linear eigenvalue problem, and the corresponding model reduction algorithm is established respectively. The qualitative theory of the discontinuous differential system based on the optimization technique is examined, together with the gradient of the function on the specified matrix manifold on the Riemannian manifold. To get the differential system's periodic solution, update the differential equation to include as the new independent variable. The findings demonstrate that the suggested technique can build a reduced-order system efficiently, and that the reduced-order system can better preserve the dynamical behavior of the original system.

## **KEYWORDS**

Matrix manifold optimization; Discontinuous differential system; Grassmann manifold; Riemannian manifold; Qualitative theory

## **1. INTRODUCTION**

Due to the lack of mathematical analysis tools, the development of the theory of right-sided discontinuous differential equations has been quite slow so far, the development of the theory of right-sided discontinuous differential equations is still in its infancy and many of the theories have not been perfected [1-2]. In the study of the qualitative theory of differential equations, the theory of differential operator spectrum and fractional order differential equations have received the attention of many scholars and had a breakthrough development along with the rapid development of fractal science, biology, automatic control, physics, fractional control systems and fractional controllers, rheology, electroanalytical chemistry, and other disciplines [3-4]. However, due to the nonlocal character of the fractional-order calculus operators and the singularity of the kernels as an integral operator, it is extremely challenging to explore fractional order differential systems with the theory and techniques of integer order differential equations [5-8]. Thus, it is necessary to establish an independent theory of fractional order calculus, which is still in its infancy due to the complexity of its computation and the fact that the elaboration of some of their physical meanings has not yet been generally accepted,

consequently, compared to the study of the theory of integer order differential equations, the study of the theory of fractional order differential equations is still in its infancy [9-12].

## 2. MODEL REDUCTION METHOD BASED ON SYMMETRIC LINEAR EIGENVALUE PROBLEM

### 2.1. RIEMANNIAN NEWTON'S METHOD BASED ON MODEL DESCENDING METHOD

#### 2.1.1. GRASSMANN FLOW PATTERN

Next, the invariant subspace corresponding to the greatest  $r$  Hankel singular value is calculated using the Riemannian Newton technique. The common orthogonal basis of invariant subspaces allows for the construction of the reduced-order system.

The non-tight Stiefel manifold will be denoted as  $ST(r, n)$ . It is a portion of the Euclidean space  $R^{n \times r}$  that is described by

$$ST(r, n) = \{Y \in R^{n \times r} : \text{rank}(Y) = r\} \quad (1)$$

The collection of all  $r$ -dimensional subspaces in the Euclidean space  $R^n$  is represented by the Grassmann manifold  $Gr(r, n)$ . Obviously, every element in the equivalence class can be tensed into the same subspace. As a result, in terms of the equivalence relation, the Rasmann manifold  $Gr(r, n)$  may be seen as the quotient manifolds of the non-tight Stiefel manifold.

#### 2.1.2. RIEMANNIAN MANIFOLDS

Define the gradient of the smooth real-valued function  $f$  on the matrix manifold, which can be defined as the Riemannian manifold  $M$ . In the tangential space  $T_yM$  at  $Y$ , the gradient  $\text{grad}f(y)$  of  $f$  at  $Y \in M$  is the only element that satisfies:

$$(\text{grad}f(y), \xi y)y = Df(y)[\xi y], \forall \xi y \in YyM \quad (2)$$

where  $\text{grad}f(y)$  is the Riemannian metric.

To obtain the direction of descent, solve the following Newton's equation for  $\eta y \in T_yM$ :

$$\text{Hess}f(y)\eta y = -\text{grad}f(y) \quad (3)$$

The following characteristics describe a withdrawal  $R$  on a manifold  $M$ , which is a smooth map from tangent bush  $TM := \cup_{Y \in M} T_YM$  to  $M$ . Let  $R_Y$  stand for  $R$ 's limitation on  $T_YM$ .

(1)  $R_Y(0_Y) = Y$  where  $0_Y$  denotes the zero element in  $T_YM$ .

(2) holds  $T_{0_Y}T_YM \square T_YM$ ,  $R_Y$  satisfies:

$$DR_Y(0_Y) = \text{id}_{T_YM} \quad (4)$$

where  $\text{id}_{T_YM}$  denotes the unit mapping on  $T_YM$ .

By definition, Riemannian exponential mapping is also withdrawn. However, it is usually more arithmetic to compute Riemannian exponential mapping. To reduce the operations, other withdrawals can be used instead of the exponential mapping.  $\eta y$  is obtained by solving Newton's equation, and then  $\eta y$  is returned to the manifold  $M$  by withdrawing the mapping. iteration is eventually obtained as an iterative sequence. The theorem demonstrates the local superlinear convergence of the iterative sequence generated using the Riemannian Newton's

technique.

## 2.2. RIEMANNIAN NEWTON METHOD FOR SOLVING SYMMETRIC LINEAR EIGENVALUE PROBLEMS

### 2.2.1. RIEMANNIAN METRIC

It is evident that the  $-F$  greatest  $r$  eigenvalues defining the cost function on  $ST(r, n)$  have a squared connection with the linear system's  $r$  largest Hankel singular value:

$$\bar{f}(Y) = \text{tr}\left(\left(Y^T Y\right)^{-1} Y^T F Y\right) \quad (5)$$

and natural mapping:

$$\pi : ST(r, n) \rightarrow \text{Gr}(r, n) : Y \mapsto Y = \text{span}\{Y\} \quad (6)$$

Since  $\bar{f}$  depends only on the subspace into which  $Y$  tensor, regardless of how the exact foundation of the subspace is represented

$$f(Y) = \text{tr}\left(\left(Y^T Y\right)^{-1} Y^T F Y\right) \quad (7)$$

$\bar{f} = f \circ \pi$  is satisfied by the definition on the Grassmann manifold  $\text{Gr}(r, n)$ . Assign the Riemannian metric listed below to each tangent space  $\text{Gr}(r, n)$ .

$$\langle \xi_Y, \eta_Y \rangle_Y := \langle \bar{\xi}_Y, \bar{\eta}_Y \rangle_Y = \text{tr}\left(\left(Y^T Y\right)^{-1} \bar{\xi}_Y^T \bar{\eta}_Y\right) \quad (8)$$

### 2.2.2. INVARIANT SUBSPACE

The crucial point  $Y_*$  such that  $\text{grad}f_{Y_*} = 0$  can be sought in order to get an invariant subspace of  $F$ . One may anticipate that  $Y_*$  is going to be the invariant of the subspace matching to the  $r$  lowest eigenvalues of  $F$  by selecting acceptable beginning values. The retreat from the tangent space  $T_Y \text{Gr}(r, n)$  to the Grassmann manifold  $\text{Gr}(r, n)$  when  $\bar{\eta}_Y$  is established is described by the features of Riemannian quotient manifolds as

$$Y_+ = \text{span}\{Y + \bar{\eta}_Y\}, \quad \bar{\eta}_Y \in H_Y \quad (9)$$

In practical operations, the non-singular matrix  $Z_+ \in \mathbb{R}^{r \times r}$  can be chosen such that  $Y_+ := (Y + \bar{\eta}_Y)Z_+$  is a standard column orthogonal matrix. Clearly,  $Y_+$  satisfies  $\text{span}\{Y_+\} = \text{span}\{Y + \bar{\eta}_Y\}$ .

To obtain  $\bar{\eta}_Y$ . Next, the numerical solution of Newton's equation, Eq. 9, is discussed. For simplicity, choosing a suitable non-singular matrix  $Z_+$  that  $Y$  is standard column orthogonal and  $Y^T F Y$  donates a diagonal matrix, i.e.,  $Y^T F Y = \text{diag}\{\rho_1, \rho_2, \dots, \rho_r\}$ , then Newton's equation, Eq. 9 can be decoupled as

$$\begin{cases} P_Y^h (F - \rho_i I_n) P_Y^h \bar{\eta}_i = -(I_n - y_i y_i^T) F y_i, \\ Y^T \bar{\eta}_i = 0 \end{cases} \quad (10)$$

where, accordingly,  $\bar{\eta}_i, y_i \in \mathbb{R}^n (i = 1, 2, \dots, r)$  is the  $i$ th column of  $\bar{\eta}_Y$  and  $Y$ . Since  $Y^T \bar{\eta}_i = 0$ ,

equation 10's first equation is equal to

$$(F - \rho_i I_n) \bar{\eta}_i + Y l_i = -(I_n - y_i y_i^T) F y_i \quad (11)$$

where  $l_i \in \mathbb{R}^r$ . therefore. The saddle point issue is further derived from Eq. 11 as

$$\begin{bmatrix} F - \rho_i I_n & Y \\ Y^T & 0 \end{bmatrix} \begin{bmatrix} \bar{\eta}_i \\ l_i \end{bmatrix} = \begin{bmatrix} -(I_n - y_i y_i^T) F y_i \\ 0 \end{bmatrix} \quad (12)$$

The related model reduction algorithm in the Riemannian Newton approach is provided based on the aforementioned study. Table 1 displays the Riemannian Newton method-based model reduction methodology for linear systems.

**Table 1.** Model reduction algorithm based on Riemannian Newton method

Input	Linear system, reduced order $r$ , maximum number of iterations $N$ .
Output	The coefficient matrix of the reduced-order system
1	The controllable Gram matrix $P$ and the observable Gram matrix $Q$ are computed.
2	Calculate the Cholesky factor $L_c$ , and let $F = -L_c^T Q L_c$
3	The column-orthogonal matrix $Y_0$ is chosen such that $Y_0^T F Y_0$ is diagonal.
4	<i>for</i> $i = 1, 2, \dots, N$ <i>do</i>
	Solve $\bar{\eta}_{Y_i}$ from the equation
	The column-orthogonal matrix $Y_{i+1} = (Y_i + \bar{\eta}_{Y_i}) Z_i$ is chosen such that $Y_{i+1}^T F Y_{i+1}$ is diagonal.
5	$V = Y_{N+1}$
6	<i>return</i> $\tilde{A} = V^T \hat{A} V, \tilde{B} = V^T \hat{B}, \tilde{C} = \hat{C} V$ .

### 3. QUALITATIVE ANALYSIS OF DISCONTINUOUS SYSTEMS

Applying a column coordinate transformation  $x_1 = x_1, x_2 = \rho \sin \xi, x_3 = \rho \cos \xi$  to the system, the system becomes

$$\begin{cases} \dot{x}_1 = \rho \sin \xi + \mu(2\rho^2 - |x_1| - \text{sign}(x_1)), \\ \dot{\rho} = \mu(2\rho^2 - |x_1| - \text{sign}(x_1))(\sin \xi + \cos \xi), \\ \dot{\xi} = 1 - \frac{\mu}{\rho}(\sin \xi - \cos \xi)(2\rho^2 - |x_1| - \text{sign}(x_1)). \end{cases} \quad (13)$$

Let  $\xi$  be the new independent variable and the differential system becomes

$$\begin{cases} \frac{dx_1}{d\xi} = x_1' = \rho \sin \xi + \mu(\sin \xi^2 - \sin \xi \cos \xi + 1)(2\rho^2 - |x_1| - \text{sign}(x_1)) + O(\mu^2), \\ \frac{d\rho}{d\xi} = \rho' = \mu(\sin \xi + \cos \xi)(2\rho^2 - |x_1| - \text{sign}(x_1)) + O(\mu^2), \end{cases} \quad (14)$$

By mathematical software, when  $-1 < a < 0$ , the Jacobi determinant of  $(f_1, f_2)$  in  $(x_1^0, \rho^0)$  is constantly greater than 20, i.e., not 0. Then, by Theorem 13, the system has a periodic solution:

$$(x(\xi, \mu), \rho(\xi, \mu)) = (x_1^0 + o(\mu), \rho^0 + O(\mu)) \quad (15)$$

Now, we must determine the periodic solution of the system, which corresponds to the periodic solution already found. Returning to the system, replace the independent variable back to  $t$  to obtain the periodic solution:

$$(x(t, \mu), \rho(t, \mu), \xi(t, \mu)) = (x_1^0, \rho^0, t(\bmod 2\pi)) + O(\mu) \quad (16)$$

#### 4. CONCLUSION

This work investigates several forms of model reduction techniques in combination with matrices manifold optimization algorithms. Model reduction algorithms are developed using the Riemannian Rayleigh quotient repetition and the Jacobi-Davidson technique, respectively, for linear systems, where the computational issue of Hankel singular value problems has been transformed to a linear eigenvalue issue and a broader eigenvalue problem, respectively. Second, the closed-loop system model reduction approach and the structure-preserving modeling reductions method are developed after studying the H2-optimal model reduction for linked systems with differential polynomial subsystems on Grassmann manifolds. In order to demonstrate the presence of periodic solutions and determine the approximative expressions of periodic solutions, the periodic solution issue of continuous segmentation linear systems is investigated.

## ABSTRACT

In the context of rural agricultural revitalization, rural agriculture is transforming to digitalization. This paper analyzes the development status of agricultural digital transformation in the 5G era, and sorts out the problems faced by agricultural rural digital transformation, such as obvious unbalanced characteristics, insufficient infrastructure and farmers' digital skills, and low level of agricultural big data and digital application. In order to solve the outstanding problems faced by the digital transformation of agriculture and rural areas, we combine the increasingly developing 5G technology, strengthen the support and guidance of government departments and the configuration of digital products and services, and build new digital business models, so as to promote the digital transformation of agriculture and rural areas.

## KEYWORDS

Rural agricultural revitalization; Digital transformation; 5G era; Agricultural big data; Digital business

## 1. INTRODUCTION

With the development of economy and society and the change of technological paradigm, human society is gradually moving from the era of industrial revolution to the era of digital revolution [1]. In the process of the development of the digital revolution, the development and application of a new generation of digital technologies with big data, blockchain, artificial intelligence, virtual reality, and the Internet of Things as the core have brought about radical changes to people's production and lifestyle [2-4]. At the same time, the digital economy, with its powerful effectiveness role and unique impact mechanism, is reshaping the global governance landscape and rapidly becoming a new driving force and engine of global economic growth [5-6]. With the changing social demands and strict requirements of industrial development, agriculture, which still relies on traditional production methods, is facing many challenges in terms of ecological and environmental protection, as traditional agriculture demands high energy and is destructive to the natural environment, which, together with the fact that the traditional agricultural production process is not easily regulated, leads to supply-side agricultural product quality problems affecting the potential consumer demand and

consumer confidence of demand-side agricultural products [7]. Therefore, to accelerate the development of high-quality agriculture in a short period of time, we will face many difficulties and urgently need digital system solutions [8]. In order to seize the opportunity of digital economy development, break through the constraint bottleneck of digital transformation of agricultural production, and accelerate and realize the high-quality development of agriculture. In this paper, we analyze the development status of digital transformation of agriculture and rural areas, sort out the problems faced by digital transformation of agriculture and rural areas, and construct the promotion strategy of digital transformation of agriculture and rural areas.

## **2. THE DEVELOPMENT STATUS OF DIGITAL TRANSFORMATION OF AGRICULTURE AND RURAL AREAS**

Digital agriculture is an important part of digital China, an effective means to innovatively promote the development of agricultural and rural informatization, and a strategic initiative to seize the high ground of agricultural and rural modernization. In recent years, China has achieved remarkable results in promoting digital agriculture and rural development, but also faces many challenges. At present, mobile Internet terminals represented by cell phones have become agricultural data collection entrances and information carriers, specifically farmers can query agriculture-related information with the help of cell phones, creating favorable conditions for farmers to understand information on supply and demand of agricultural products and grasp agricultural market conditions. In addition, the use of smartphone applets can enable farmers to manage agricultural production more precisely. For example, the Chinese Academy of Agricultural Sciences developed Counting Grain, an applet that allows farmers to solve the problem of manual grain counting in agricultural cultivation and breeding. Relying on image recognition and artificial intelligence technology, the program can automatically identify the number of seeds after farmers upload photos, and the average time to obtain results is only 4s, with an accuracy rate of over 98%. With the support of 5G technology, the application of sensing technology is also widespread, and sensors are able to transmit data from various links to data centers, helping to achieve the goal of agricultural big data analysis. The development of agricultural digital transformation in the 5G era has already achieved certain results, but there is still a broad space for development. For this reason, China should seize the opportunity of the 5G era and actively use 5G communication technology to make up for the shortcomings of agricultural modernization and create favorable conditions for solving the “three rural issues”.

## **3. PROBLEMS FACED BY THE DIGITAL TRANSFORMATION OF AGRICULTURE AND RURAL AREAS**

With the rapid development of digital economy, agricultural digitization has become an important means to solve the problems of “three rural areas” and eliminate the “digital divide” between urban and rural areas. At the present stage, there are problems such as regional imbalance, lack of in-depth application and data sharing in China's agricultural digitalization.

### **3.1. CLEAR IMBALANCE CHARACTERISTICS**

The digital transformation of agriculture in different regions of China is at different stages, and the overall pattern of strong East and weak West and regional imbalance is difficult to change for a while. In general, the development of agriculture in different regions of China shows the coexistence of three stages: traditional agriculture, small-scale agriculture and automated agriculture. Yunnan, Guizhou, Sichuan and other western regions with poor production conditions are still in the traditional agriculture stage, mainly using traditional farming tools. The main production areas in the northeast, east-central and western plains are in the stage of small-scale agriculture mainly using mechanized tools, while the coastal,

eastern and central-western economically developed regions have entered the stage of automated agriculture using computers as the main tool. Figure 1 shows the disposable income of rural residents and the level of rural development of digital agriculture in major provinces of China in 2020. The income of rural residents is highly positively correlated with the level of digital development of regional agriculture. A total of nine provincial-level administrative regions have a per capita disposable income of rural residents higher than the national average, and all of them are provinces and cities in the eastern region. There is a significant urban-rural gap in the income of rural residents, which restricts the achievement of common prosperity.

**Figure 1.** Disposable income and the level of rural development of digital agriculture

### 3.2. INADEQUATE INFRASTRUCTURE AND DIGITAL SKILLS OF FARMERS

Compared with cities and towns, there is still a large gap in the construction of rural information infrastructure and network service supply. The enthusiasm of rural network construction is not strong, and traditional information infrastructure is backward. Some rural network infrastructures are costly and difficult to lay and operate, and there is little enthusiasm to invest in rural broadband construction, making it difficult for rural networks to further support digital applications. Unlike urban areas, rural areas themselves have low information penetration and Internet penetration, with data as of March 2020 showing that the Internet penetration rate in rural areas is only 46.2%, a significant chasm gap compared to 64.5% nationwide and 76.9% in cities and towns. The overall digital skills of farmers are insufficient to meet the needs of agricultural digital transformation, and the lack of internet usage skills and low literacy of farmers has led to a large number of “information-poor households” in rural areas, unable to adapt to the new digital trend.

### 3.3. THE LEVEL OF AGRICULTURAL BIG DATA AND DIGITAL APPLICATION IS NOT HIGH

China's “dormant” data on agriculture needs to be activated, and the value of data elements has not been fully released. The digitization of agriculture needs to fully explore the value of “three rural” data, but the current level of agricultural data sharing is limited and the quality is not high. At this stage, in the process of data mining and integration in rural and agricultural areas, there is a lack of policy funding, talent training, project construction, technical services and other areas needed to support the rural digital economy, and the active promotion is not strong. At present, there are many websites and data platforms in agriculture, but the level of each platform is not clear, the content covered is not consistent, the layout of the architecture

is not reasonable, and interconnection and interoperability cannot be achieved yet. There is no technical support for the convergence of data formats from different regions, industries and fields. Lack of convenient and efficient data query, browsing, retrieval and distribution technology. The promotion of agricultural digital applications is at the initial stage, and the value-added space of the agricultural value chain has not been fully explored. Figure 2 shows the penetration rate of agricultural digital economy from 2016 to 2020. the growth rate is high from 2016 to 2018, followed by a slow growth rate. Affected by factors such as insufficient technology supply, agricultural digitization is still at the stage of general, single-technology application, lacking highly sophisticated and precise technologies, and the degree of integration is not high, so the role of liberating and developing productivity, tapping and releasing the potential of agricultural digital economy is not yet obvious.

**Figure 2.** Penetration rate of agricultural digital economy from 2016 to 2020

#### **4. AGRICULTURAL RURAL DIGITAL TRANSFORMATION PROMOTION STRATEGY**

##### **4.1. STRENGTHEN THE SUPPORT AND GUIDANCE OF GOVERNMENT DEPARTMENTS**

Agricultural digital construction work is a long-term development process that requires a lot of financial and technical support. Government departments need to invest a lot of work to support, strengthen the top-level design of government departments in the construction of agricultural information technology, especially with a perfect information technology organization system to promote the development process of digital construction. Strengthen the top-level design and macro-control efforts, according to the development characteristics of the region to build differentiated development measures, the digital construction focus on the information technology mechanism to promote agricultural production and income.

##### **4.2. DIGITAL PRODUCT AND SERVICE CONFIGURATION**

To guarantee service quality without affecting other products, to achieve larger scale service sharing with lower service costs, to optimize the allocation efficiency of public service resources, and to accelerate the equalization of services in urban and rural areas with effective feedback. Agricultural development should give full play to demonstration projects and lead role to guarantee the creation of characteristic agricultural demonstration areas, especially on the basis of the existing demonstration areas to improve the level of infrastructure support to develop industrial chains, create special product brands to provide security services, and build

this area into a higher level of digitalization and functional organism while establishing the core area of services.

### 4.3. NEW DIGITAL BUSINESS MODELS

The digital business model should be based on infrastructure construction, and should also realize the upgrading and expansion of communication networks in rural areas, including 5G and other facilities need to be specially deployed in rural areas to meet the daily needs of production and life. For enterprises, they should actively assume social responsibility focusing on the advantages of technical talents and platforms in terms of Internet platform enterprises, agricultural enterprises and socialized service organizations to expand the excellent goods and services in rural areas and encourage new agricultural business entities to carry out digital applications.

## 5. CONCLUSION

The arrival of the 5G era helps agriculture transform in the direction of digitalization. In this paper, by analyzing the development status of digital transformation of agriculture and rural areas, with the support of 5G technology, the digital development of agriculture has achieved good results. Digital technology development has provided a new development environment and space for agriculture and rural areas and accelerated the promotion of new business models. Faced with the development status of infrastructure level and service level in rural areas to be improved, government departments need to cooperate with rural areas to jointly promote various management programs, not only focusing on the development requirements of digital transformation of agriculture and rural areas, but also reasonably laying out infrastructure construction to make up for the shortcomings in services.

## ABSTRACT

Along with the development of various technologies such as big data, various industries in society are gradually moving towards informationization in various aspects such as business management methods, development strategies and operation modes. Mining the hidden value of financial data through big data makes financial analysis more scientific and accurate. The application of big data technology can enable higher-level units to more effectively analyze the financial situation of different subordinate business units horizontally and provide support for the integrated management of each unit. It also puts forward the strategy of financial management informatization of business units from two aspects, namely, financial management system and construction of supervision mechanism, to provide effective support for building modern financial management system of administrative institutions.

## KEYWORDS

Institutions; Financial management system; Supervision mechanism; Informatization strategy

## 1. INTRODUCTION

For a long time, the financial management of administrative institutions in China has been inefficient, and the phenomenon of using funds in violation of the law is endless, even involving serious illegal and criminal problems [1-2]. These problems not only reduce the efficiency of financial capital use in administrative institutions, but also lead to the loss of state funds and seriously overdraw the credibility of administrative institutions, and the reform of financial management in Chinese administrative institutions has a long way to go [3-5]. At present, China has entered the stage of high-quality development, and the high-quality development of the economy and society needs the support of a good administrative and public service environment, which is inseparable from a compliant, orderly and efficient financial management system of administrative institutions, and it is urgent to promote the transformation of financial management of administrative institutions [6-8]. In addition, big data provides new technical support for the transformation of financial management of administrative institutions [9].

The literature [10] explored the capacity of public institutions for climate change adaptation and risk management support in agriculture in Punjab, Pakistan, and the challenges and opportunities that exist. The study found that there are some capacity constraints and deficiencies in climate change adaptation in public institutions that need to be improved and strengthened. The literature [11] describes the application of machine learning and artificial intelligence technologies in corporate financial management and analyzes their advantages in

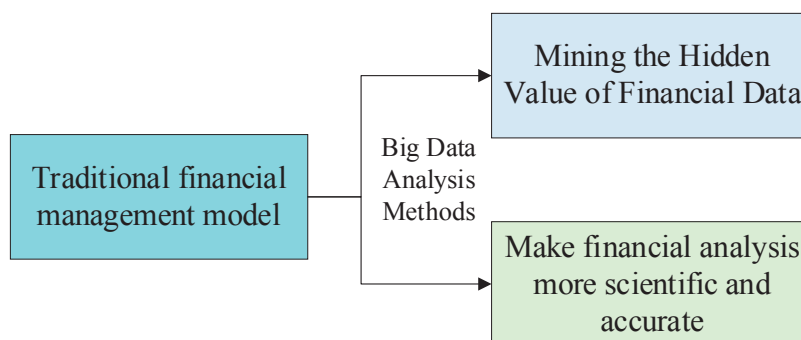

improving financial management efficiency, predicting future trends, and reducing risks. The literature [12] explored the use of deep interactive neural networks and machine learning to predict and classify financial metrics of management control systems in manufacturing industries. The authors describe the application of deep interactive neural networks and machine learning in management control systems and analyze their advantages in predicting and classifying financial metrics in the manufacturing industry.

## 2. THE OPPORTUNITIES BROUGHT BY BIG DATA TO THE FINANCIAL MANAGEMENT OF ADMINISTRATIVE INSTITUTIONS

### 2.1. DIGGING DEEPER INTO THE VALUE OF FINANCIAL DATA

Big data technology provides a new financial management tool for administrative institutions as shown in Figure 1, which can effectively tap the value of financial data. Under the traditional financial management model, financial information is mainly displayed through various comprehensive financial statements and the correlation between different financial indicators is discovered through various financial analysis methods, and the business represented by each financial indicator is highly condensed into a summary data, which cannot well analyze the situation of each business under each indicator. Unlike traditional financial management, using big data analysis method can not only deepen traditional financial analysis, make full use of the 5V characteristics of big data, explore the correlation between different indicators based on massive data, but also conduct structural analysis of data indicators, discover the laws that cannot be found by traditional financial analysis through analyzing different business record data, and explore the hidden value of financial data, making financial analysis more scientific and accuracy.

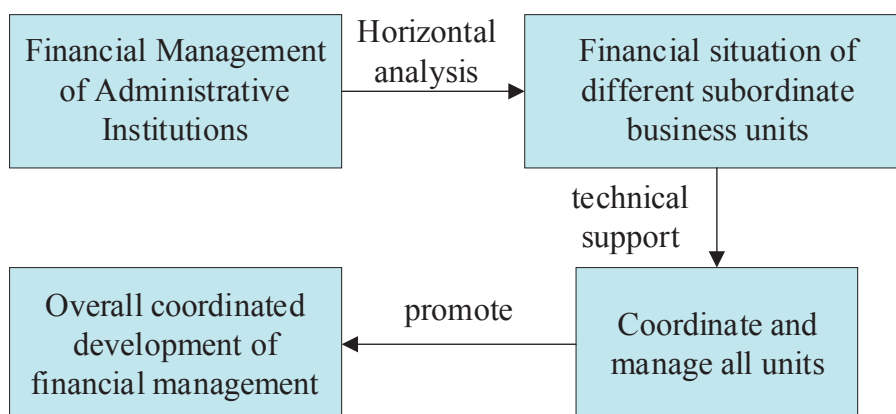

**Figure 1.** Administrative and Financial Management of Education Big Data Technology

### 2.2. PROMOTE COORDINATED FINANCIAL MANAGEMENT OF ADMINISTRATIVE AND BUSINESS UNITS

Big data technology provides new support for coordinating the financial management of administrative and institutional units at all levels. Chinese administrative institutions are divided into several different systems according to the functions they perform, such as public security system, education system, health and health system, etc., and have distinct hierarchical characteristics, with higher-level units managing or guiding lower-level units. The business units within the same system have similar business, which facilitates the superior unit to coordinate the management of its business units, and the application of big data technology can promote more coordinated management of the business units within the system. Under the traditional management method, the higher-level unit obtains financial information data from multiple business units at the lower level in the form of statistical reports, and then conducts statistical analysis to manage and guide the multiple business units accordingly. The application of big data technology can make the superior unit more effectively analyze the financial situation of different subordinate business units horizontally, provide support for the

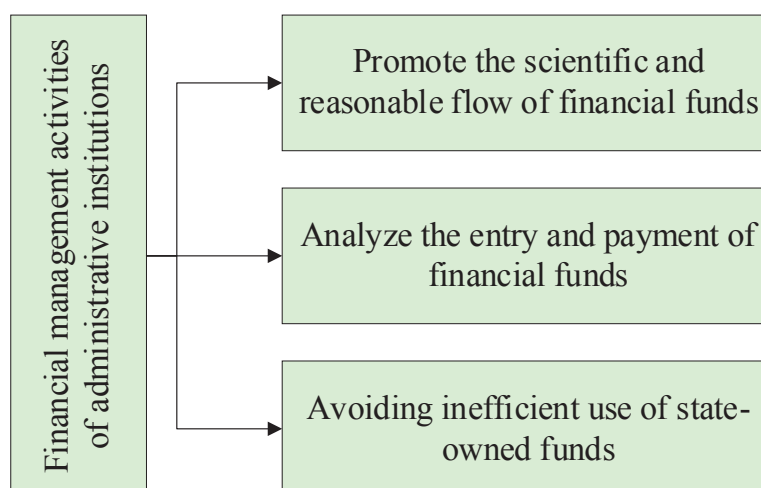

integrated management of each unit, and help the superior unit make better business decisions, and big data promotes the overall coordinated development of financial management as shown in Figure 2.

**Figure 2.** Big Data Promotes the Overall Coordinated Development of Financial Management

### 2.3. PROVIDE MORE EFFECTIVE MEANS OF RISK PREVENTION AND CONTROL

Big data can provide new technical support for the financial risk prevention and control of administrative institutions as shown in Figure 3. Big data can effectively track the financial management activities of administrative institutions, analyze the entry and payment of financial funds, provide timely warning once abnormalities occur, notify business units for verification and audit, discover and dispose of problems at the first time, avoid inefficient use and waste of state-owned funds It even loses, promotes the scientific and reasonable flow of financial funds, and provides effective support for the construction of modern financial management system of administrative institutions.

**Figure 3.** Big data provides new technical support for financial risk prevention and control

## 3. STRATEGIES TO IMPROVE THE LEVEL OF FINANCIAL MANAGEMENT INFORMATIONIZATION IN INSTITUTIONS IN THE CONTEXT OF BIG DATA

### 3.1. ESTABLISH A PERFECT FINANCIAL MANAGEMENT SYSTEM

The perfect financial management system has a very important role for institutions, so it requires institutions to establish a perfect financial management system in the new financial information management, and the actual situation of their units to do a good job of the corresponding financial management information platform construction work, specifically the following aspects: First, according to the financial sector management system, do a good job

of financial management information The platform construction work. Information platform as an important part of the construction of financial information management, its construction, installation, maintenance and other aspects of good and bad directly related to the security of the financial system of the entire institution or not, so it requires financial management personnel to carry out regular and comprehensive security checks on the information platform, in order to ensure the safe operation of the financial information platform as a whole. Second, the formation of a special information security management department, the organization of professionals to update, improve and upgrade the network system of the platform in a timely manner, so as to reduce the chances of financial network vulnerabilities in institutions.

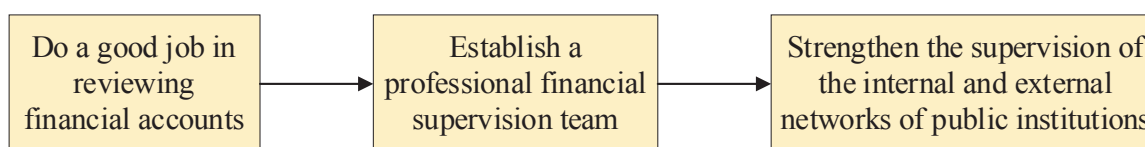

### 3.2. FINANCIAL MANAGEMENT INFORMATION CONSTRUCTION SUPERVISION MECHANISM

Based on the open nature of the Internet, making its use in the process of risk greatly increased, which requires institutions in the process of financial management information technology construction will require financial supervisors to do the following supervision work, financial management information technology construction supervision mechanism is shown in Figure 4.

First, do a good job of financial account auditing. Financial supervisors of institutions should regularly check the actual financial accounts and the corresponding Internet data accounts to avoid large mistakes and bring huge economic losses to the institutions.

Second, the formation of a professional financial supervision team to supervise the management of financial information. Supervision team through the design of scientific and reasonable supervision mechanism to ensure the normal operation of the overall financial information technology.

Third, the use of modern supervision means to strengthen the supervision of the intranet and extranet of institutions, the effective combination of manual supervision and network supervision, so as to ensure the security of property in the process of information-based financial management of institutions.

**Figure 4.** Supervision mechanism for financial management informatization construction

## 4. CONCLUSION

Under the background of big data, administrative institutions should grasp the opportunity of big data development, reasonably respond to the challenges brought by big data development, crack the current problems in financial management by strengthening the application of big data technology, and actively promote the transformation of financial management, so as to promote the high-quality development of financial management of administrative institutions. At the same time, they should also do a good job in extending the financial management information platform and strengthening the market connection, so as to better promote the financial management information construction of Chinese institutions and achieve the strategic goal of comprehensive and integrated development.

## FUNDING

This research was supported by Research results of 2022 Zhejiang Province Human Resources and Social Security project "Construction of New Occupational Harmonious Labor Relations from the Perspective of Digital Economy" (2022073).

# THE PRACTICE AND EXPLORATION OF BIG DATA TECHNOLOGY IN THE TEACHING REFORM OF “BUILDING REGULATIONS” COURSE IN COLLEGES AND UNIVERSITIES

---

Youxiong Chen\*

Wuchang Shouyi University, Wuhan, Hubei, 430064, China

[chenyx\\_sy@163.com](mailto:chenyx_sy@163.com)

---

## ABSTRACT

The traditional teaching mode of construction regulations course has not been able to meet the needs of social development, and it is a new training goal to be a compound talent who is both proficient in construction and knowledgeable in law. In the teaching, the problems existing in the teaching practice of construction law should be addressed. From the teaching content, teaching methods, theory and practice and assessment methods and other aspects of reform, while strengthening theoretical knowledge, with a variety of ways to train students to analyze and solve practical problems and the spirit of legal theory, so as to improve the quality of teaching.

## KEYWORDS

Construction regulations course; Teaching content; Teaching methods; Assessment methods; Theory and practice

## 1. INTRODUCTION

Construction regulations is a compulsory or limited basic course for the study of laws and regulations in construction majors, is a basic course of vocational skills, as long as students are employed in the construction industry, through the study, so that senior students can contact the laws and regulations and operational practices needed in China's construction projects, improve the ability of students to apply the knowledge learned to solve practical legal problems related to engineering construction because the course has a strong comprehensive. Interdisciplinarity systemic [1-3]. Therefore, how to teach, turn the many raw theories and boring regulations into something that students can touch and melt into themselves, so as to finally achieve the organic combination and effective application of theory in practice becomes the main exploration of this course in teaching mode and method [4-6].

The literature [7] presents a simplified integral method modeling code written in Python for fast computation in gravitational wave extrapolation. The literature [8] introduces the importance of computability analysis of building codes, analyzes some problems of existing methods, and proposes an improved scheme based on clustering methods. The scheme can effectively perform clustering analysis of building codes, thus reducing the complexity of codes and improving computational efficiency. The authors of the literature [9] describe the purpose of enhancing the code requirements for residential buildings and analyze its advantages in improving the resistance of buildings to natural hazards such as tornadoes. Through a survey and analysis of homes damaged during the Moore tornado, the authors demonstrate the importance of strengthening residential building code requirements and explore directions for their further improvement.

## 2. “CONSTRUCTION REGULATIONS” TEACHING CONTENT REFORM AND TEACHING METHOD REFORM

### 2.1. TEACHING CONTENT REFORM

Flexible selection of teaching propaganda, do a good job in the construction of self-edited teaching materials, the construction of teaching materials on an important position, teaching content reform as shown in Figure 1.

#### (1) Teaching content should pay attention to the timeliness

Supplement the laws, regulations and business management knowledge of architects involved in teaching, update and improve the content of self-prepared teaching materials, including the latest revised norms, the basic system of regulations, the mandatory standards of engineering construction, real estate development and engineering supervision and other related knowledge, so that teaching knowledge to adapt to the needs of the present and future development, but also to adapt to the requirements of the changing economic environment.

#### (2) Teaching content focuses on practicality and practicability

The teaching content is not too much biased towards its academic, systematic and complete, but focuses more on the cultivation of construction practical training ability, and makes use of the profession’s own expression characteristics to feedback the degree of mastery of teaching knowledge from the drawings. Teachers in the selection of course content to abstract and simplify the actual engineering into a design content consistent with the purpose of the course, integrated into the understanding and analysis of the teaching content.

#### (3) The use of cases with practical application

The actual engineering of both positive and negative concrete cases, are the best learning object for students, to consolidate and deepen the content of the course with half the effort.

#### (4) Teaching content should be combined with the characteristics of students

According to the characteristics of “engineering training” of our school, we design and organize the content of self-published teaching materials with the competence and quality requirements of practice qualification as the center, and introduce the concept and method from the problem to attract students’ interest in learning and cultivate their ability to solve professional practical problems.

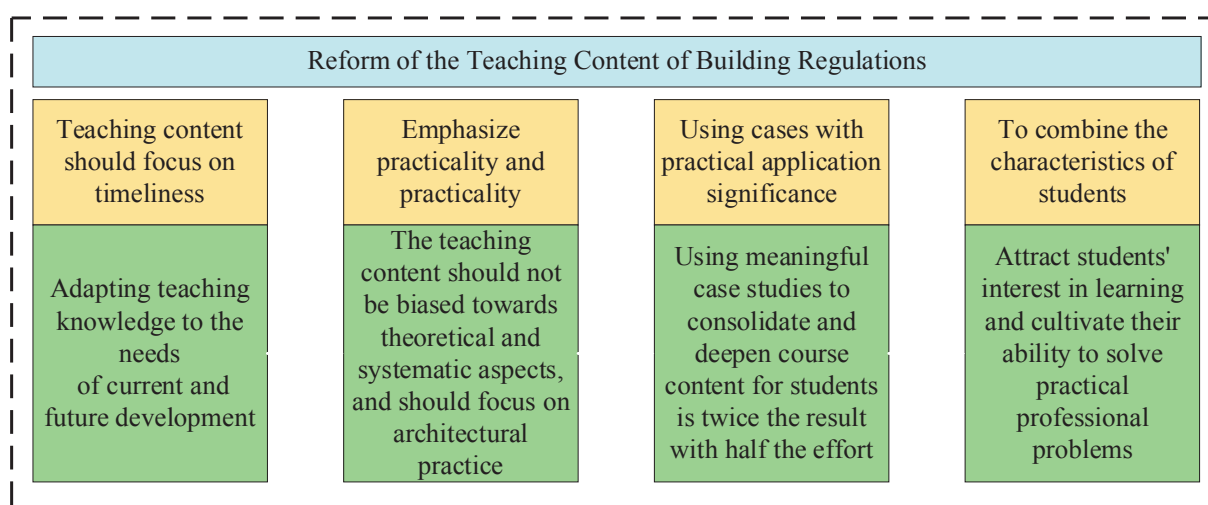

Figure 1. Reform of the Teaching Content of Building Regulations

## 2.2. TEACHING METHOD REFORM

In order to solve the current problems of the teaching knowledge structure of this course and this direction in architecture, the reform of teaching method is proposed as shown in Figure 2.

### (1) Interactive classroom teaching

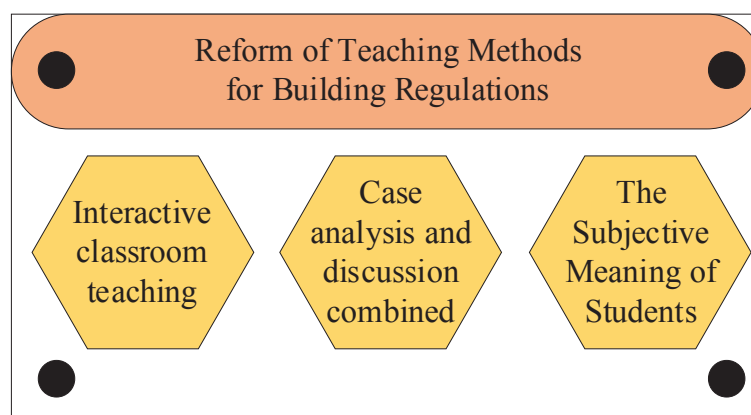

Mobilize students' interest in learning and stimulate their desire for knowledge and enthusiasm for innovation. Students are required to give multi-perspective answers to the questions raised by teachers, emphasizing the uncertainty and multiple meanings of the results, which in turn corroborate the clarity and guidance of construction laws and regulations in design. Case-based, debate and seminar teaching methods appear more often in the course teaching to realize the juxtaposition of architectural knowledge and architectural culture.

### (2) The main significance of students

Give full play to the main role of students in teaching. Mobilize students' subjective consciousness and strengthen theoretical knowledge while at the same time cultivating students' analytical and creative spirit in various ways. Students are trained to absorb the useful components and identify the authenticity from many relevant materials, to understand that the textbook view is only one view and there are different assertions from the textbook, and to understand that although there is an eternal thesis, there is no eternal answer. At the same time, students are encouraged to develop the habit of self-learning, expand their knowledge and broaden their horizons so that they can change from passive indoctrination to active learning, from passive thinking to active inquiry, and from being able to integrate and integrate, and then become adept at subjective thinking, research and discussion of problems.

### (3) Use case study and seminar

Through case teaching, the application of basic theoretical knowledge and the cultivation of practical ability are highlighted in the teaching content, which is conducive to students' flexible use of the knowledge they have learned and solving practical problems. At the same time, the main lines of Construction Law, Bidding and Tendering Law, Contract Law, Regulations on Quality Management of Construction Works, Regulations on Management of Survey and Design of Construction Works and Common Specifications of Construction facilitate students to understand laws and regulations and enhance the strengthening of their professional background.

**Figure 2.** Reform of Teaching Methods for Building Regulations

### 3. REFORM MEASURES OF PRACTICAL TEACHING OF CONSTRUCTION REGULATIONS

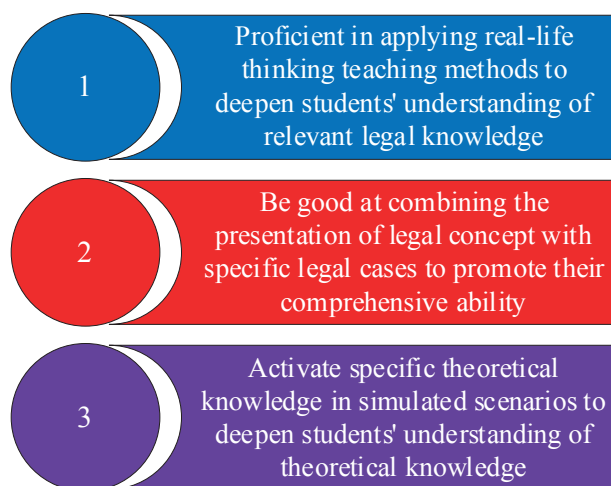

#### 3.1. THEORY TO PRACTICE

The concepts of relevant laws and regulations in the field of construction are numerous and highly practical, and can only be understood, absorbed and internalized by students if they are applied in practice. Therefore, in the specific teaching process of the course, teachers should focus on combining theoretical teaching with practical teaching as shown in Figure 3.

(1) Teachers should apply the laws and regulations contained in the course to try to analyze the relevant legal issues in the current construction field, so that students can develop a good learning mindset of linking theory with practice. Teachers should be good at applying a living thinking teaching method to deepen students' understanding of relevant legal knowledge in the process of teaching theoretical knowledge to students.

(2) Teachers should pay attention to the inspiration of students in the teaching of the course, and be good at combining the narration of legal concepts with specific legal cases to promote the improvement of their comprehensive ability. In the field of construction, there are often some issues such as the determination of liability for construction quality and safety accidents, contractual breach of contract and negligence, and related liability issues, which are the more common legal issues in the construction field that the students will be engaged in the future.

(3) In the teaching of this course, teachers should introduce actual teaching cases, so that the specific theoretical knowledge can be revitalized in the simulated scenarios and deepen the students' understanding of the theoretical knowledge. Relatively speaking, the new way of combining theoretical teaching and practical teaching is also a major test for teachers, which makes them to continuously improve their professional ability and update their teaching methods to help the steady improvement of the course teaching.

**Figure 3.** Emphasize the combination of theoretical teaching and practical teaching

#### 3.2. INNOVATIVE ASSESSMENT METHODS

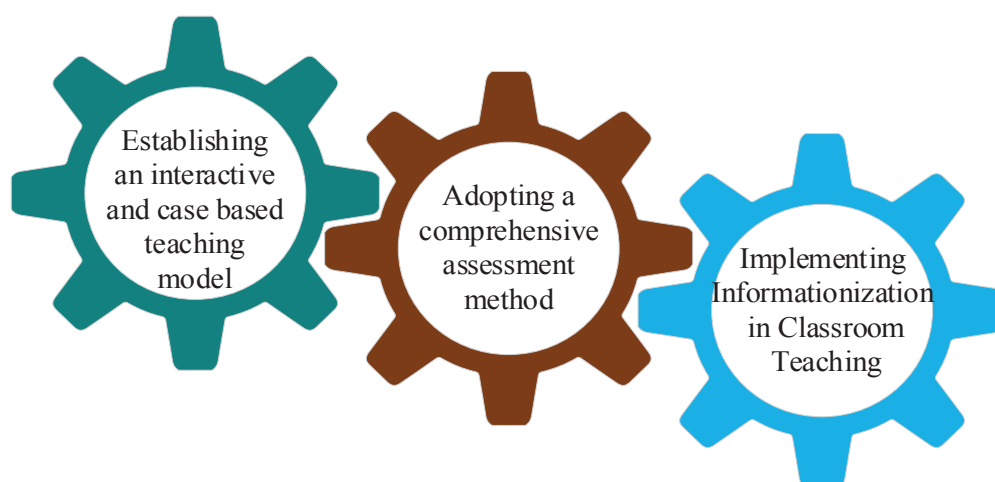

Reforming and updating the old teaching methods are conducive to improving the teaching level and teaching effectiveness of the construction regulations course. The old teaching methods will be innovated, so that it will change from one-way transmission of theoretical knowledge from teachers to students to a more active open classroom teaching with a combination of interactive, case-based and discussion-based teaching methods, and the innovative assessment method is shown in Figure 4. Specifically, we can start from three aspects:

(1) Establishing a combination of interactive, case-based and discussion-based teaching methods. The open classroom with a more active teaching atmosphere must maximize the students' main role in the classroom and strengthen their basic knowledge while promoting their comprehensive ability. It is also necessary to fully stimulate students' enthusiasm for exploring unknown fields, and to adopt interactive, case-based and discussion-based teaching methods in combination with the relevant laws to strengthen students' professional background and enhance their mastery of professional skills and relevant laws.

(2) Adopt an integrated assessment method. Incorporate students' performance in discussions and moot court in teaching into the regular assessment. For example, the paper test mainly assesses students' understanding of the basic knowledge of the course, the discussion performance in the teaching mainly assesses students' views on some controversial issues, and the mock court performance mainly assesses students' ability to apply theoretical knowledge in practice.

(3) Realization of information-based classroom teaching. Teachers use multimedia equipment to teach, and can use the advantages of its vivid and rich resources to mobilize students' multiple senses and improve the teaching quality of the course.

**Figure 4.** Assessment Methods for the Reform of Building Regulations Curriculum

#### 4. CONCLUSION

Therefore, in the teaching practice, teachers in colleges and universities should constantly improve their professional ability and reserve relevant knowledge, and apply different teaching modes and methods according to students' characteristics and talent cultivation modes, focusing on cultivating students' legal awareness required for the future construction field and effectively improving students' legal literacy level.

# REFORM OF LEGAL EDUCATION AND CULTIVATION OF STUDENTS' LEGAL LITERACY IN CONTEMPORARY UNIVERSITIES UNDER INFORMATION DIFFUSION MODEL

---

Yu Xue\*

Financial and Monetary Institute, Guangdong Nanhua Vocational College of Industry and Commerce, Guangzhou, Guangdong, 510000, China

[xueyu472022@163.com](mailto:xueyu472022@163.com)

---

## ABSTRACT

The research mainly focuses on the lack of legal literacy of college students under the information diffusion mode and the cultivation methods of college legal courses, and analyzes the importance and teaching effect of college legal courses through survey. The results show that only 30.85% of college students approve of the learning effect of law courses, 50.14% of college students think the learning effect is average and there is room for improvement, and put forward measures for legal education reform and students' legal literacy cultivation.

## KEYWORDS

Information diffusion model; Students' legal literacy; Law courses; Emphasis; Teaching effectiveness

## 1. INTRODUCTION

With the popularization of higher education and the rapid development of market economy, the cultivation quality of college students, as the cultivation output of higher education and the reception input of social market, has increasingly become the focus of attention in the fields of education, society and economy [1-3]. The legal literacy of college students, as a necessity for college students to be based in society and to better participate in modernization, is not only related to the self-development of students, but also to the construction of the rule of law society and the harmonious and healthy development of the market economy [4-6]. However, the important value of legal literacy of college students and its status and the current situation of its mismatch is a problem that needs to be solved in front of modern high-quality talent training. How to improve the legal literacy of students, improve the quality of college education, promote the harmonious development of social economy and the implementation of the strategy of the rule of law, still need to be further explored and solved [7-8].

An intelligent system for university legal education is presented in the literature [9]. The system uses artificial intelligence technology to provide a new pedagogical approach aimed at improving student learning and teaching quality. The literature [10] discusses legal and ethical issues in nursing education and provides a necessary guide. This guide can help nursing educators better understand and respond to the issues involved to ensure the quality and legitimacy of nursing education. The literature [11] describes methods and strategies to help educators better teach legal practice and improve students' practice and knowledge.

## **2. REFORM MEASURES OF UNIVERSITY LEGAL EDUCATION UNDER THE INFORMATION DIFFUSION MODEL**

### **2.1. STRENGTHEN THE RELEVANCE AND PRACTICALITY OF LEGAL EDUCATION**

All teaching activities in colleges and universities must take the professionalism and practicality of teaching as the core, and legal literacy is a crucial ability among the comprehensive professional ability of college graduates, which has a close relationship with many aspects of students' employment and after joining the profession. Therefore, the legal education courses need to be precisely designed for different majors, and based on the general legal education, the professional courses that are closely related to the future industry of colleges and universities should be actively developed to ensure the relevance and practicality of the teaching contents. In this regard, teachers can increase the content of the Labor Law of the People's Republic of China and the Labor Contract Law of the People's Republic of China to guide students to ensure their own rights and interests through legal means.

### **2.2. ESTABLISHING A SOUND INDEPENDENT LEGAL EDUCATION SYSTEM**

Universities and colleges, as the main body of education, should focus on quality education for students to ensure the formation of a comprehensive and systematic improvement of the education target ability, and one of the connotations of legal literacy, specifically refers to whether students in universities and colleges have legal awareness, legal knowledge and legal ability. The legal education that takes the teaching of legal foundation in moral education activities as the main line must be based on the general environment of legal literacy education and take it as the guiding ideology, so that it is conducive to positioning the quality standard of talent cultivation in colleges and universities. It also helps to improve the adaptability of the talents in the society of the universities and colleges. As a result, it is not reasonable to integrate legal education with moral education, because morality and law are juxtaposed, and morality mainly restrains people's inner thoughts, while law focuses on restricting people's outer behavior. For this reason, colleges and universities should divorce legal education from moral education and treat it in a professional way, and invest more in human and financial resources, so as to establish a sound and independent legal education system, which can ensure the integration of legal education into the daily life, study and future work of college students, and make the system of legal education in colleges and universities more professional, systematic and standardized, which is of positive significance for cultivating students' legal literacy. This will ensure the integration of legal education into the daily life, study and future work of college students, and make the system of legal education in colleges and universities more professional, systematic and standardized, which is of positive significance to the cultivation of students' legal literacy.

## **3. CULTIVATION OF STUDENTS' LEGAL LITERACY UNDER THE INFORMATION DIFFUSION MODEL**

### **3.1. SURVEY ON THE DEGREE OF IMPORTANCE OF LAW COURSES**

The importance of law courses in colleges and universities is shown in Figure 1. 67.8% of the surveyed students in colleges and universities think that law courses are not as important as math, English and professional courses compared with them. Only about 10% of the college students think that other courses such as language, English and professional courses are not as important as law courses. Besides, only a small number of college students said they did not know.

**Figure 1.** Survey Results on Understanding the Importance of Legal Courses

### 3.2. SURVEY ON THE LEARNING EFFECT OF LAW COURSES

But all the students who enter the college school, mostly in the compulsory education learning stage foundation comparison of college students' own psychological characteristics on the learning effect of college law courses is very deep, most college students have a negative attitude towards the learning effect of students' law courses. As shown in Table 1, only 30.85% of the surveyed college students approve of the learning effect of law courses, 50.14% of the college students think the learning effect is average and there is room for improvement, 15.14% of the college students do not approve of the learning effect, and 3.87% of the college students have difficulty in making a fair and objective evaluation of their learning effect. In addition to the influence of students' psychology on the learning effect of college law courses, there are undoubtedly many other factors that restrict the learning effect of college students' law courses.

**Table 1.** Investigation on the Learning Effectiveness of Legal Courses

option	Number of people	Proportion (%)
The effect is very good	438	30.85
The effect is average	712	50.14
The effect is not good	215	15.14
Difficult to evaluate	55	3.87
total	1420	100%

### 3.3. WAYS TO DEVELOP STUDENTS' LEGAL LITERACY

The way to cultivate students' legal literacy is shown in Fig. 2. The development of today's society is changing rapidly, and the construction of a country under the rule of law has entered a critical stage, which requires more demanding comprehensive quality of builders. Therefore, to ensure that college students can better adapt to the trend of social development and play the role of the "tide" of the times, it is far-reaching to strengthen the cultivation of legal literacy, and this paper cultivates students' legal literacy in the following ways.

(1) Change the ideological understanding and attach importance to the cultivation of legal literacy

Fundamentally change the unscientific position that legal literacy education is secondary to other professional literacy education, reasonably and effectively embed legal education in the teaching of students' professional skills education, put the two on a relatively equal footing,

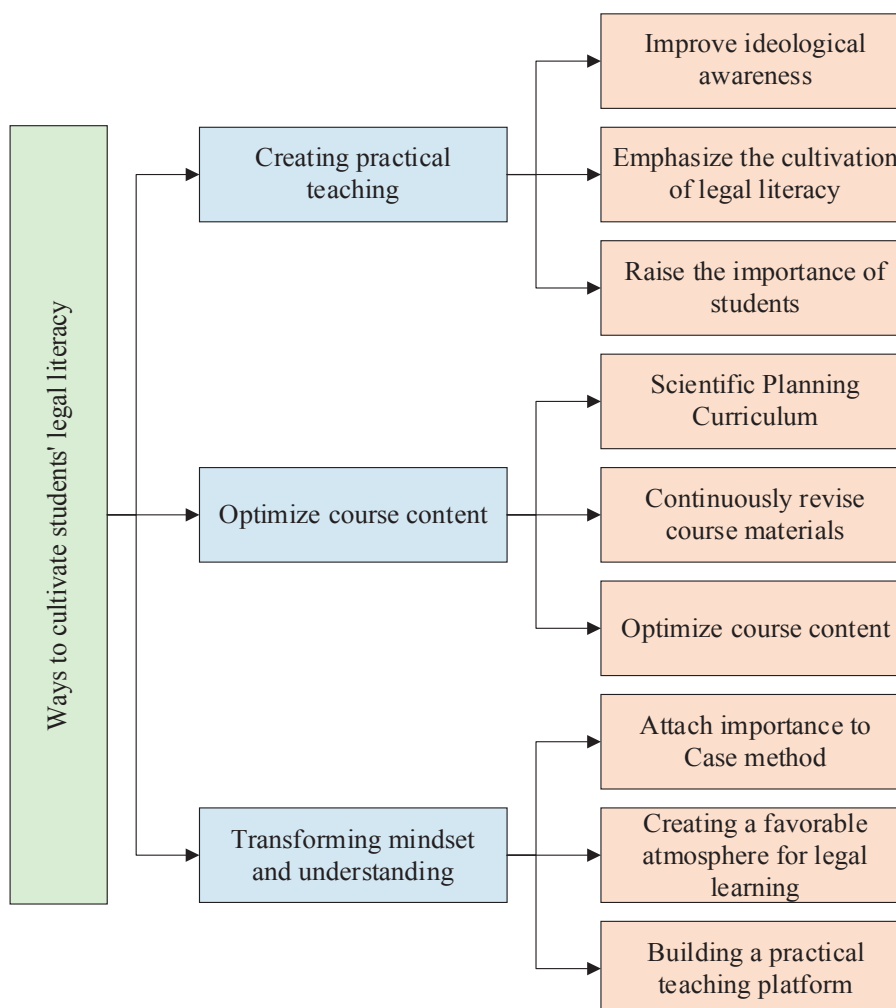

and invest human, material and financial resources to construct a complete and independent legal literacy education system in colleges and universities, so that it is standardized, professional, systematic and scientific.

(2) Promote curriculum reform and optimize curriculum content

Cultivating the legal literacy of college students requires scientific planning of the school's law curriculum. Based on the subject characteristics of law, students' interests and cultural values promoted by the society, the university school should make a series of selective, arranged and organized plans for the law curriculum based on a series of factors such as course objectives, teaching methods, teaching contents and assessment methods of the law curriculum. Teachers should make reasonable use of the quality legal resources in their hands, dig deeper into the real needs of students, continuously optimize the existing legal courses and enrich the content of the courses.

(3) Innovation of teaching forms and creation of practical teaching

In the face of this group of university schools, cultivating students' interest in learning law is undoubtedly the most urgent task. This goal can be achieved by flexible teaching methods, extensive use of multimedia networks, and advanced teaching methods or modes, and by raising students' interest in learning in multiple ways and in multiple dimensions. The effectiveness of good law teaching cannot be achieved without the extensive publicity of legal knowledge and the creation of a good learning atmosphere on campus. "Practice makes true knowledge", to cultivate the legal literacy of college students, we should also focus on the process of legal practice to enhance the reverence and faith in law, etc.

**Figure 2.** Ways to cultivate students' legal literacy

#### 4. CONCLUSION

The cultivation of legal literacy of students in colleges and universities is a comprehensive and systematic education project, and at present, the legal literacy of students in colleges and universities in China is not satisfactory and needs to be improved. As the main body of education, universities and colleges should clarify the problems of current legal education and change the current legal education system by strengthening the relevance of legal education and building a sound independent legal education system, so as to really improve the efficiency of legal teaching and make students' legal literacy improved and be able to flexibly apply the legal knowledge they learn.

# A STUDY ON THE IMPROVEMENT STRATEGIES OF COLLEGE STUDENTS' ENGLISH SPEAKING ABILITY IN PBL PROJECT TEACHING METHOD COMBINED WITH DECISION TREE MODEL

---

Jin Wang\*

Foreign Language College, Wuchang Shouyi University, Wuhan, Hubei, 430064, China

[Wangjin52615@163.com](mailto:Wangjin52615@163.com)

## ABSTRACT

This paper studied the characteristics of PBL project teaching method, based on the characteristics of decision tree algorithm, determine the mining target, object, data collection to establish a decision tree data model, the basic information of students using Excel software in Microsoft Office to store the collected data, clear the data that will have an impact on the research results, so as to complete the data pre-processing, using SPSS11.0 statistical software was used to analyze the experimental results, and a  $t$ -test was conducted to test whether there was a significant difference between the gain scores before and after the treatment. A decision tree model-based method for assessing college students' English speaking ability was used to improve the accuracy and scientificity of English speaking ability assessment.

## KEYWORDS

PBL project teaching method; Decision tree algorithm; Mining objectives; SPSS11.0 statistical software

## 1. INTRODUCTION

With the rise of the field of data mining, it has also been widely used and achieved good results in the field of education, and educational data such as student performance data and teaching management data have received more attention and importance [1-2]. People have started to realize that educational data cannot just stay in the stage of storage, query and simple statistics [3-5]. The timely identification of problems or influencing factors in actual teaching and learning has become the key to improve the quality of teaching and learning [6-7]. Researchers have tried to use different kinds of methods to evaluate and measure teaching data, and then discover the potentially valuable information in these educational data for improving teaching and learning and promoting students' development [8-9]. In this paper, a decision tree model was constructed and the data were processed, and students in the experimental group applying the PBL project teaching method showed higher ability to understand the interpretation and presentation of language in the examination.

## 2. PBL PROJECT TEACHING METHOD AND DECISION TREE MODELING

### 2.1. DECISION TREE ALGORITHM AND ITS MODEL CONSTRUCTION

#### 2.1.1. OVERVIEW OF DECISION TREE ALGORITHM

The decision tree algorithm is an instance-based classification algorithm that constructs a decision tree model from a set of irregular, unordered instances and generates classification rules to classify and predict unknown data. In a decision tree, each leaf node is assigned a class label. Non-terminal nodes (including root and internal nodes) contain test conditions for attributes to separate records with different characteristics. The process of constructing a

decision tree using the decision tree algorithm is top-down recursive. In other words, in a practical study, building a decision tree is the process of classifying data according to certain attributes.

### **2.1.2. CHARACTERISTICS OF THE DECISION TREE ALGORITHM**

Compared with other common classification algorithms used in educational data mining, the decision tree algorithm has the following advantages:

a) Faster. The decision tree algorithm is less computationally intensive and has better computational speed than other classification algorithms.

b) Higher accuracy. Due to the simple operation process of decision tree algorithm, the efficiency of problem solving is relatively high, which is conducive to improving its accuracy.

c) Easy to understand. The structure of decision tree is clear and can clearly show the importance of the attributes. Using decision tree algorithm will eventually generate IF... THEN classification rules, which does not require much background knowledge from the user.

d) Highly scalable. Decision tree algorithms can handle both small and large data sets. It can also handle continuous data and discrete data.

## **2.2. PBL PROJECT TEACHING METHOD**

### **2.2.1. PBL TEACHING PROCESS**

The flow of a teaching unit realized is generally as follows:

1) Introduce with a driving question to arouse the interest of the students.

2) Design an interdisciplinary project based on this key question. The most important thing to keep in mind when designing a project is that it is linked to the curriculum standards. If students are involved in the design, it is more likely to increase their sense of ownership of the learning.

3) The purpose of a timeline is to give students a clear idea of time and to teach them to manage their time and plan their tasks.

4) Assessing program outcomes can help educators set standards and teach more efficiently. It allows students to understand how well they understand the content, the progress they have made, and the gaps that exist.

## **3. SPECIFIC APPLICATION OF DECISION TREE ALGORITHM IN THE ANALYSIS OF STUDENTS' SPOKEN ENGLISH**

### **3.1. DECISION TREE MODEL CONSTRUCTION PROCESS**

The process of decision tree construction includes two stages: growing and pruning. The growth process of decision tree, i.e., the building process, divides the attribute values according to certain criteria and gradually builds the decision tree from top to bottom. The essence of pruning is to eliminate the noise or noise like anomalous data.

#### **3.1.1. DETERMINE THE TARGET AND OBJECT OF EXCAVATION**

This study uses the PBL project teaching method of spoken English for college students as an example, and the study is based on data information from undergraduate students who took this course in 2022. This study proposes research preconceptions based on the analysis of the collected data and information, i.e., students' gender, achievement data, and the impact it will have on students' performance, and further explores what kind of impact it will have, and then proposes rationalization suggestions for teaching to improve the quality of teaching.

### 3.1.2. ACQUISITION OF DATA

#### (a) Basic information about the student

The corresponding data tables were created by exporting the basic information collected from the students directly through the school's academic system.

#### (b) Students' grade information

The final grades of students' courses are composed of two parts: regular grades and examination grades according to a certain ratio, and the three data of regular grades, examination grades and final grades can be obtained directly from the academic affairs system.

### 3.2. DATA PRE-PROCESSING

#### 3.2.1. DATA INTEGRATION

Data integration is the combination of data from multiple data sources stored in a consistent data store. In this study, Excel software in Microsoft Office was used to store the collected data. The basic student information table includes the following attributes: serial number, grade 1, grade 2, grade 3, total regular grade, exam grade, and final grade. The total number of data in the data table is 1750. The basic student data table is shown in Table 1.

**Table 1.** Basic information table of students

Serial number	Achievement 1	Achievement 2	Total Grade Point Average	Exam Results	Final Score
1	83	96	87	78	75
2	86	92	85	82	81
3	84	91	73	82	79
...	...	...	...	...	...
1748	94	91	89	86	79
1749	94	82	84	91	80
1750	94	88	97	96	79

#### 3.2.2. DATA CLEANING

Data cleaning means removing data that would have an impact on the results of the study. In the process of sorting the data, it was found that there were some students who did not have test scores for reasons such as not taking the test or for other reasons the score items all had vacant values, totaling 50 data items. These data were considered invalid, and 1700 valid data remained after deletion.

### 4. EXPERIMENTAL RESULTS AND ANALYSIS

Based on the data of college students' English speaking ability in the PBL project teaching method derived from the decision tree algorithm, 20 students' scores were taken to construct the experiment, and the experimental results were analyzed by SPSS11.0 statistical software. The results of comparing the differences of gain scores before and after treatment are shown in Table 2. The difference scores of pre-test 1 and pre-test 2, and pre-test 2 and pre-test 3 were tested separately, and the results showed that there was no significant difference between them. Meanwhile, the gain scores of pre-test 2 and pre-test 3, and pre-test 3 and post-test 1, respectively, were tested by *t* test, and the differences were found to be very significant. This method of segmentation test confirmed the experimental hypothesis from another perspective.

**Table 2.** Comparison of differences in gain scores before and after treatment

	<i>N</i>	<i>M</i>	<i>SD</i>	<i>t</i>	<i>p</i>
Pre-test 2 - Pre-test 1	20	0.75	2.50		
Pre-test 3 - Pre-test 2	20	1.55	1.89	1.37	>0.1
Pre-test 3 - Pre-test 1	20	1.29	1.48		
Post-test 1 - Pre-test 3	20	2.21	2.83	2.51	<0.01

## 5. CONCLUSION

In terms of the three modes of language communication, the students in the experimental group applying the teaching method showed a higher ability to understand the interpretation of language and express the presentation than the students in the control group in the examination. In this paper, according to the specific application of decision tree algorithm in the analysis of students' English speaking performance and the analysis of the generated decision tree model, students' final grades consist of exam grades and usual grades, among which students' exam grades have a greater impact on the final grades of the course, and if students' final grades are to be excellent, both exam grades and usual grades must be at least "medium". The final grade is composed of the exam grade and the usual grade. Training college students to consciously use oral communication strategies in English can significantly promote the development of their English speaking ability. The final grade factor variable had an independent significant effect on the choice of oral communication strategies in English for college students, and the major factor variable significantly influenced the choice of achievement strategies, although it did not have an independent main effect on the choice of avoidance strategies.

## ABSTRACT

With the rapid development of network economy and e-commerce. E-commerce development has become an important way for regional college students to start their own business, while college industry education is relatively lagging behind. It is necessary to reverse the concept and goal of talent training in colleges and universities, encourage the development of e-commerce and improve the level of education in colleges and universities. Using a combination of quantitative and qualitative methods, the education input cost and the number of e-commerce patents in a city were selected as parameters to analyze the interrelationship between e-commerce and university entrepreneurship education in a city region by calculating Pearson correlation coefficient values. The results show that the Pearson correlation coefficient is 0.9392, and since 0.9392 is between 0.8 and 1.0, there is an extremely strong correlation between e-commerce development and university innovation and entrepreneurship education in a city, and suggestions for e-commerce development are made.

## KEYWORDS

E-commerce; University education level; Innovation and entrepreneurship; Pearson correlation coefficient; Correlation analysis

## 1. INTRODUCTION

E-commerce refers to information technology and network technology as a means to exchange goods as the center of business activities, is the product of the organic integration of information technology and traditional business model [1-2]. Common e-commerce models include B2A, B2C, B2B, C2C, B2M, etc. [3]. The application of e-commerce can reduce business costs, weaken the dependence of enterprises on the traditional business environment, simplify business processes, and enhance the competitive advantage of enterprises [4-5]. In order to meet the demand for e-commerce professionals in the talent market, many universities have opened e-commerce majors, but the actual teaching effect is not satisfactory, and many students have insufficient practical ability to solve practical work

problems independently [6-7]. Therefore, colleges and universities should face up to the shortage of e-commerce majors in practical teaching and strengthen teaching reform [8].

The literature [9] investigated the impact of e-commerce entrepreneurship education on the development of the marine economy and analyzed it using the entropy value method. The study aimed to explore how to promote the development of marine economy through e-commerce entrepreneurship education. The literature [10] studied the development of e-commerce and its influencing factors in the era of digital technology and provided empirical evidence from 27 EU member states. The study aims to explore the impact of digital technologies on the development of e-commerce and the extent to which various factors influence its development in order to improve the sustainability of e-commerce. Literature [11] The study aims to explore how to improve the quality and competence of cross-border e-commerce talents in universities by improving the training model to meet the needs of cross-border e-commerce development.

## **2. RELEVANCE OF E-COMMERCE TO UNIVERSITY EDUCATION**

### **2.1. COLLEGE EDUCATION CAN BE A NEW ENTRY POINT FOR E-COMMERCE**

The core of the foundation of e-commerce development is the user. Because of the distribution of education resources, some students are unable to obtain sufficient education resources, network education makes it possible to share excellent educational resources, network education market demand is extremely strong. This is the primary factor for the rapid development of online education. Education is a kind of industry, and from the perspective of business, online education in colleges and universities will become a new profit point for e-commerce.

Online education in colleges and universities provides a strong demand and a broad market for e-commerce. People can learn by various methods, but online education has its unique advantages. As a kind of distance education, online education shares the independence of self-learning and has the nature of individual learning outside the structure of the learning community, while at the same time has a strong institutionalized management character on campus. Online education has the characteristics of fun personalization, interaction, intelligence, and mastery, while having more flexible teaching modes that can provide lecture mode, personalized independent learning mode, and collaborative learning mode. The Ministry of Education has approved dozens of universities to carry out pilot modern online education. Network education of pilot universities was expanding, and the coverage is getting bigger and bigger. Once network education is packaged with e-commerce, it will immediately show its unique charm.

### **2.2. COLLEGE NETWORK EDUCATION CAN BORROW THE OPERATION MODE OF E-COMMERCE**

The operation mode of e-commerce, including the information flow, logistics and capital flow involved in e-commerce, has many similarities with the teaching and management mode of modern network education. The B to B and B to C models in e-commerce can find similar models in network education. Network education has two forms: group learning at each branch and individual learning at any location, and the relationship with the school is the B to B and B to C mode. Modern network education applies the operation mode of e-commerce and transforms on top of it to form a business operation mode with its own characteristics, which is the long-term plan for the survival and development of network education. Only when online education is used as both an educational activity and a profitable business activity to truly achieve a win-win situation for both the education provider and the educated, it will be able to exist for a long time and continue to grow and develop.

### 3. ANALYSIS OF THE CORRELATION BETWEEN E-COMMERCE AND INNOVATION AND ENTREPRENEURSHIP EDUCATION IN COLLEGES AND UNIVERSITIES

In order to test the correlation between online entrepreneurship of college students and entrepreneurship education in colleges and universities, this paper adopts a combination of quantitative and qualitative methods, and selects the education investment cost and the number of e-commerce patents in a city as parameters to analyze the interrelationship between e-commerce and entrepreneurship education in colleges and universities in a city area by calculating Pearson correlation coefficient values.

#### 3.1. PEARSON CORRELATION COEFFICIENT

Correlation analysis is the analysis of two or more elements of variables with correlation, so as to measure the closeness of correlation between two variable factors. Pearson correlation coefficient is used to measure whether two data sets are on top of a line, and it is used to measure the linear relationship between fixed distance variables, which is calculated as shown in equation (1) below.

$$r = \frac{N \sum x_i y_i - \sum x_i \sum y_i}{\sqrt{N \sum x_i^2 - (\sum x_i)^2} \sqrt{N \sum y_i^2 - (\sum y_i)^2}} \quad (1)$$

The larger the absolute value of the correlation coefficient, the stronger the correlation. The strength of correlation is usually determined by the following range of values: (1) 0.8-1.0 for very strong correlation, (2) 0.6-0.8 for strong correlation, (3) 0.4-0.6 for moderate correlation, (4) 0.2-0.4 for weak correlation, and (5) 0.0-0.2 for very weak or no correlation. Where  $r$  is the correlation coefficient,  $N$  is the sample size,  $x$  is the independent variable, and  $y$  is the dependent variable.

#### 3.2. CORRELATION ANALYSIS RESULTS

E-commerce development includes innovation awareness, management knowledge, business operation experience and project execution ability, among which innovation ability is an important indicator of e-commerce development, and the number of patent applications and acquisitions is one of the important indicators of a region's e-commerce development, so the selection of education funding investment and the number of regional patents to verify the relationship between e-commerce development and university education has a certain substitutable relationship. Since it is impossible to obtain the specific data on the results of e-commerce development in a city and the funds and manpower invested in entrepreneurship education by each university, this paper will find the cost of education investment in a city from 2014 to 2023 as shown in Figure 1, and the changes in the number of e-commerce patents granted in the corresponding years as shown in Figure 2 by collecting the yearbook data from a city's statistics bureau.

**Figure 1.** Education investment costs from 2014 to 2023

**Figure 2.** Changes in the number of e-commerce patent authorizations obtained from 2014 to 2023

The relevant data in Fig. 1 and Fig. 2 are substituted into Eq. (1) for the calculation, and the results are as follows:

$$r = \frac{2229961 - 1623681}{228.11 \times 2831.11} = 0.9392, \text{ because } 0.9392 \text{ is between } 0.8 \text{ and } 1.0, \text{ so there is}$$

an extremely strong correlation between e-commerce development in a city and innovation and entrepreneurship education in universities.

#### 4. CONCLUSION

Online education in colleges and universities will play an important role in building a modern society with lifelong learning function, and a flexible learning mode mediated by technology will become the development trend. Through correlation analysis, the coefficient of the peeren coefficient between e-commerce development and university entrepreneurship education reached 0.9392, and showed a significant correlation. But how to solve the problem of the long-term development of online education, this paper puts forward the idea of combining

online education and e-commerce in colleges and universities. On the one hand, e-commerce uses education as a breakthrough for its own profitability and forms a new profit point, on the other hand, network education can develop itself in a long term by using e-commerce model or combining with e-commerce to form a better operation mechanism that can guarantee education quality and economic benefits. The use of e-commerce model to solve the modern network education can undoubtedly become a good opportunity for the common development of both.

## ABSTRACT

Although global trade governance has put all countries in the world under pressure and challenges, global economic and trade rules reorganization is inevitable and urgently needed to be addressed. Based on information fusion, a Bayesian network model is trained by machine learning to obtain an intelligent prediction model of international multinational enterprises' economic and trade risks based on Bayesian network, and a robustness analysis of the Bayesian prediction model is conducted. The results show that the overall prediction accuracy of the international multinational enterprise economic and trade risk prediction model for 10 test cases is 83.04%, indicating that the prediction results of the prediction model have high guiding significance and good robustness. This paper proposes a path to change the economic and trade governance system of international multinational enterprises to promote the possibility of trade growth, and to establish a foundation and remove obstacles for the transformation of global economic and trade governance.

## KEYWORDS

Bayesian predictive model; Robustness analysis; Multinational enterprises; Economic and trade governance system; Change path

## 1. INTRODUCTION

The overall characteristics and trends of the current world economic situation are the deepening and consolidation of the trend of globalization of the world economy, and the consequent rapid expansion of the position and role of multinational enterprises in the development of the world economy, and the global business strategies of multinational enterprises are also bringing profound changes to the development of the world economic landscape [1-3]. The traditional pattern of international economic interactions, mainly commodity trade, has been broken, and the international division of labor has deepened under the impetus of socialization of production and increasingly penetrated into industrial and corporate fields, which makes multinational enterprises play a significant role in a country's economic growth, structural adjustment, industrial upgrading, technological progress and the

evolution of corporate governance structure [4-6]. It is easy to see that, in the current international situation, the quantity and quality of multinational enterprises owned by a country represent its economic strength and international competitive position [7].

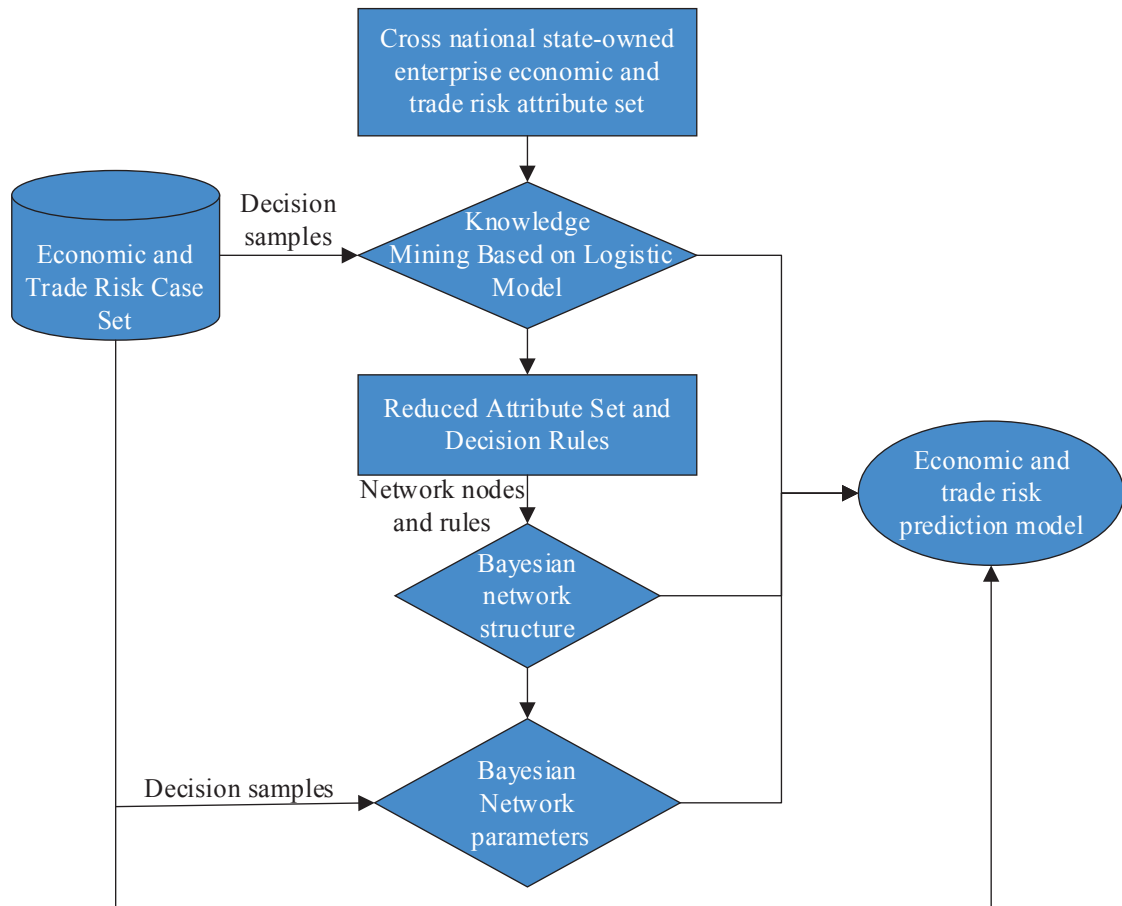

The literature [8] proposes a multi-objective optimization method for industrial park layout design that aims to balance the trade-off between economic benefits and safety. The method can help designers to consider economic benefits along with safety to ensure the sustainability of industrial parks. The literature [9] studied the impact of the U.S.-China trade dispute on the global agricultural market, the U.S. economy, and greenhouse gas emissions. The study aimed to explore the impact of the U.S.-China trade dispute on global agriculture and the economy, as well as its possible impact on greenhouse gas emissions.

## **2. ANALYSIS OF INTELLIGENT PREDICTIVE MODELS FOR ECONOMIC AND TRADE GOVERNANCE OF INTERNATIONAL MULTINATIONAL ENTERPRISES**

### **2.1. BAYESIAN PREDICTIVE MODELING FRAMEWORK FOR INTERNATIONAL MULTINATIONAL ENTERPRISES' ECONOMIC AND TRADE GOVERNANCE**

However, the traditional Bayesian network building process relies mainly on subjective experience, and coupled with the fact that this study involves a large number of influencing factors directly building Bayesian networks is bound to be unconvincing and exceptionally complex, while overly complex Bayesian networks can lead to computational complexity and overfitting problems. In addition, this study involves the prediction of different kinds of economic and trade risks, and the influencing factors of different economic and trade risks are different if the influencing factors identified above are used directly for modeling without consideration, it is difficult to avoid introducing irrelevant nodes in the network, increasing the model noise and reducing its predictive ability.

Therefore, in order to make the Bayesian network establishment process more rigorous and to reduce the network complexity and improve the node correlation, which in turn improves the prediction ability and prediction efficiency of the Bayesian network, this study first analyzes the sample and the influencing factors using a Logistic regression model to uncover the most relevant influencing factors corresponding to each economic and trade risk, as well as the causal relationships between the influencing factors. Based on the output of the logistic regression model, a Bayesian network structure is established to maintain the flexibility and fault tolerance of the Bayesian network inference process, while increasing the accuracy of its network structure. The collected case data are used as samples in the Bayesian network to train the Bayesian network model for machine learning and obtain an intelligent prediction model of international multinational enterprises' economic and trade risks based on Bayesian network. In summary, the basic idea of establishing the prediction model of international multinational enterprises' economic and trade risks in this paper is shown in Figure 1

**Figure 1.** A Prediction Model for Economic and Trade Risks of Multinational Enterprises

## 2.2. BAYESIAN PREDICTIVE MODEL ROBUSTNESS ANALYSIS

Regulatory policy change risk, administrative restrictions and discrimination risk, political violence risk, corruption risk, government default risk, and project-specific protest risk are represented by F1, F2, F3, F4, F5, and F6, respectively. Ten randomly selected samples have been used as a test set in this study to verify the robustness of Bayesian network parameter learning for the prediction of trade and economic risks of international multinational enterprises. The prediction probability greater than or equal to 49.9% is considered as the occurrence of the prediction result of the type of economic and trade risk, and the prediction result less than 49.9% is considered as the non-occurrence of the type of economic and trade risk. The accuracy of the model prediction is calculated by comparing the model prediction results with the actual results of the cases. For example, for test case 2, the prediction results are F1 and F2 occur and F3, F4, F5 and F6 do not occur, while the actual results are F2 occur and F1, F3, F4, F5 and F6 do not occur. The model's prediction results for F1 in case 2 are wrong, and the prediction results for F2, F3, F4, F5 and F6 are correct, i.e., the prediction model's economic and trade risk prediction for test case 2 The accuracy rate is 83.3%. The prediction results of the model for all test cases are shown in Table 1. It can be seen that the overall prediction accuracy of this international multinational enterprise economic and trade risk prediction model for the 10 test cases is 83.04%, indicating that the prediction results of this prediction model have high guiding significance and good robustness.

**Table 1. Robustness test results**

No.	Forecast Results (%)						prediction	reality	Accuracy (%)
	F1	F2	F3	F4	F5	F6			
1	66.6	33.2	66.6	33.2	33.2	33.2	F1;F3	F1;F3	100
2	49.9	49.9	14.2	12.4	18.7	19.9	F1;F2	F2	83.2
3	19.9	49.9	33.2	33.2	74.9	33.2	F2;F5	F5	83.2

**3. PATH OPTIONS FOR THE CHANGE OF ECONOMIC AND TRADE GOVERNANCE SYSTEM OF INTERNATIONAL MULTINATIONAL ENTERPRISES**

**3.1. PROMOTE SUSTAINABLE GROWTH OF GLOBAL TRADE WITH NATIONAL CULTURAL EXCHANGE**

Although the development of economic, technological and network media has injected a new impetus for cultural communication, allowing people of all countries to communicate in a timely manner, assuming the medium and mission of national cultural communication, opening new ways for the dissemination and preservation of culture in all countries. But after all, the network, technology media is only as a tool of existence, its flexibility and human contrast, has a relative disadvantage. Therefore, the dissemination of culture not only needs new communication media such as technology, Internet and new media, but also needs the participation and contribution of multinational corporations.

Since the 21st century, the number of multinational enterprises has shown a greater growth trend as shown in Figure 2, and multinational enterprises have gradually become a part of international economic and trade governance, and the participation of multinational enterprises in the formulation of the international economic and trade system has become a reflection of democratization. And the exchange of multinational companies is a mutual cultural exchange between the employees of enterprises and government departments and personnel of other countries, which has a very important significance for the foreign development of national culture and plays an important role in the balance between trade growth and cultural exchange. Therefore, we need to make good use of science and technology, new media as the medium of cultural communication, but also to see the significance of traditional media in cultural exchange. Only by playing the role of all mediums of cultural exchange can we minimize cultural differences between countries, promote the possibility of trade growth, and build the foundation and remove obstacles for the transformation of global economic and trade governance.

**Figure 2.** The number of multinational enterprises is showing a significant growth trend

### **3.2. BUILD INTERNATIONAL CULTURAL TRADE NETWORK TO REALIZE MUTUAL FEEDING OF ECONOMY, TRADE AND CULTURE**

Countries strengthen humanistic exchanges, deepen economic and trade cooperation, and expand the scale of global cultural trade. In fact, each country can formulate different exchange policies for different regional countries to build up their own international cultural trade network, which is of great significance to the development of trade and culture. In addition, countries can give full play to their own social institutions, overseas Chinese, foreign enterprises and foreign students to actively open bilateral and multilateral cultural exchanges and enhance the identification of their own cultures.

Countries can fully study and explore the correlation and historical origin between other countries and their own cultures, accelerate the establishment of cultural networks in the era of “Internet+”, develop cultural products with common cultural aspirations between their countries and other countries, and promote the upgrading of national cultural trade structures.

Establish a cultural trade network and actively utilize the advantages of a cultural trade network. Combine market needs and selectively develop cultural trade markets in different regions in selected target countries. Through publicity and promotion, further enhance the market scope of the country’s cultural trade and realize mutual feeding of culture and economic and trade.

### **4. CONCLUSION**

In this paper, the prediction of six types of international multinational enterprises’ economic and trade risks by Bayesian networks can fully consider the influence of variables on the probability of occurrence of economic and trade risks and the covariance relationship between variables, so as to achieve dynamic prediction and improve the prediction accuracy. The prediction accuracy of the established intelligent prediction model for international multinational enterprises’ economic and trade risks reaches 83.04%, with high sexual robustness. This paper provides certain policy recommendations for international multinational enterprises’ economic and trade governance from the perspective of national culture for economic development and economic and trade convenience, and countries should actively participate in the reconstruction of international economic and trade rules to inject new momentum for the new development of global trade.

## ABSTRACT

This paper explores a neural network-based intelligent extraction method for key electronic information. Convolutional neural networks, electronic information extraction mechanisms and data pre-processing are constructed, and the extraction of key electronic information using neural networks is discussed in detail. In order to ensure the accuracy and reliability of the data, data pre-processing methods such as data cleaning, data set division, feature extraction and data normalization are proposed. The results show that the overall accuracy of information recognition is improved by an average of 0.58% and 0.62%, respectively, by using convolutional neural networks. The F1 values of recognition were improved by 2.81% and 2.49%, respectively. It indicates that the method can effectively extract key information with high accuracy and stability. And it provides strong support for the technological innovation and development of related fields.

## KEYWORDS

Neural network; Electronic information; Intelligent extraction; Data preprocessing; Normalization; F1 value

## 1. INTRODUCTION

Intelligent extraction of electronic information is a challenging task that requires a combination of artificial intelligence and electronic information technology to extract key information from a large amount of electronic information in an automated and efficient manner [1-3]. Past research has relied on manual rule formulation and manual mining for information extraction [4-5]. However, these approaches are often limited by rule formulation and have

difficulty in coping with the complex and changing electronic information environment [6]. The existing related literature mainly focuses on the design and optimization of neural network models. For example, some studies use convolutional neural networks (CNNs) for classification and recognition of electronic information text for automated information extraction [7]. Other studies have applied recurrent neural networks (RNNs) and long short-term memory (LSTM) networks to model and predict electronic information sequence data with good results [8]. In addition, there are also studies that integrate deep learning methods with other techniques, such as combining convolutional neural networks and recurrent neural networks to improve text classification accuracy [9]. The purpose of this paper is to explore new ideas of neural network applications and design more suitable methods for electronic information extraction in order to improve the efficiency and accuracy of intelligent information processing.

## 2. NEURAL NETWORK-BASED ELECTRONIC INFORMATION WISE EXTRACTION

### 2.1. CONVOLUTIONAL NEURAL NETWORK

The basic training units of convolutional neural networks include: convolution, nonlinear transform, pooling, Dropout and batch processing. The core units are convolution, nonlinear transform and pooling.

#### (1) Convolution

In the convolution operation, two core parameters are included, the input variable and the convolution kernel. In digital image processing, the types of convolution are classified as, full element convolution, same-size convolution and effective convolution. Suppose,  $X = \{x_1, x_2, \dots, x_n\}$ ,  $X \in R^n$  are the input variables,  $\omega \in R^m$  are the convolution kernel weights are the convolution kernel weights, then we have:

$$y(k) = \sum_{i=1}^m x(k-i+1) \cdot \omega(i) \quad (1)$$

#### (2) Nonlinear transformation

The core of nonlinear transformation is to improve the nonlinear portrayal of the whole network structure by a simple nonlinear mapping of each neuron, also known as the activation function. Currently, the activation functions commonly used in convolutional neural network algorithms are, ReLU, Sigmoid function and tanh function. Their mathematical expressions are respectively:

$$\left\{ \begin{array}{l} \text{Sigmoid}(y) = \frac{1}{1 + e^{-y}} \\ \text{Tanh}(y) = \frac{e^y - e^{-y}}{e^y + e^{-y}} \\ \text{ReLU}(y) = \max(0, y) \end{array} \right. \quad (2)$$

where variable  $y$  refers to the output value of the convolution operation.

#### (3) Pooling

Pooling reduces the spatial dimension of the feature map by aggregating the feature space or type by downsampling, with the main purpose of reducing the computation and ensuring the translation invariance of the features. Expand the perceptual field range, reduce the input dimension of the next layer, and effectively reduce the risk of overfitting. There are many ways

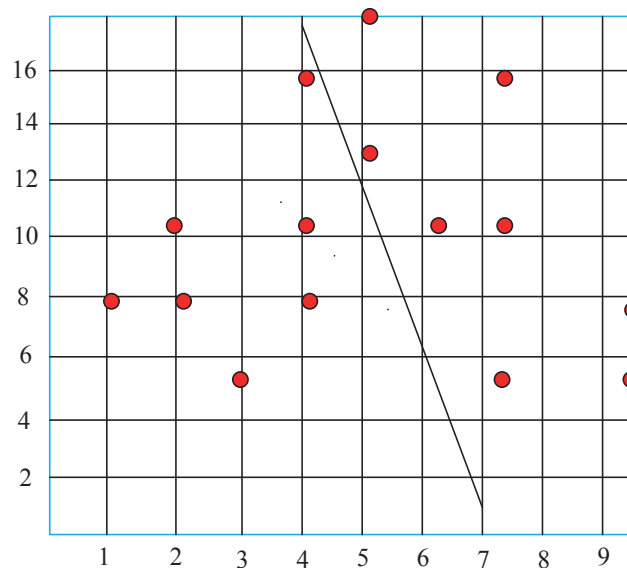

of pooling operations, such as maximum pooling, average pooling, global average pooling, etc. are common.

## 2.2. ELECTRONIC INFORMATION EXTRACTION MECHANISM

Electronic information extraction is actually categorized as a dichotomous task that falls under the category of classification. The supervised classification problem includes two processes: learning and discriminating. In the learning process, an effective learning method is used to extract feature information based on a known training data set, and a suitable classifier is selected to finally obtain an information extraction model; in the discriminating process, a discriminating model is used to extract information from deeper features.

Ideally, in the information extraction task, the data distribution has linear separability. However, in practice, for electronic information, the background structure is complex, and the status quo of many feature categories, small differences between classes and large differences within classes leads to linear indistinguishability of the original data.

Therefore, the existing traditional algorithms usually transform the original image so that the features to be extracted have explicit or implicit separability as much as possible, and then use the classifier for information extraction. In the decomposition process, the linear separability of the data set directly affects the final information extraction accuracy as shown in Figure 1. The traditional algorithm is used to separate the data by linear separation, which easily causes some of the points to be abandoned completely, so the information obtained is inadequate.

**Figure 1. Linear Separated Data**

Given a set of discrete data  $T = \{(x_1, y_1), (x_2, y_2), \dots, (x_N, y_N)\}$ , where,  $x_i \in R^n$ ,  $y_i \in \{+1, -1\}$ ,  $i = 1, 2, \dots, N$ . If there exists a hyperplane  $S$  as

$$\omega \times x + b = 0 \quad (3)$$

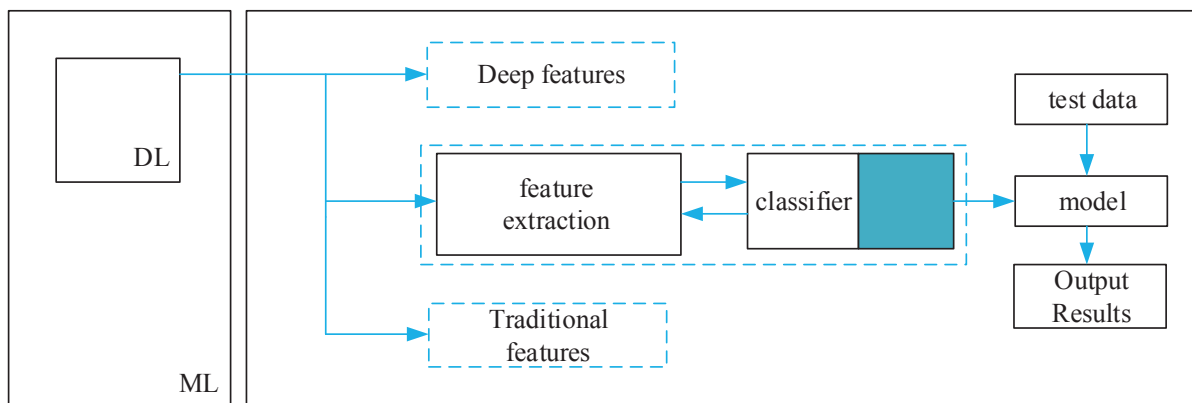

The ability to divide the positive and negative values in the data exactly correctly to both sides of the hyperplane and to satisfy Eq:

$$y_i = \begin{cases} +1, \forall i, \omega \times x_i + b > 0 \\ -1, \forall i, \omega \times x_i + b < 0 \end{cases} \quad (4)$$

Then, the data set  $T$  is linearly divisible; otherwise, the data set is linearly indivisible.

The process of electronic information extraction is usually considered as a process of effective information screening in the field of remote sensing information interpretation, based on various features of the ground features presented by electronic information. The process of identifying feature information through comprehensive image transformation, analytical reasoning, learning and judgment, i.e., extracting feature information from remote sensing simulated images of ground reality and inversion of ground prototypes.

The machine neural learning algorithms are divided into two categories: supervised learning and unsupervised learning from the perspective of sample labeling or not. In this paper, we mainly use convolutional neural network classifier for information extraction, while unsupervised learning algorithms cover a wide range of areas and cannot be exhaustive. Therefore, this paper only analyzes from the supervised learning perspective, and the basic process of machine supervised learning algorithm is shown in Figure 2.

**Figure 2.** Process of Supervised Learning Algorithms

## 2.3. DATA PRE-PROCESSING

### 2.3.1. DATA CLEANING

Data cleaning is an important step in data pre-processing, which aims to remove noise, outliers and duplicate values from the data to ensure the accuracy and reliability of the data. In the intelligent extraction of key electronic information, data cleaning is also very important because the quality of data directly affects the training effect of the subsequent neural network. The steps of data cleaning include, removing duplicate values, handling missing values, handling outliers, etc.

### 2.3.2. DATA SET PARTITIONING

In order to train and test the neural network model, the original data set needs to be divided into three parts: training set, validation set, and test set. Among them, the training set is used to train the model, the validation set is used to adjust the hyperparameters of the model and prevent overfitting, and the test set is used to evaluate the performance of the model. The division of the dataset needs to take into account the number of samples, sample distribution, and category balance.

### 2.3.3. FEATURE EXTRACTION

Feature extraction is the process of transforming raw data into feature representations that can be learned by neural network models. In the intelligent extraction of key electronic information, the goal of feature extraction is to extract features related to key information. Commonly used feature extraction methods include edge detection, texture feature extraction, and color histogram in image processing, bag-of-words model and TF-IDF in text processing, and wavelet transform and time-frequency analysis in signal processing.

### 2.3.4. DATA NORMALIZATION

In order to avoid the impact of scale differences between different features on the training of neural network models, it is necessary to normalize the data so that different features take the same range of values. Commonly used normalization methods include maximum-minimum normalization, Z-score normalization, etc.

## 3. INFORMATION EXTRACTION RESULTS AND ANALYSIS

The depth of the network structure and the width of the perceptual field are crucial in the task of electronic information extraction in complex contexts. Especially in electronic information, expanding the perceptual field can be effective in obtaining more effective features. Therefore, in this paper, we propose two basic training units, RCU and DPU, both of which can effectively improve the network's ability to extract deep features. Where the RCU is the residual convolution unit, which consists of a adaptive block. The DPU is a configurable unit of computation, which is commonly used to optimize the convolution neural network. To demonstrate that the joint constraint of RCU and DPU can effectively improve the recognition accuracy, the recognition ability of single training unit and joint training unit are compared in this section. The accuracy evaluation results are shown in Table 1 under the same training data and hardware and software environment.

**Table 1.** Comparison of the results with either RCU or DPU at the breakeven point.

data set	TEST	OA(%)	P(%)	R(%)	F1(%)	IoU(%)
Massachusetts dataset	Only RCU	98.38	75.41	73.96	73.26	59.63
	Only DPU	98.12	76.35	72.28	76.52	58.44
	Both	98.53	83.85	79.34	74.37	61.27
Gaofen No.2 Dataset	Only RCU	98.02	75.38	77.11	79.05	66.38
	Only DPU	97.96	77.47	80.85	75.73	59.31
	Both	97.83	80.11	80.81	79.66	65.42

When only RCU or DPU units are included in the network structure, the overall accuracy of information recognition is improved by 0.58% and 0.62% on average, respectively. Meanwhile, the F1 values of recognition are improved by 2.81% and 2.49%, respectively. RCU training units are used to increase the network depth in order to obtain more informative features. The DPU, on the other hand, is used to expand the sensing range as much as possible to reach the purpose of improving recognition accuracy while the feature resolution remains unchanged. Therefore, the joint constraint of the two can effectively improve the accuracy of information recognition in high-resolution remote sensing images.

## 4. CONCLUSION

The purpose of this paper is to explore a neural network-based intelligent extraction method for key electronic information. By introducing convolutional neural networks, electronic information extraction mechanisms and data pre-processing, this paper proposes a new method for extracting critical electronic information using neural networks. Through experiments and analysis, this paper draws the following conclusions:

(1) By using convolutional neural networks, the overall accuracy of information recognition is improved by 0.58% and 0.62% on average, respectively. The F1 values of recognition are improved by 2.81% and 2.49%, respectively. It indicates that the method can effectively extract key information and has excellent accuracy and stability.

(2) The data pre-processing method proposed in this paper, including data cleaning, data

set division, feature extraction and data normalization, can ensure the accuracy and reliability of the data, thus improving the efficiency and accuracy of information extraction.

Through the research of this paper, we can better understand the process of intelligent extraction of electronic information and provide strong support for technological innovation and development of related fields. The research results of this paper have certain guiding significance for the intelligent extraction of electronic information and can provide new ideas and methods for the research in related fields.

## ABSTRACT

This paper focuses on the application of intelligent data analytics and art disciplines in rural revitalization. By introducing intelligent data analysis application in rural revitalization. Specifically, it includes help rules and data pre-processing based on intelligent data analysis. The path mechanism of art majors in rural revitalization is focused on, including the characteristics and advantages of art majors, and the application in rural cultural revitalization, environmental construction and planning and design of tourist attractions. The results show that the synergy between intelligent data analysis and art majors can help promote rural revitalization and improve the quality and efficiency of rural development.

## KEYWORDS

Intelligent data analysis; Art majors; Rural revitalization; Help rules; Data pre-processing; Attraction planning

## 1. INTRODUCTION

With the development of society and the acceleration of urbanization, the population of rural China is gradually decreasing, and the economic development of rural areas is facing great challenges [1-2]. In recent years, more and more researchers have begun to pay attention to the role of art majors in rural revitalization [3-4]. Art majors have the value of inheriting rural culture as well as playing a positive role in the development of rural economy [5]. Art majors play an important role in preserving and inheriting rural culture, and help to explore the cultural resources and characteristics of villages [6]. Researchers have enhanced the value of rural characteristic culture by preserving and inheriting historical and cultural buildings, traditional handicrafts, etc. [7]. Meanwhile, more art graduates returned to their hometowns to start their own businesses and contributed to the development of local cultural industries and rural tourism [8]. The collaboration and cooperation of the researchers through art graduates has led to the expansion of channels and branding of local agricultural products and the improvement of rural tourism [9]. Intelligent data analysis technology, on the other hand, provides a new way of thinking to provide more refined and efficient support to promote rural revitalization through in-depth mining and analysis of art and cultural data [10].

## 2. APPLICATION OF INTELLIGENT DATA ANALYSIS IN RURAL REVITALIZATION

### 2.1. HELPFUL RULES BASED ON INTELLIGENT DATA ANALYSIS

Rule learning, as one of the early intelligent data analysis techniques, is also called “symbolic learning”. Its core is similar to other intelligent data analysis techniques in that it acquires knowledge by learning from existing data, except that the goal of rule learning is to obtain rules that can correctly distinguish data categories. In the rural revitalization work, when the person in charge of helping the poor household makes a revitalization plan, the help measures chosen are only to solve the most urgent problems of the poor household at the surface.

The purpose of rule induction is to clarify the specific conditions for the implementation of policy measures and to provide a more in-depth description of the link between the strength level of measures and the characteristics of poor households, so the chosen method should have good interpretability. On the one hand, compared with neural networks and support vector machines, rule learning and decision trees are more explanatory, so that users can intuitively understand the process of rule generation. The overall framework of rule induction is divided into two parts, including rule set generation and rule optimization, and the schematic diagram of the modules is shown in Figure 1.

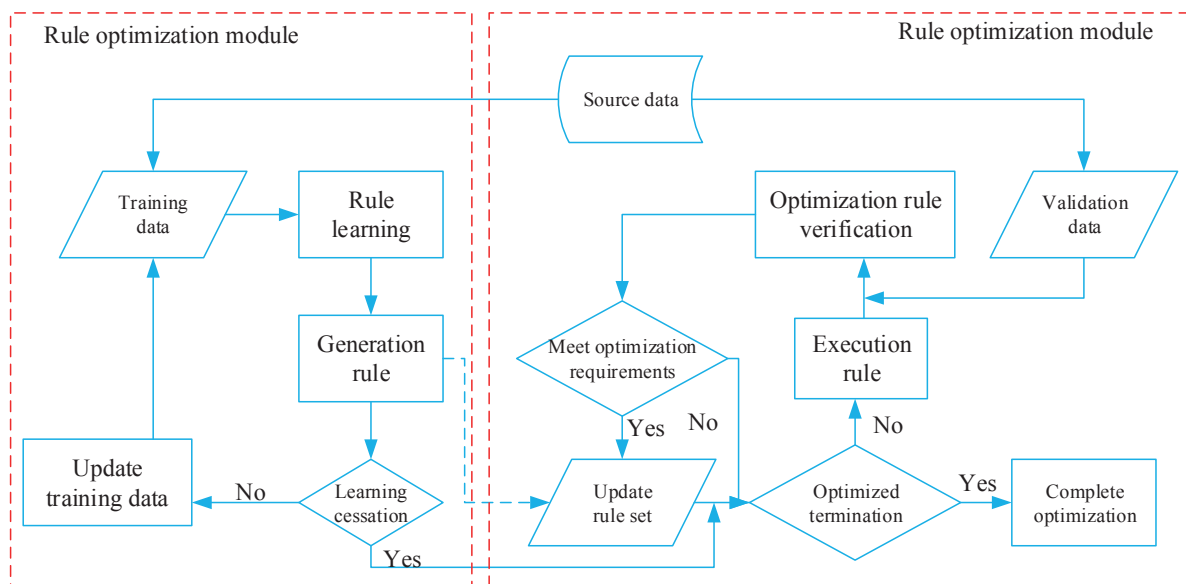

Figure 1. Rule induction module diagram

### 2.2. DATA PRE-PROCESSING

To ensure that the interference of data noise, missing values and inconsistent data is received in the modeling process, data cleaning transformation is required to ensure the accuracy, completeness and consistency of the data. Among them, data cleaning includes the processing of missing values, outliers and incorrect values, and data transformation includes the processing of character variables.

Missing data is a common problem in data mining. If the amount of missing data is small and has little impact on the model, the operation of deletion can be used directly; otherwise, data filling is carried out, and the filled values generally refer to statistics that can reflect the overall distribution pattern of data. The median/mean/plural is a description of the trend of the data center, which can reflect the data concentration distribution to a certain extent. Also, it should be noted that the mean is sensitive to extreme values, and the expression for the mean is

$$\bar{x} = \frac{\sum_{i=1}^N x_i}{N} = \frac{x_1 + x_2 + \dots + x_N}{N} \quad (1)$$

Where,  $\bar{x}$  is the sample mean,  $N$  is the sample number, and  $x_i$  is the sample value.

When the occurrence of missing, the mean value will be selected as the filler value data distribution as shown in Figure 2, the horizontal coordinate is the amount of compensation for following and the vertical coordinate is the number of people counted, at this time the mean, median and plural of the compensation amount basically overlap in a certain range.

**Figure 2.** Data distribution of fill values

In order to control the values of the input variables between 0 and 1, it is necessary to transform some of the data. For example, for the description of the educational level of the main labor force of poor households, it is necessary to quantify the numerical value of the educational level since it is related to the self-development potential to some extent.

For example, in this paper, text data describing educational qualifications need to be converted to numerical data, where the conversion rules for illiteracy as  $\alpha$ , elementary school as  $\beta$ , middle school as  $\chi$ , and high school and above as  $\delta$  are as follows

$$\alpha = \frac{N_1 + N_2 + N_3}{N_0 + N_1 + N_2 + N_3} \quad (2)$$

$$\beta = \frac{N_0 + N_2 + N_3}{N_0 + N_1 + N_2 + N_3} \quad (3)$$

$$\chi = \frac{N_0 + N_1 + N_3}{N_0 + N_1 + N_2 + N_3} \quad (4)$$

$$\delta = \frac{N_0 + N_1 + N_2}{N_0 + N_1 + N_2 + N_3} \quad (5)$$

Among them,  $N_0$ ,  $N_1$ ,  $N_2$  and  $N_3$  are the number of poor households with illiteracy, elementary school education, junior high school education, and high school education and above, respectively.

Similarly, numerical data with attribute values exceeding the range of [0, 1] in this paper, such as the number of students in school (C\_n), the number of major labor force (C\_s), the

area of cultivated land (A) and monetary data such as education grants and medical assistance, and compensation payments for returning farmland to forests, are normalized using the Standard Scaler method in this paper, and the conversion rules are:

$$x = \frac{x - u}{\sigma} \quad (6)$$

where  $u$  and  $\sigma$  are the mean and variance of the sample of the attribute value, respectively.

### 3. PATH MECHANISM OF ART MAJORS IN RURAL REVITALIZATION

#### 3.1. CHARACTERISTICS AND ADVANTAGES OF ART MAJORS

##### 3.1.1. CHARACTERISTICS OF ART MAJORS

Art majors have unique teaching methods and contents, and focus on cultivating students' creativity, imagination and aesthetic ability. These characteristics make art majors have unique advantages in rural revitalization. The teaching methods of art majors focus on practice and experience, which is in line with the practical and experiential nature required for rural revitalization. The teaching contents of art majors cover a wide range of fields, such as painting, music, dance and drama, which have important roles in rural cultural construction, tourism development and cultural product creation. Students of art majors have strong innovation ability and artistic expression, and they can provide unique cultural creativity and cultural products for rural revitalization and promote the development of rural economy. Therefore, art majors have an irreplaceable role in rural revitalization.

##### 3.1.2. ADVANTAGES OF ART MAJORS

The advantages of art majors are mainly reflected in Table 1. The influence of art majors on rural revitalization is mainly focused on four aspects, innovation ability, artistic expression, artistic skills and teamwork. Art majors have unique advantages in rural revitalization and can make important contributions to the development of rural economy and cultural construction.

**Table 1.** Main Advantages of Art Majors

Capacity	Advantage	Mechanism of action
Innovation ability	Students majoring in art have strong innovative abilities	They can provide unique cultural creativity and products for rural revitalization
Artistic expression	Students majoring in art have strong artistic expression skills	They can showcase rural culture and rural style through artistic forms, promoting the development of rural tourism and cultural industries.
Art Skills	Students majoring in art have high artistic skills	They can provide professional technical support for rural cultural construction and the creation of cultural products.
Team work	Art majors emphasize teamwork	They can collaborate with rural cultural institutions, cultural enterprises, and cultural creative teams to jointly promote rural revitalization

#### 3.2. THE APPLICATION OF ART MAJORS IN RURAL REVITALIZATION

##### 3.2.1. THE APPLICATION OF ART MAJORS IN RURAL CULTURAL REVITALIZATION

Art majors can provide support for rural cultural revitalization in many aspects. First, art majors can promote the development of rural culture through the excavation and inheritance of traditional culture. For example, traditional culture can be presented to the audience through music, dance and drama, so that the audience can better understand and know traditional culture, thus stimulating their interest in and love for traditional culture.

Art majors can inject new elements and vitality into rural cultural products through creative

design. For example, design handicrafts with rural characteristics that meet contemporary aesthetics and market demand, promote rural cultural products, and facilitate local economic development.

Art majors can provide platforms and opportunities for rural cultural revitalization through the organization and planning of cultural activities. For example, organize rural cultural festivals, art exhibitions and other activities to attract more people to the countryside, understand local culture, and promote rural tourism and cultural industries.

### **3.2.2. THE APPLICATION OF ART MAJORS IN THE CONSTRUCTION OF RURAL ENVIRONMENT**

Art majors can improve the appearance of the rural environment through landscape design. For example, design landscape elements that meet the characteristics of the countryside, such as small farmhouses and idyllic scenery. Creating rural culture excavation and inheritance Rural revitalization needs to be excavated and inherited from the aspect of cultural connotation. Art majors can promote the inheritance and development of rural culture by researching and creating local characteristic culture and transforming it into cultural products with market value. For example, after researching the local village culture, an art major student found that there is a traditional handicraft making skill in the area, but due to the backward production process and insufficient market promotion, the market influence of the handicraft is very small. By learning about art design and marketing, the student created a series of new handicrafts and promoted and sold them through an online platform, successfully recreating and promoting the local traditional handicrafts and injecting new momentum into local economic development.

### **3.2.3. PLANNING AND DESIGN OF RURAL TOURIST ATTRACTIONS**

Art students can provide ideas and solutions for the planning and design of local rural tourist attractions through their research and creation of local natural scenery and humanistic landscapes. For example, after researching local rural tourism resources, an art major student found a local mountainous area with beautiful natural scenery, but few tourists due to inconvenient transportation and lack of related facilities. By learning about art design and tourism planning, the student designed a series of tourism facilities and activities that were compatible with the distinctive local culture and natural environment, successfully turning the area into a rural tourist attraction with special characteristics and injecting new vitality into the local economic development.

## **4. CONCLUSION**

The purpose of this paper is to explore the practical paths of helping rural revitalization based on intelligent data analysis and art majors. By exploring the application of intelligent data analysis in rural revitalization and the path mechanism of art majors in rural revitalization, this paper draws the following conclusions:

Firstly, the help rules based on intelligent data analysis can effectively improve the efficiency and quality of rural economy, and the information resources of rural people can be better utilized through data pre-processing.

Secondly, art majors have rich and diverse characteristics and advantages, and can promote rural revitalization through applications in rural cultural revitalization, environmental construction and planning and design of tourist attractions.

To sum up, the combination of intelligent data analysis and art majors can optimize the rural economic structure, improve the quality of life of rural residents and achieve the goal of rural revitalization.

## ABSTRACT

This paper firstly constructs a comprehensive platform for continuing education based on data visualization, and visualizes the design of school career data through data visualization layout algorithm. Secondly, the implementation of the data visualization platform in the process of continuing education is discussed, including the implementation of visualization of learning process evaluation and visualization of individual student evaluation. The results show that the learning cognitive evaluation dimension in the process evaluation can understand the teaching goal achievement degree of 0.65. The research of this paper has certain guiding significance and practical value for promoting the development of intelligence and informationization of college continuing education and improving the teaching quality and service level of college continuing education.

Data visualization; Continuing education; Layout algorithm; Academic career data; Individual evaluation

## 1. INTRODUCTION

Continuing education in colleges and universities is a form of education established to meet the needs of various sectors of society for continuous updating of talents and strengthening of their own learning, so that working people can receive a certain degree of continuing education [1-2]. The construction of the service platform is one of the necessary conditions for the development of continuing education in universities [3-4]. With the continuous data visualization technology

development and application, how to give full play to the advantages of data visualization technology in the construction of college continuing education service platform and improve the efficiency and effectiveness of the service platform has become one of the focal points of

research [5]. Data visualization technology has been widely used in many fields, and its application in education and teaching has also been gradually paid attention to [6]. Relevant studies have shown that data visualization has a wide application prospect in learning effect assessment, student behavior pattern identification, and student feedback [7]. In the construction of comprehensive service platform for university continuing education, the service platform based on data visualization can improve the efficiency and quality of services, optimize the utilization and distribution of resources, and better promote the learning and development of students [8-9].

## 2. A COMPREHENSIVE PLATFORM FOR CONTINUING EDUCATION BASED ON DATA VISUALIZATION

### 2.1. DATA VISUALIZATION LAYOUT ALGORITHM

The main task of data visualization is to display complex data relationships visually through a concise and intuitive form. The force-guided layout algorithm is an important underlying algorithm for the representation of network data in information visualization and is applicable to most network data sets. Using data nodes as charges and edges as springs with attractive and repulsive forces between every two data nodes, repulsive forces are simultaneously calculated for each data node and attractive forces are calculated for each neighboring node. The repulsive and attractive forces of the data nodes are summed and their sums are stored in temporary variables for updating the positions of the nodes. By the action of attractive and repulsive forces, each data node keeps moving until the system is balanced.

#### (1) Calculation of attraction force

The attractive force is the force between two adjacent data nodes in the spring simulation system, so that these two adjacent nodes are closer together. The gravitational force between the adjacent data node  $a$  and data node  $b$  is proportional to the distance between data node  $a$  data node  $b$ , denoted by  $F$  the gravitational force between  $a$  and  $b$ , which is calculated as

$$F(a,b) = K(x_a - x_b) \quad (1)$$

where  $x_a - x_b$  is the distance between node  $a$  and node  $b$ , and  $K$  is defined as

$$K = C \sqrt{\frac{s}{|x|}} \quad (2)$$

where  $s$  is the area of the layout area and  $C$  is a constant.

#### (2) Calculation of repulsive force

The repulsive force is a repulsive force between every two data nodes, and its repulsive force is inversely proportional to the square of the distance between the two data nodes, which is calculated by the formula

$$F(a,b) = \frac{k}{|x_a - x_b|^2} \quad (3)$$

#### (3) Update the node position force

The guiding layout derives the velocity of the node by calculating the forces on each node, and the distance the node needs to move is calculated by multiplying the node velocity by the step size. In the KK algorithm, instead of considering repulsive and attractive forces separately,

an energy function minimization model is created. The model is expressed as the two data nodes have repulsive force when the Euclidean distance between them is closer than the theoretical distance. Otherwise, the two data nodes are attracted to each other. Its energy function  $E$  is calculated as

$$E = \sum_{a=1}^{n-1} \sum_{b=a+1}^n \frac{1}{2} k_{a,b} (|q_a - q_b| - s_{i,j})^2 \quad (4)$$

where  $k_{a,b}$  is the elasticity coefficient of nodes  $a$  and  $b$ .  $s_{i,j}$  is the ideal length of the spring, and  $|q_a - q_b|$  is the Euclidean distance of nodes  $a$  and  $b$ .

## 2.2. VISUALIZATION DESIGN OF ACADEMIC CAREER DATA

Data visualization uses computer graphics to display data in the form of graphs or tables on the page, including the processing of interactions, the essence of which is to convert data into visual codes, visual codes are mainly divided into visual markers and visual channels, where the visual channels are divided into location variables and visual variables, the basic visual variables are mainly color, size, texture, direction, shape, brightness, location variables that is the two-dimensional plane of the horizontal and vertical coordinate system, these seven basic variables and the combination of points, lines and surfaces will constitute a very large number of visual channel combinations, too many visual channels will make the visualization effect becomes confusing, the data become difficult to understand.

In this paper, career planning is an important research direction in the field of continuing education, and the construction of a career planning visualization platform contains a large amount of heterogeneous data. The integration of heterogeneous data provides the data basis for the visualization of the platform, and the information behind the data is clearly and effectively expressed through graphical means. By providing better visual analysis, the platform helps people to quickly access and efficiently interpret visual information, and better gain insight and decision from complex data information in the field of study career through an interactive way.

The visualization process of school career data for continuing education is shown in Figure 1. The most important point in the visualization construction process is visual mapping. The data in each dimension of the database is mapped into a graphical structure of people's visual sense. Through the visualization of the graphical structure, the data can fully express its characteristics and be easily perceived and understood by people, helping them to quickly analyze and gain insight into the value of the data. Therefore, what kind of visual coding form to display and whether the layout of the chart is reasonable are the keys to achieve effective visual mapping in the process of visualization construction.

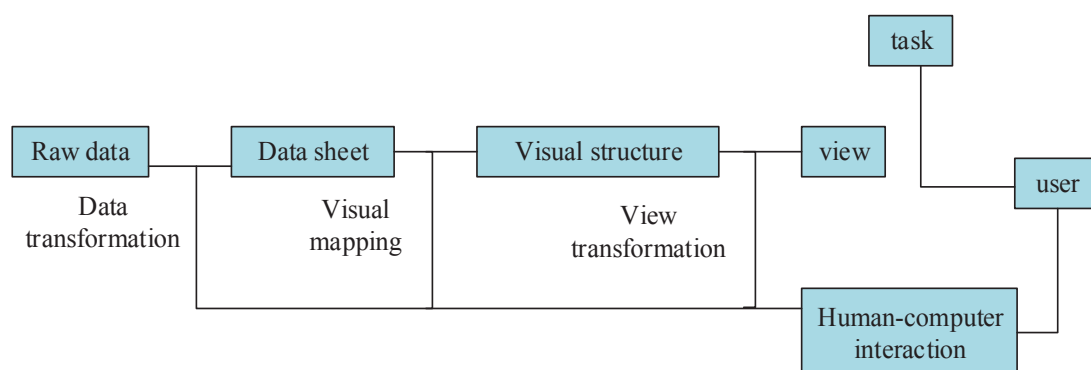

Figure 1. Data visualisation flowchart

### 3. IMPLEMENTATION OF DATA VISUALIZATION PLATFORM IN THE PROCESS OF CONTINUING EDUCATION

Perform statistical analysis of data in the Hive environment, using SQL-like statements and data functions to complete statistical analysis. Or connect to MySQL and query and obtain data through SQL statements according to visualization requirements. The display of data analysis results can be done by using EChart or custom visualization algorithms to draw line graphs, bar graphs or hotspot graphs and other visual graphics as needed.

#### 3.1. IMPLEMENTATION OF VISUALIZATION OF LEARNING PROCESS EVALUATION

Teachers design teaching tasks or activities to accomplish the teaching objectives, and the learning cognitive assessment dimension in the process evaluation provides insight into the achievement of teaching objectives, and the visualization results in the learning process evaluation provides insight into students' performance in classroom learning. Learning cognition-high level thinking evaluation corresponds to homework activities, and low level thinking corresponds to quiz activities. Learning attitude evaluation corresponds to attendance and check-in activities, and learning style evaluation corresponds to resource learning, brainstorming, and discussion activities. The participation rate or score rate of students completing teaching activities is calculated and displayed visually as a ring chart to understand the achievement of teaching objectives and student learning as shown in Figure 2.

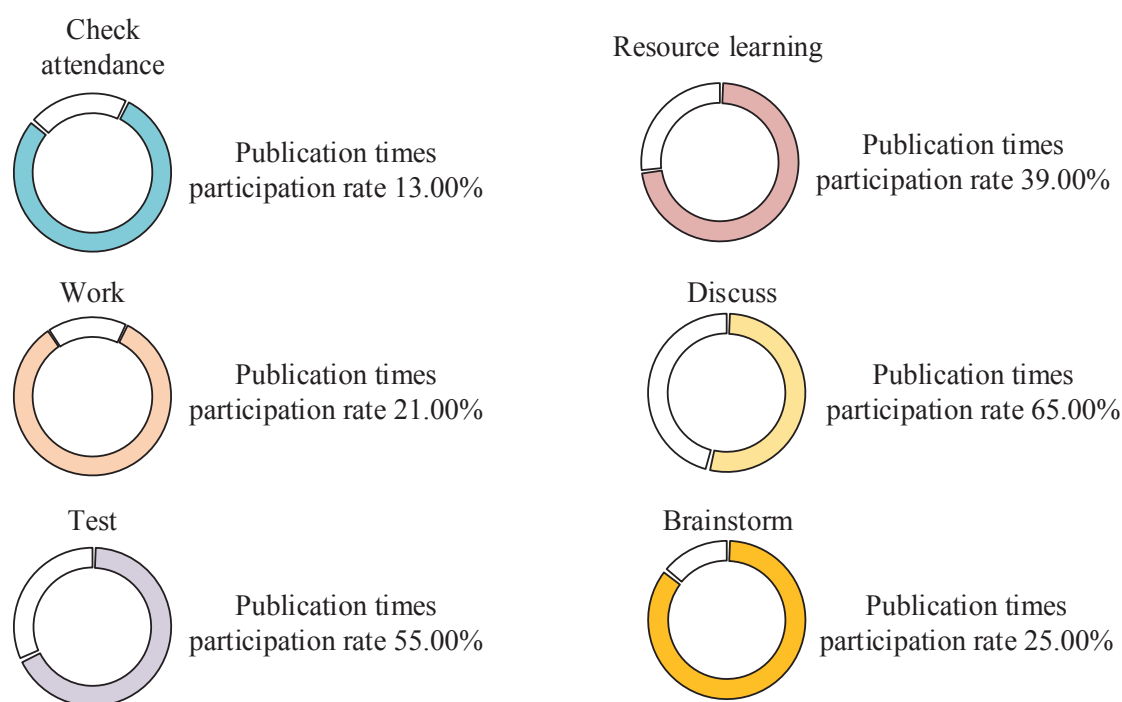

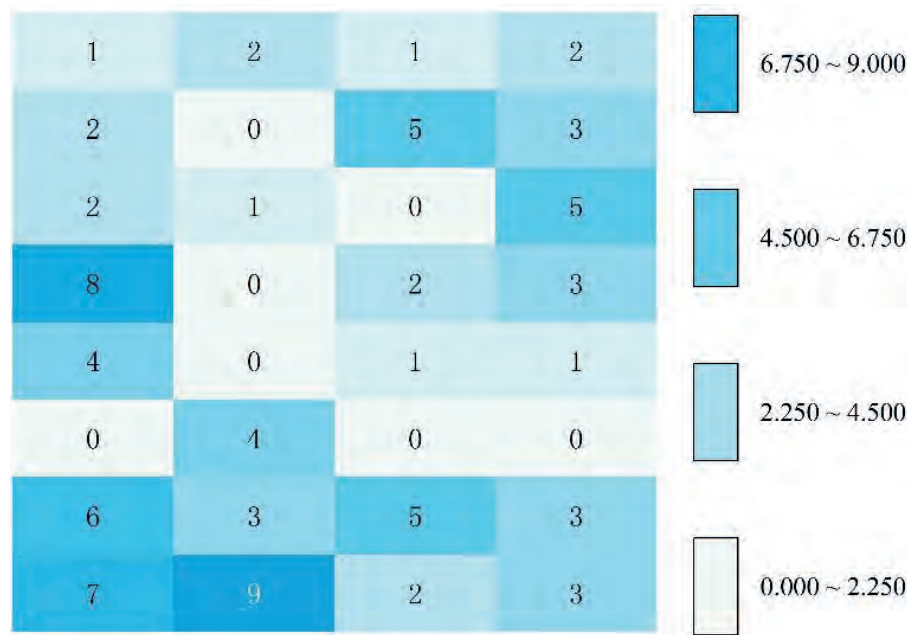

Figure 2. Visualization of learning process evaluation

#### 3.2. IMPLEMENTATION OF INDIVIDUAL STUDENT EVALUATION VISUALIZATION

The classroom teaching process evaluation is mainly designed to evaluate the learning behavior of students' performance in classroom teaching, and to count and display the overall situation of students, which can facilitate teachers to view the general situation of the current teaching class and have a comprehensive understanding of continuing education students. For example, through the heat map of professional learning ability evaluation, we can understand the class prerequisite courses, the number of failed courses, the number of failed courses, and the score distribution of each course, and understand the learning situation of the class in general as shown in Figure 3.

**Figure 3.** Heat map of professional learning ability

#### 4. CONCLUSION

The purpose of this paper is to investigate the construction path of a comprehensive service platform for continuing education in colleges and universities based on data visualization technology. During the research, we found that data visualization technology can help improve the efficiency and effectiveness of the college continuing education service platform, and can enable students to better understand their learning status and discover their strengths and weaknesses, so that they can better develop their personal learning plans and improve their learning effects. In this paper, we propose a data visualization layout algorithm and a visualization design of learning data to optimize the layout and design of the service platform. In the implementation, we propose two implementation methods, learning process evaluation visualization and individual student evaluation visualization. The visualization of learning process evaluation aims to help students better grasp the information of learning progress and class attendance, while the visualization of individual student evaluation helps students discover their own learning status and evaluate their learning outcomes.

## ABSTRACT

This paper takes B2B cold chain distribution between single distribution center and customer point as the research object, selects ABC algorithm as the base algorithm for solving the model, combines the characteristics of cold chain logistics, introduces flower fragrance mechanism and concentration adjustment mechanism of artificial immune algorithm to improve ABC algorithm for the shortcomings of ABC algorithm, and applies the improved ABC algorithm to solve the model. The results show that the BABC algorithm reduces the unnecessary crossings of distribution paths when solving the cold chain low carbon logistics distribution path optimization model, thus allowing the total cost to be reduced by 0.23. It shows that the research of this paper fits the actual vehicle path optimization model and provides a more reliable distribution solution for the enterprise cold chain logistics transportation.

B2B cold chain; ABC algorithm; Cold chain logistics; Floral fragrance mechanism; Immune algorithm; Path optimization

## 1. INTRODUCTION

With the development of social economy and the continuous improvement of people's quality of fresh food, low-carbon and efficient transportation mode in cold chain logistics is increasingly becoming a new research hotspot [1-2]. Path planning is one of the key issues in cold chain low carbon logistics [3]. As one of the most fundamental and critical issues in the field of transportation, path planning has long attracted extensive attention from scholars [4]. ABC method, as an improved costing method, has been widely applied in the field of transportation [5-6]. Related studies have shown that some scholars have designed an improved genetic algorithm with multigenerational competition to optimize the cold chain distribution problem, and the effectiveness of the improved algorithm has been verified by arithmetic examples, and satisfactory results have been achieved [7]. Based on the requirement of service time for cold chain products, the idea of converting the distribution time

between logistics nodes into service radius was proposed to establish the distribution model with the lowest cost considering each network node [8]. In this paper, ABC costing method and path planning are combined and improved ABC method is applied for path planning to achieve cost optimization in cold chain low carbon logistics transportation.

## 2. APPLICATION OF IMPROVED ARTIFICIAL BEE COLONY (ABC) ALGORITHM IN COLD CHAIN LOGISTICS

### 2.1. COLD CHAIN LOGISTICS

#### 2.1.1. APPLICABLE OBJECTS AND CLASSIFICATION OF COLD CHAIN LOGISTICS

The products transported by cold chain logistics are mainly those that are easily affected by the external environment and can be roughly divided into the following three categories as shown in Table 1.

**Table 1.** Cold chain logistics product classification

Product nature	example
Pharmaceutical cold chain	Vaccines, blood products, plasma substitutes, etc
Food cold chain logistics	Meat, eggs, fruit, vegetables, seafood, etc
	Aquatic product processing, slaughter and meat processing, etc
	Frozen food, edible ice, canned, frozen food, etc
Other cold chain logistics	Plant cold chain products, flowers, soft drinks, etc

The cold chain logistics products are different and the required cold chain temperature is also different. The classification of cold chain logistics according to the storage temperature zone is shown in Table 2.

**Table 2.** Cold chain logistics storage temperature zone classification

Temperature layer	Temperature zone	Storable product
Ultra-low temperature storage	<-50°C	Vaccines, reagents, plasma, etc
Frozen storage	-20°C-18°C	Ice cream, egg products, cream, etc
Ice temperature storage	-2°C-2°C	Seafood products, fruit juices, etc
refrigerate	2°C-10°C	Medicine, vegetables, bread, yogurt, etc
Low temperature refrigeration	10°C-25°C	Fruit wine, fructose, cosmetics, etc

#### 2.1.2. COMPOSITION OF COLD CHAIN LOGISTICS

Cold chain logistics is a system project, involving all aspects of the product from production to consumption. Usually cold chain logistics products in the whole circulation process, need to go through the production of products, cold chain logistics distribution center, product distributors, and finally to consumers, in all these processes need to be realized in the low-temperature distribution process as shown in Figure 1.

**Figure 1.** Flow chart of cold chain logistics

### (1) Raw product

After output at the place of production, it needs to be cooled or various operations are carried out in a low temperature environment.

### (2) Low-temperature storage

After production at the production site, it needs to be stored in a low-temperature environment to ensure quality.

(3) The most important reason for the decline in the quality of transport and distribution of food is the fluctuation of temperature, in the refrigerated transport link, both to maintain low temperature and to maintain temperature stability.

## 2.2. IMPROVED ARTIFICIAL BEE COLONY (ABC) ALGORITHM

The advantages of ABC algorithm are its few parameters, simple calculation and easy implementation, but the disadvantages also make it difficult to adapt to too many constraints, etc. in the process of solving the actual cold chain logistics vehicle path optimization model. Therefore, this chapter improves the initialization population, honey source search strategy and honey source selection strategy of the artificial bee colony algorithm by fusing the firefly algorithm and the artificial immune algorithm, and increases the local optimization strategy to improve the solution accuracy.

### 2.2.1. HONEY SOURCE SEARCH STRATEGY

Based on the idea of attracting other fireflies by the intensity of light in the firefly algorithm, the improved artificial bee colony algorithm introduces a floral fragrance mechanism, where the nectar source attracts the hired bee by its floral fragrance. As the distance between the nectar source and the hired bee increases, the concentration of floral fragrance becomes lighter, then the attraction decreases, then the possibility of the hired bee finding the nectar source is low.

The floral concentration of the nectar source itself is represented by  $\beta_0$ . Following the formula of the firefly algorithm for calculating attractiveness, the artificial bee colony algorithm is improved to calculate floral concentration, i.e. attractiveness  $\beta_{ij}$ , as follows:

$$\beta_{i,k} = \beta_0 e^{-\gamma(x_{i,j} - x_{k,j})^2} \quad i, k = 1, 2, \dots, m; j = 1, 2, \dots, n \quad (1)$$

Where,  $\beta_0$  indicates the nectar source's own floral concentration, which generally takes the value of 1.  $\gamma$  is the coefficient of decreasing floral concentration with distance and is a constant. The current optimal adaptation value is added to the updated equation for the hired bee to find a new nectar source. The improved search equation, then, is:

$$v'_{i,j} = x_{i,j} + \beta_{i,best} (x_{best,j} - x_{i,j}) + \alpha (x_{c1,j} - x_{c2,j}) \quad (2)$$

Where  $j \in (1, 2, \dots, n)$  and  $c1, c2 \in (1, 2, \dots, m)$  are randomly selected indices, and  $\beta_{i,best}$  indicates the floral concentration of the nectar source with the optimal adaptation value drifting to the nectar source where the hired bee is currently located.  $(x_{best,j} - x_{i,j})$  is the random interference term introduced to prevent the hired bee from falling into a local optimum.  $\alpha$  is the step size factor, which is a constant between [0,1] and is generally a random number distributed according to Gaussian.

### 2.2.2. HONEY SOURCE UPDATE STRATEGY

Artificial immunity algorithm is an optimized search process implemented by imitating the immune mechanism of the biological immune system. In this process, the antibody level is maintained at the most appropriate level by using the comprehensive evaluation method of concentration and affinity through the immune regulation mechanism. To solve the local optimum problem of the artificial bee colony algorithm, the improved artificial bee colony algorithm introduces the concentration evaluation mechanism and incentive degree calculation mechanism of the artificial immune algorithm, which prevents falling into local optimum by calculating the concentration of nectar sources as well as the incentive degree, selecting new nectar sources based on the probability calculated from the incentive degree, suppressing nectar sources with high density, and retaining nectar sources with small concentration but potential.

According to the concentration calculation of the artificial immune algorithm, the affinity of the nectar source is calculated first, and the improved artificial bee colony algorithm takes the nectar source adaptation value as the affinity between the nectar source and the objective function. Then the affinity between the nectar source and the objective function is expressed, as:

$$Q = \{f_1, f_2, \dots, f_m\} \quad (3)$$

The calculation of the affinity between the nectar source and the honey source is then, as:

$$q_{i,j} = \begin{cases} 1, & f_i = f_j \\ \frac{1}{1 + |f_i - f_j|}, & \text{else} \end{cases} \quad (4)$$

The concentration of nectar source  $X_i$  in the current nectar collection  $den_i$ , calculated as:

$$den_i = \frac{1}{N} \sum_{j=1}^n q_{i,j}, i=1, 2, \dots, m \quad (5)$$

It can be seen that when there are more nectar sources with high affinity to nectar source  $X_i$ , the concentration of nectar source  $X_i$  is greater. According to the antibody excitation degree mechanism in the artificial immunization algorithm, the calculation formula for the nectar source  $X_i$  excitation degree  $act_i$  is obtained by considering the affinity degree and nectar source concentration together as:

$$act_i = \sum_{j=1}^n q_{i,j} \times e^{-\frac{den_i}{\mu}} \quad (6)$$

Where,  $\mu$  denotes the regulator,  $\mu \geq 1$ . In the excitation function, nectar sources with high affinity and low density are able to obtain larger excitation values.

### 3. ANALYSIS OF THE OPTIMIZATION RESULTS OF IMPROVED ABC IN THE DISTRIBUTION PATH

In this paper, we assume that the maximum load capacity of the distribution vehicle is 200, the fixed cost of the vehicle is  $f_k = 500$ . The distribution cost is  $c_{ij} = 500$  yuan/km, the time of each vehicle in the service of each consumer is 10 minutes, the average driving speed of

the distribution vehicle is  $v = 50\text{Km}/h$ , and the carbon tax due to carbon emission is  $P_c = 30$  yuan/g. The distribution route of the basic artificial bee colony (BABC) algorithm to solve the cold chain low carbon logistics distribution path optimization model is shown in Table 3.

**Table 3.** Routes obtained by ABC

vehicle	Distribution route
1	0(1(5(11(7(0
2	0(6(9(0
3	0(10(2(16(15(13(0
4	0(4(3(12(8(14(0

It can be seen that the distribution center needs to send out 4 vehicles to complete the distribution task to 16 consumers, vehicle 1 serves 1, 5, 11, 7, vehicle 2 serves 6, 9, vehicle 3 serves 10, 2, 16, 15, 13, vehicle 4 serves 4, 3, 12, 8, 14, and all vehicles return to the distribution center after completing the distribution. Figure 2 shows the distribution path diagram of the BABC algorithm solving the cold chain low carbon logistics distribution path optimization model.

**Figure 2.** Distribution path diagram of BABC

It can be seen that since the BABC algorithm reduces the unnecessary intersection of distribution paths in solving the cold chain low carbon logistics distribution path optimization model, the total distance of the distribution paths is shorter, which reduces the total cost by 0.23. Comparing the convergence process diagram of ABC algorithm and BABC algorithm, it can be seen that BABC converges faster than ABC algorithm in solving the cold chain low carbon logistics distribution path optimization model, the number of generations of convergence of BABC algorithm is 40 and the number of generations of convergence of ABC algorithm is 80. The number of generations of convergence of the BABC algorithm is 40 and the number of generations of convergence of the ABC algorithm is 80, indicating that the BABC algorithm converges faster and the solution effect is better.

#### 4. CONCLUSION

With the accelerated development of the national economy, the demand for fresh agricultural products is gradually increasing in the proportion of people's daily life. And the

special nature of agricultural products makes it necessary to rely on the special transportation method of cold chain for distribution. The ABC algorithm is chosen as the base algorithm for solving the model of this paper, and the initial solution generation strategy is improved for the problem of discontinuity in the cold chain logistics vehicle path optimization model. In addition, in order to solve the shortcomings of ABC algorithm such as low solution accuracy and easy to fall into local optimum, the flower fragrance mechanism and concentration adjustment mechanism are introduced to improve the solution accuracy of ABC algorithm, and at the same time, the random perturbation allows the improved ABC algorithm to overcome the local optimum and strengthen the global optimization seeking ability.

## ABSTRACT

This paper firstly constructs the application of nonlinear programming in cross-border e-commerce trade, especially the nonlinear programming method based on the linear inequality constraint. Secondly, the efficiency of self-branded cross-border e-commerce and the potential of self-branded cross-border e-commerce trade are described. Finally, a nonlinear programming model is established, and the model is solved and simulated using data collection and analysis methods to obtain the optimal solution and conduct efficiency and potential analysis. The results show that the accuracy check results of the trade size potential prediction using the nonlinear programming model are  $P=0.92$  and  $c=0.35$ , which meet the requirements of trade potential prediction on accuracy. This paper helps to promote the development of self-owned brand cross-border e-commerce and improve the competitiveness and market share of self-owned brand cross-border e-commerce.

## KEYWORDS

Nonlinear programming; Cross-border e-commerce; Inequality constraint; Self-branding; Data collection; Trade potential

## 1. INTRODUCTION

With the continuous globalization process, cross-border e-commerce trade has gradually become an important part of the world economic development [1-2]. Self-branding is the key point of competition among enterprises in cross-border e-commerce trade [3]. And how to improve the efficiency and explore the potential of cross-border e-commerce trade of self-owned brands has become a hot research topic in the industry [4-5]. Nonlinear programming is an important method in operations research, which has the advantages of flexibility and efficiency in solving complex problems and optimizing decisions, and has been widely used in the analysis of efficiency and potential of cross-border e-commerce trade [6-7]. Relevant studies have shown that the application of nonlinear programming can effectively analyze the impact of factors such as product selection, marketing strategy, and logistics strategy on efficiency and potential in cross-border e-commerce trade, optimize sales patterns, and improve trade efficiency and potential [8-9]. In this paper, we first establish a nonlinear programming model for cross-border e-commerce trade of independent brands and choose a suitable solution method for model solving. In the process of model solving, the efficiency and potential of cross-border e-commerce trade of independent brands are analyzed according to the obtained optimal solutions.

## 2. APPLICATION OF NONLINEAR PROGRAMMING IN CROSS-BORDER E-COMMERCE TRADE

### 2.1. NONLINEAR PROGRAMMING METHODS BASED ON LINEAR INEQUALITY CONSTRAINTS

The main consideration in solving the method of nonlinear programming problem with mixed constraints is to solve the objective function by dimensionality reduction to find out a point as the initial point, and then operate with the method of filling function. In this paper, we use the dimensionality reduction method to find out the initial point, but some operations are also performed on the constraints, which has better coupling reduction for the use of the later improved sliding algorithm.

For the nonlinear programming with linear inequality constraint, as

$$\begin{aligned} \min f(x_1, x_2, \dots, x_n) \\ \text{s.t. } Ax_i \leq b_i \end{aligned} \quad (1)$$

where  $x_i \in R^n$ ,  $b_i = (b_1, b_2, \dots, b_m)^T$  are real constants,  $(m \geq n)$ ,  $b_i \in R^+$ ,  $A = (a_{ij})_{m \times n}$ .  $f$  is a general nonlinear multiobjective function, from the solution of the continuous derivable higher functions, the most important thing that can be thought of is to derive the desirable region of the extreme value point according to the constraints, which is defined as the acceptable domain.

The sliding algorithm is a method proposed by scholars to solve the global optimum of equation-constrained linear programming, in which it is considered that finding the minimum value is the fastest to get the minimum value only for a new point after gravity descent of a point in the region. So for the points that can gravity fall will be gravity fall in the region, so that the new point is obtained quickly.

A vector sliding example diagram is shown in Figure 1, in two dimensions, where each line represents the individual facets and from which a vector is taken as the basic interpretation. Other vectors of course have a similar improvement process, here starting at a random  $P_0$  inside the feasible domain  $Y$ . Starting from  $P_0$ , it tries to descend in the direction of  $G_0$  to form an improvement vector, at this point the descent is gravity descent, and gravity descent is the projection equation as

$$d \downarrow \alpha = d - [(d, \tau) / (\tau, \tau)]\tau \quad (2)$$

When it encounters the blocking surface during its descent it descends to:

$$P_1 = P_0 + t_{G_0}^- \quad (3)$$

This is sliding in the direction of  $t_{G_0}^-$ , which is the intersection of the descent line and the facet.

**Figure 1.** An example of vector sliding

## **2.2. CROSS-BORDER E-COMMERCE TRADE EFFICIENCY AND POTENTIAL**

### **2.2.1. SELF-BRANDED CROSS-BORDER E-COMMERCE EFFICIENCY**

And the cross-border e-commerce efficiency of autonomous brands refers to the ratio between the sales generated by autonomous brands on the cross-border e-commerce platform and the resources invested. Through the analysis of cross-border e-commerce efficiency of independent brands, we can understand the operation status and profitability of independent brands on cross-border e-commerce platforms. Commonly used indicators of cross-border e-commerce efficiency of independent brands include sales/capita, sales/advertising input, sales/logistics cost, etc.

### **2.2.2. POTENTIAL OF CROSS-BORDER E-COMMERCE TRADE OF INDEPENDENT BRANDS**

The development trend of cross-border e-commerce trade mainly presents the following aspects:

(1) The continuous emergence of cross-border e-commerce trade platforms. With the expansion of cross-border e-commerce trade market, more and more e-commerce platforms have entered the market, such as Amazon, eBay, Alibaba, etc.

(2) Diversification of cross-border e-commerce trade. In addition to the traditional B2C and B2B models, more and more platforms are trying C2C and O2O models.

(3) The intelligence and digitalization of cross-border e-commerce trade. With the continuous development of technology, cross-border e-commerce trade platforms have started to use artificial intelligence, data collection, cloud computing and other technologies to improve transaction efficiency and user experience.

To sum up, the cross-border e-commerce trade market will continue to maintain high growth in the future, and the development trend will be more diversified, intelligent and digital.

## **3. ANALYSIS OF CHINA'S CROSS-BORDER E-COMMERCE TRANSACTION SCALE AND POTENTIAL FORECAST RESULTS**

There is also a certain degree of uncertainty in China's independent brand cross-border e-commerce exports, such as the influence of various policy and environmental factors, which just verifies the accuracy of nonlinear programming. Nonlinear programming model is a kind of prediction model with both locally known and locally unknown. Before developing a forecast,

data collection must be done cumulatively to generate new data and the resulting relationships between the data. Then a linear differential equation is constructed and the coefficients are obtained by the least squares method, and the corresponding forecasting model is further derived from this method to obtain the corresponding forecasting results. The following data on the scale of cross-border e-commerce export transactions of China's own brands from 2012 to 2021 are used as the base data for forecasting.

**Table 1.** Scale of China's cross-border e-commerce export transactions from 2012 to 2022

Year	Transaction scale (trillion yuan)	Year	Transaction scale (trillion yuan)
2012	1.11	2017	4.66
2013	1.56	2018	5.38
2014	1.83	2019	6.22
2015	2.12	2020	7.31
2016	3.53	2021	8.08

Using the above data of China's cross-border e-commerce export transaction scale from 2012 to 2021 as, the base data for this experiment, a GM(1,1) prediction model is established. The non-linear programming model for predicting the potential of cross-border e-commerce transaction size for autonomous brands is

$$\begin{aligned}
 x^{(0)} &= (x_{(1)}^{(0)}, x_{(2)}^{(0)}, \dots, x_{(n)}^{(0)}) \\
 &= (1.11, 1.56, 1.83, 2.12, 3.53, 4.66, 5.38, 6.22, 7.31, 8.08)
 \end{aligned}
 \tag{4}$$

The predicted data of cross-border e-commerce export transaction scale potential of independent brands are collected and imported into MATLAB program to get the prediction result of cross-border e-commerce export transaction scale, and the comparison of the predicted value and the real value of cross-border e-commerce export ease scale potential of independent brands in China from 2012 to 2021 is shown in Figure 2.

**Figure 2.** Potential prediction results of China's cross-border e-commerce export transaction scale

From the above figure, the predicted pre-real value of China's own brand cross-border e-commerce export transaction scale potential from 2012-2021 is compared with the results shown in Table 2.

**Table 2.** Comparison result between predicted value and true value of transaction size potential

Year	Transaction scale	Predicted value	Difference
2012	1.11	1.11	0
2013	1.56	1.63	-0.07
2014	1.83	1.96	-0.13
2015	2.12	2.10	0.02
2016	3.53	3.62	-0.09
2017	4.66	4.61	0.05
2018	5.38	5.25	0.13
2019	6.22	6.17	0.05
2020	7.31	7.41	-0.1
2021	8.08	8.05	0.03

It can be found that the accuracy check results of the prediction of China's autonomous cross-border e-commerce export transaction size potential obtained by using the nonlinear programming model are,  $p = 0.92$ ,  $c = 0.34$ , which meet the requirements of trade potential prediction on accuracy.

#### 4. CONCLUSION

This paper applies a nonlinear programming approach to analyze the efficiency and potential of cross-border e-commerce trade of independent brands. The research results show that the accuracy check results of the trade size potential prediction using nonlinear programming model are  $P=0.92$  and  $c=0.35$ , which meet the requirements of trade potential prediction for accuracy. By optimizing factors such as product selection, marketing strategy and logistics strategy, the efficiency and potential of cross-border e-commerce trade of independent brands can be improved.

The nonlinear programming model proposed in this paper has certain feasibility and effectiveness, and has achieved better results and outcomes in practical applications. The research results help to promote the development of cross-border e-commerce trade, improve the economic and social benefits of enterprises, and provide reference and decision support for enterprises.

#### FUNDING

This research was supported by Performance evaluation of 2022 Cultural and Tourism Integration Demonstration Project of Sichuan Culture and Tourism Department.

---

## ABSTRACT

The first part of this essay examines the three dimensions of policy-led, demand-driven, and technology-enabled evolution of the political and ideological studies of college students. Second, it demonstrates how variation in rebuilding the line is one of the primary ways in which the ideological and political education system has undergone a digital transition. To complete the digital transformation of college students' ideological and political education, a tailored suggestion of learning routes based on learner profiles is suggested. The development of a big data education platform, enhancement of participants' digital technology application skills, and innovation of the complete big data technology application mechanism are all required for its implementation strategy. This can better support the political and ideological studies of college students as it transitions to the digital age and offer top-notch technological skills for societal advancement.

## KEYWORDS

Ideological and political education; Digitalization; Application strategies; Learner profiling; Personalized recommendation

## 1. INTRODUCTION

It is inevitable that ideological and political education will undergo a digital metamorphosis as a result of the big data era's emergence of digital technology, which is transforming social structures with its relentless and potent force [1-2]. As Chinese education enters a new stage of digital transition, new growth opportunities for ideological and political learning have emerged [3-4]. However, at the moment, when academics talk about the digital transformation of ideological and political education, they still veer off topic when discussing issues like its concept, value, and meaning and are unclear about structural issues like the process and transformation mechanism [5-6]. Determining "what to transform," "how to transform," "who to transform," and "where to transform" are therefore vitally needed. To implement the digital change of ideological and political education, action plans must be provided, along with an overall and systemic action framework, clarification of the practical questions of "what to transform," "how to transform," "who to transform," and "where to transform" [7-9].

## 2. GENERATIVE MOTIVES OF DIGITAL DEVELOPMENT OF IDEOLOGICAL AND POLITICAL EDUCATION

### 2.1. POLICY LEADERSHIP: DIGITAL TRANSFORMATION IS A STRATEGIC REQUIREMENT

Scientific grasp of digital development trends is a prerequisite for promoting the construction

of digital China and a guarantee for realizing digital civilization for the benefit of the people. Figure 1 illustrates how digital technology is transforming ideological and political education in a way that is empowering.

**Figure 1.** The enabling role of digital technology

Deeply pushing the digital evolution of education seeks to advance both the excellent standards in education and further improve the quality of education. Ideological and political instruction has demonstrated considerable development momentum in the context of the larger educational digital revolution under the multifaceted influences of policy-led, demand-driven, and technology-enabled variables.

## 2.2. DEMAND-DRIVEN: HIGH-QUALITY DEVELOPMENT IS THE GOAL OF CREATING CHANGE

“The digital transformation of education reflects a demand-driven tendency of digital education paradigm leap.” This demand is concentrated in multiple dimensions such as the development of information society, national digital construction, education transformation goals, student growth rules, and curriculum innovation opportunities, etc. The digital growth of political and ideological training is gaining traction for a variety of reasons. In addition to being a method of thinking and a strategy, digital transformation is also seen as a technology revolution and a reform objective. Figure 2 depicts the objective of bringing about change in the digital growth of ideological and political education.

**Figure 2.** The goal of digital change

Ideological and political education continues to be the "lifeline" of schooling in the process of comprehensively constructing a modern socialist nation and comprehensively advancing the great rejuvenation of the Chinese people, and ideological and political theory courses continue to be the key courses for carrying out the crucial task of developing moral character.

## 2.3. TECHNOLOGY EMPOWERMENT: DIGITAL TECHNOLOGY OPENS UP SPACE FOR CREATIVE CHANGE

A broad category of digital technologies, such as big data, cloud computing, the Internet of Things, blockchain, artificial intelligence, and others, are referred to as "digital technology." Digital resources are represented by big data technology, digital devices are represented by cloud computing, digital transmission is represented by the Internet of Things, digital information is represented by blockchain, and digital intelligence is represented by artificial intelligence technology. The integration of different technologies with each other will break the traditional connection and power mode, realize the logic of three-dimensional, folding and

interactive architecture, and significantly improve the operation efficiency. Technology is a significant element behind the advancement of education. Digital change is the opportunity, digital thinking is the concept, and digital technology is the guarantee in the process of bringing about modifications to the digital growth of ideological and political education. This is also an example of the dimensional autonomy of digital technology for the growth of philosophical and political education.

### 3. MAIN FEATURES OF THE DIGITAL TRANSFORMATION OF IDEOLOGICAL AND POLITICAL EDUCATION

#### 3.1. DIVERSITY DRIVEN BY DIGITAL TECHNOLOGY

It is difficult to discuss the digital transformation of ideological and political education absent the thorough replacement, intervention, and integration of digital technology. The digital alteration of ideological and political education depends on technology. Technology will alter human beings' perceptions of themselves in a more profound way than just as a tool for them to influence the world and a force to further change of human social and economic structures. Technology's impact on ideological and political education will not only result in changes to the learning environment, but will also open up a wide range of teaching and learning opportunities that are not just restricted to human-to-human interactions. The use of technology to promote ideological and political education may be observed in all of the connections and procedures, from the digitalization of assets to the integration of data between divisions, from platform development to information sharing. Additionally, it completes the link between the physical and digital worlds in a variety of ways, and promotes the intelligent interaction between human → machine → object → environment.

#### 3.2. RECONFIGURABILITY OF THE COMBINATION OF ELEMENTS OF IDEOLOGICAL AND POLITICAL EDUCATION SYSTEM

In order to effectively use online resources for information in ideological and political education, system elements must be rebuilt in terms of goal logic, value logic, theoretical logic, and practical logic. This process is known as the digital evolution of ideological and political education. Numerous parts of political and ideological education are rebuilt as a result of digitization, particularly the flow and circulation of intellectual and political knowledge elements in educational activities, which can optimize the business logic, reconstruct the order of education, innovate the guided education scene, obtain the best education experience and achieve remarkable education results.

In order to fully reflect the cross-domain, cross-border, permeability, and connectivity of subject involvement and full collaboration in the course of the digital evolution of ideological and political education, it is necessary to effectively collaborate with a number of subjects. Figure 3 illustrates the interactive platform of several themes in the online evolution of political and ideological education.

**Figure 3.** Multi-subject interactive platform

## 4. THE APPLICATION STRATEGY OF BIG DATA TECHNOLOGY IN THE TRANSFORMATION OF IDEOLOGICAL AND POLITICAL EDUCATION

### 4.1. PERSONALIZED RECOMMENDATION OF LEARNING PATHS BASED ON LEARNER PORTRAITS

In philosophical and political digital learning structures and online learning environments, there are typically issues with personalized learning recommendations because instructional strategies and corresponding educational resources can hardly meet the needs of various student types and lack thorough processing of tense and uncertain information factors. This leads to low precision and poor efficacy of tailored suggestions. In this article, we propose a similarity calculation method that can effectively cater to the learning requirements of various student types and deal with temporal and uncertain information in a comprehensive manner. We also offer students personalized recommendation algorithms for efficient learning pathways and the best learning services in ideological and political education.

The PASCOLR algorithm's precise stages are as follows:

(1) Improvement of Pearson's similarity calculation method so that it can handle temporal information  $t$  and uncertainty information  $v$ . The improvement of the similarity calculation formula is

$$\beta = \delta \times P(\text{path}_i | (Eero\_Actu_{sti}, PATH_j)) \times \text{sim}(St\_char, Co\_char(\text{path}_i)) \quad (1)$$

where  $\delta = F(r, v, t)$  is a function of the combined treatment of confidence, reliability, and temporal information,  $P(\cdot)$  is a function of the probability of having the occurrence of adjustment  $\text{path}_i$  in the presence of problematic learning paths  $Eero\_Actu_{sti}$  as,  $\text{sim}(\cdot)$  is the similarity of the learner personality profile  $St\_char$  to the public learner profile  $Co\_char$  of the learning paths and associated learning services in the learning path network, i.e:

$$\text{sim}(x, y) = \frac{\sum x_i y_i - nxy}{(n-1)S_x S_y} = \frac{n \sum x_i y_i - \sum x_i \sum y_i}{\sqrt{n \sum x_i^2 - (\sum x_i)^2} \sqrt{n \sum y_i^2 - (\sum y_i)^2}} \quad (2)$$

(2) Based on the learning path network  $E\_Net(KN_i)$ , learner characteristics data  $D_{cha}$ , problematic learning behaviors that affect learning quality  $Eero\_Actu_{sti}$ , learning environment  $Env_{sti}$  and learning resources  $Res_{sti}$ . The similarity between learner personality characteristics  $St\_char$  and public learner characteristics  $Co\_char$  of each learning path and related learning services in the learning path network is synthesized by applying the improved Pearson similarity calculation method.

(3) The calculation recommends personalized learning path  $\text{path}_{ind}$  and optimal learning service  $ser_{opt}$  for learners.

$$\text{path}_{ind} = \langle act_1 \rightarrow act_2 \rightarrow \dots \rightarrow act_n \rangle \quad (3)$$

$$ser_{opt} = \{pro(act_i)_1, pro(act_i)_2, \dots, pro(act_i)_n\} \quad (4)$$

## **4.2. ANALYSIS OF DIGITAL TRANSFORMATION STRATEGY OF IDEOLOGICAL AND POLITICAL EDUCATION IN THE ERA OF BIG DATA**

### **(1) Creating a big data platform for ideological and political education**

We develop a single platform for big data of ideological and political education that can gather, process, and analyze student information directly from the source. This platform includes both basic information on students and comprehensive information needed to get their consent. The basic situation and real-time trends of students can be grasped and guided in a timely manner, and the university's student big data research and management center can be established to further realize the excavation and use of data values.

### **(2) Improving the ability of ideological and political education participants to use big data**

The vital duty of developing top-notch talent falls on the shoulders of all teaching staff members on university campuses, including political and ideological education specialists in colleges and universities. The only method to encourage the utilization of big data technology by political and ideological education workers and subtly impact college students' big data awareness is to improve the big data understanding among ideological and politics education workers at colleges and universities.

### **(3) Innovation of comprehensive mechanism for the use of big data technology**

The key assurance for the utilization of big data in political and ideological education is a competent management system for big data. Control how data is used to control how each data collector and user behaves. A strong assurance for the use of big data in college students' ideological and political education is the development of big data monitoring mechanisms. Big data monitoring aims to successfully clean up the network environment and control how people utilize networks.

## **5. CONCLUSION**

This study examines the political and ideological learning guided by policy, fueled by demand, and facilitated by technology, starting with the generative reasons of the digital evolution of ideological and political education. A customized recommendation algorithm for learning routes of large data used to online political and ideological instruction is proposed after a discussion of the key components of digital ideological and political education. A big data system for ideological and political education has to be further developed, according to an analysis of the transformation strategy for ideological and political learning in the big data age. College students' ideological and political education will be transformed by employing a complete system for inventing the use of big data technology and the capacity of the participants to use big data.

## ABSTRACT

The peculiarities of ideological and political education in higher education institutions in the big data era are examined in this article along with the impact of big data on both of these academic disciplines. In order to address the problems of ideological and political education in higher education institutions, a quantitative analysis of the data is then conducted. This study takes into account participation, the expertise of the professors, and the methods of instruction. Last but not least, in order to further clarify the importance of big data in ideological and political education in higher education institutions, the Stacking integrated learning algorithm is chosen to create a prediction model of learner behavior and offer a creative approach for ideological and political education. Establishing a flawless network platform, fully integrating educational resources, enhancing instructors' abilities, and using an innovative educational model are all necessary for the advancement of ideological and political education in higher education institutions.

## KEYWORDS

Ideological and political education; Stacking integrated learning; Teaching vehicle; Innovative strategies; Learning behavior

## 1. INTRODUCTION

Since it is an essential practical experience for the development of college students themselves, the state and university systems have paid special attention to political and ideological learning in higher education institutions. Along with the rapid expansion of the big data age, ideological and political learning in higher education and colleges has also experienced major changes [1-3]. The value of big data as "the next natural resource of the human world" is incalculably great. Big data has rapidly grown around the world in recent years, and its extensive application has significantly changed how people create and live [4-6].

In order to deliver political and ideological learning for college students, complete ideological and political learning tasks, and achieve ideological and political learning goals, educators in higher education institutions must innovate. The big data era presents this opportunity [7-8]. Big data may successfully increase the amount of customization and informatization of education while also making it more scientific and efficient. This is especially true when used to ideological and political teaching techniques in higher education institutions [9-10].

## 2. THE CHARACTERISTICS AND INFLUENCE OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES IN THE ERA OF BIG DATA

## 2.1. CHARACTERISTICS OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES IN THE ERA OF BIG DATA

Big data may support instructors by enhancing the content of their lesson plans and by giving them access to more educational materials, according to the ideological and political learning activity being done in higher education institutions against the backdrop of the big data age. Figure 1 illustrates the fundamental elements of ideological and political learning for higher education in the age of big data.

Figure 1. Basic features

Big data technology can also fully understand the philosophical dynamics and behavioral patterns of students while carrying out political and ideological learning activities at higher education institutions, providing a foundation for reference when developing lesson plans.

## 2.2. IMPACT OF BIG DATA ERA ON IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES

The big data age has had a favorable effect on political and ideological learning. The majority of judgments may now be made through data analysis, which has replaced the practice of relying on experience to guide judgment. As a result, decisions are now more precise and scientific. Big data analysis is a tool that higher education institutions may use to make decisions about education. Ideological and political learning may be converted into a quantitative presentation by creating a skilled and efficient data platform.

While the emergence of the big data age offers many advantages for the political and ideological learning of students, there are some negatives as well, with the impact on students' ideologies being the most important. The digital era is increasing the amount of information that children learn, and the collision of many different cultures and ideologies will make ideological and political teaching more difficult.

## 3. PROBLEMS OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES IN THE ERA OF BIG DATA

The questionnaire, which has 20 items, is the primary research method employed in this study. A total of 300 surveys were distributed via the questionnaire star; 280 have been collected; the recovery percentage is 93.33%. Among them, 275 are valid questionnaires, and the effective rate is nearly 91.67%.

### 3.1. LOW PARTICIPATION OF UNIVERSITY STUDENTS

In the first question, 14.92% of the students chose to follow and retweet the news or notices released on the campus website, 78.67% chose to follow occasionally, and 6.41% never followed. In the first question, 14.92% of the students chose to follow and retweet frequently, 78.67% of the students chose to follow occasionally and just look, 6.41% of the students never followed, and only 7.14% of the students chose to always participate in the second question.

According to the study findings, despite frequent Internet usage, college students seldom

engage with ideological or political information. College students' worldviews, perspectives on life, and values are very malleable since they are in the crucial stage of ideological development. Students will be readily used by criminal elements if teachers do not instruct and mentor them in a timely manner. Additionally, the Internet exhibits both openness and secrecy, and the abundance of knowledge there will contaminate students' traditional ideals. Students frequently use the Internet to look for harmful material or images, and they also frequently break the law, post improper remarks, and defame other people online.

**Figure 2.** Findings of attention and discussion

### 3.2. RELATIVE LACK OF TEACHERS WHO ARE PROFICIENT IN BIG DATA SKILLS

The majority of educators participated with this position lack the capacity to interpret and foresee big data, and their majors are primarily in education, management, psychology, ideological and political learning, etc. Counselors are typically the administrators of the everyday ideological and political learning in higher education institutions. They cannot be more influential in big data applications for ideological and political learning due to their professional backgrounds. Due to a dearth of specialists, it will be challenging to make use of the data created by the numerous digital footprints college students leave on networks using smart devices and important information cannot be extracted from them to assist the ideological and political education professionals. Counselors can examine students' purchasing patterns, buying preferences, and consumption quantities by having them use shopping apps like Jingdong, Taobao, and Jindo. In this way, we can infer students' consumption views, and counselors can guide students who have wrong consumption views in time so that they will not take a chance to make bad online loans.

### 3.3. THE CARRIER OF IDEOLOGICAL AND POLITICAL EDUCATION IS NOT CREATED WITH ENOUGH STRENGTH

More than 90% of college students believe that campus culture and new media technology can help to strengthen management and construction. This is in response to the question, "Suggestions on using new the media resources and tools for ideological and political learning at educational institutions in the era of big data." 84.28% of students choose to set up college student role models, 78.93% of students choose to actively build a branded WeChat public website. Table 1 displays the findings from the examination of college students' recommendations for the advancement of ideological and political learning.

**Table 1.** Suggestions for the development of ideological and political education

Options	Number	Proportion
A. Strengthen the construction of new media technology hardware facilities, and do a good job in maintenance and updating	268	95.71%
B. Strengthen the construction of excellent culture and the construction of a soft environment for new media on campus	261	93.21%
C. Actively cultivate outstanding college student network opinion leaders	236	84.28%
D. Actively build influential official and teachers' Weibo and WeChat platforms	221	78.93%
E. Miscellaneous	46	16.43%

The survey results show that although colleges and universities have opened official public numbers, their current software and hardware facilities do not effectively serve college students and cannot meet their actual needs, and they need specific channels to publish their views on hot topics of current affairs. For instance, on September 18 and the anniversary of the Nanjing Massacre, schools and institutions may utilize a variety of carriers to post articles that will instruct students and answer their concerns in a focused manner, assisting them in forming the right worldview, viewpoint on life, and values.

#### 4. INNOVATIVE APPLICATION OF BIG DATA TECHNOLOGY IN IDEOLOGICAL AND POLITICAL EDUCATION OF COLLEGES AND UNIVERSITIES

##### 4.1. STUDENT BEHAVIOR PREDICTION MODEL BASED ON STACKING INTEGRATED LEARNING

For students' online browsing, their data were divided into training and test sets. The training set was divided randomly and equally into 5 parts, i.e.  $E_1, E_2, E_3, E_4, E_5$ . Each base classifier was trained for 5 iterations, i.e:

$$W_i^k = N_i(E - E_1) \quad (1)$$

where  $i \in (0, 4), k \in (0, 4)$ ,  $W_i^k$  denote the prediction models generated by the  $i$  rd model algorithm in the  $k$  th cross-validation. The prediction of the training set  $E$  using the trained base classifier, i.e:

$$P_i^k = M_i^k(E^k) \quad (2)$$

The final model predictions obtained are:

$$(P_i)^T = ((P_i^0)^T, (P_i^1)^T, (P_i^2)^T) = (P_i^0, P_i^1, P_i^2) \quad (3)$$

where  $P_i$  indicates the prediction of the  $i$  nd base classifier for  $E_i$ .

Through the above methods, we can target the effective screening of students' Internet browsing data, and then obtain the basic situation of students, in order to comprehend how they were formed ideologically and aid colleges in more directly delivering ideological and political learning.

##### 4.2. INNOVATIVE STRATEGIES FOR IDEOLOGICAL AND POLITICAL EDUCATION IN UNIVERSITIES IN THE ERA OF BIG DATA

(1) Increase the amount of sharing by including different instructional resources.

In the era of big data, political and ideological learning at higher education institutions must concentrate on top-notch instructional resources. For internal resources of higher education institutions, deep integration may be achieved through the ease of the Internet. Schools and universities must also include network resources and regularly update ideological and political

education materials and contents on campus websites, libraries, and other platforms in order to enhance instructional content and stimulate students' interests in their studies.

(2) Make the most of the network platform for political and ideological learning at higher education institutions.

Higher education institutions need to actively design networking platforms that represent their current situation in order to develop a healthy teaching environment. On the wisdom management platform, you can join the group of college learners and collect their feedback to act as a reliable basis for the development of political and ideological learning programs.

(3) Assembling a team of information-based educators and redefining the educational process

Through personalized education, the political and ideological learning of undergraduates may be more in line with their cognitive norms and thinking states, which can therefore significantly boost the educational effectiveness.

## 5. CONCLUSION

This paper examines the characteristics and outcomes of current political and ideological learning at higher education institutions against the backdrop of the big data era. It also draws attention to several problems with the political and ideological learning provided by these organizations. Using the behavior prediction model to more fully evaluate students' learning behavior, big data technology is combined with a blended learning algorithm. Out of this, the innovation approach for university political and ideological learning for the big data era is proposed, which entails utilizing the network platform for school ideologies and politics to its fullest extent, incorporating various educational resources, and creating new pedagogical approaches.

## ABSTRACT

In this paper, we analyzed the botanical characteristics and floral classification of Clematis as the starting point, and designed cross breeding and in vitro fast breeding experiments of Clematis. In the cross breeding experiment, different species and relatives of Clematis were selected for comparison, and in the in vitro fast breeding experiment, “Wang Meng” was selected as the model. The results showed that the crosses of the same species and relatives were compared with each other. The results showed that the crosses of the same group had the highest fruiting rate, basically reaching 82% or more, and the germination and flowering rates were maintained at about 80%. The optimal growth hormone ration for clematis in the isolated fast breeding experiment was 2 mg/L 6-BA + 0.2 mg/L NAA medium.

## KEYWORDS

Clematis; Hybrid breeding; In vitro fast breeding; Flowering rate; Fruiting rate; Germination rate

## 1. INTRODUCTION

Clematis is a perennial vine of the buttercup family Clematis. It is as tough as iron wire, beautiful as the new lotus, enjoys the “Queen of the vine” reputation [1-2]. Its young leaves like eyebrows, pink flowers like cheeks, elegant, fresh and elegant, clematis flowers around the finger soft. According to statistics, there are about 355 species of clematis, with more than 140 species in China [3-5]. Clematis has a high ornamental and medicinal value, but the seeds of clematis have a long dormancy period and low natural reproduction efficiency. The large variation in the survival rate of cuttings propagation, coupled with the relative lag in domestic breeding research on clematis, has greatly limited the promotion and application of clematis [6-7]. Plant tissue culture technology is an effective means of rapid propagation, and the establishment of an efficient regeneration system is crucial for the factory nursery and application of clematis [8-9].

This paper firstly addresses the botanical characteristics and floral analysis of clematis, describing its floral composition and the flowering species to be pruned. Secondly, we designed a hybrid breeding experiment for clematis in the spring of 2020 and analyzed the fertility, germination and flowering rates of selected hybrid seeds. Finally, by selecting Clematis “Wang

Meng” as the subject of the in vitro fast breeding experiment, the proliferation coefficients were compared by different hormone ratios. The results showed that clematis with close relatives in the same group are more likely to set fruit and germinate and flower, and that the ratio of growth hormones needs to be emphasized when performing in vitro fast breeding. This study can provide a useful reference for large-scale factory breeding of clematis.

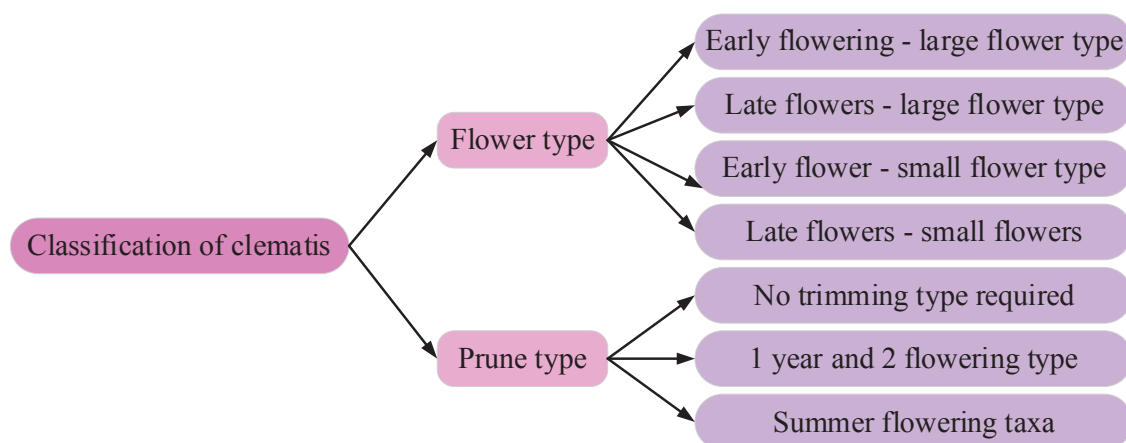

## 2. BOTANICAL CHARACTERISTICS AND CLASSIFICATION OF CLEMATIS

### 2.1. BOTANICAL CHARACTERISTICS OF CLEMATIS

Clematis is a perennial herb or subshrub of the buttercup family, clematis stems usually climbing dependent or erect state, herbaceous vines. Adult length up to 1 to 2m, the stem is purplish red or brown, commonly with six longitudinal lines, and the nodes often produce an inflated state. The epidermis has 1 layer of short and sparse tomentum, and shows a dichotomous and trifoliate state, with the leaf blade connecting the petiole reaching a length of about 9cm. The leaflet blade is usually narrowly ovate and lance-shaped, reaching a length of about 5 cm at maturity, with a more rounded tip and a broad cuneate shape, with sparsely divided margins and often with uneven hairiness on both sides. The inconspicuous vein pattern appears in the axils of the leaves after flowering and the pedicels are about 5 to 10 cm long and in a glabrous state. The bracts are triangular-oval in shape up to 4 cm long and have a distinct stalk at the base, and the unfolded flower leaves are about 4 cm in diameter.

### 2.2. HORTICULTURAL CLASSIFICATION OF CLEMATIS

Horticulturally, clematis are divided into “early-flowering-large-flowering”, “late-flowering-large-flowering”, and “early-flowering-small-flowering” “Late flowering - small flowering type”. The “large-flowered” type includes all cultivated large-flowered types with spreading sepals. The “early-flowering-large-flowering type” is planted on top of old vine stems and blooms in early spring without pruning before blooming. The “late flowering - large flowering type” peanut is grown on top of the current year's branches and requires heavy pruning in spring to promote new growth. The specific classification of each flower type is shown in Figure 1.

**Figure 1.** Horticultural classification of clematis

Clematis need to be pruned regularly during planting and cultivation to ensure an attractive plant shape and proper distribution of nutrients to promote flowering. The types of pruning for clematis can be divided into three categories. The first type of pruning is the no-pruning type, which is mostly the evergreen type and the deciduous type that grows on mature old vine stems. The second pruning type is for plants that flower twice a year, which generally bloom once in early spring and once in late summer. The third pruning type is the summer-flowering group of clematis, which require heavy pruning in early spring before growth.

### 3. CROSS BREEDING AND IN VITRO FAST BREEDING EXPERIMENTS AND ANALYSIS OF CLEMATIS

#### 3.1. HYBRID BREEDING OF CLEMATIS

All experimental materials were obtained from the germplasm resource nursery of the Genetic Breeding and Research Department of an agricultural and forestry university, and the hybrid parents were selected from the collected wild species, early flowering large-flowered group varieties, Florida group varieties, Texas group varieties, allopatric group varieties, and evergreen group varieties. In this study, the crosses were bred in the spring of 2020, and Table 1 shows the parental information for the cross experiment.

**Table 1.** Parental information for hybridization experiments

Number	Parental breed name	Constituencies
Group 1	Medengli	Early flowering large flower group
	Kanawa	Early flowering large flower group
Group 2	Green jade bud changes	Florida Group
	kingfisher	Early flowering large flower group
Group 3	Angel jewelry	Texas Group
	Cherry lips	Texas Group
Group 4	Angel dance dress	Texas Group
	Wang Meng	Texas Group
Group 5	Angel dance dress	Texas Group
	Sri	Early flowering large flower group
Group 6	painting	Texas Group
	Central China clematis	Wild species

The operational steps of hybrid breeding were as follows:

(1) Pollen collection, choose a sunny morning to collect the anthers of the target parent plants that have been in flower for 3-4 days, dry them in the oven at 28°C and store them in the refrigerator at 5°C for later use.

(2) Depollination, select the budding flowers of the target parent, carefully cut off the petal stamens with a scalpel and bag them. Estimate the blooming time of the flower and choose a cool morning or evening to gently apply the saved pollen to the stigma with a brush and repeat three times to ensure that the stigma is successfully coated with pollen. The bags were marked with the date and observed regularly.

(3) Harvesting seed pods, Clematis seeds usually mature in 90 days. Mature seeds are harvested, peeled off the outer seed coat and placed in a plastic bag with sterile water in a 5°C refrigerator for 0.5 to 1 month, followed by sowing.

The seed set, germination and flowering of the hybridized clematis in 2020 are shown in Table 2.

**Table 2.** Fruiting, germination and flowering of hybrid parents in spring 2020

Number	Number of normal seeds/seeds	Number of germinations / number of normal seeds	Number of flowers /total germination
Group 1	25/48	22/25	2/22
Group 2	13/55	4/13	0
Group 3	24/29	14/18	4/14
Group 4	36/42	21/25	18/21
Group 5	8/44	3/8	2/3
Group 6	0	0	0
Number	Seed normal rate	Germination rate	Flowering rate
Group 1	52.08%	88.00%	9.09%
Group 2	23.64%	30.77%	0.00%
Group 3	82.76%	77.78%	28.57%
Group 4	85.71%	84.00%	85.71%
Group 5	18.18%	37.50%	66.66%
Group 6	0	0	0

Combined with the hybridization experiment it can be clearly observed that the highest cross fertility rate of the same group of varieties, Angel Jewelry × Cherry Lips and Angel Dance Dress × King Dream, both groups of Texas parents produced normal seeds of more than 80%, and Medenri × Kanawha as two early flowering large flowering group of varieties with low normal seed rate of 52.08%.

The overall cross fertility of crosses and budded varieties was low, with only 18.18% normal seed rate for Sili × Angel Dance Dress and no hybrid seeds were harvested from any of the parents in the group of Danqing × Chinese clematis. The reason for the failure of cross pollination of Danqing × Chinese clematis may be that the parents are distantly related and the cross pollination is not affinity or the pollen activity of the parents is poor. 2020 hybrid seed germination and fruiting situation is similar to the same group of species hybrid germination rate can reach more than 84%, angel jewelry × cherry lip seed germination rate is lower than the average, only 77.78%. The normal rate and germination rate of seeds of Sili × Angel Dance Dress was the lowest.

### 3.2. IN VITRO FAST BREEDING OF CLEMATIS “WANG MENG”

In this experiment, young terminal stem segments of Clematis “Wang Meng” were cut as explants, and the leaves were removed and set aside. The explants were sterilized and divided into nine experimental groups named A1~A6. When the adventitious buds of the explants on the induction medium grew to 1~2 cm, they were transferred to the multiplication medium for cultivation, and the effect of different growth factors on the multiplication effect was measured. The effect results are shown in Table 3.

**Table 3.** Effects of different hormonal ratios on clematis rooting

Coding	Proliferative coefficient			Seedling growth
	I	II	III	
A1	3.67	3.42	3.78	Yellow-green, average growth
A2	3.23	3.24	3.46	The leaves are small, pale green, and weak
A3	2.98	2.69	2.83	The leaves are small and the seedlings are slender
A4	5.76	5.67	6.02	The leaves are stretched, the seedlings are thick and grow well
A5	3.31	3.16	3.43	Yellow-green, average growth
A6	2.64	2.55	2.76	The leaves are small, pale green, the seedlings are thin
A7	2.01	1.92	1.98	The buds are small and the seedlings are thin.
A8	1.76	1.66	1.86	The buds are small, the seedlings are malformed
A9	1.41	1.27	1.32	The buds are small, the seedlings are deformed, and the leaves are vitrified

In this experiment, the optimum hormone concentration ratio of the proliferation medium for Clematis “Multiblue” was 1 mg/L 6-BA + 0.1 mg/L NAA. In this experiment, the seedlings of Clematis “Wang Meng” grew fast, with spreading leaves, sturdy seedlings, good growth, more effective shoots, and the highest proliferation coefficient of 5.76-6.02 on medium containing 2 mg/L 6-BA and 0.2 mg/L NAA, while on medium containing 1 mg/L 6-BA and 0.1 mg/L NAA, the leaves were yellowish green, with average growth and lower proliferation coefficient. This may be the difference between the two varieties themselves, and “Wang Meng” has a greater demand for 6-BA. It can be seen from A4I, A5I and A6I treatments that when the concentration of 6-BA is certain, the proliferation coefficient of seedlings decreases continuously with the increase of NAA concentration, from 5.76 to 2.64. It can be seen from A1I, A4I and A7I treatments that when the concentration of NAA is certain, too high concentration of 6-BA will inhibit the growth of seedlings, and when the concentration of 6-BA is too low, the growth rate decreases and the proliferation coefficient decreases. In further experiments, the concentrations of 6-BA and NAA can be fine-tuned to find a more accurate hormone concentration ratio.

#### 4. CONCLUSION

In this paper, starting from the botanical characteristics of Clematis, two experiments were set up for the analysis of cross breeding and in vitro fast breeding of Clematis, and the following conclusions were drawn:

(1) In the cross breeding process, clematis crosses with the same group of species had the highest fruiting rate, basically reaching more than 80%, while crosses across groups and crosses with budded varieties had an overall low fruiting rate, basically below 20%. This indicates that in the process of cross breeding clematis, it is necessary to select varieties that are closely related to each other for cross breeding.

(2) In the in vitro fast breeding experiment of Clematis “Wang Meng”, the optimal growth hormone ratio was 2 mg/L 6-BA + 0.2 mg/L NAA, and the proliferation coefficient of “Wang Meng” decreased as the concentration of 6-BA increased. The proliferation coefficient of “Wang Meng” decreases as the concentration of 6-BA increases. This indicates that the correct growth hormone ratios should be used in the in vitro fast breeding culture of Clematis to ensure proper rooting and germination of Clematis and to promote large-scale factory breeding of Clematis.

## **ABSTRACT**

This paper analyzes the characteristics and application issues of virtual reality technology, including the characteristics of interior design using virtual reality technology. To further illustrate the role of virtual reality technology for interior interactive design, 50 subjects were selected to evaluate the effect of satisfaction with the 3D model of virtual space built based on Unity3D technology. The results show that the average satisfaction of users in the virtual space is 84.28%. Among them, the satisfaction for the continuity of virtual space and free switching scene decoration reached 93.41% and 96.54% respectively. This shows that VR technology can effectively promote the satisfaction of interior space design, and further strengthen the user's sense of participation and interactive experience in interior space design.

## **KEYWORDS**

Virtual reality technology; Interior interactive design; Unity3D; 3D model; Interactive experience

## **1. INTRODUCTION**

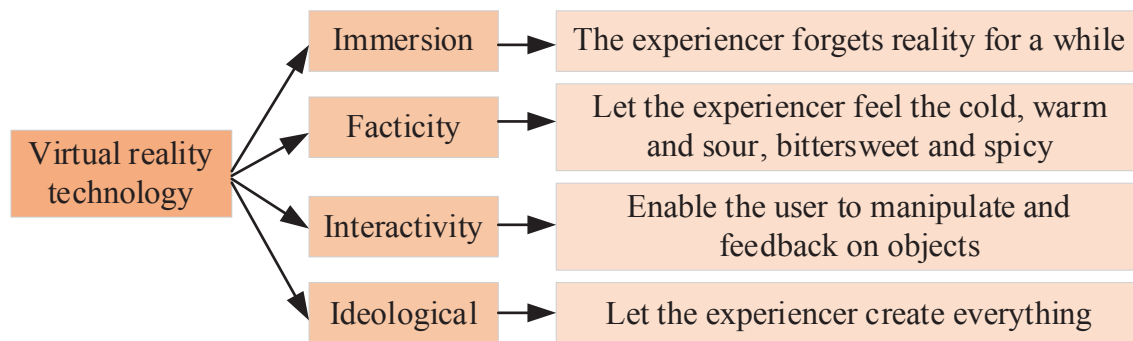

In recent years, with the continuous innovation, maturity and development of science and technology, more emerging technologies have been tried to be applied in various design fields, largely promoting the development of each design field [1-3]. From VR technology converting static advertisement to dynamic advertisement in visual communication design, to VR technology bringing immersive experience to designers and clients of interior space design, outdoor architecture, landscape design and other people [5-6]. VR technology solves the shortcoming of traditional design methods that make it difficult to display design effects in a realistic and intuitive way. It solves the dilemma that designers cannot immerse themselves in the design process to feel the actual effect of the design. The birth of virtual reality technology undoubtedly makes up for the deficiencies and defects in the traditional design methods effectively [7-8].

This paper firstly analyzes the characteristics of virtual reality technology, and then leads to the characteristics of using virtual reality technology in interior design and the problems in interior design applications. Secondly, a 3D model of virtual space is constructed based on Unity3D technology, and a density function is introduced to refine the slicing of the model. Finally, in order to verify the effectiveness of the virtual space 3D model, quantitative analysis of the data was carried out using the actual user experience satisfaction as the evaluation index. The results show that VR technology can effectively promote the user's interactive experience of virtual space design and further strengthen the user's sense of participation in interior design.

## 2. THE CHARACTERISTICS AND APPLICATION PROBLEMS OF VIRTUAL REALITY TECHNOLOGY

### 2.1. CHARACTERISTICS OF VIRTUAL REALITY TECHNOLOGY

Virtual reality has four main characteristics, namely immersion, realism, interactivity and conceptualization, which are the precise embodiment of the connotation of virtual reality technology. After entering the virtual space, the experiencer has the same real experience as in reality, and can also interact with the surrounding environment and use the perception of the environment to form spatial information. The characteristics of virtual reality technology are shown in Figure 1.

**Figure 1.** Features of virtual reality technology

For interior space design, the introduction of virtual reality technology greatly enhances the overall artistry of design and eliminates the problem of lack of authenticity that exists in traditional work to achieve better design effects and a higher degree of meeting the living needs of people in the new era.

### 2.2. CHARACTERISTICS OF INTERIOR DESIGN USING VIRTUAL REALITY TECHNOLOGY

#### (1) Using virtual reality technology to enhance artistic personality

Because the owners cannot understand the drawings, they can only compare their own design plans. Also, because the owners lack design experience, the ideas generated do not match the overall style, so most designers do not include the owners' ideas, resulting in the difference between the actual effect and the owners' expectations. With virtual reality technology, when the owner makes a request, it can be made into a 3D model for the owner to view. This can effectively show the owner's design ideas, but also make reasonable adjustments to them to achieve the joint participation of the owner and the designer, making the design style more artistic.

#### (2) Multi-level information exchange

Through virtual reality technology, users can view scenes anytime and anywhere, and can calculate material costs more accurately. Through virtual reality technology, designers can show the design effect to a great extent and make changes to the design easily. For the owner, the design plan can be immediately previewed for effectiveness and the use of materials will be more transparent. So the use of virtual reality technology can achieve a win-win situation for both parties and avoid unnecessary conflicts.

### 2.3. PROBLEMS IN THE APPLICATION OF VR TECHNOLOGY IN INTERIOR DESIGN

In the past, when VR technology was not widely used, most interior design practitioners used traditional floor plans and renderings to present interior design content for clients, thereby conveying the designer's design ideas and design concepts for the interior. However, because

construction drawings are highly specialized, it is difficult for many consumers to feel the home environment outlined by the designer through construction drawings. In the process of applying VR technology to interior design, there are also some problems, as shown in Figure 2.

**Figure 2.** Problems with VR technology in interior design applications

The software required by designers from design conception to drafting to rendering models is quite complex and independent of each other, which causes designers to pay too much learning cost. And if the draft is repeatedly revised, it will make the designer's workload increase and duplicate work.

### 3. ANALYSIS OF THE APPLICATION OF VIRTUAL REALITY TECHNOLOGY IN INTERIOR DESIGN

#### 3.1. MODELING SYSTEM DESIGN OF VR TECHNOLOGY IN INTERIOR DESIGN

In theory, the designer can default the thickness of the wall by inputting the data of the designed room, so that the 3D space model of the designed room can be built more easily and quickly, and eventually combined with VR technology to let consumers fully feel the virtual 3D space. Consumers can also verify whether the design meets their expectations by improving the interactivity between the design solution and the designer, and communicate with the designer in a timely manner to reduce design deficiencies. However, it is not easy to use VR technology to solve the current problem of fast modeling and high realistic real-time rendering in the interior design process. This paper builds an application model of interior design based on Unity3D technology.

In order to ensure the high precision requirements of virtual 3D space design, in the modeling of each component, the different components should be sliced to divide as many thin slices as possible according to the actual workpiece body model requirements, the specific formula is:

$$f_0(x) = \begin{cases} \frac{1}{x_{\max} - x_{\min}}, & x \in [x_{\min}, x_{\max}] \\ 0, & \text{other} \end{cases} \quad (1)$$

where is the slice decision behavior,  $f_0(x)$  is the density function of the decision behavior, according to different parameter ranges, which indicates the difference of the most value of each part slice in the indoor space, to complete the model processing with different grading accuracy.

#### 3.2. SPECIFIC APPLICATIONS OF VR TECHNOLOGY IN INTERIOR DESIGN

##### (1) On-site data collection

During traditional data information collection, relevant personnel often obtain data information through measurement and then use storage, import, and edit a picture before proceeding to the next data measurement. With the promotion of VR technology in architectural interior design work, the collectors are able to simplify the process of data collection in a shorter period of time by using reasonable interactive methods to store and keep screenshots of relevant data information through advanced cameras and other equipment.

Compared with traditional data collection methods, it ensures that the measurement work can be fully dovetailed with the recording session, solving the real-life on-site data collection problem.

(2) Project scheme design

When the designer communicates with the client in words, it cannot fully reflect the rationality of the design scheme, nor can it more truly reflect the three-dimensional effect of the design drawings. And further application of the appropriate amount of 3D and other processing software, whether on paper or screen, are static, failing to fully reflect the real environment. In response to this phenomenon, VR technology should be fully utilized to comprehensively show the entire interior design space from multiple angles of realism and a sense of place, to ensure that the design effect can meet the requirements of customers on the basis of comprehensive communication between designers and customers.

(3) Project implementation phase

For the implementation of the interior design of the entire building structure, the grassroots construction operator will generally combine the specific content of the construction design plan for construction operations. In this regard, the designer should conduct a comprehensive technical communication with the construction operator to explain the design concept and ideas comprehensively. And with the application of VR technology, workers can make uniform arrangements for positioning nodes of different building structures by using cell phone smart devices. With the cell phone screen as the interactive interface, a three-dimensional virtual simulation image of this node is displayed to ensure that the construction building work can achieve the corresponding design effect.

### 3.3. EVALUATION OF THE APPLICATION EFFECT OF VIRTUAL REALITY TECHNOLOGY IN INTERIOR DESIGN

In order to analyze more intuitively for the application of virtual reality technology in interior design, this chapter selects 50 users for VR effect experience based on the 3D model of interior space constructed by Unity3D technology in the previous paper. Satisfaction tests were conducted for the corresponding items in the experience, and the satisfaction results were obtained as shown in Table 1.

**Table 1.** App performance satisfaction evaluation

project	Three-dimensional effects	Spatial continuity	An immersive experience	Realistic video and audio
Satisfaction	85.67%	93.41%	92.13%	66.82%
project	Switching of decorative elements	Tactile action interaction	Freshness	Operability
Satisfaction	96.54%	91.86%	72.35%	75.48%

VR technology, users wear VR glasses, hand grip, through the experience of data collection, collation and comparative analysis, users are still satisfied with the display of VR, the average satisfaction of the eight evaluation angle is 84.28%. Compared to 72.35% of freshness, users are more satisfied with the ability to visit freely in a continuous space, realistic TV and sound, creating a sense of immersion, and their satisfaction is 93.41% and 92.13% respectively. This shows that users are very satisfied with the elements in the switching scenes, and they think that changing the items in the scenes is good for participating in the design of the program and selecting the decorations they are satisfied with. With regard to the interaction of the touchable interior, 91.86% of the users thought that the operation “felt like real”. Therefore, VR technology greatly meets the needs of users, improves user participation, and is “people-oriented” in interior design, starting from the needs and feelings of people.

#### 4. CONCLUSION

This paper analyzes the design of modeling system of VR technology in interior design, starting from the characteristics and application problems of virtual reality technology, and the 3D model of interior space constructed by using Unity3D technology. In order to verify the effectiveness of virtual reality technology in interior space design, user satisfaction evaluation analysis was conducted. For the virtual space constructed by virtual reality technology, the average user satisfaction was 84.28%, and 96.54% of the users thought that the switching of virtual space elements could effectively enhance the freedom of interior design. This indicates that the virtual reality technology can effectively promote the interactive interior design and further enhance the user satisfaction for the interior space design.

## **ABSTRACT**

This paper firstly addresses the factors affecting the security of information technology in computer networks, which include hacker and virus attacks, system vulnerabilities and risks. Secondly, a chaotic mapping from a one-dimensional segmentation is selected, and then a chaotic mapped random sequence of image encryption is obtained. Finally, an example analysis is conducted in order to verify the effectiveness of the algorithm in computer network information transmission. The results show that the sensitivity of the algorithm is between 49% and 50% for ciphertext and plaintext in the transmission of digital image information in computer networks. This shows that the use of the improved chaos mapping digital image encryption algorithm can effectively improve the security of information transmission in computer networks.

## **KEYWORDS**

Computer networks; Information technology; Secure transmission; Chaotic mapping; Image encryption; Random sequences

## **1. INTRODUCTION**

With the continuous development of social science and technology, computer network information technology has been closely connected with people's production and life, changing people's production and life style, achieving better application effects in various industries, and receiving wide attention [1-3]. Although computer network information technology provides people with convenience, there are also certain security loopholes, and people's personal privacy and confidential information of enterprises are easily leaked [4-5]. In this case, how to improve the security of computer network information technology has become an important topic of current research by various experts and scholars, and must be given great attention [6-7]. In order to give full play to the role of computer network information technology, solve the problem of information leakage, and improve the security of network information in the new era, effective computer network information technology security measures should be implemented to create a safer network operation environment for people [8-9].

This paper analyzes the factors affecting the security of computer network information technology, which include hacker virus attacks, system vulnerabilities, and system risks. Based on this, an improvement of digital image encryption algorithm with chaotic mapping is proposed, which can efficiently realize the encrypted transmission of computer network information, and then meet the security of computer network information. In order to verify the effectiveness of this algorithm ciphertext and plaintext sensitivity analysis is conducted, and the results show that this algorithm can effectively ensure the security of computer network information transmission and improve the decryption difficulty.

## 2. FACTORS AFFECTING THE SECURITY OF COMPUTER NETWORK INFORMATION TECHNOLOGY

### 2.1. HACKER AND VIRUS ATTACKS

Malicious attacks by hackers and various computer virus infections are the most common security risks when managing computer network information. Some hackers rely on excellent computer technology to illegally log into servers and steal personal information from other people's computer networks, which interferes with the normal use of computer network information by others, while seriously threatening the confidentiality and security of personal privacy. So the danger of computer network viruses cannot be underestimated, and if a computer is infected with a virus, it will seriously affect the security management of computer network information technology. Some viruses have the ability to automatically start by hiding in important computer files, which may damage the computer's core data programs. And some viruses will use computer programs to control the computer and affect the computer's data transmission, thus implementing the illegal act of stealing computer network information.

### 2.2. THE VULNERABILITY OF THE COMPUTER NETWORK SYSTEM ITSELF

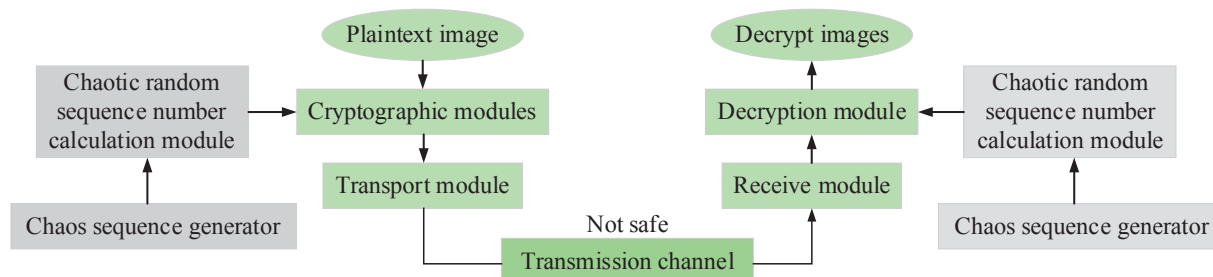

As we all know, the computer network information system has a strong openness and can absorb data information from all aspects of the Internet. But it is the openness of this computer network information system that leads to a low threshold of access to the Internet and the existence of technical shortcomings in the network information system itself, which leads to hidden dangers in the security of computer network information. And the security level of the network protocol used to operate the Internet information is very low, which may lead to loopholes in the operation of the computer network information technology system, further deepening the security risks of the computer network information system.

### 2.3. RISKS OF COMPUTER OPERATING SYSTEMS

At present, computer network information is open to computer users all over the country, and the penetration rate of computers in the country has been significantly increased. However, there are many old people, teenagers or people with low education level among computer users, who are totally unfamiliar with the operation of computers and even have no awareness of defending against computer viruses and poor recognition of computer network traps, so they are unable to distinguish malicious codes from normal data when using computers, resulting in the computers used being heavily invaded by malicious computer viruses.

## 3. IMPROVEMENT OF DIGITAL IMAGE ENCRYPTION ALGORITHM BASED ON CHAOTIC MAPPING

According to the previous description of the security problem of computer network information technology, this chapter proposes an improvement of digital image encryption algorithm with chaotic mapping, which can efficiently realize the encrypted transmission of computer network information, and then meet the security of computer network information. The given digital image encryption architecture is shown in Figure 1.

**Figure 1.** Digital image encryption algorithm based on chaotic mapping

### 3.1. GENERATION OF CHAOTIC MAPPED RANDOM SEQUENCES

The generation of a good random sequence requires a choice from a chaotic mapping of one-dimensional segmentality, which is defined as shown below:

$$Q(f, p) = \begin{cases} p / f & p \in (0, f) \\ (p - f) / (\frac{1}{2} - f) & p \in (f, \frac{1}{2}) \\ Q(f, 1 - p) & p \in (1/2, 1) \end{cases} \quad (1)$$

where  $f$  is the parameter of the control,  $f \in (0, \frac{1}{2})$ , and the region of the chaotic mapping is  $(0, 1)$ . and has some statistical advantages in this region:

(1) When the exponent is greater than zero, the whole system is in a chaotic state and the output signal can satisfy the characteristics of mixture and determinism. (2) There is an invariant distributed density function  $Z(x) = 1$ . (3) The trajectory of the signal output is approximately autocorrelated  $\alpha(n) = \phi(n)$ . Based on the above advantages, the random sequence that needs to be encrypted for the image can be selected from the chaotic mapping of one-dimensional segmentation  $x_0, x_1, \dots, x_n$ .

### 3.2. STEPS OF THE IMPROVED ENCRYPTION ALGORITHM

The improvement of digital image encryption algorithm using chaotic mapping-based encryption algorithm requires the decomposition of the image into modules and the encryption of sub-images with different key parameters. Thus, the security of the output key sequence and the cyclic nature of the cycle are improved, and the improvement of its encryption algorithm is divided into the following steps:

(1) The original image file is input, which can be represented in the form of a matrix  $W_{n \times n}$  as well as an encrypted number  $t$ . (2) The initial condition  $(x_0, m)$  is input, and a random sequence  $x_0, x_1, \dots, x_n$  of  $n \times n$  is generated by the chaotic mapping, and this is processed appropriately to obtain a chaotic sequence of natural numbers. (3) The image is encrypted using the function of diffusion. (4) The input parameters are improved by the encryption algorithm of the chaotic mapping and the parameters are obtained again. (5) Repeat step 2 and step 4 until the  $t$ th time, thus resulting in the output encrypted image file.

## 4. CIPHERTEXT AND PLAINTEXT SENSITIVITY ANALYSIS IN COMPUTER NETWORK INFORMATION SECURITY

Based on the previous description of the digital image encryption algorithm improved by chaos mapping, this chapter explores the application of digital image encryption algorithm in computer network information technology security by conducting sensitivity analysis of ciphertext and plaintext for image transmission in computer network information security.

This algorithm not only utilizes the randomness of the sequence number obtained from the logistic chaos mapping in the process of image pixel diffusion processing, but also performs the group encryption process using the preorder pixels in the process. By adding the construction of correlation between image pixels to the traditional chaotic encryption algorithm, the algorithm is more sensitive to both ciphertext and plaintext. That is, a very small modification to the ciphertext will result in an avalanche benefit to the decrypted plaintext

obtained with exactly the right key. Taking a  $512 \times 512$  Lena plaintext image as an example, the encryption and decryption keys are (4.01, 0.552, 0.354), and the results obtained by varying the number of pixel color values for the ciphertext are shown in Table 1.

**Table 1.** Cipher sensitivity test results

<b>The number of pixels changed</b>	1	20	60	120
<b>Decryption result pixel change rate (%)</b>	49.762	49.683	49.921	49.637
<b>The number of pixels changed</b>	300	600	800	1200
<b>Decryption result pixel change rate (%)</b>	49.825	49.653	49.827	49.924

From Table 1, we can see that after changing the pixel color value in the ciphertext, nearly 49% to 50% of the pixels in the plaintext after decryption are changed, and an avalanche effect occurs. Also the pixel change rate in the decryption result has no relationship with the number of pixels changed in the ciphertext, and the ciphertext sensitivity is very high. This indicates that after the group diffusion processing based on the preorder pixels added in this algorithm, the algorithm appears ciphertext sensitivity compared with the traditional chaotic image encryption method, and the avalanche effect occurs after changing a small number of encryption results in the ciphertext.

The same method is used to verify the plaintext sensitivity, with the same choice of encryption key and image as in Table 1, and the pixel change rate of the encrypted ciphertext obtained after changing the plaintext pixels is examined, and the results obtained are shown in Table 2.

**Table 2.** Expressly sensitivity test results

<b>The number of pixels changed</b>	1	20	60	120
<b>Decryption result pixel change rate (%)</b>	49.758	49.669	49.903	49.681
<b>The number of pixels changed</b>	300	600	800	1200
<b>Decryption result pixel change rate (%)</b>	49.826	49.679	49.824	49.906

As can be seen from Table 2, the sensitivity of the digital image encryption scheme proposed in this paper is also very high for the plaintext, which is not much different from the ciphertext, with 49% to 50% of pixels changed in both. This indicates that the encrypted ciphertext will have an avalanche utility after the change to the plaintext pixels.

In summary, in the specific work, the pseudo-random sequence number is created by setting up a logistic chaos mapping with correlation, and it is applied to the image diffusion and dislocation processing. In the diffusion process, the pseudo-random sequence number and the original image pixel color are computed as an anomaly, and in the disorder operation, the uniformization of the chaotic sequence number is used. The pixel positions of the image are replaced directly, eliminating the complex operation of sequencing. This can effectively guarantee the secure transmission of computer network information and promote the security of computer network information technology.

## 5. CONCLUSION

In this paper, the digital image encryption algorithm is improved by introducing chaotic mapping random sequences from the factors affecting the security of computer network information technology. In order to verify the effectiveness of the improved algorithm, the sensitivity of ciphertext and plaintext of digital images in computer network information security is analyzed. The results show that the sensitivity of the digital image encryption scheme proposed in this paper is between 49% and 50% for both ciphertext and plaintext, which indicates that the digital image encryption algorithm by chaos mapping can effectively improve

the security of information transmission in computer networks.

## ABSTRACT

This paper proposes an EM clustering algorithm for mobile app big data by incorporating Gaussian distribution for the basic maximum expectation algorithm. The distribution of college students' cell phone APP usage time is obtained through QuestMobile smart device hybrid data pool, and the correlation between college students' cell phone addiction and interpersonal relationship is analyzed in this way. Finally, the three variables of cell phone addiction tendency, loneliness and interpersonal relationship were analyzed according to the mediating effect test. The correlation coefficient between the total score of cell phone addiction tendency and the total score of interpersonal relationship reached 0.35. The higher the degree of cell phone addiction tendency of college students, the greater the degree of interpersonal relationship behavior distress.

## KEYWORDS

EM clustering algorithm; Correlation analysis; Mediating effect; Cell phone addiction; Interpersonal relationship

## 1. INTRODUCTION

With the popularity of smartphones, college students commonly hold smartphones, and they are often seen playing with their phones with their heads down on college campuses. Smartphones have changed the way college students live, study and socialize, enhancing their learning and living efficiency and expanding their interpersonal interaction [1-3]. At the same time, because college students are free from the high-pressure learning environment of high school, they often lack self-control in college and tend to overuse cell phones [4-5]. They are addicted to online activities such as online games, videos, and online social networking, and even have the tendency to become addicted to cell phones [6-7].

The literature [8] suggested that sleep quality, but not sleep duration, partially mediated the association between cell phone addiction and daily cognitive impairment. The literature [9] tested the mediating role of rumination and the moderating role of solitary ability in the relationship between cell phone addiction and psychological distress, noting that machine addiction was significantly and positively associated with psychological distress. The literature [10] concluded from an investigation and analysis that narrative disorders can directly or indirectly predict cell phone addiction through patterns of recreational and transactional use. The literature [11] similarly studied that narrative disorders had a significant positive predictive effect on cell phone addiction, with cell phone depression, anxiety, and stress as positive

predictors. The literature [12] compared the cell phone addiction patterns of Tibetan and Han Chinese adolescents and concluded through the analysis of the Mobile Phone Addiction Scale that it was more severe in Tibetan students compared to Han Chinese students.

## 2. MOBILE APP BIG DATA ANALYSIS BASED ON EM ALGORITHM

### 2.1. EM ALGORITHM UNDER BIG DATA

The maximum expectation (EM) algorithm is an iterative algorithm. Each iteration cycle of the EM algorithm generally consists of E and M steps. Where the E step calculates the mathematical expectation and the M step is called the maximization step.

#### 2.1.1. GENERAL MODEL OF EM ALGORITHM

Assuming that  $X$  is the existing data and  $Y$  is the missing data, the complete data  $Z = (X, Y)$ . The posterior distribution density function of parameter  $\theta$  with respect to the existing observed data is expressed as  $P(\theta | X)$ . The posterior distribution density function for the complete data is denoted as  $P(\theta | X, Y)$ . To calculate  $P(\theta | X, Y)$ , the EM algorithm can be used.

Letting  $\theta^i$  be the posterior plurality estimate at the beginning of the  $i+1$ nd iteration, the steps of the  $i+1$ rd iteration are

Step E: The expectation of the conditional distribution of  $P(\theta | X, Y)$  with respect to  $Y$  is found, i.e:

$$Q(\theta | \theta^i, X) = E_Z \left[ \frac{\log P(\theta | X, Y)}{\theta^i}, X \right] = \int \log [P(\theta | X, Y) P(Y | \theta^i, X)] dy \quad (1)$$

Step M: Maximize the  $P(\theta | X, Y)$  obtained after integration and find the point  $\theta^{i+1}$  such that:

$$Q(\theta^{i+1} | \theta^i, X) = \max Q(\theta | \theta^i, X) \quad (2)$$

Iterate E and M steps repeatedly until  $\|\theta^{i+1} - \theta^i\|$  is sufficiently small to stop.

#### 2.1.2. COMBINATION OF EM ALGORITHM AND GAUSSIAN DISTRIBUTION

In order to facilitate the processing and study of the data, the incomplete data can be assumed to obey the Gaussian distribution. Let the observed data be array  $X = (L_1, L_2, \dots, L_{n-1})$  and the unobserved data be  $Y = (L_n)$ . Both sets of data obey Gaussian distribution, and the probability density function of Gaussian distribution is

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma} \left[ -\frac{(x-\mu)^2}{2\sigma^2} \right] \quad (3)$$

Then the likelihood density function of the fully observed data is

$$P(\theta | X, Y) = \left( \sqrt{2\pi}\sigma \right)^{-n} e^{-\frac{(L_1-\mu)^2}{2\sigma^2}} e^{-\frac{(L_2-\mu)^2}{2\sigma^2}} \dots e^{-\frac{(L_n-\mu)^2}{2\sigma^2}} \quad (4)$$

The conditional distribution probability function for the unobserved data  $Y$  based on the observed data is

$$P(Y|\theta^i, X) = (\sqrt{2\pi}\sigma_i)^{-1} e^{-\frac{(L_n - \mu_i)^2}{2\sigma_i^2}} \quad (5)$$

where,  $\mu_i, \sigma_i$  is the parameter valuation obtained after the  $i$  nd iteration.

## 2.2. RESEARCH ON THE DISTRIBUTION OF CELL PHONE USAGE TIME BASED ON EM ALGORITHM

### 2.2.1. SMARTPHONE DATA OF COLLEGE STUDENTS

The data in this paper comes from QuestMobile’s smart device hybrid data pool, involving APP usage information data of college students’ Android users over a 90-day period. The daily App behavior monitoring table is extracted, and the usage hours of each type of APP per person per day are aggregated by user ID and the tagged APP category as the unique identification. Mark the APPs that do not belong to the APP sorting table as ELSE category. Using the obtained aggregated data, the user IDs are connected according to their various types of APP usage time, and then the matrix of APP usage per person per day per category is obtained. Each row in this matrix represents a user, each column represents an APP, and the data in each loci represents the time that the user used that APP on that day.

### 2.2.2. FITTING OF MOBILE APP USAGE TIME DISTRIBUTION

The EM algorithm estimates the two mixed normal distributions to obtain the distribution fit of the average daily usage time of APP. The EM algorithm calculates the maximum likelihood function value from the posterior distribution of the hidden variables in the E step, and then solves the M step to obtain the parameter estimate, and uses this parameter estimate to further obtain the new posterior distribution, and then continues with the E step. The EM algorithm ensures that the maximum likelihood function is improved after each iteration. The parameter estimates of the mixed-normal distribution for the 10 classes of APPs obtained using the EM algorithm are shown in Table 1. The results of most APPs in both categories taken by the EM algorithm are as expected, i.e., the mean and standard deviation of one category are very close to 0, and the mean of the other category is significantly greater than 0. However, individual APPs do not match the expectations of this paper because the EM algorithm itself is an unsupervised method and there is no way to control the location of the centroids of each category.

**Table 1.** Estimation of mixed normal distribution parameters of APP

Category	p	a	b	Category	p	a	b
Online shopping	0.25	0.00	0.00	Network music	0.73	0.21	1.21
Local life	0.45	0.26	0.00	Practical tool	0.62	0.00	2.36
Network video	0.21	0.00	0.21	Digital reading	0.58	0.00	0.86
Communication chat	0.36	0.00	0.36	Social networking	0.64	0.49	0.00
News information	0.57	0.84	0.00	game	0.39	1.02	0.65

## 3. THE IMPACT OF CELL PHONE ADDICTION ON INTERPERSONAL RELATIONSHIPS AMONG COLLEGE STUDENTS

### 3.1. CORRELATION ANALYSIS OF CELL PHONE ADDICTION AND INTERPERSONAL RELATIONSHIP AMONG COLLEGE STUDENTS

After completing the processing and analysis of the big data of college students’ cell phone use based on EM algorithm, this paper investigates the influence of cell phone addiction on interpersonal relationship quality through further correlation analysis. The results of the correlation analysis between cell phone addiction and interpersonal relationships are shown in

Figure 1, where the measurement of interpersonal relationship quality was obtained through the interpersonal relationship scale. There was a significant positive correlation between the total score of cell phone addiction tendency and each dimension score and the total score of interpersonal relationship and each dimension score, so the higher the degree of cell phone addiction tendency among college students, the greater the degree of interpersonal relationship behavior distress. The correlation coefficient between the total score of cell phone addiction tendency and the total score of interpersonal relationship reached 0.35.

**Figure 1.** Correlation analysis between mobile phone and interpersonal relationship

### 3.2. TESTING THE MEDIATING ROLE OF CELL PHONE ADDICTION AND INTERPERSONAL RELATIONSHIPS

The three variables of cell phone addiction tendency, loneliness and interpersonal relationship were analyzed according to the mediating effect test. The results of the mediating effect test are shown in Table 2. In the first step, it can be seen that  $a, b, c$  is significant, which indicates that both the tendency of mobile phone addiction and loneliness have a good predictive effect on interpersonal relationships. However, when considering the predictive effect of cell phone addiction tendency and loneliness on interpersonal relationships at the same time, the effect of cell phone addiction tendency on interpersonal relationships was significantly reduced due to the intervention of loneliness, and the coefficient decreased from 0.28 to 0.18. The third step showed that loneliness played a partial mediating role between cell phone addiction tendency and interpersonal relationships.

**Table 2.** Results of mediation tests

Step	Standardized regression equation	Regression coefficient test
1	$y=0.28x$	$t=8.25$
2	$m=0.18x$	$t=5.26$
3	$y=0.18x+0.50m$	$t=6.21$

### 4. CONCLUSION

In this paper, we conducted a correlation analysis and mediated utility test between cell phone addiction and the quality of interpersonal relationships based on the EM algorithm to cluster the big data of college students' cell phones, combined with the data obtained from the

interpersonal relationship scale. The higher the degree of cell phone addiction tendency of college students, the worse the interpersonal relationships. College students spend relatively more time and energy on cell phones and have a higher tendency of cell phone addiction, while the virtual interpersonal relationships established through cell phones are very unstable, resulting in unreliable interpersonal networks of college students. It can be said that there is a significant correlation between college students' tendency of cell phone addiction and interpersonal relationships.

## ABSTRACT

At a time when the soft power of culture is constantly emphasized, the integration of traditional music culture in piano teaching is of significant significance. In this paper, for music performance based on MIDI standard, we extracted the piano tonal characteristics and rhythmic characteristics, proposed the performance effect evaluation based on bidirectional LSTM network, and completed the construction of classification labels for music evaluation prediction. With the incorporation of traditional music elements, the performance evaluation of piano performance improved by 12.41% in pitch, 8.65% in modulation, and 10.32% in rhythm. This study helps to promote the inheritance of excellent traditional music culture and the development of piano performance teaching innovation.

## KEYWORDS

MIDI standard; Bidirectional LSTM network; Piano teaching; Traditional music culture; Rhythmic characteristics; Tonal characteristics

## 1. INTRODUCTION

At the present stage, music teaching in colleges and universities has become one of the main contents of quality education [1-2]. In college music teaching, piano teaching is an important teaching content, which is crucial to improve students' artistic cultivation and also inherits traditional Chinese music culture to a certain extent [3-4]. Rickels, D. A et al. compared the motivation and influence of music students interested in music teaching careers with those who were not, and suggested that career choices in music teaching are multidimensional [5]. Powell et al. explored Celeste's particular music teaching, arguing that she established a shared world of music that contained empathy outside of the monotonous world of music teaching [6]. Botstein et al. explored the history of music teaching, examining the situation of traditional music culture in modern times based on an analysis of popular classical music popularity in the Trump era [7]. Ng, H. H used three Singapore school teachers' popular music teaching materials to explore the factors influencing the effectiveness and quality of popular music teaching in public schools [8]. Kuebel, C. R examined the career development, choices and goals of elementary general music teachers identified as instrumental music majors during their undergraduate degree programs based on survey interviews [9].

In this paper, a two-way LSTM-based performance evaluation system for piano teaching is constructed in order to explore the integration of traditional music culture in college piano teaching. Based on the MIDI standard, the player's operation of the instrument is converted into MIDI signals, and the rhythm and beat of the current bar are extracted with features based

on the localization of the playing time. The resulting digitized signal of the performance is input into a bidirectional LSTM network, and the evaluation results are obtained by the attention mechanism layer and Softmax function classification, and the output.

## 2. NEURAL NETWORK-BASED PIANO PERFORMANCE EVALUATION

### 2.1. FEATURE EXTRACTION OF PIANO PERFORMANCE MUSIC

#### 2.1.1. MUSIC PERFORMANCE BASED ON MIDI STANDARDS

When a performer plays music on a MIDI instrument, the MIDI instrument converts the player's manipulation of the instrument into MIDI signals, which are transmitted via cable to the sequencer. In fact, a sequencer is a piece of software that stores, edits and forwards MIDI signals. The MIDI signal stored by the sequencer is the MIDI file, which can be edited and finally output to the sound source.

The MIDI signal is transmitted over a cable, using a serial asynchronous method, at a rate of 31.25 Kbaud, which consists of one start bit, eight data bits and one end, with the eight data bits forming a byte. It is divided into a status code and a data code. The status code is followed by a series of data codes, and the length of the data code is determined by the status code. Due to the serial transmission, the data codes take the form of multiple codes, and different MIDI codes constitute different MIDI messages.

#### 2.1.2. EXTRACTION OF PIANO TONE FEATURES

The effect of the note played by the performer is directly related to the correctness of the key presses, their strength and duration. The extraction of tone characteristics is essentially a matter of determining the strength, duration, and correctness of key presses. In this paper, a standard MIDI volume value is obtained to determine the student's ability to play a single note with a certain amount of force, i.e., the difference between the volume value of the MIDI signal and the standard value.

#### 2.1.3. EXTRACTION OF RHYTHMIC FEATURES

The rhythmic features are extracted for each bar of the music score. Based on the division of the score into musical measures, each measure of the performed piece can be accurately located. The rhythm and beat of the current measure can be extracted by locating the time of performance. The rhythm is the relationship between the length of a certain note interval, that is, to extract the point of articulation and the length of articulation of each note in the current bar, and to synthesize the degree of the player's grasp of the rhythm of this bar. The difference between the articulation point of each note and the standard value is extracted and multiplied by the weight of the note to obtain the degree of good or bad grasp of the rhythm of the current bar:

$$f(x) = \sum |(S_i - B_i)|Q_i + \|E_i - D_i\|Q_i \quad (1)$$

where  $i$  is the number of the note in the measure,  $S$  is the time when the player presses the key, and  $B$  is the standard time.  $E$  is the time when the player releases the key,  $D$  is the standard release time, and  $Q$  is the corresponding weight for the different notes.

### 2.2. MIDI PIANO PERFORMANCE EVALUATION BASED ON BIDIRECTIONAL LSTM NETWORKS

In order to implement the function of evaluating multiple piano music, multiple sub-network models are designed, each sub-network model needs to be trained separately, and multiple sub-network models are evaluated for specific piano music.

### 2.2.1. TWO-WAY LSTM LAYER

By studying the MIDI format, we can know that the music feature sequence can be regarded as a longer time sequence. LSTM, as an improved version of RNN, effectively improves the gradient disappearance and gradient explosion problems by adding three special gate components. However, LSTM and RNN can only process data along one direction in the time series problem, and often ignore the future information. While the bidirectional LSTM network can propagate not only forward but also backward, this way of combining past information with future information is similar to human enjoying music, and more reliable parameters are obtained when the model is trained.

### 2.2.2. ATTENTION MECHANISM LAYER

The Attention mechanism was first used in the image domain and its main idea is to design a pattern recognition by identifying the core content. The attention mechanism algorithm is shown in the following equation:

$$\alpha = \frac{\exp(e_{t,i})}{\sum_{j=1}^N \alpha_{t,i} h_i} \quad (2)$$

$$c = \sum_{j=1}^N \alpha_{t,i} h_i \quad (3)$$

where  $e_{t,j}$  denotes the network output of the bidirectional LSTM.

### 2.2.3. SOFTMAX CLASSIFICATION

The Softmax function is a nonlinear function that maps the output of multiple neurons to a vector of real numbers in the interval 1 and the sum of all elements in the vector of real numbers is (0,1). The Softmax function expression is:

$$S(x_j) = \frac{e^{x_j}}{\sum_{k=1}^K e^{x_k}}, j = 1, 2, \dots, K \quad (4)$$

where  $S(x_j)$  denotes the value of the  $i$  nd dimension of the feature vector and  $k$  denotes the number of categories.

Then, the categorical labels for MIDI music evaluation prediction are calculated as

$$\hat{m} = \arg \max S(x_j) \quad (5)$$

## 3. THE INTEGRATION OF PIANO PERFORMANCE EVALUATION TEACHING AND TRADITIONAL MUSIC CULTURE

### 3.1. EVALUATION OF THE INTEGRATION OF TRADITIONAL MUSIC CULTURE IN PIANO PERFORMANCE

In this paper, we construct a quantitative evaluation method for piano performance based on artificial intelligence techniques. In this subsection, we will use this method to analyze the integration of traditional music culture in piano performance teaching. The evaluation of traditional music elements in piano performance before and after teaching is shown in Figure 1. With the integration of traditional music elements, the evaluation of piano performance in terms of meter increased by 12.41%, the evaluation of prosody increased by 8.65%, and the evaluation of rhythm increased by 10.32%. In the process of teaching piano performance, it can cultivate students' traditional music culture for a long time and has strong teaching

effectiveness.

Figure 1. Evaluation of traditional music elements in piano performance

### 3.2. INTERPRETATION OF THE INTEGRATION OF TRADITIONAL MUSIC CULTURE IN PIANO TEACHING IN HIGHER EDUCATION

The integration of traditional music culture in college piano teaching needs to be organized through a certain teaching organization. The organization of integration of traditional music culture in piano teaching is shown in Figure 2. Only 13.1% of the teaching atmosphere is evaluated as excellent, only 15.2% of the traditional music culture is rich in activities, and only 11.8% of the teaching atmosphere can make full use of multimedia teaching. The good or bad teaching atmosphere is very critical to students' learning efficiency, and music teaching in colleges and universities must create a good teaching atmosphere and create a traditional cultural teaching environment so that students can learn in a traditional music cultural environment. In order to better let students inherit traditional music culture in piano teaching, colleges and universities should regularly hold campus music culture activities, such as piano performance competitions.

## Figure 2. The integration organization of traditional music culture in piano teaching

### 4. CONCLUSION

Based on artificial intelligence algorithm, this paper constructs a music performance evaluation method applied to piano teaching, and explores the organization of traditional music culture integration in college piano teaching by exploring the evaluation effect of traditional culture integration into piano performance teaching. In the music teaching in colleges and universities, piano teaching and traditional music culture are one and the same. Therefore, colleges and universities must pay attention to piano teaching, and through improving piano teaching level, and then achieve the purpose of inheriting and promoting traditional music culture.

## ABSTRACT

In this paper, based on the finite element calculation of the elastic-plastic strain tensor, strain and displacement of steel bars, a finite element model is established for the hole-rolling process of stainless steel cladding angles under the assumption that the conditions are valid. The minimum wall thickness of group A is 0.793 mm and the maximum wall thickness is 1.274 mm, the difference between the maximum and minimum wall thickness of group B is 0.481 mm. The minimum wall thickness value is 0.731 mm and the maximum wall thickness value is 1.248 mm, with a maximum difference of 0.517 mm from the minimum wall thickness.

## KEYWORDS

Stainless steel cladding; Hole type system; Finite element simulation; Contact stress; Strain tensor; Strain versus displacement

## 1. INTRODUCTION

Stainless steel cladding rebar has better corrosion resistance than ordinary carbon steel rebar, and its outer layer of stainless steel can well prevent the infiltration of chloride ions, reduce the corrosion of the rebar in normal use, and prolong the service life of the rebar [1-3]. In addition, compared to solid stainless steel bars, stainless steel cladding bars can effectively save stainless steel under the premise of achieving the same corrosion resistance. The production of stainless steel cladding bars using the rolling method is different from the

production of traditional mild steel bars, the rolling process there is a relative shear movement deformation of stainless steel and mild steel, the relative sliding between the two metals directly constrains the occurrence of the composite [4-5]. As the deformation of the two metals and the composite are occurring in the process of rolling through the rolling rod, so the impact of the hole system on the composite condition of carbon steel and stainless steel is the most direct and important [6-7]. How to use the hole pattern to reasonably distribute the amount of metal deformation in each pass, so that stainless steel and mild steel through several passes of rolling to achieve a good metallurgical bond, as well as the impact of different hole pattern systems on the rolled composite condition is relatively little research [8-9]. Therefore, it is important to study the effect of different hole-type systems on the composite condition of stainless steel cladding bars.

## 2. FINITE ELEMENT SIMULATION OF STAINLESS STEEL CLADDING ROLLING

### 2.1. FINITE ELEMENT CALCULATION OF ELASTICITY OF REINFORCING STEEL

#### 2.1.1. STRAIN TENSOR

The change of distance between the masses in an object is the basic sign of the deformation of the object. Since the rigid motion of the object does not produce deformation, the change of distance between the masses can be used to describe the deformation. In the three-dimensional space right-angle coordinate system, the distance between two adjacent masses  $P(X_i)$  and  $Q(X_j + dX_j)$  at the initial moment is

$$(dL_0)^2 = (dX_1)^2 + (dX_2)^2 + (dX_3)^2 = \delta_{ij} dX_i dX_j \quad (1)$$

At the end moment, the two masses reach new positions  $P'(X_i)$  and  $Q'(X_j + dX_j)$  at a distance of

$$(dL)^2 = (dx_1)^2 + (dx_2)^2 + (dx_3)^2 = \delta_{ij} dx_i dx_j \quad (2)$$

The amount of change in the square of the distance between two points is

$$(dL)^2 - (dL_0)^2 = \left( \delta_{\alpha\beta} \frac{\partial x_\alpha}{\partial X_i} \frac{\partial x_\beta}{\partial X_j} - \delta_{ij} \right) dX_i dX_j \quad (3)$$

Then  $(dL)^2 - (dL_0)^2 = 2E_{ij} dX_i dX_j$ , the left side of the equation is a tensor, and  $dX_i dX_j$  is a second-order tensor. It is known that  $E_{ij}$  is a second-order tensor and  $E_{ij} = E_{ji}$ , then  $E_{ij}$  is a second-order symmetric tensor, called the Green's strain tensor.

#### 2.1.2. STRAIN AND DISPLACEMENT

Let the coordinates of the mass point with initial coordinates  $X_i$  be  $x_i$  at the last moment position and its displacement component be  $u_i$ . Then we have

$$\frac{\partial x_\alpha}{\partial X_i} = \frac{\partial u_\alpha}{\partial X_i} + \delta_{\alpha i}, \quad \frac{\partial x_\alpha}{\partial x_i} = \delta_{\alpha i} - \frac{\partial u_\alpha}{\partial x_i} \quad (4)$$

Substitution yields:

$$E_{ij} = \frac{1}{2} \left[ \delta_{\alpha\beta} \left( \frac{\partial u_\alpha}{\partial X_i} + \delta_{\alpha i} \right) \left( \frac{\partial u_\beta}{\partial X_j} + \delta_{\beta j} \right) - \delta_{ij} \right] \quad (5)$$

$$e_{ij} = \frac{1}{2} \left[ \delta_{ii} - \delta_{\alpha\beta} \left( \frac{\partial u_{\alpha}}{\partial x_i} + \delta_{\alpha i} \right) \left( \frac{\partial u_{\beta}}{\partial x_j} + \delta_{\beta j} \right) \right] \quad (6)$$

Thus, the relationship between strain and displacement is obtained as

$$E_{ij} = \frac{1}{2} \left( \frac{\partial u_i}{\partial X_j} + \frac{\partial u_j}{\partial X_i} + \frac{\partial u_k}{\partial X_i} \frac{\partial u_k}{\partial X_j} \right) \quad (7)$$

$$e_{ij} = \frac{1}{2} \left( \frac{\partial u_i}{\partial e_j} + \frac{\partial u_j}{\partial e_i} + \frac{\partial u_k}{\partial x_i} \frac{\partial u_k}{\partial x_j} \right) \quad (8)$$

## 2.2. ESTABLISHMENT OF FINITE ELEMENT MODEL

### 2.2.1. HYPOTHETICAL CONDITIONS

Finite element simulation is an approximate calculation, and there is still some difference between it and the actual situation. When modeling, try to consider a variety of factors in order to get a more realistic description of the rolling process. In order to facilitate finite element analysis calculations, reduce computing time, without changing the nature of the research problem, the simulation process to make the following assumptions:

(1) As the rolling is carried out at high temperatures, the impact of the deformation of the rolling series on the deformation of the rolled parts is very small, so ignore the elastic deformation of the rolling series, the rolling series is defined as a rigid body.

(2) The contact heat transfer between the roll and the roll stick, the roll plastic deformation work heat, the impact of convective heat transfer on the free surface of the roll to be considered.

(3) Plastic zone metal deformation obeys Plante-Ruiz flow law.

(4) The material obeys the Mises yield criterion.

### 2.2.2. FINITE ELEMENT GEOMETRY MODEL

Due to the symmetry of rolling, a quarter of the rolled part is taken to build the model, and the section nodes are taken to be symmetrically constrained. The unit is an eight-node hexahedral unit, and the length of the rolled part is finally determined to be 140 mm after several simulations to facilitate comparison with later experiments. The core material is Ck15 with a diameter of 15 mm, and the section is divided into 42 units. The shell material is 304 stainless steel with a thickness of 2.2 mm, and the cross-section is divided into 25 units, and the cross-sectional cladding area accounts for 34% of the total cross-sectional area of the rolled part.

In this paper, the rolling temperature of the simulated hot-rolled composite process is 1150 °C. The mechanical properties of stainless steel and plain carbon steel at this temperature are shown in Table 1. The coordinate systems in Pro/E and MARC are completely overlapping, and the geometric model bodies are kept in their original relative positions after the files are transferred between the two software. The flat elliptical hole-shaped stick and round hole-shaped spokes were drawn in Pro/E with a diameter of 212 mm, and saved in IGS format.

**Table 1.** Mechanical properties of stainless steel and carbon steel

	Yield limit	Modulus of elasticity	Density	Bosson ratio
304 stainless steel	69	203	7950	0.35
Ck15	48	213	7850	0.35

### 2.3. BOUNDARY CONDITION SETTING

Boundary conditions are also called support conditions in structural mechanics, mainly including stress analysis boundary conditions and temperature boundary conditions. In this paper, the boundary conditions of the rolling model are mainly temperature boundary conditions, including contact heat transfer conditions and convective heat exchange conditions and radiation heat exchange conditions.

The surfaces of the two objects in contact are called thermal contact when mechanical loads are transferred and heat is generated and exchanged on the contact surface. Two objects in contact with the contact interface, contact heat transfer occurs, contact heat transfer by heat transfer can be expressed as follows:

$$q = h_c (T_{b1} - T_{b2}) \quad (9)$$

where  $q$  is the heat transferred through the boundary in  $\text{kW/m}^2$ .  $T_{b1}$  and  $T_{b2}$  are the temperatures of the two contact surfaces in  $\text{K}$ , respectively.  $h_c$  is the contact heat transfer coefficient at the contact interface in  $\text{kW}/(\text{m}^2 \cdot \text{K})$ .

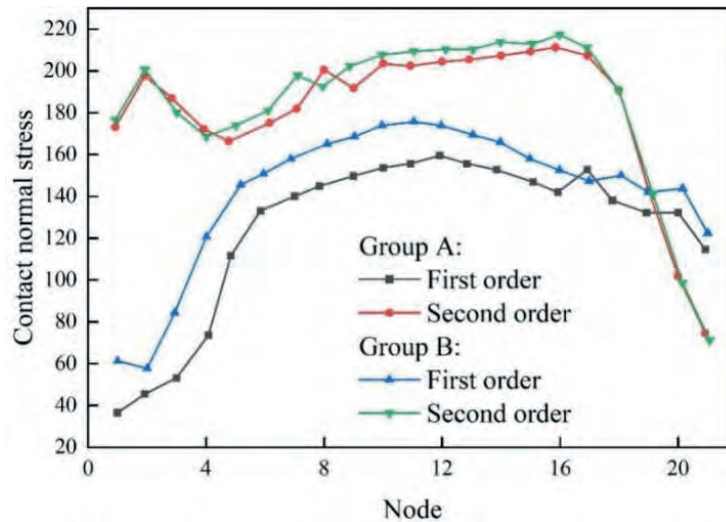

### 3. COMPARATIVE ANALYSIS OF DIFFERENT HOLE TYPE SYSTEMS FOR ROLLING CLADDING REINFORCEMENT

In order to compare the effect of different extension coefficients on the rolling of overlay reinforcement, two sets of diamond-rinse hole type systems are designed. The preassumed extension coefficients are shown in Table 2, respectively.

**Table 2.** Presuppose the coefficient of elongation

	$\mu_{\Sigma 2}$	$\mu_{\Sigma 4}$	$\mu_{\Sigma 6}$
Group A	1.610	1.542	1.343
Group B	1.622	1.55	1.352

Now, the two groups of rhombus-rhombus type rolling processes with different extension coefficients are compared, and firstly, the positive contact stresses between the two metals are extracted during the first two passes of rolling for groups A and B to ensure the metallurgical bonding of the two metals. The relevant node data extraction is shown in Figure 1. Except for some nodes on the wide spreading side, the contact normal stress between stainless steel and carbon steel in the rest of the nodes can basically reach 145 MPa, and the bonding area between the two metals is relatively reliable. The second pass of rolling, the wide spreading side into the depressed side, due to the first pass of rolling forming, the wide spreading side after the second pass, the amount of depression is very large. From the figure can also be seen that the force between the two metals increased a lot compared to the first pass, and the bonding area of the last pass in the second pass rolling, the contact stress between stainless steel and carbon steel is more than 205 MPa, further consolidating the bonding state of the two metals. After two passes of rolling, the two metals have basically achieved metallurgical bonding.

**Figure 1.** Related node data extraction

After the above analysis, the use of A and B two groups of diamond - diamond hole type system to roll the cladding steel are feasible. After six passes of rolling, the comparison of stainless steel wall thickness distribution along the circumferential direction is shown in Figure 2. The minimum wall thickness of group A is 0.793 mm and the maximum wall thickness value is 1.274 mm, the difference between the maximum and minimum wall thickness is 0.481 mm, and the wall thickness distribution is not uniform. The minimum wall thickness of group B is 0.731 mm and the maximum wall thickness was 1.248 mm, with a difference of 0.517 mm between the maximum and minimum wall thicknesses, and the wall thickness distribution was not uniform. Comparing the two hole type systems, the improvement effect on the wall thickness is not very big. The first and second pass extension coefficients are close to each other, which has a certain effect of improving the uniform wall thickness distribution.

**Figure 2.** The distribution of stainless steel wall thickness along the circumference

#### 4. CONCLUSION

In this paper, based on the hypothetical conditions, a finite element simulation model of hole rolling of stainless steel clad angle is established, and the design method of its synergistic process is studied through the comparative analysis of different hole systems for rolling clad steel bars. In the simulation process, excluding some nodes on the wide spreading side, the contact normal stress between stainless steel and carbon steel in the rest of the nodes can basically reach 145 MPa, and the bonding area between the two metals is relatively reliable.

After multiple passes of rolling, the stainless steel cladding reinforcement has an inner square or irregular shape of the stainless steel inner layer, and this different shape is the result of the uneven accumulation of deformation of the rolled piece as it passes through the different hole patterns. In the index of the uniformity of stainless steel thickness and thickness, the diamond - diamond hole type system has certain advantages.

## ABSTRACT

In this paper, based on the basic framework of principal component analysis, the sparse principal component method based on the maximum variance method was proposed for the problem that the dimensionality reduction of general principal component analysis data was not obvious enough, and the variation of the original sample points was retained. Then, a test for poisoning of male rabbits with *Oxytropis glabra* was designed, and the data obtained from the experiment were analyzed based on sparse principal components, as a way to investigate the effect of *O. glabra* poisoning on the reproductive function of the animals. Compared with the control group, the haploid apoptosis rate was significantly higher ( $p < 0.05$ ) in the test group than in the control rabbits at day 15, but only the spermatogenic apoptosis rate was significantly higher ( $p < 0.05$ ) in the test 3 group.

## KEYWORDS

Principal component analysis; *Oxytropis glabra* DC poisoning; Maximum variance method; Apoptosis rate; Reproductive function

## 1. INTRODUCTION

*Oxytropis glabra* DC is the most widely distributed and harmful toxic plant in the southern Xinjiang region [1-2]. According to incomplete statistics, nearly 15% of the natural pastures in South Xinjiang have been widely clumped with *O. glabra* DC, and its cover is all around 50%,

and the serious cover can reach more than 95% [3-4]. The main symptoms of poisoned livestock are reproductive and neurological damage, and the main symptoms are pathological changes such as cellular vacuolar degeneration and nuclear atrophy in the testes, ovaries, brain tissue and other substantive organs [5-6]. It has been shown that the main toxic component of *O. glabra* DC, bitter madderin, can cause cell nuclear condensation and DNA fragmentation by affecting the expression of p16, p 53, caspases-3, caspases-9, Bcl-2 and Bax, which eventually leads to apoptosis [7-9].

In this paper, in a poisoning experiment, 54 male rabbits were divided equally into a control group and three experimental groups and kept in separate cages. The control group was fed only green alfalfa hay, while the three experimental groups were fed a mixture of hay with 15%, 30% and 45% of *O. glabra* DC, respectively, and the experimental period was set at 65 days. The experimental data were combined with a modified VM-based sparse principal component analysis to investigate the effect on the reproductive function of the animals.

## 2. SPARSE PRINCIPAL COMPONENT ANALYSIS METHOD

### 2.1. PRINCIPAL COMPONENT ANALYSIS METHOD

#### 2.1.1. BASIC FRAMEWORK OF PRINCIPAL COMPONENT ANALYSIS

Assuming that the number of study data including samples and variables are  $n$  and  $p$ , respectively, and  $p$  variables are represented sequentially as  $X_1, X_2, \dots, X_p$ . The random vector consisting of these  $p$  variables can be represented as  $X = (X_1, X_2, \dots, X_p)$ .  $\mu$  represents the mean of  $X$  and  $\Sigma$  represents the covariance matrix of  $X$ .  $Y$  denotes the extracted principal components, then the principal components are linearly represented by the original variables as follows:

$$\begin{cases} Y_1 = c_{11}X_1 + c_{21}X_2 + \dots + c_{p1}X_p = \mathbf{c}_1^T X \\ Y_2 = c_{12}X_1 + c_{22}X_2 + \dots + c_{p2}X_p = \mathbf{c}_2^T X \\ \vdots \\ Y_p = c_{1p}X_1 + c_{2p}X_2 + \dots + c_{pp}X_p = \mathbf{c}_p^T X \end{cases} \quad (1)$$

Arbitrary original variables can be transformed by equation (1), and the statistical properties of the different principal components obtained differ. The solved principal components lose less information of the original variables under the premise that the variance of  $Y_i = \mathbf{c}_i^T X$  is as large as possible and each  $Y_i$  is independent of each other. The variance of  $Y_i$  can be expressed as

$$\text{var}(Y_i) = \text{var}(\mathbf{c}_i^T X) = \mathbf{c}_i^T \Sigma \mathbf{c}_i \quad (2)$$

For any constant  $a$ , there is  $\text{var}(a\mathbf{c}_i^T X) = a^2 \mathbf{c}_i^T \Sigma \mathbf{c}_i$ . It is necessary to restrict the value of  $\mathbf{c}_i$  so that  $\text{var}(Y_i)$  cannot increase arbitrarily, so certain constraints must be satisfied when performing the linear transformation.

#### 2.1.2. SOLUTION OF COVARIANCE MATRIX BASED ON SINGULAR VALUE DECOMPOSITION

SVD decomposition is a classical method of decomposing a matrix and can decompose any matrix. Suppose there is matrix  $A$ , the steps to decompose this matrix using SVD are as follows:

(1) Find the eigenvalues of matrix  $AA^T$  and their corresponding eigenvectors, and combine these unitized eigenvectors into matrix  $U$ .

(2) Find the eigenvalues of matrix  $A^T A$  and their corresponding eigenvectors, and combine these unitized eigenvectors into matrix  $V$ .

(3) Solve for the square root of the eigenvalues of matrix  $AA^T$  or  $A^T A$  and combine them into matrix  $D$ .

When SVD decomposes the covariance matrix to solve for the principal components, the original analysis variables are first selected according to the actual problem. Then the covariance matrix of the sample is calculated and SVD decomposed to solve for the eigenvalues of the covariance matrix and its corresponding standard orthogonal eigenvectors. Thus, the expressions of the first  $k$  principal components are obtained, the number of principal components is determined, and the appropriate principal components are selected. Finally, the actual data are studied in depth according to the solved principal components.

## 2.2. VM-BASED SPARSE PRINCIPAL COMPONENT ANALYSIS

The main idea of the maximum variance method is to preserve as much variation as possible in the original sample points when projecting the data points into a low-dimensional space. The variance of the maximized first principal component can be equivalently expressed as

$$\max_{v_1} (v_1^T X^T X v_1) \quad s.t. \quad v_1^T v_1 = 1 \quad (3)$$

The addition of the  $L_1$  penalty function to the objective function introduces a sparse PCA framework:

$$\max_{v_1} (v_1^T X^T X v_1 - \lambda_1 \|v_1\|_1) \quad s.t. \quad v_1^T v_1 = 1 \quad (4)$$

where  $\lambda_1 \geq 0$  is the regularization parameter that controls the amount of shrinkage on the first PC. It can be seen that the larger the value of  $\lambda_1$ , the larger the shrinkage. Then, based on the first  $j-1$  PCs, the  $j$ th sparse PC can be solved by the following optimization problem:

$$\begin{aligned} \max_v \quad & v^T X^T X v - \lambda_j \|v\|_1 \\ s.t. \quad & v^T v = 1, v^T v_1 = 0, \dots, v^T v_{j-1} = 0 \end{aligned} \quad (5)$$

where  $\lambda_j \geq 0$  is the regularization parameter that controls the amount of shrinkage on the  $j$ nd PC.

Since the principal components are required to be orthogonal,  $j-1$  constraint is added to solve the  $j$ nd PC, which makes the problem difficult to solve. The basic idea of the algorithm proposed in this paper is to reduce the problem to a series of optimizations in the two-dimensional plane under the constraint of unit parametrization. This boils down to the maximization of a series of features on the unit circle. This is only a univariate maximization problem and can be solved by grid search.

## 3. OXYTROPIS GLABRA DC POISONING TEST

### 3.1. TEST MATERIALS

Small-flowered echinocereus was taken from the above-ground part, and the samples were

air-dried. Detection reagents included total SOD assay kit, SOD typing kit. Rabbit SOD primary antibody, SABC immunohistochemistry kit, DAB color development kit. Total RNA extraction kit, Real - time q PCR kit, 5810R high-speed frozen centrifuge, 5331 PCR instrument, Realplex2 real-time fluorescence quantitative PCR instrument, CX31 biological microscope, DSC microtome, HI1220 temperature-controlled baking table.

### 3.2. TEST METHODOLOGY

Fifty-four male rabbits were divided equally into control and three experimental groups and kept in separate cages. The control group was fed only green alfalfa hay, while the three experimental groups were fed a mixture of hay with 15%, 30% and 45% of *O. glabra* DC, respectively, for 65 days. The testes and epididymis of five rabbits were dissected on days 15, 30 and 65, and some tissues were homogenized and tested for SOD activity, some tissues were fixed in Bouin's solution and stained for immunohistochemistry, and some tissues were used for Real-time PCR and Western Blot.

The primers were designed using Beacon Designer software with reference to the sequences of rabbit T- SOD, Cu/Zn - SOD, Mn - SOD and  $\beta$ -actin genes published in GenBank, and the primer information is shown in Table 1. Total RNA was extracted from rabbit testis and epididymal cells using the kit, followed by reverse transcription. 1.0  $\mu$ L of RT Primer Mix and 10.0  $\mu$ L of RNA extraction solution were used. Reaction conditions were 15 min at 37°C.

**Table 1.** Test all primer information

Item	Primer and probe sequence	Size of product
T-SOD	AATGCCCGCCAAAGCAGTT	498
Cu/Zn - SOD	GAGCCTTTCCCCGAGTCAT	153
Mn - SOD	GTGGGCCGCTCTAGGCACCA	246
$\beta$ -actin	ATTAACGCGCAGATCATGCAG	482

## 4. SPARSE PC-BASED EXPERIMENTAL DATA ANALYSIS

### 4.1. EFFECT OF OXYTROPIS GLABRA DC POISONING ON THE SPERMATOGENIC CELL CYCLE OF RABBIT TESTIS

The spermatogenic cell cycle of the experimental and control rabbits was examined as shown in Figure 1, and the number of stage  $G_0 / G_1$  cells gradually increased and the number of stage  $S$  cells gradually decreased in testicular spermatogenic cells of *O. glabra* DC-intoxicated rabbits compared with the control rabbits. There was a significant negative correlation between the number of stage  $G_1$  and stage  $S$  cells. The changes were obvious in the high-dose *Echinocereus floresiensis* poisoned rabbits. The testicular spermatogenic cells of rabbits were mainly divided into haploid cells, diploid cells and tetraploid cells. Compared with the control group, the apoptosis rate of haploid cells in the test group was significantly higher than that of the control rabbits at day 15 ( $p < 0.05$ ), but only the apoptosis rate of spermatogonia in the test 3 group was significantly higher than that of the control rabbits ( $p < 0.05$ ). The apoptosis rates of haploid cells and spermatogonia in the test groups were significantly higher than those in the control rabbits at day 30 ( $p < 0.01$ ), but the apoptosis rates of diploid cells were significantly higher than those in the control rabbits.

**Figure 1.** Comparison of spermatogenic cell cycle detection in rabbits

#### 4.2. EFFECTS OF OXYTROPIS GLABRA DC POISONING ON REPRODUCTIVE CELLS OF MALE ANIMALS

The effects of *P. minor* poisoning on the reproductive system of livestock were significant, with males exhibiting low libido and no mating ability. The main toxic component of *O. glabra* DC caused a significant decrease in the proportion of male spermatogonia transformed into primary spermatocytes, and further tests revealed that the number of stage  $G_0 / G_1$  cells in the reproductive organs of poisoned males increased significantly and the number of stage *S* cells decreased sharply. The toxic effects of *O. glabra* DC significantly inhibited the DNA synthesis of reproductive cells in stage *S* and significantly affected the entry of reproductive cells from stage *S* to stage  $G_2 / M$ . However, it had a facilitating effect on the entry of reproductive cells into stage  $G_1$ . The DNA content, intracellular  $Ca^{2+}$  concentration and mitochondrial membrane potential of the reproductive cells of male livestock poisoned with *O. glabra* DC were measured by flow cytometry, and it was found that bitter madderin significantly increased the apoptosis rate of spermatogonia and secondary spermatocytes, but did not significantly affect the apoptosis rate of primary spermatocytes, the reproductive cells in the division and proliferation stage were more sensitive to the main toxic components of *O. glabra* DC.

#### 5. CONCLUSION

*O. glabra* DC poisoning significantly affected the activity and expression of SOD enzymes in testis and epididymis tissues of rabbits. After 30 days of attack, the T-SOD, Cu/Zn-SOD and Mn-SOD activities in testis, and epididymis tissues of rabbits poisoned with *O. glabra* DC were extremely significantly lower than the control. T-SOD, Cu/Zn-SOD and Mn-SOD mRNA expressions and protein expressions were highly significant lower than the control. *O. glabra* DC poisoning caused a decrease in the antioxidant capacity of testes and epididymis in rabbits, which led to impairment of their reproductive function.

## **ABSTRACT**

The development of cross-border e-commerce has brought significant changes to the export benefits of manufacturing firms. This paper constructs a structural equation model oriented to cross-border e-commerce and firms' export competitiveness, establishing the variables of cross-border e-commerce from internal and external dimensions, and the variables of firms' export competitiveness from two dimensions: explicit competitiveness and potential competitiveness. Controlling other factors constant, the coefficients of export cross-border e-commerce treat are all significantly negative, and the competitiveness score of cross-border e-commerce is significantly lower than that of e-commerce exporters by 0.09. In the context of cross-border e-commerce, this study can help manufacturing enterprises to improve their export effectiveness.

## **KEYWORDS**

Cross-border e-commerce; Export efficiency; Structural equation modeling; Export competitiveness; Manufacturing firms

## **1. INTRODUCTION**

Cross-border e-commerce has become the theme of the times in recent years, and the market scale is growing rapidly [1]. The State Council and the General Administration of Customs have recently issued intensive documents to encourage cross-border e-commerce, boosting it to become an industry hotspot, and cross-border e-commerce will maintain its rapid development in the coming years [2-3]. With its own unique advantages of the Internet, cross-border e-commerce cleverly circumvents the drawbacks of long time, large capital and high cost in traditional trade, and creates a geographical and time unlimited transaction environment [4]. Cross-border e-commerce greatly facilitates buyers from all over the world and accelerates the global circulation of various goods [5-6].

Yu, W et al. conducted an in-depth study on the impact of cross-border e-commerce on international trade [7]. Chen, N et al. and other scholars proposed and verified that cross-border e-commerce as an important part of enterprise innovation, its business model innovation not only expands the connotation of electronic on the basis of the above-mentioned studies, commerce, and brings more new business opportunities for enterprises [8]. Giuffrida, M et al. conducted a study for Chinese online exporters and third-party freight logistics service providers, and used structural equation modeling analysis to assess firms' export risk management strategies [9]. Qi, X et al. used transaction cost theory as a basis to explain the motivational choice of cross-border e-commerce entry modes [10]. In the context of considering cross-border e-commerce supply chains, Liu, Z et al. proposed a series of

models based on blockchain technology, aiming to provide a new solution for cross-border e-commerce supply chain management [11]. Ma, S et al. studied the impact of applying different risk mitigation strategies on international online suppliers for cross-border e-commerce, and pointed out that customers would suffer less default losses in the context of increased frequency of post-event investigations [12].

## 2. INFLUENCE ANALYSIS MODELING

### 2.1. STRUCTURAL EQUATION MODEL

Based on the covariance matrix of variables, structural equation modeling (SEM) is an important method for impact factor studies. In it, the measurable variables are called observed variables and the non-measurable variables are called latent variables.

The equation of the measurement model is as follows:

$$y = \Lambda_y \eta + \varepsilon \quad (1)$$

$$x = \Lambda_x \xi + \delta \quad (2)$$

The structural model is calculated as follows:

$$\eta = B\eta + \Gamma \xi + \zeta \quad (3)$$

The fit is the central part of the structural equation model evaluation analysis, which represents the degree of fit of the variables and thus determines whether the model is scientifically valid.

### 2.2. VARIABLE STRUCTURE

#### 2.2.1. RESEARCH DIMENSIONS OF CROSS-BORDER E-COMMERCE

This paper identifies the research dimensions of cross-border e-commerce applications from both internal and external enterprise perspectives. The internal dimensions of enterprises include human resources, organizational structure and capital management. The external dimensions include laws and regulations and technological environment. The variable dimensions of cross-border e-commerce are shown in Table 1.

**Table 1.** Variable dimension of cross-border e-commerce

Environment	Dimension	Characteristic
Internal dimension	Human resources	The rapid transmission of information
	Organizational structure	Flatness
	Fund management	Efficiency of fund use
External dimension	Laws and regulations	Important safeguard function
	Technical environment	Play the role of carrier

#### 2.2.2. RESEARCH DIMENSIONS OF ENTERPRISE EXPORT COMPETITIVENESS

In this paper, we measure the competitiveness of companies in terms of both apparent and potential competitiveness. The variable dimensions of the export competitiveness of enterprises are shown in Table 2. The development of global Internet technology, the improvement of logistics level, the improvement of financial system and the improvement of economic level provide intrinsic and extrinsic conditions for the expansion of cross-border e-commerce market demand.

**Table 2.** The variable dimension of export competitiveness of enterprises

Environment	Dimension	Characteristic
Apparent competitiveness	Market demand	Expansion of demand
	Process cost	Determine the profitability of the enterprise
	Fund efficiency	Velocity of payment for goods
Potential competitiveness	Information sharing	Optimal allocation of resources
	Service level	E-commerce operation status
	Customer satisfaction	The business prospect of the enterprise

### 3. EMPIRICAL ANALYSIS OF CROSS-BORDER E-COMMERCE AND EXPORT EFFICIENCY OF ENTERPRISES

#### 3.1. ANALYSIS OF THE IMPACT OF EXPORT COMPETITIVENESS

The results of the empirical test of the competitiveness profile of exporting firms are shown in Figure 1. Controlling for other factors, the coefficients of export cross-border e-commerce treat are all significantly negative, and the competitiveness score of cross-border e-commerce is significantly lower than that of e-commerce exporters by 0.09. This indicates that the average firm competitiveness of export cross-border e-commerce is lower than that of other firms from 2015 to 2019. Since this finding is contrary to the theory, it implies that in analyzing the five-year sample interval from 2015 to 2019, there may be cross-sectional differences between the samples due to time-series effects, and inappropriate results may be obtained. Further study finds that the competitiveness of cross-border e-commerce export enterprises decreases significantly in 2019, which is significant at the 0.01 level in 2019, and its marginal effect shows an incremental increase. It indicates that the effect of reducing the competitiveness of enterprises in the experimental group in 2019 is larger than that in 2018, probably because the United States is the official start of the larger amount of Chinese goods tax in June, and the degree of impact on the competitiveness of enterprises in the first six months is not significant.

**Figure 1.** The empirical test results of the competitiveness of export enterprises

#### 3.2. THE IMPACT OF ENTERPRISE EXPORT EFFICIENCY

Compared with traditional trade transactions, both sides of the business in cross-border e-commerce mode can easily obtain the required information from the constructed platform or diversified ways. For small and medium-sized enterprises, they can avoid spending more time

and money on human search, and can directly obtain a lot of useful information related to the market, on the basis of which they can make their own business strategies more scientifically and effectively.

The development of the Internet platform makes it possible for both sides to communicate instantly through the Internet, so that they no longer need to face the distance and language barriers and negotiate face-to-face, as in the traditional trade model. At the same time, due to the dual limitations of time and space, the traditional business faction can usually only talk to one side of the import or export enterprises, and cannot reach the optimal choice with the least cost of time and space. In the waste of human resources, but also will face a greater risk of loss. In the cross-border e-commerce model, the “de-intermediation” of the e-commerce platform not only removes the link of trade intermediaries, but also simplifies the complexity of time and space, and overcomes the distance and language differences. On the basis of the breakthrough of time and space restrictions, it expands the range of choice of customers for enterprises.

#### **4. CONCLUSION**

Compared with the traditional trade model, cross-border e-commerce model has a great role in reducing the cost of SMEs' participation in the international market, thus improving the export efficiency of enterprises, and cross-border e-commerce has advantages for enterprises. However, it is also evident that there are many problems behind the immature e-commerce background. The study makes the following recommendations:

(1) Develop cross-border e-commerce-related laws and regulations, including standardization of transaction process, payment, and logistics.

(2) Promote the transformation and upgrading of enterprises, especially increase the integration of SMEs into the international market, lower the threshold of internationalization for SMEs, and encourage and support SMEs to strengthen infrastructure construction. Facilitate the construction and participation in the international market.

## ABSTRACT

This paper firstly discusses the medical principles and care protocols of orthopedic stress injuries and proposes a psychological intervention for their compliance problems. Then, a comparative experiment was used to study the differences in the time effect, between-group effect and interaction effect between the two groups to analyze the correlation between medical care and the effect of psychological intervention on compliance, and to analyze the reasons for the differences in the results. The difference in scores between the intervention and non-intervention groups was statistically significant at  $P < 0.05$ , and the adherence scores were higher in the intervention patients than in the non-intervention patients. This study provides a new idea and reference for the field of medical care and provides a basis and reference for psychological interventions to prevent adherence.

## KEYWORDS

Medical care; Stress injury; Adherence; Psychological intervention; Interaction effect; Correlation analysis

## 1. INTRODUCTION

Psychological intervention is usually a new therapeutic approach to intervene and guide the human body to a normal life when it encounters psychological frustrations and crises by taking a third party to intervene and share the treatment [1-2]. Human physiological and psychological activities are closely interrelated and influence each other psychological activities have an important regulatory role in the functioning of the human body systems and can have a large impact on human daily life, disease processes, etc. [3]. A healthy psychological state is an element of maintaining and improving physical health, which has both a preventive and antidisease effect, as well as a positive transformative effect on the process of disease treatment and recovery [4-5].

Clinical care workers should give psychological care interventions along with clinical medical care to patients Patients also develop new experiences of health in the process of receiving psychological care interventions [6-7]. Through emergency interventions, patients can reduce the purpose of the emergence of risk, on the other hand, can alleviate the patient's inner panic, insecurity, anxiety and other emotions, helping the patient's heart to health more conducive to the recovery of social functions [8-9].

Turner J et al. explored the therapeutic effects of fear interventions and relaxation methods

for cancer survivors and identified their potential mediators and moderators [10]. Hecht L M et al. analyzed the initial treatment effects of psychological interventions provided in primary care for patients suffering from chronic pain [11]. Kabadayi M et al. examined the effectiveness of psychological interventions for different groups with posttraumatic stress disorders and compared the effectiveness of psychological interventions in different groups [12].

## **2. MEDICAL CARE OF ORTHOPAEDIC STRESS INJURIES**

### **2.1. ORTHOPAEDIC STRESS INJURIES**

Pressure injuries originate either vertically or in the horizontal position, and pressure injuries are rarely mentioned clinically. Orthopedic stress injuries, such as spinal compression fractures. When the spine is fallen, the thoracolumbar spine is compressed during the fall due to vertical compressive stresses on the vertebrae and a vertebral compression fracture occurs.

Mostly seen in falls with osteoporosis, the bones may be compressed and flattened, and this is the time to have bone cement. Younger people may be a little more violent and have compression fractures when they fall from a height, and they need to be fixed with nails.

Compression fractures in other parts of the body, the heel bone also has a heel compressive stress when the heel falls from a height, resulting in a compressive comminuted fracture of the heel bone.

The knee joint is also the location of the tibial plateau, and if compressive stress is applied to this plateau, the medial plateau or lateral plateau will collapse, and these are common compression fractures in clinical practice. Less commonly, compression fractures can occur when the foot is crushed by a wheel. This kind is usually accompanied by severe soft tissue or skin compression injuries in addition to the bone being compressed.

### **2.2. PSYCHOLOGICAL INTERVENTIONS FOR ORTHOPAEDIC STRESS INJURIES**

Stress injury prevention includes two aspects. The first is to prevent it from occurring in people at risk. The second is to take measures to prevent it from worsening in patients who have already had it. For the preventive care of stress injury, psychological interventions can be taken.

Should actively give understanding and sympathy to their negative or unreasonable attitude, should remain tolerant calm, fully understand the patient's desperation, fear and bleaching inner pain, with love to ease, persuade the patient, so that they cheer up the courage to live, recognize the value of survival, avoid pessimistic loss stress injury patients often feel pain because of the delay in the course of the disease, prone to anxiety, pessimism, despair and other negative inferiority complex, to the disease The treatment of the loss of confidence, family members or caregivers should be patient and comfort, active guidance, and promote the early recovery of the patient's body.

## **3. CORRELATION ANALYSIS OF THE EFFECT OF PSYCHOLOGICAL INTERVENTIONS ON MEDICAL CARE AND ADHERENCE**

In this paper, high-risk patients with pressure injuries who were hospitalized in an orthopedic center of a tertiary care hospital in city A from June to November 2020 were selected to study the correlation between medical care and the effect of psychological interventions on adherence. The experiment was divided into an experimental group and a control group of 60 patients each, and the experimental group was given medical care while the control group was not given additional medical care.

There was no statistically significant difference between the adherence scores of the two groups before the intervention  $P > 0.05$ . Table 1 shows the comparison of the adherence of the

two groups before the intervention.

**Table 1.** Comparison of compliance between the two groups before intervention

Dimensions.	Experimental group (n=60)	Control group (n=60)	t	P
compliance	5.34±1.29	5.32±1.08	0.334	0.723

Table 2 shows the comparison of the adherence of the patients in the test and control groups before and after their own. The adherence scores of patients in the test and control groups increased after the intervention compared with those before the intervention, and the difference was statistically significant  $P < 0.05$ .

**Table 2.** Comparison of patients' compliance before and after the two groups

group	pre-intervention	post-intervention	t	P
Experimental group	5.32±1.21	7.92±10.32	-15.245	0.000
Control group	5.31±1.02	7.46±0.52	-14.234	0.000

Table 3 shows the comparison of patient compliance between the experimental and control groups after the intervention. The difference between the scores of the two groups after the intervention was statistically significant  $P < 0.05$ , and the adherence scores of patients in the test group were higher than those in the control group.

**Table 3.** Comparison of compliance between the two groups after intervention

dimension	Experimental group (n=60)	Control group (n=60)	t	P
compliance	7.93±10.56	7.47±0.56	5.025	0.000

Table 4 shows the adherence scores of the patients in the two groups at different time points. There was no statistically significant difference between the adherence scores of the patients in the test and control groups before the intervention  $P > 0.05$ , and the scores of the test group were higher than those of the control group 1 month and 2 months after the intervention  $P < 0.05$ . Figure 1 shows the trend of the adherence scores of the patients in the two groups at different time points. The adherence scores of the test group and the control group showed an increasing trend.

**Table 4.** Compliance scores of the two groups at different time points

group	Number of people	pre-intervention	1 month after intervention	2 months after intervention	F	P
Experimental group	60	5.36±1.22	6.83±0.83	7.93±10.34	123.611	0.000
Control group	60	5.30±1.04	6.44±0.83	7.44±0.43	98.782	0.000
t		0.345	2.635	5.022		
p		0.743	0.004	0.000		

**Figure 1.** Compliance score trends of the two groups at different time points

The results of the study showed that before the intervention, the adherence scores of the test and control groups were comparable  $P > 0.05$ , and with the extension of time, both the test and control groups showed an increase in the level of adherence, but the adherence scores of the test group were higher than those of the control group  $P < 0.05$ . By repeated measures ANOVA, the results showed statistically significant differences in the time effect, between-group effect and interaction effect of the two intervention groups  $P < 0.05$ , indicating that medical care was effective in enhancing the level of compliance in patients with orthopedic stress injuries.

The analysis may be due to the fact that positive emotions were promoted through positive psychological interventions, and in positive psychological group interventions, patients shared with each other and exchanged their experiences, especially when patients with longer years of illness used their personal experiences to tell their patients the importance of perseverance, which effectively enhanced the compliance of orthopedic stress injury patients. The patients' experience of positive emotion was enhanced, and they faced life with a positive attitude, which enhanced their confidence in disease treatment, thus improving their level of compliance.

#### 4. CONCLUSION

This paper first explored the medical care modalities of orthopedic stress injury, and then investigated the effect of psychological interventions of medical care on prevention compliance in high-risk patients with orthopedic stress injury through a comparative experiment. The following conclusions are drawn:

The scores of the experimental group 1 month after the intervention and 2 months after the intervention were higher than those of the control group  $P < 0.05$ . This indicates that the psychological intervention of medical care on the prevention of compliance in patients at high risk of orthopedic stress injury is effective, and the effect of the intervention is better with the increase of time.

Before the intervention, the adherence scores of the test and control groups were comparable  $P > 0.05$ . With the extension of time, the adherence levels of both the test and control groups showed an increasing trend, but the adherence scores of the test group were higher than those of the control group  $P < 0.05$ . This indicates that medical care can effectively improve the adherence levels of patients with orthopedic stress injury.

## ABSTRACT

This paper firstly uses scale statistics to analyze the influencing factors of the integration of civil construction professional and innovation and entrepreneurship education, uses hierarchical analysis to establish an evaluation model to evaluate the importance degree of the factors affecting the integration, and distills the factors affecting the integration of civil construction innovation and entrepreneurship education and professional education at the university level, and calculates the influence weights of each factor through the model indexes, finally, some targeted countermeasures are proposed. The factors affecting the integration influence are curriculum system, practice platform, innovation and entrepreneurship atmosphere, faculty team, innovation and entrepreneurship education concept, professional talent training program, policy support, integration mode, teaching management system and evaluation index system, and their weights are 0.3378, 0.2055, 0.1454, 0.0886, 0.0645, 0.0593, 0.0232, 0.0194, 0.0116, 0.0049.

## KEYWORDS

Civil construction profession; Innovation and entrepreneurship education; Hierarchical analysis; Talent training; Influence weight; Integration path

## 1. INTRODUCTION

In today's rapidly developing world of science and technology, society demands a higher level of quality of human resources, and teaching, research and service to society are the three recognized functions of universities [1-2]. The service to society function is becoming more and more important today, and in the knowledge society, universities are seen as a powerful direct driver for future socio-economic growth, and the economic value brought by knowledge is infinitely estimated [3-4].

With the rapid development of science and technology in today's world, challenges and opportunities coexist, society needs more talents who can adapt to the changes of the times, and universities undoubtedly need to shoulder the task of talent training reform [5-6]. In the field of higher education in China, education related to the advancement of entrepreneurship for students has become a crucial strategic initiative [7]. Chinese universities are deeply aware of the need to combine with professional education [8]. At present, although the two have made certain achievements in the process of development, they still have not achieved the expected results, and need to further vigorously promote a deeper integration of the two [9].

Wang C proposed the use of fuzzy fault tree analysis to evaluate the quality of relevant education and the reliability of mechatronics classroom teaching for university teachers and

students [10]. Georgescu P et al. pointed out that the university should improve the integration of study and research as well as practice to address the imbalance between the supply of talents in universities and the needs of industrial development [11]. Cascais E et al. explored the key factors that influence the self-efficacy of lifestyle entrepreneurs in innovation and entrepreneurship [12].

This paper uses scale statistics to explore the integration status of civil construction majors and innovation and entrepreneurship education, and uses hierarchical analysis to establish an evaluation model to assess the degree of importance of factors affecting integration. At the university level, this paper summarizes the key factors affecting the integration of civil construction majors and innovation and entrepreneurship education, and calculates the influence weight of each factor. In response to the ranking of the influencing factors, relevant countermeasures for the integration of civil construction majors and innovation and entrepreneurship education are proposed.

## 2. ANALYSIS OF FACTORS INFLUENCING THE INTEGRATION OF CIVIL ENGINEERING AND INNOVATION AND ENTREPRENEURSHIP EDUCATION

This paper uses scale statistics to study the factors influencing the integration of civil engineering and innovation and entrepreneurship education, and this paper mainly focuses on University A. A total of 350 and 100 questionnaires were collected from students and teachers respectively, and the final valid questionnaires were 293 and 85 respectively after strict screening. Hierarchical analysis was used to evaluate the importance of factors influencing the integration of innovation and entrepreneurship education and professional education in civil engineering. The importance ranking of factors influencing the integration of innovation and entrepreneurship education and professional education in civil engineering was obtained from the perspective of students and teachers respectively, and finally the main factors influencing the integration of innovation and entrepreneurship education and professional education in civil engineering were extracted by combining the ranking results of students and the ranking results of teachers.

### 2.1. STATISTICAL RESULTS OF THE SCALE

Tables 1 and 2 show the statistical results of the top 10 factors affecting the integration of innovation and entrepreneurship education and professional education in civil engineering according to students and teachers, respectively.

**Table 1.** Statistical results of 10 Factors affecting integration (Student)

	Have no effect	General effect	Great influence	Great influence	Very large influence	total
Influencing factor	1 points	2 points	3 points	4 points	5 points

## 2.2. MODELING OF HIERARCHICAL ANALYSIS

Figure 1 Hierarchical structure of the analysis of the factors of integration of innovation and entrepreneurship education and professional education in civil engineering derived from the hierarchical analysis method.

**Figure 1.** Hierarchical structure of fusion factor analysis

## 2.3. ANALYSIS OF MODEL METRICS

The importance ranking of factors affecting the integration of innovation and entrepreneurship education and professional education in civil engineering was derived from students' and teachers' perspectives, respectively, and the main factors affecting the integration of innovation and entrepreneurship education and professional education in civil engineering were extracted by combining the ranking results of students with those of teachers, and Table 3 shows the comparison of integration criteria. According to the size of the score difference of the importance of the two factors, the scale is determined and the judgment matrix of each level is established A. Finally, the respective weight values of the primary and secondary matrices are calculated by YaahpV12.4 software.

**Table 3.** Comparison of fusion criteria

	environment	resources	Management and regulations
environment	1	1/4	3
resources	4	1	7
Management and regulations	1/3	1/7	1

Obtain the first-level judgment matrix:

$$A_1 = \begin{bmatrix} 1 & 1/4 & 3 \\ 4 & 1 & 7 \\ 1/3 & 1/7 & 1 \end{bmatrix}, \quad w_1 = \begin{bmatrix} 0.2109 \\ 0.7049 \\ 0.0841 \end{bmatrix} \quad \lambda_{\max} = 3.0324 \quad (1)$$

Consistency indicators:

$$CI = \frac{\lambda - n}{n - 1} = \frac{3.0324 - 3}{3 - 1} = 0.0162 \quad (2)$$

Consistency ratio:

$$CR = \frac{CI}{RI} = \frac{0.0162}{0.515} = 0.03145 < 0.1 \quad (4)$$

By the consistency test, the feature vector  $w_1$  of  $A_1$  can be used as the weight vector at this time.

Therefore, the weight vector is:

$$w_1 = \begin{bmatrix} 0.2109 \\ 0.7049 \\ 0.0841 \end{bmatrix} \quad (5)$$

The weights of each factor were calculated. Figure 2 shows the importance ranking of each influencing factor. The importance ranking of factors affecting the integration of innovation and entrepreneurship education and professional education in civil engineering are curriculum system, practice platform, innovation and entrepreneurship atmosphere, faculty team, innovation and entrepreneurship education concept, professional talent training program, policy support, integration mode, teaching management system, and evaluation index system, and their weights are 0.3376, 0.2052, 0.1874, 0.0883, 0.0625, 0.0599, 0.0238, 0.0193, 0.0118, and 0.0043, respectively, 0.0625, 0.0599, 0.0238, 0.0193, 0.0118, 0.0043.

**Figure 2.** Importance ranking of each influencing factor

### **3. MEASURES FOR THE INTEGRATION OF CIVIL ENGINEERING AND INNOVATION AND ENTREPRENEURSHIP EDUCATION**

#### **3.1. DEEP COOPERATION BETWEEN SCHOOLS AND ENTERPRISES TO ESTABLISH PRACTICE BASES**

Higher vocational colleges and enterprises cooperate deeply, jointly establish innovative practice bases with reasonable layout, complete functions, matching equipment and sufficient quantity, guarantee the quality of talent cultivation in practice. Higher vocational colleges and universities can rely on enterprise resources and equipment, jointly agree on talent training programs, precisely analyze the qualities required by industry enterprises, formulate reasonable, systematic and complete curriculum teaching plans, provide sufficient guarantees for students' internship training and innovation and entrepreneurship practice, give teaching guidance in terms of professional development and innovation ability cultivation, and improve the school system of industry-education integration.

#### **3.2. CULTIVATE STUDENTS' CREATIVE CONSCIOUSNESS AND INNOVATION ABILITY**

Strengthen students' awareness of the subjective integration of professional learning and innovation and entrepreneurship education, strengthen the learning of cultural knowledge and connotation literacy, enrich their knowledge reserves, understand and think deeply about professional knowledge, pay attention to the exercise and cultivation of personal ability, and encourage students to actively and enthusiastically innovate.

#### **3.3. REFORM OF COURSE TEACHING METHODS AND EXAMINATION METHODS**

Integrating innovation and entrepreneurship education in civil construction not only in terms of teaching methods, the traditional indoctrination method is changed to transform the passive acceptance of students, so that more students can actively participate in teaching activities. Use the form of student discussion and teacher-student discussion to cultivate students' creative thinking.

### **4. CONCLUSION**

This paper studies the factors influencing the integration of civil construction majors and innovation and entrepreneurship education in undergraduate institutions, and constructs the

integration path of civil construction majors and innovation and entrepreneurship education. The following conclusions are drawn:

The importance ranking of factors influencing the integration of civil construction innovation and entrepreneurship education and professional education are curriculum system, practice platform, innovation and entrepreneurship atmosphere, faculty team, innovation and entrepreneurship education concept, professional talent training program, policy support, integration mode, teaching management system and evaluation index system, and their weights are 0.3378, 0.2055, 0.1454, 0.0886, 0.0645, 0.0593, 0.0232, 0.0194, 0.0116, 0.0049.

---

## ABSTRACT

This paper first examines the definition and connotation of translator subjectivity. Then, starting from Sai Pearl's cultural identity and its influence, it explores her subjectivity in the selection of materials for translation, translation operation and the defense of the translation. Finally, we explore the university between author subjectivity, translator subjectivity and reader subjectivity, and analyze the intersubjectivity of the translation of Water Margin from the perspective of Sai Pearl's upbringing and translation process. The subjectivity is expressed in the translation method which reflects the translator's subjective will to the greatest extent, and Sai's translation reflects Sai Pearl's value identification with Chinese culture and respect for the differences between Chinese and Western cultures. Inter-subjectivity is mainly manifested in the fact that the translator's subjective behavior is constrained by other subjects such as readers, patrons and publishers, and Sai is constrained by other subjects in the translation of the book title. The study of this paper is important for the translation and study of Water Margin.

## KEYWORDS

Water Margin; Subjectivity; Intersubjectivity; Translation operation; Value identity; Cultural differences

## 1. INTRODUCTION

By subjectivity is meant the basic characteristics of the subject in the activity of the object [1]. Specifically, subjectivity is the externalization of the subject's basic abilities in the activity of the object and has the characteristic of actively transforming the object, influencing it, and controlling it as a way to serve it [2]. Subjectivity includes purposefulness, autonomy, initiative, creativity, etc. [3]. Therefore, subjectivity is a subjective initiative. The translator is the subject of translation, and the original work is the object of the translator's activity. In order to successfully complete the translation task and achieve the translation goal, the translator must give full play to his or her subjective initiative [4]. However, the exercise of subjective initiative may be restricted by various factors such as the language characteristics and habits of the original work and the translated work, the language and culture of the original work, and the time in which the translator lives [5]. Inter-subjectivity is also called interactive subjectivity. It is a property that is reflected in the relationship between people that is inherent in their interaction, communication, influence and exchange, and is a prerequisite for achieving mutual understanding between different subjects, their common validity and coexistence [6]. The literature [7] studied the subjectivity of translation in discourse, comparing the different manifestations of subjectivity in translation in different fields.

## **2. THE SUBJECTIVITY OF SAI PEARL'S TRANSLATION OF WATER MARGIN**

### **2.1. DEFINITION AND CONNOTATION OF TRANSLATOR SUBJECTIVITY**

The so-called translator's subjectivity refers to the subjective initiative or creativity that the translator, as the subject of translation, shows in the translation to realize the translation purpose under the premise of respecting the translation object. Translation is a special kind of reading and interpretation activity, which is not a simple restoration of the original work, but a constructive interpretation containing individual experience. The translator's subjectivity is reflected in the "production" rather than "reproduction" of the meaning of the original text, and the "gaps" and multiple meanings of the original text are not only a sharp weapon for the translator, but also a source of creativity. It is also a source of creativity. In order to give the reader the same sense of artistic beauty as the original, the translator must find a linguistic means to mobilize and stimulate the reader to make the same or similar associations in the translated language. In order to achieve this, the translator needs to read and study the original text with a fair amount of care, as well as to be bilingual and bicultural. In this way, the translator's work is not a simple copy of the original text, but another kind of creation. And by interweaving his or her current reading experience with the historical experience of the past, the translator goes beyond the meaning given by the static text.

### **2.2. ANALYSIS OF THE TRANSLATOR'S SUBJECTIVITY IN SAI'S TRANSLATION OF WATER MARGIN**

When translation is regarded as an act of "encroachment/transgression", the meaning of translator's subjectivity goes beyond the dichotomy of translation-output-translation-input set by traditional translation studies, and is more expressed in the spirit and courage of the translator's subject to challenge the power. The "encroachment" in the context of deconstructionism is to a large extent limited to crossing the boundaries set by the original language or the original language itself, but in postcolonial theory, "encroachment" is given a new connotation of resisting the cultural power of the translated language, and is given a new connotation of resisting the cultural power of the translated language. In postcolonial theory, "encroachment" is given a new connotation of resistance to the cultural power of the translated language, and becomes a subjective ethical consciousness of the translator to break the inequality of power. If contemporary translators and translation researchers in the post-colonial context, especially translators and translation theorists in the Third World, have a profound experience and understanding of cultural colonization and cultural hegemony, and consciously take an anti-colonial and anti-hegemonic stance and behavior in theory and practice, it is a reasonable choice. If it is a reasonable choice to take an anti-colonial and anti-hegemonic stance and behavior, then, as a strong cultural translator in the colonial era, Pearl Sai's recognition of the problem of cultural hegemony and her conscious "encroachment" on the strong translating language in the translation process show the rare subjective spirit of a "post-colonial" pioneer. His translation strategy was one of the few, though not unique, at that time, and thus the ethical significance and historical value of his subjective behavior make it an ideal case study of the subjectivity of translators in post-colonial translation theory, and an ethical model and methodological reference for Chinese and foreign translators in the post-colonial context. Based on the above considerations, this paper intends to explore the subjectivity of the translator in the selection of materials, translation operation and the defense of the translation, as well as the game and dialogue between the translator's subject and the target subject, and to reveal the influence and significance of the translator's subjectivity and the subjectivity in the translation process on the translation of Water Margin, starting from the cultural identity of Sai Pearl and its influence.

### **2.2.1. THE CULTURAL IDENTITY OF SAI PEARL AND ITS INFLUENCE**

The translator's subjective behavior originates from his or her translation motivation, which is inextricably linked to the cultural identity of the translator subject. Therefore, clarifying the issue of Sai Pearl's cultural identity is an important prerequisite for studying and interpreting his or her translation subjectivity. Zhang Jinyuan points out that "identity is not determined by descent, but is the result of society and culture. Race, class, gender, and geographical location influence the formation of 'identity,' and specific historical processes, specific social, cultural, and political contexts also play a decisive role." But the difficulty in defining Pearl's cultural identity lies mainly in the fact that, in terms of nationality, descent or race, she seems to be unquestionably an American who has lived in China for many years, while, in terms of cultural background, she grew up and lived in China for a long time, was deeply influenced by Chinese culture, and to a large extent is more like a Chinese person. These are only objective factors, but if we add the subject's own cultural identity, the problem will be even more complicated. Pearl's cultural identity has actually transcended the category of pure "Chinese" or "American", and presents a typical hybrid and "mixed" character.

Pearl's migration experience is perhaps better described and explained by the postcolonial theory of "ethnic dispersal" and the resulting "cultural mingling. Ethnic diaspora refers to "the dispersal of a race to different parts of the world, either by force of external forces or by self-choice". However, post-colonial theory is mainly concerned with the phenomenon of migration from the Third World to the First World and the cultural identity/identity of immigrants, while the reverse ethnic diaspora and the cultural hybridity and identity it brings do not seem to enter its theoretical agenda. However, there is no essential difference between third-world to first-world and reverse diaspora in terms of the subject's feelings and experiences in terms of self-fragmentation, sense of marginality, and identity/identity anxiety. Whitfield points out that Pearl's situation reverses the dominant paradigm of cultural hybridity research in two ways. First, the process of cultural change and assimilation is often from East to West, from societies of color to white societies; second, the pursuit of power is human nature. Therefore, a study of Sai Pearl's immigrant experience and the resulting cultural identity not only helps to explain the motives of her creative work, translation and social activities, but also complements the gaps in postcolonial theory in this regard.

### **2.2.2. SUBJECTIVITY IN THE TRANSLATION PROCESS**

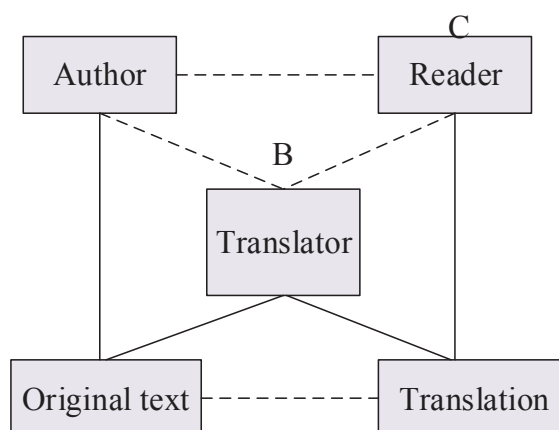

In terms of translation methods, text manipulation and cultural translation strategies, Sai Pearl can be said to have maximized the value of the translator's subjectivity, i.e., the resistance to the powerful culture. On the other hand, China's own internal and external problems and self-denial led to a "one-sided" situation in the field of cultural exchange, in which Western discourse became the fashion and mainstream, The young intellectuals were keen to criticize and deny their own language, culture, literature and other traditions.

Her choice of the translation of *Water Margin* and the 70-volume *Jin Pao* reflects her awareness and respect for the literary and artistic value and relevance of the original work. Sai's translation reflects Sai's recognition of the value of Chinese culture and her respect for the differences between Chinese and Western cultures, which should be recognized as significant in clarifying the identity and maintaining the uniqueness of Chinese culture in cultural exchange. If the translation method reflects the translator's subjective will to the greatest extent, then Sai Pearl's translation of the title reflects that the translator's subject has a passive side in addition to subjective initiative. The analysis of the translator's subjectivity in the selection of materials and translation process of Sai Pearl fully illustrates the complexity and multifaceted nature of the subject's motivation and behavior.

### 3. INTER-SUBJECTIVITY IN THE TRANSLATION OF SAI PEARL'S WATER MARGIN

Inter-subjectivity theory tries to grasp the relationship between subjects and subjects, and between individuals and society from a new perspective, advocating a relationship that is both one and the other, where you have me and I have you, and co-exist at the same time. It transcends the dichotomy of the subject-object mindset and has important guiding significance for translation. Figure 1 shows the relationship between subjects and between individuals and society.

Translation research draws on its ideas and moves from the subjectivity of translation subjects to intersubjectivity. The translator, as the subject of translation, also constitutes an intersubjective relationship with other translation subjects, the original author and the reader. Since the author and the reader of the translation are in different cultures, the translator should not only be familiar with two languages, but also understand two different cultures. However, there are inevitable contradictions and conflicts of language conversion in translation. In particular, the three subjects involved in literary translation activities, namely, the author, the translator and the reader, are not isolated subjects, but a kind of co-existing self premised on the existence of each other. It is very important to harmonize the relationship between the three, so that the co-existing selves can give full play to the harmonious creative role in translation. In a word, translation is the result of the mutual constraint of author subjectivity, translator subjectivity and reader subjectivity.

**Figure 1.** Diagram of the relationship between the three

In the process of translation, the “ideology” and “poetics” of the culture of the translated language will influence and restrict the translator at all times, which is also an important factor to ensure the readability and acceptability of the translated text. In many cases, the ideological and poetic norms of the translated language are internalized into the translator’s conscious behavior. Although Pearl Sai grew up in China and was deeply influenced by Chinese culture, her family education and church school life kept her in close contact with American culture, and her adult life in American universities deepened her understanding of American culture. Her unique upbringing enables her to take care of the needs of both the author and the reader in the translation process, so that her translation not only conveys the Chinese culture and linguistic characteristics to the greatest extent possible, but also conforms to the poetic norms of the target language. The translator’s interlinguistic strategies in the translation process are largely determined by the translator herself, but this does not mean that the translator enjoys absolute freedom of decision making in the process. The translator’s behavior may also be subject to the constraints of other subjects such as readers, sponsors and publishers. Although Sai Pearl enjoyed a great deal of freedom in the selection of the edition of *Water Margin* and the specific operation of translation, her translation of the title of the book was subject to the constraints of other subjects.

#### 4. CONCLUSION

This paper first studies the subjectivity of the translation of Sai's translation of *Water Margin*, explores the definition and connotation of subjectivity, and analyzes the subjectivity of the translation at the level of cultural identity and its influence, and the translation process. The inter-subjectivity of translation is then analyzed at the level of the contradiction and conflict of language conversion in translation. Sai Pearl's unique upbringing enables her to take care of the needs of both subjects, the author and the reader, in the process of translation, so that her translations can convey both Chinese culture and linguistic characteristics to the greatest extent. Although Sai Pearl enjoyed a great deal of freedom in the selection of the edition of *Water Margin* and the specific translation operation, her translation of the title was constrained by the other subjects.

# AN ANALYSIS OF PRESCHOOL CURRICULUM AND TEACHER QUALITY IN THE ERA OF BIG DATA

---

Xiaomeng Wu\*

Faculty of education, Beijing City University, Beijing, 101300, China

[wuxiaomeng850205@126.com](mailto:wuxiaomeng850205@126.com)

---

## ABSTRACT

This paper first investigates the curriculum framework of preschool education in the era of big data, and explores the training objectives, curriculum structure, and curriculum content of preschool education. Then the professional philosophy, professional knowledge, and professional competence level of preschool teachers were investigated through online and offline methods to assess the current quality of early childhood teachers. Finally, preschool education reform measures were proposed in response to the data analysis. The overall score of teachers' professional philosophy was 3.65, the average score of each item of professional knowledge only fluctuated between 3.4 and 3.6, and the overall score of teachers' professional competence and each item of their scores were above 3.6, indicating that the professional quality situation of early childhood teachers is at an intermediate level, and educational theoretical knowledge and scientific research ability still need to be improved. The study of this paper is important for improving the quality of preschool teachers and promoting the development of preschool education.

## KEYWORDS

Preschool education; Teacher quality; Training objectives; Curriculum structure; Educational competence

## 1. INTRODUCTION

As the foundation of the whole education system, preschool education is very important. The state and society are paying more and more attention to the status of preschool education, which also puts forward higher requirements for the training of early childhood teachers [1-2]. With the development and progress of society, the overall quality of people has improved, which has promoted the rapid development of the preschool education industry, but there is a lag in the construction of teachers due to the extreme lack of talents related to preschool education, resulting in the unbalanced and insufficient development of preschool education [3-4]. Social development has put forward higher requirements for the specialization of early childhood teachers, and kindergartens have higher standards for the educational requirements of teachers [5-6].

Bautista A The current state of arts education in a kindergarten in Singapore was examined through an analysis of extensive observational data from the kindergarten [7]. Dhawan et al. surveyed 65 pairs of urban parents' perceptions of preschool education and found that despite the perceived importance of early childhood education for their children's development, parents were less knowledgeable about play-based approaches and preferred traditional subject education [8]. Elbaum B et al. explored developmental outcomes of preschool special

education services for cohorts of participating children statewide [9]. Beets et al. provided key information for successful interventions in early childhood physical activity by examining the effects of preschool competencies, quality of prevention support systems, and teacher characteristics on the level of implementation of outdoor activities in kindergarten [10].

## **2. PRESCHOOL EDUCATION CURRICULUM IN THE ERA OF BIG DATA**

With the rapid development and popularity of information technology, preschool education curriculum in the era of big data is gradually going digital, informational and technological. In such a context, preschool education begins to focus on cultivating children's information literacy and technological innovation ability.

### **(1) Training Objectives**

The cultivation goal of preschool curriculum is to enhance children's intellectual, emotional, social and hands-on skills as the main purpose to help children develop comprehensively. And in the era of big data, in addition to the traditional cultivation goals, we should also focus on cultivating children's information literacy and technological innovation, so that children can master basic information technology and develop their innovative thinking and practical skills.

### **(2) Course Structure**

The curriculum structure of preschool education needs to include curriculum development, materials development, and instructional management for each kindergarten grade level. In the era of big data, the curriculum structure needs to be updated and improved, which includes:

#### **1. Increase in information technology courses**

Information technology courses should be an important part of preschool education. In addition to the traditional basic computer courses, innovative and interesting courses such as digital enlightenment, smart manufacturing and virtual reality should be added to allow children to master IT through exploration and innovation.

#### **2. Construction of science and technology education experience area**

Technology education experience area is an open space that allows children to master knowledge and skills through independent exploration and discovery. This area can be set up with different scenarios and equipment, such as VR glasses, robots, intelligent electronic blocks, etc., allowing children to improve their information literacy and innovation skills through exploration and innovation.

#### **3. Game-focused learning**

Games are one of children's favorite activities and a way to learn. In the era of Big Data, games can be seen as an educational tool that can help children acquire knowledge and skills while playing. Therefore, play as a core learning style should be added to the curriculum structure.

### **(3) Course content**

The curriculum content of preschool education should be closely focused on the developmental needs of children, so that children can master knowledge and skills through games and interactions. In the era of big data, the curriculum content should add information technology-related content to the original foundation, such as digital enlightenment, intelligent manufacturing, virtual reality, etc. Some innovative and interesting courses, such as robotics programming and 3D printing, can also be added so that children can develop innovative thinking and practical skills through exploration and practice. Some digital culture courses, such as digital art and digital music, can also be introduced so that children can better

understand the diversity and charm of the digital world and develop aesthetic and artistic skills. Some social courses, such as emotional intelligence education and teamwork, can also be included so that children can learn to communicate, cooperate and share in an interactive way, and develop all-round abilities in all aspects. In conclusion, the curriculum content of preschool education needs to be constantly updated and improved to meet the needs of the new era, so that children can grow up healthy and happy.

### 3. ANALYSIS OF PRESCHOOL TEACHERS' QUALITY IN THE ERA OF BIG DATA

In order to ensure the authenticity and comprehensiveness of the data of this research study, this paper interviewed 13 private kindergarten teachers through online and offline methods: A1, A2, A3 teachers in City A, B1, B2 teachers in City B, C1, C2 teachers in County C, D1, D2 teachers in County D, E1, E2 teachers in County E, and F1, F2 teachers in County F. The questionnaire for this study focused on the professional quality of kindergarten teachers. The questionnaires were brought to the field for distribution and collected on the spot after being completed by the respondents. 200 questionnaires were distributed and 180 were collected, with a recovery rate of 94.5%, of which 182 were valid, with an efficiency rate of 90%, which meets the requirements of the questionnaire recovery rate of the survey research and also indicates that the data of this survey are valid.

#### 3.1. QUESTIONNAIRE RELIABILITY AND VALIDITY ANALYSIS

The reliability of the questionnaire in this study was tested by using reliability analysis in SPSS 20.0 for the reliability of the questionnaire. Table 1 shows the reliability of the questionnaire on the current professionalism of kindergarten teachers. The overall Cronbach's  $\alpha$  coefficient of the questionnaire was 0.895. The Cronbach's  $\alpha$  coefficients of professional philosophy, professional knowledge and professional competence were 0.814, 0.743 and 0.825 in order. The questionnaire used in this study has good reliability coefficient and can be used with confidence. Factor analysis also revealed that the KMO value of the questionnaire was 0.898, corresponding to a probability value of  $P < 0.05$ , and the validity of the questionnaire was acceptable.

**Table 1.** Reliability of the questionnaire on the status quo of teachers' professional quality

dimension	Cronbach $\alpha$ index
General questionnaire	0.8958
Professional concept	0.814
Professional knowledge	0.743
Professional ability	0.825

#### 3.2. ANALYSIS OF TEACHERS' PROFESSIONAL PHILOSOPHY

Table 2 shows the teacher professional philosophy scores. The overall situation of the professional philosophy of kindergarten teachers was good. The scores of each item of professional philosophy are shown in the table. According to this study, the scores of the collected data were processed using a five-point Likert scale with a median score of 3. Thus, a higher score indicates that the teacher performs better in making judgments on this item consciously. The data obtained from the analysis showed that the overall score of teachers' professional philosophy was 3.65 and their mean scores for each item were above 3.0, which indicates that the kindergarten teacher team has a good professional philosophy and is a team of teachers who love early childhood education and care and love children. According to the scores, the items of professional philosophy were ranked as the concept of valuing children, professional belief of loving teaching, and positive and optimistic mindset.

**Table 2.** Scores of teachers' professional concepts

project	M	SD
Positive and optimistic attitude	3.45	1.068
Attach importance to the concept of young children	3.82	0.974
Faith in education and teaching	3.67	1.018

### 3.3. ANALYSIS OF TEACHERS' EDUCATIONAL EXPERTISE CAPABILITIES

Table 3 shows the teachers' professional knowledge competencies in early childhood education. The mean scores of each item of professional knowledge fluctuated only between 3.4 and 3.6, indicating that private kindergarten teachers have low self-evaluation in conducting the evaluation of professional knowledge mastery. Among them, knowledge of early childhood psychology scored the lowest at 3.56, and its degree of variation was large, indicating that kindergarten teachers' knowledge of early childhood psychology was poor. The mastery of 3.67 for early childhood pedagogy and 3.56 for early childhood psychology further indicates that kindergarten teachers are negligent in their knowledge of basic education theory.

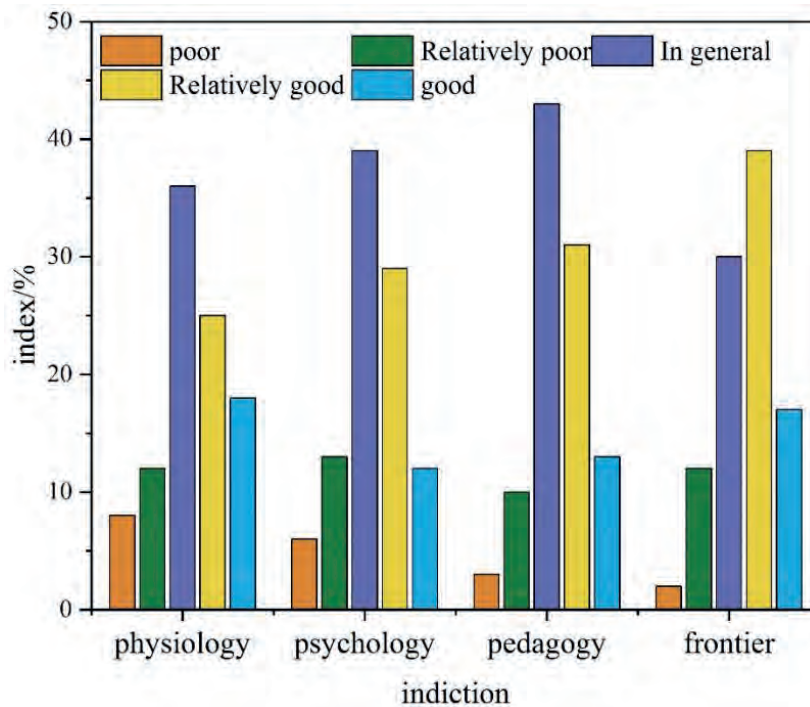

**Table 3.** Professional knowledge and ability of teachers in early childhood education

project	M	SD
Infant physiological knowledge	3.66	1.043
Knowledge of infant psychology	3.56	1.144
Preschool pedagogy knowledge	3.67	0.957
Advanced knowledge of preschool education	3.59	0.956

Teachers' knowledge of early childhood physiology. As shown in the figure, 8% of the kindergarten teachers self-rated their mastery of physiological knowledge of young children as very poor, 12% of the teachers self-rated it as worse than poor, 37 % of the teachers self-rated their mastery as fair, 25% of the teachers self-rated their mastery as relatively good, and only 18% of the teachers were very good. Cumulatively, 57% of the teachers self-rated their mastery of physiology as poor.

For the evaluation of the knowledge of early childhood psychology, a cumulative 58.2% of the teachers indicated that the mastery was very poor. As for the knowledge of early childhood pedagogy, 55.5% of the teachers indicated that their mastery was very poor. More than half of the respondents indicated that their knowledge of early childhood psychology and early childhood pedagogy was insufficient. Among the kindergarten teachers, the young teachers did not have enough knowledge and experience in early childhood education. Figure 1 shows the self-assessment of teachers' professional knowledge.

**Figure 1.** Self-evaluation of teachers' mastery of professional knowledge

### 3.4. ANALYSIS OF TEACHERS' PROFESSIONAL EDUCATIONAL COMPETENCE

The overall teacher professional competency scores and their individual scores are above 3.6, which means that kindergarten teachers have high professional competency overall. On its various items, early childhood education competency scores were the highest and the most stable, i.e., the least variation among teachers. In contrast, educational research competency scored the lowest and had the greatest variation among teachers. The overall indicates that early childhood education competency, as a basic quality necessary for kindergarten teachers, is generally valued in kindergartens, but with social and economic development and progress, kindergarten teachers are not only required to do well in early childhood education, but their educational research competency is also added to their overall competency assessment. Kindergarten teachers need to be further strengthened in their research ability. Table 4 shows the professional competency scores of teachers.

**Table 4.** Scores of teachers' professional competence

project	M	SD
Early childhood educational ability	3.88	0.759
Educational and scientific research ability	3.67	1.077
Total professional competence	3.85	0.724

## 4. CONCLUSION

This paper mainly studies the curriculum setting of preschool education in the context of big data, as well as analyzes the quality of preschool teachers in the era of big data in three dimensions: professional philosophy, professional knowledge, and professional competence. The following conclusions are drawn:

Preschool education curriculum in the era of big data is gradually going digital, informational and technological. Preschool education should focus on cultivating children's information literacy and technological innovation ability.

In terms of teachers' professional philosophy, the overall score of teachers' professional philosophy was 3.65, and their mean scores for all items were above 3.0, which indicated that

the professional philosophy of the kindergarten teacher team was good.

In terms of professional knowledge competence in early childhood education, the mean scores of each item of professional knowledge fluctuated only between 3.4 and 3.6, indicating that private kindergarten teachers have low self-evaluation in conducting the evaluation of mastery of professional knowledge. The mastery of 3.67 in early childhood pedagogy and 3.56 in early childhood psychology indicates that kindergarten teachers are negligent in paying attention to theoretical knowledge of basic education.

In terms of teachers' professional educational competence, the overall score of teachers' professional competence and all of their scores were above 3.6, which means that kindergarten teachers in general have high professional competence. Educational research ability scored the lowest and had the greatest variation among teachers. Kindergarten teachers need to be further strengthened in their research ability.

## ABSTRACT

In this paper, the implementation process of the AOA algorithm is firstly studied, and then the TDOA localization algorithm alone or the AOA localization algorithm is used in combination to improve the AOA algorithm. Then the definitions of entropy and image entropy are discussed, and an image recognition model based on the improved AOA algorithm with optimized image entropy is developed. Finally, the performance comparison and cross-validation methods are applied to analyze the model performance. The results show that the accuracy of checking the classification of corner points using SVM is 91.1% and 89.8%, while the image recognition with optimized model image entropy has an accuracy of 92.1%. It indicates that the image recognition model classification scheme of optimized image entropy in this paper works well. The research in this paper is important for the development of image recognition field.

## KEYWORDS

AOA algorithm; TDOA localization algorithm; Image entropy; Image recognition; Cross-validation; Performance comparison

## 1. INTRODUCTION

Image recognition is a computer vision technique that allows machines to recognize and classify objects in digital images or videos. The technique uses artificial intelligence and machine learning algorithms to learn patterns and features in images in order to recognize them accurately [1-2]. By recognizing and classifying objects in an image, it enables machines to interpret visual data as humans do [3].

The technology has a wide range of applications in various industries, including manufacturing, healthcare, retail, agriculture, and security [4]. Image recognition can be used to improve quality control in manufacturing, detect and diagnose medical conditions, enhance the customer experience in retail, optimize agricultural crop yields, and assist in surveillance and security measures. In addition, image recognition can help automate workflows and improve the efficiency of various business processes [5-6]. Sengupta A investigated the use of deep learning neural networks in the field of image recognition [7]. Chen M et al. proposed a solution to the problem of limited data set samples in low illumination image recognition tasks,

namely, cascaded feature matching network, which improves the performance of image recognition through feature matching blocks, multi-scale information and relational learning to improve the recognition performance of the meta-learner, and achieved effective results in several photo tasks with odds ratio learning experiments and multiple labels [8].

## 2. IMPROVE THE AOA ALGORITHM MODEL

### 2.1. AOA ALGORITHM

The AOA hybrid positioning algorithm is an algorithm that integrates various signal information and feature measurements to estimate the position of the MS. Compared with the TDOA positioning algorithm or AOA positioning algorithm alone, the combination of the two algorithm models can significantly improve the positioning accuracy and reduce the impact of measurement errors.

Assuming that M base station receivers are arranged in a two-dimensional plane, the distance equation can be listed according to the (T0A) measurement:

$$r_i = c\tau_i = \sqrt{(x_i - x)^2 + (y_i - y)^2} \quad (1)$$

Assuming that the distance difference is, denotes the distance difference between the mobile station to base station i ( $i \neq 1$ ) and to base station 1, i.e:

$$r_{i,1} = r_i - r_1 + n_{i,1} = \sqrt{(x_i - x)^2 + (y_i - y)^2} - \sqrt{(x_1 - x)^2 + (y_1 - y)^2} + n_{i,1}n \quad (2)$$

The equation can be established based on the AOA measurements a:

$$\tan \alpha = \frac{y - y_1}{x - x_1} + n_a \quad (3)$$

according to the above equation, we can obtain:

$$\Delta r = r - r_1 + n \quad (4)$$

Assuming that the measurements are independent of each other, the maximum likelihood estimate of the location of the mobile station is:

$$(x, y) = \operatorname{argmin} \left[ (\Delta r - r + r_1)^T (\Delta r - r + r_1) + \frac{\sigma^2}{\alpha^2} \left( \alpha - \arctan \left( \frac{y - y_1}{x - x_1} \right) \right)^2 \right] \quad (5)$$

Solving the nonlinear equation (5) by the general method is difficult to obtain the desired result, so the optimal solution of the coordinates is obtained after the optimization process with the IMPSO algorithm.

### 2.2. IMAGE RECOGNITION MODEL WITH OPTIMIZED IMAGE ENTROPY BY IMPROVED AOA ALGORITHM

#### 2.2.1. ENTROPY AND IMAGE ENTROPY

Taking the average of the self-information of the N possible outcomes of the random event:

$$H = -\sum p(i) / \log(p(i)) \quad (6)$$

Image entropy describes the average information content of the image source.

$$H = -\sum_{i,j} p(i) \log p(i) \quad (7)$$

## 2.2.2. IMAGE RECOGNITION MODEL BASED ON AOA ALGORITHM TO OPTIMIZE IMAGE ENTROPY

Image restoration is performed using the images acquired by the surrounding nodes. In order to make multiple images using pixels to do the synthesis operation, the disease targets in each image are rotated to the specified reference direction based on the original information acquired by each node, keeping the same orientation as much as possible. Then the rotated image is obtained from Equation (8):

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & -\cos \theta \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} \quad (8)$$

Where,  $(u,v)$  is the original image acquired by the neighboring node and  $(x,y)$  is the image coordinates after image conversion. Whether the target alignment direction of multiple images is consistent will directly affect the effect of the image restoration method, and the interrelationship number criterion is to ensure that the disease orientation of multiple images will be aligned. The target images acquired by neighboring nodes are slid through the window to find the best matching DA that matches region  $DA^{(s)} (s = 2, 3, \dots, K)$ :

$$DA^{(s)} = DA_{ij}^{(s)} = \max_{i,j} \left( \rho \left( DA^{(1)}, DA_{ij}^{(s)} \right) \right) \quad (9)$$

$$\rho(x, y) = \frac{\text{Cov}(x, y)}{\sqrt{\text{Var}(x) \times \text{Var}(y)}} \quad (10)$$

$$Q_{ij} = \max_{s=1,2,\dots,K} \left( DA^{(s)} \right)_{ij} \quad (11)$$

In this equation,  $\rho(x, y)$  is the number of interrelationships between diseased regions  $x$  and  $y$  of the same size,  $\text{Cov}(x, y)$  is their covariance, and  $\text{Var}(x)$  is the variance. Equation (11) represents the pixel value  $Q$  located at  $(i, j)$  in the target image  $Q$  after the image restoration operation. Further preprocessing is required for the multi-node restored image to eliminate the noise generated in the image restoration process that interferes with the extraction of image features.

## 3. IMAGE RECOGNITION MODEL PERFORMANCE ANALYSIS

### 3.1. COMPARATIVE ANALYSIS OF IMAGE CLASSIFICATION PERFORMANCE

In this paper, the performance of the model is compared with the image classification performance of the SVM model using this paper to analyze the performance of the model. Grid features and peripheral features are extracted for corner points, and 25 corner point samples of each of 52 classes are selected. Among them, 1000 are used as the number of input samples  $n$  for the model, and the remaining 300 corner points are used as the test set, whose corner point types are output data. The value of vector dimension  $m$  for each sample is 32 dimensions. From the set model network configuration parameters, the corner point sample feature vector is used as input and the classification corresponding to each corner point sample is used as output, and the minimum training error is achieved by continuously adjusting the threshold value. Table 1 shows the classification results of the statistical corner points.

**Table 1.** Classification results for corner points

Angle point type	A	D	Db	E	Eb	L	R	Rb	Average
P/%	87.6	88.9	92.8	87.6	89.5	98.2	94.3	81.4	90.8
R/%	89.4	90.6	88.1	90.4	71.8	92.8	91.6	89.5	92.1

From the statistical results in the table, it is concluded that the accuracy rate of the classification of corner points using SVM is 91.1% and the completeness rate is 89.8%. The experimental results of the SVM corner point classification method and the image recognition method with optimized image entropy were compared and analyzed. The objects of both sets of experiments are the same data, and their purpose is to classify corner points into 52 classes. The SVM classifier is experimentally verified to select grid features and peripheral features, and the corner point classification results are better when  $m$  and  $n$  are taken as 8. That is to say, the classification accuracy is higher when the features of corner points in SVM classifier are 128-dimensional, reaching an accuracy of 90.8%. In contrast, when the image recognition model with optimized image entropy is used for classification, the input parameters are too many, which makes the neural network converge slowly and the training time is long. After the adjustment of the selected features, 32-dimensional features were selected as the input network data, and finally an accuracy of 92.1% was achieved. Relatively speaking, the optimized model image entropy has the least risk of image recognition structure, better generalization ability, global optimality, and good recognition advantage when the target sample is small, non-linear, and high feature dimension. Therefore, on the whole, for the classification of corner points in this paper, the image recognition model classification scheme with optimized image entropy works better.

### 3.2. CROSS-VALIDATION ANALYSIS

Dividing the training data into two parts, training set and test set, the prediction accuracy of the training set largely reflects the classification performance on the test set, and the improvement of the training process, i.e., cross-validation, which can reduce the overfitting to a certain extent.

For the optimization of the model parameters, this experiment chooses the network search optimization method, using the grid.py parameter tool in LIBSVM, which can automatically perform parameter search and finally get the best parameters  $c=3.5678$  and  $g=9.757967$ . The  $c$ ,  $g$  values obtained by using the parameter tool are modeled in the image recognition model to predict the corner point types. The experimental dataset was divided equally into 5 groups with 520 corner points per group. The detection of corner point types in the test set is carried out according to each training set, and the detection and accuracy rates and the average detection and accuracy values for each corner point type are calculated. The experiment uses cross-validation for the five sets of corner point data sets, and the experimental results are shown in Figure 1.

From the summary analysis of the experimental results, the results of the corner point classification of the test set are satisfactory, and the average value of the experimental results of the eight types of corner points in the five groups is 93.9% and 89.0%. It indicates that the image recognition performance of the model is good.

**Figure 1.** Cross-validated classification results

#### 4. CONCLUSION

In this paper, we first study the implementation process of AOA algorithm and optimize the algorithm teaching, and then explore the image recognition performance of the algorithm. The following conclusions are drawn:

In the performance comparison, the check accuracy rate of the classification of corner points using SVM is 91.1% and the check integrity rate is 89.8%. The image recognition with optimized model image entropy has 92.1% accuracy. The classification scheme of image recognition model with optimized image entropy is more effective.

In the cross-validation, the experimental results of 8 types of corner points are averaged to get a check accuracy rate of 93.9% and a check-complete rate of 89.0%. It indicates that the image recognition performance of the model is good.

## ABSTRACT

The STA anesthesia system can be used in all treatment areas of dentistry that require local anesthesia and is more painless in endodontic treatment. This paper focuses on the analysis of the application of the second generation computer-controlled local anesthesia system. The STA anesthesia technique reduces the amount of anesthetic agent compared with the traditional anesthetic injection, but has a more precise range of action. Patients with acute pulpitis or acute attack of chronic pulpitis were selected and randomly divided into test and control groups, and the patients' anesthetic pain level and heart rate and blood pressure before and after injection were compared and analyzed. The *The Wand*<sup>TM</sup> system was superior to conventional conventional local anesthesia in terms of pain during injection and time for the anesthetic to take effect in dental treatment.

## KEYWORDS

STA anesthesia system; Acute pulpitis; Heart rate and blood pressure; Test group; Control group; Local anesthesia

## 1. INTRODUCTION

Endodontic diseases are a high incidence in clinical dentistry and are divided into different types such as pulpitis, pulp necrosis and dental caries. The pulp is in a hard and inelastic pulp chamber with four walls, and its blood circulation can only pass through the tiny apical foramen, lacking collateral circulation [1-2]. Once the pulp becomes inflamed, the inflammatory exudate is not easily drained and the pressure in the pulp cavity quickly increases, causing pressure on the nerves within the tooth, and the patient develops oral diseases such as severe tooth pain, bleeding and abscesses, which can then lead to masticatory dysfunction and reduce the patient's quality of life [3]. Literature [4-5] pointed out that in recent years, with the gradual

improvement and development of medical technology and dentistry, endodontic treatment has become the first choice for the treatment of endodontic diseases, and the level of endodontic treatment has improved significantly, especially the microscopic root canal is being used more and more widely in clinical practice. In the literature [6], root canal treatment is considered to be mainly a deep fusion of chemical and mechanical modalities to remove the irritant from the pulp chamber of the affected tooth and eliminate the source of infection in the root canal. The root canal is then tightly closed, which allows the apical lesion to gradually recede to prevent secondary infections, thus achieving a restorative and preventive effect on periapical disease. The literature [7-8] shows that both multiple root canal treatment and disposable root canal treatment are endodontic methods, and the use of disposable root canal treatment in clinical practice is gradually increasing with the improvement of root canal cleaning and disinfection. The literature [9] pointed out that nowadays, endodontic disease is mainly treated by root canal treatment, which is used to eliminate the infection of the affected tooth and restore the normal masticatory function of the patient.

## **2. STA ANESTHESIA SYSTEM AND ITS ANESTHESIA TECHNIQUE**

The second generation computer-controlled local anesthesia system, or STA anesthesia system, is also known as a painless anesthesia instrument. Compared with the traditional anesthesia injection method, it reduces the amount of anesthetic agent and does not anesthetize the adjacent tissues while acting on the dental tissues, making the scope of action more precise and eliminating the numbness of the occlusal and facial muscles. It can precisely control the injection speed and pressure of local anesthetics, and can also reduce discomfort during administration, helping dentists reduce complications from local anesthetic injections and giving patients a better injection experience.

### **2.1. STA ANESTHESIA SYSTEM**

The STA device's host interface consists of a series of LED indicators that, along with acoustic signals, provide information on the rate of administration, the amount of anesthetic, and the pressure of the needle position during anesthesia. The STA's unique handle design conforms to the dentist's operating habits, and the injection handle can take the form of a pencil grip, which not only makes it easy to find the pivot point, but also gives the operator a precise sense of touch. The handle is breakable and non-threatening. The grip handle adopts a rotating injection method, which avoids the deviation of injection position that occurs during traditional injection when blocking anesthesia and reduces the failure rate of anesthesia.

### **2.2. STA ANESTHESIA TECHNIQUE**

STA anesthesia system can be used in all treatment areas of dentistry that require local anesthesia. The STA anesthesia system can be used in all areas of dentistry that require local anesthesia, such as endodontics, periodontal therapy, alveolar surgery and implant surgery for children and adults, giving patients a new sense of injection experience. STA has a unique injection technique in addition to the common clinical use of supraperiosteal infiltration anesthesia, mandibular and maxillary nerve block anesthesia. The STA anesthesia system's unique STA dynamic pressure sensing technology provides real-time feedback to the system through a combination of visual and acoustic Drug delivery. The outlet pressure of the local anesthetic is monitored during all phases of the injection, indicating blockage or leakage of the injection needle. The system also features automatic suction back to avoid injecting anesthetics into the blood vessel. In clinical use, to improve injection comfort, most physicians endorse the pre-puncture technique when applying the STA anesthesia instrument. A small portion of the local anesthetic can enter the tissue before and during the puncture before the tip of the needle, and ativan, with its strong tissue penetration, enters the tissue before the tip

of the needle and creates an anesthetic channel.

### 3. CLINICAL APPLICATION OF STA ANESTHESIA SYSTEM IN ENDODONTIC TREATMENT

#### 3.1. OBSERVATION SUBJECTS AND TEST METHODS

In this paper, informed consenters with acute pulpitis or acute exacerbation of chronic pulpitis were selected as observation subjects. The *t* test was used for data analysis. The test group was anesthetized with the *The Wand*<sup>TM</sup> system of blocking, and the pulp was opened with a dental drill, followed by extraction with a pulp extraction needle. Immediately after completion, patients were asked to mark their own assessment on a pain chart, and they could withdraw from the test if they could not tolerate it. The control group also used BILAN anesthesia, but the difference was that a commercially available disposable hollow syringe was used for local anesthesia, and the pulp was also opened and extracted, and then the patients were asked to mark their own assessment.

#### 3.2. APPLICATION RESULTS

##### 3.2.1. BASELINE COMPARISON

There was no statistical difference between the two groups in terms of basic conditions such as number of cases, gender, age, type of pulpitis, different sites, etc., and preoperative pain level in the two groups.

##### 3.2.2. ANALGESIC EFFECT

The analgesic effect is shown in Table 1. In the treatment of pulpitis, 15 cases of pulp opening analgesia, 8 cases of effective, 2 cases of improvement, and 100% of total effective rate were found in the experimental group. The pulp extraction analgesia was effective in 4 cases, effective in 6 cases, improved in 4 cases, and invalid in 1 case, with a total efficiency of 90.15%. In the control group, there were 7 cases of effective analgesia, 9 cases of effective analgesia and 1 case of improvement, with an effective rate of 94.21%. In the control group, there were 4 cases of open pulp analgesia, 4 cases of effective, 6 cases of improvement, and 1 case of ineffective, with an efficiency of 85.5%. In the process of pulp extraction, there was no significant difference in analgesia between the test group and the control group, i.e.  $P > 0.05$ .

**Table 1.** Analgesic effect in the treatment of pulp disease

	<i>The Wand</i> <sup>TM</sup>	Control group
Injection pain (graded)	2±0.3	4±0.5
Kaipai zhen (grading)	2±0.4	2±0.3
Pull-out analgesia (grading)	2±0.2	3±0.5
Anesthetic injection time (seconds)	93.2±0.01	111.02±0.02
Anesthetic effective time (seconds)	2.56±0.02	4.23±0.04

##### 3.2.3. CHANGES IN HEART RATE AND BLOOD PRESSURE

The results of blood pressure and heart rate before and after the injection in the 2 groups are shown in Figure 1. The differences in blood pressure and heart rate before and after injection in the painless injection group were not statistically significant. There was a statistically significant change in systolic blood pressure in the conventional injection group before and after injection, i.e.,  $t = -2.345$ ,  $P = 0.021$ . The differences in diastolic blood pressure and heart rate were not statistically significant. The changes in VAS values before and after injection in the painless injection group and the conventional injection group were  $1.44 \pm 0.153$  and  $3.73 \pm 0.173$ , respectively, with statistically significant differences, i.e.,  $t = -12.458$ ,  $P = 0.001$ .

**Figure 1.** Changes in blood pressure and heart rate before and after injection

#### 4. CONCLUSION

In this paper, the blood pressure and heart rate of patients before and after injection were stable in the painless injection group. The heart rate of patients before and after injection in the conventional injection group was stable, but the difference in blood pressure was statistically significant. Due to the painful discomfort accompanying the conventional injection, the patients were nervous, anxious, and even more fearful of the subsequent extraction operation. This adverse emotional reaction has an excitatory effect on cardiovascular, and sympathetic excitation and catecholamine release can lead to faster heart rate, increased myocardial contraction, and increased cardiac output, resulting in increased blood pressure. There is a statistically significant difference in pain during painless injections versus conventional injections in pediatric dental treatment. Applying painless oral local anesthesia injector to the elderly, a statistically significant difference in pain was found between painless injection and traditional injection.

#### FUNDING

This research was supported by Education's collaborative education project of production and education: research on the construction of online platform for the teaching of dental and endodontics courses in colleges and universities from the perspective of "Internet" (220607037203440).

## **ABSTRACT**

This paper analyzes the “dual-teacher” teacher team in higher vocational institutions from two aspects: the development and characteristics of higher vocational education and the characteristics of “dual-teacher” teachers. Based on the current situation that the structure of “dual-teacher” teachers in higher vocational institutions is unreasonable, the evaluation system is not perfect and the training channels are not smooth, the scientific top-level design and in-depth learning construction of “dual-teacher” teachers, the construction of curriculum development and curriculum resource sharing platform, the establishment of a strict mechanism for vocational education teachers, and the establishment of the “dual-teacher” teachers. We propose a scientific top design and deep learning construction for “dual-teacher” teachers, construction of curriculum development and sharing of curriculum resources, improvement of vocational education teacher mechanism, and establishment of a strict vocational education assessment and appointment system to achieve coordinated development of the order.

## **KEYWORDS**

Higher vocational education; Dual-teacher faculty; Assessment system; Training channels; Deep learning

## **1. INTRODUCTION**

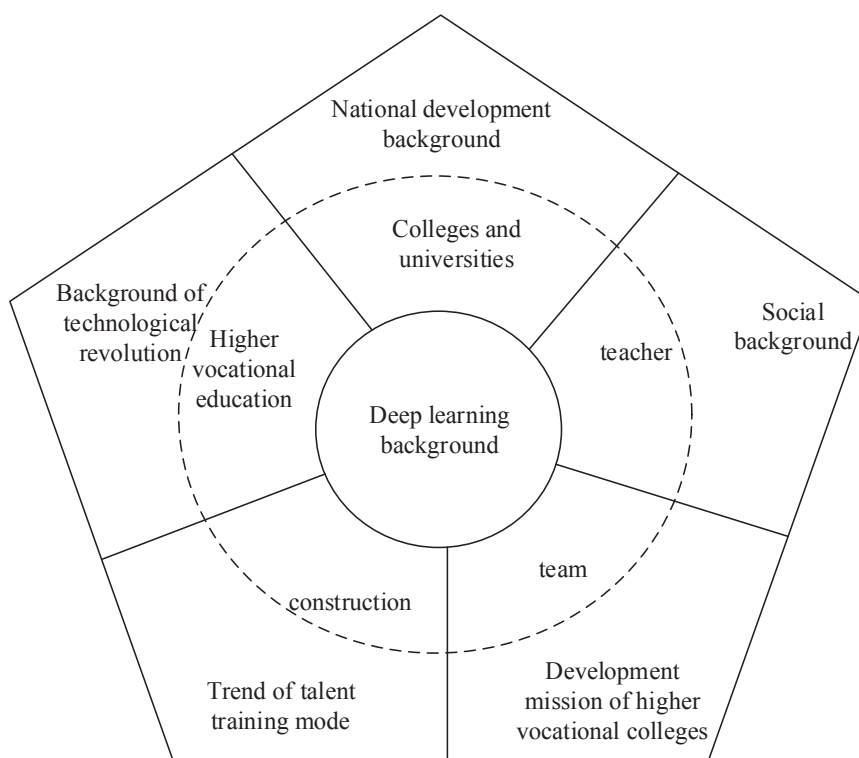

As an indispensable force of higher education, higher vocational colleges and universities cultivate millions of high-quality skilled talents for the country every year, supporting the development of manufacturing industry and being an important talent output and training base for industrial restructuring, transformation and upgrading. How vocational education can adapt to the current new situation of scientific and technological innovation development and cultivate a large number of high-quality skilled and practical talents for the society has become the focal issue of talent cultivation in higher education [1-3]. The key to solve this focal issue is to build a dual-teacher team. However, the construction of a dual-teacher team in vocational colleges and universities lags far behind the social development of vocational education. It has seriously affected the demand for high-quality skilled talents for industrial optimization and upgrading and technological progress of enterprises [4].

The literature [5] points out that the development of higher vocational institutions has achieved certain achievements and at the same time, there are bottlenecks that restrict the development. The curriculum system is not sound, the structure of teachers is single source, and the quality of “dual-teacher” teachers is low, which cannot adapt to the rapid development

of higher vocational education. According to literature [6], there are many problems in the construction of dual-teacher teachers in terms of ideological awareness, cultivation system, recognition criteria teacher structure, guarantee system mechanism and school-enterprise cooperation channels, which restrict the development of vocational colleges. The literature [7-8] argues that it is necessary to deeply analyze the outstanding problems and acute contradictions in the construction of dual-teacher teachers, sort out and summarize the existing research results, find the breakthrough of the problems, and put forward practical countermeasures and suggestions for strengthening the construction of dual-teacher teachers and improving the quality of talent training in vocational colleges.

## 2. FACULTY DEVELOPMENT IN HIGHER EDUCATION INSTITUTIONS IN THE CONTEXT OF DEEP LEARNING

Throughout the development of vocational education in the world, one of the common experiences of countries with successful vocational education lies in the ability to place the strategic planning of vocational education development in the context of the era in which it is located and achieve mosaic synchronous development. As an important part of the development of vocational education, only by recognizing and fully grasping the characteristics of the new era can we deliver a perfect answer based on a systemic perspective. Following the overall principle, the system elements of country, society, technology, talents and school can clearly outline the panoramic system model of the era background of teacher team construction in higher vocational colleges in the new era. The system of teacher team construction in higher vocational colleges and universities is shown in Figure 1. As an important project in the development of national vocational education, the teacher training team of higher vocational colleges in the new era is embedded in a coupled background system composed of five backgrounds: national strategy, social era, technological revolution, talent training mode direction and development mission of higher vocational colleges.

**Figure 1.** Background of teaching staff construction in higher vocational colleges

### **3. HIGHER VOCATIONAL “DUAL-TEACHER” TEACHER TEAM**

#### **3.1. THE DEVELOPMENT AND CHARACTERISTICS OF HIGHER VOCATIONAL EDUCATION**

Higher vocational education is the abbreviation of higher vocational education, and its development has been paid attention by all walks of life now. Unlike ordinary higher education, higher vocational education is more vocational and more practical. With the help of higher vocational education, the technical skill talents needed by the society can be cultivated effectively, and the employment rate of the whole society has been improved accordingly.

#### **3.2. CHARACTERISTICS OF “DUAL-TEACHER” TEACHERS**

A “dual-teacher” teacher is not only able to teach, but also to carry out practical teaching. They are not only teachers, but also engineers and technicians in a particular field. This is the original definition of a “dual-teacher” teacher. In short, teachers must have a teaching certificate and a skill certificate that enables them to work in the relevant industry, which is the primary criterion for determining whether a teacher is a “dual-teacher” and is the outward form of a “dual-teacher” teacher. However, this is not the most accurate interpretation of “dual-teacher”, because “dual-certification” only means that the teacher has the status of “dual-teacher”, but also requires the teacher to have the behavior of “dual-teacher”. A “dual-teacher” teacher must have the appropriate skills and professionalism to teach and educate students while completing their career guidance. Not only should they be able to teach professional courses, but they should also be able to adjust the teaching content, teaching standards and teaching methods in accordance with the needs of professional positions, so that the teaching is truly aligned with the market. They should also have a certain degree of economic literacy, understand the market, and be able to effectively teach general economic knowledge to cultivate students’ comprehensive quality. Have strong communication skills, communication skills, not only can effectively communicate with students, but also with enterprises to communicate effectively.

### **4. FEASIBILITY ANALYSIS OF THE NEW MODEL OF “DUAL-TEACHER” TEACHER TRAINING TEAM CONSTRUCTION IN HIGHER VOCATIONAL INSTITUTIONS**

The feasibility analysis of the new model of “double-teacher” teacher team construction in higher vocational institutions is based on the analysis of the current situation and problems of professional teacher team construction, reflecting the specific requirements and construction goals of “double-teacher” and improving the teaching level of the teacher team in higher vocational institutions.

#### **4.1. ANALYSIS OF THE CONSTRUCTION OF “DUAL-TEACHER” TEACHER TEAM IN HIGHER VOCATIONAL INSTITUTIONS**

In the analysis of the current situation of “dual-teacher” faculty construction in higher education institutions, it is found that there are low academic structure of teachers, single source and low level of teachers, unreasonable structure of “dual-teacher” faculty, lack of standardized management of part-time teachers, lack of specialized “dual-teacher” faculty training colleges and universities, insufficient scientific research system of “dual-teacher” faculty, and poor training channels. This paper focuses on the problems of “dual-teacher” teacher training institutions, the overall research level of the teacher team is not high, the evaluation system of “dual-teacher” teacher team is not perfect, and the training channels are not smooth. This paper mainly analyzes the structure of “dual-teacher” teachers, the evaluation system of “dual-teacher” teachers and the training channels.

#### 4.1.1. THE STRUCTURE OF “DUAL-TEACHER” FACULTY IS NOT REASONABLE

The structure of teachers' titles is shown in Figure 2. Among the full-time teachers, there are 1,675 “double-teacher” teachers, accounting for 30.32% of the full-time teachers. Among the part-time teachers, there are 352 “double-teacher” teachers, accounting for 52% of the part-time teachers. These two ratios are obviously lower than the requirement standard for “double-teacher” teachers in higher vocational education.

After some institutions of higher education were upgraded, the scale of students has increased by leaps and bounds, and the number of students in some schools has even doubled several times, while the construction of faculty has obviously lagged behind. The teacher-student ratio of some higher vocational colleges has been hovering around 18:1 for a long time. At the same time, most of the higher vocational colleges are transformed from secondary schools, and the teachers are mainly teachers of the original schools, and most of these teachers have not gone through systematic vocational education training. Therefore, there is a situation that many teachers have high theoretical level, but insufficient practical experience and poor hands-on ability. The disconnection between theory and practice of full-time teachers, the general lack of professional teachers with working experience in industry and enterprises, the influence of professional leaders in industry and enterprises seems to be minimal, the proportion of part-time teachers from the production line of middle and senior professional and technical personnel, social skilled craftsmen is low, and the proportion of teaching tasks undertaken by such teachers is not high, such a teaching team cannot adapt to the requirements of higher vocational education and cannot meet the requirements of technical and technical training. This kind of teaching staff cannot meet the requirements of higher vocational education, and cannot meet the requirements of cultivating skilled professionals, which seriously affects the teaching quality of higher vocational education.

Figure 2. Structural data of teachers' titles

#### 4.1.2. THE EVALUATION SYSTEM OF “DUAL-TEACHER” FACULTY IS NOT PERFECT

In the current title evaluation policy, it is difficult to reflect the characteristics of higher vocational schools in the evaluation of senior high school teachers. The corresponding policy regulations do not have clear provisions on the connotation, requirements, cultivation and treatment of “dual-teacher” teachers. If they are not improved in time, it is difficult for higher

vocational teachers to enter into the world of students and become their true mentors and friends. The charisma of teachers' personality includes both the profound professional knowledge and extensive learning possessed by teachers, and more importantly, these comprehensive qualities of teachers should be recognized by students, and then students can trust teachers. In this way, teachers can do their best to serve students and solve their problems, and students can learn knowledge and improve their own cultivation by following the teacher as a model, which is a comprehensive quality improvement process.

#### **4.1.3. INADEQUATE TRAINING CHANNELS**

On the one hand, the development of higher education institutions requires an urgent need to increase training, while another reality is that the training policies of individual schools are not uniform. Many new teachers accept heavy substitute teaching tasks as soon as they arrive at the school and have no time to attend training again. Although most higher vocational colleges and universities have established close school-enterprise cooperation internship bases, not many have entered into substantial cooperation for various reasons. In addition, it is difficult to go to foreign countries for training due to the limitation of funding, and the policy of training is not implemented by each school. The training channels are not smooth, which is not conducive to the cultivation and improvement of teachers' individual "double teacher" quality. Despite the great efforts made by institutions of higher education, the problem of poor training channels still exists, because there are few training opportunities.

### **4.2. A NEW MODEL OF FACULTY DEVELOPMENT IN HIGHER EDUCATION INSTITUTIONS**

#### **4.2.1. SCIENTIFIC TOP-LEVEL DESIGN TO ACHIEVE ORDERLY DEVELOPMENT**

The construction of teachers' team in higher vocational colleges is a long-term system project with the joint participation of multiple interests such as government, enterprises, vocational colleges and teachers. In order to ensure the orderly promotion of this project, the government, as the representative of public interests, should firstly carry out the top-level design scientifically and focus on three aspects of work. The first is to develop vocational education teacher standards based on the development plan of vocational education teachers' lifelong career. The second is to clarify the vocational education teacher qualification certification process, standardize the national vocational education teacher qualification certification process, and raise the visibility and standardization of vocational education teacher qualifications to a level comparable to CPA credentials and attorney licenses, so as to provide authoritative certification navigation for talented individuals who are committed to becoming vocational education teachers. Third, we will improve the mechanism for prospective vocational education teachers and establish a strict vocational education assessment and appointment system.

#### **4.2.2. DEEP LEARNING CONSTRUCTION FOR SYNERGISTIC DEVELOPMENT**

First, we build a platform for curriculum development and curriculum resource sharing. Serving the teaching work of vocational education teachers. Along with the rapid changes of new technologies and inventions, the vocational education curriculum has a high elimination rate and difficult curriculum development.

Second, build a platform for professional learning and experience exchange . Supporting the continuous learning of vocational education teachers.

Third, we build a platform for inter-school linkage and school-enterprise collaborative development to help vocational education teachers' deep learning.

Fourth, the international vocational education information sharing and skills cutting platform.

Broadening the international vision of vocational education teachers. Vocational education teacher training is the common cause of vocational education actors all over the world, so only open cooperation can make the vocational education teachers in the new era international.

## 5. CONCLUSION

This paper analyzes the current situation and problems of “dual-teacher” professional teachers in higher education institutions in the context of deep learning, and addresses the problems of “dual-teacher” teacher team structure, “dual-teacher” teacher evaluation system and training channels. In order to realize a new model of collaborative development, we propose scientific top-level design, order development and deep learning construction. Among the full-time teachers, there are 1675 teachers with “double-teacher” quality, accounting for 30.32% of the full-time teachers. The ratio is obviously lower than the requirement of “double-teacher” teachers in higher vocational education. In some institutions of higher education, the teacher-student ratio hovers around 18:1 for a long time. Build inter-school linkage and school-enterprise collaborative development platform to help vocational education teachers’ deep learning. The construction of vocational education teachers is a common undertaking of vocational education actors all over the world, so only open cooperation can make vocational education teachers international in the new era.

## ABSTRACT

Under the perspective of deep learning, the conceptual idea of humanistic nursing in nursing education must be updated. This paper mainly explores the value of humanistic nursing in nursing education, and implements professional ethics education for students by combining the actual needs of nursing with their personal qualities to realize the cultivation of humanistic care ability under the perspective of deep learning. The data difference between the control group and the observation group before and after receiving humanistic nursing education was analyzed. After receiving humanistic education, the total humanistic care ability of the observation group was  $175.2 \pm 11.7$ , and the total humanistic care ability of the control group was  $169.6 \pm 11.9$ , and the humanistic care ability of both groups was improved.

## KEYWORDS

Humanistic nursing; Deep learning; Nursing education; Professional ethics education; Observation group; Control group

## 1. INTRODUCTION

Humanistic nursing refers to the nursing care with humanistic care for nursing subjects by nursing staff with good humanistic qualities. Humanistic quality includes humanistic knowledge and humanistic spirit, which is an internal quality of an individual integrated by various factors such as knowledge, ability, concept and emotion, and is expressed as a person's personality, temperament and cultivation, which becomes a relatively stable internal quality of an individual [1-3]. The basic principles of medical ethics are respect for autonomy, medical practice, and fairness and justice. With this as the bottom line, nursing emphasizes on dispelling patients' physical diseases while also giving them spiritual care, psychological comfort and guidance on how to behave, meeting their physical, psychological, social and spiritual needs and making them feel cared for [4-5].

In the context of today's time, with the continuous development of the economy, there has been a comprehensive improvement in the level of people's quality of life. People have higher requirements for their own health, so whether the medical care technology in the medical field is humane has become a key concern of the social masses [6]. For the time being, there are certain problems with the humanistic qualities of medical and nursing staff, and there is still a lot of room for improvement in many aspects [7]. One of the more prominent ones is the low humanistic literacy of nursing staff, which can easily cause conflicts between patients and nursing staff and is not conducive to the use of excellent clinical decision-making by nurses in clinical practice and the development of medical care work [8-9]. In order to effectively improve the service level of nursing staff, it is necessary to improve the humanistic quality of nursing

staff, so that the enthusiasm and initiative of nursing staff can be effectively stimulated, and then the overall efficiency and quality of nursing staff can be improved, which is conducive to the improvement and soundness of the institutional system of the nursing industry.

## **2. THE VALUE AND ETHICAL ROLE OF HUMANISTIC CARE IN A DEEP LEARNING PERSPECTIVE**

Humanistic nursing refers to nursing staff with high humanistic quality, fully reflecting their humanistic care in the nursing process, which actually means fully caring for patients and showing the pursuit of the value and meaning of life. Humanistic nursing is very important to the treatment and rehabilitation of patients' diseases. It includes humanistic knowledge and spirit, which is a personal cultivation composed of various factors and is a long-term inner quality of human beings. Humanistic education, on the other hand, combines the actual needs of nursing and students' personal qualities to implement professional ethics education and realize the effective cultivation of students' modern humanistic literacy.

Medical theorizing is to follow the principles of justice, righteousness, respect and kindness, to give patients drug care and life care at the same time, to implement spiritual care and psychological care for patients, to focus on the guidance of the patient's mind, to make the patient's treatment emotion more positive, so that patients establish the confidence of recovery, and to improve the nurse-patient relationship.

The realization of the value and ethical role of humanistic nursing in nursing education is achieved by infiltrating the ideological education into the professional curriculum, promoting the same direction of ideological education and professional education, and integrating the knowledge of humanistic care into the teaching of nursing education. Embodying humanistic knowledge in the process of nursing can make patients feel safe and give them a sense of dependence. In the process of communicating with patients, humanistic care can enhance patients' desire for health and inspire confidence in early recovery, thus achieving the nursing goals of alleviating pain, treating disease and restoring health and promoting wellness. Clinical nursing work under the perspective of deep learning advocates quality nursing, and interpenetrates quality nursing and humanistic care to make nursing more humane, which will gradually increase patients' satisfaction with nursing care.

## **3. EXPLORING THE VALUE OF HUMANISTIC EDUCATION IN NURSING EDUCATION**

### **3.1. TEACHING METHODS AND EVALUATION CRITERIA**

The study subjects in the control group were taught according to the conventional nursing teaching process. The study subjects in the observation group received humanistic education based on the teaching operation of the control group, which was divided into several scenarios according to the difficulty of nursing operations, instrument education, operation requirements, and teaching methods.

Questionnaires were used before and after nursing care to count the humanistic care attitudes and abilities of the study subjects before and after receiving education. It was mainly divided into two aspects: nursing attitude and humanistic care ability. The nursing attitude aspect included a 30-question questionnaire with a total score of 150, and the questionnaire of humanistic care ability contained six dimensions of instilling beliefs, forming humane altruistic concepts, health education, problem-solving, meeting basic needs, and emotional communication, with a total score of 200.

### 3.2. COMPARISON OF DATA BEFORE AND AFTER HUMANITIES EDUCATION

The questionnaire scores of the two study groups were counted, and the questionnaire data were entered into SPSS16 statistical software for data analysis, using a  $\chi^2$ -test square test, with significant differences when  $P < 0.05$ . The comparison of the data before the two groups of study subjects received education is shown in Figure 1. The six dimensions of the survey were A instilling beliefs, B forming humane altruistic concepts, C health education, D problem solving, E meeting basic needs, and F emotional communication. The total humanistic care ability of the observation group before receiving humanistic education was  $170.4 \pm 11.3$ , and the total humanistic care ability of the control group before receiving education was  $168.8 \pm 11.5$ , and there were no significant differences between the groups, i.e.,  $P > 0.05$ .

**Figure 1.** Comparison of data before receiving education

The comparison of the data after the two groups of study subjects received education is shown in Figure 2. After receiving humanistic education, the total humanistic care ability score of the observation group was  $175.2 \pm 11.7$ , and the total humanistic care ability score of the control group was  $169.6 \pm 11.9$ , and both groups were able to improve their humanistic care ability.

**Figure 2.** Comparison of data after receiving education

#### 4. CONCLUSION

This paper focuses on the comparative investigation of the value of humanistic nursing in nursing education from the perspective of deep learning. The observation group and the control group were selected as the research subjects, and humanistic education was administered on top of the teaching operations of the control group, and they were divided into different scenarios according to the degree of difficulty of nursing operations. The data analysis revealed that the students in the humanistic education group after receiving education had higher humanistic nursing attitude score and humanistic nursing ability score than the conventional teaching, with a significant difference, i.e.,  $P < 0.05$ . Thus, humanistic education can improve the humanistic nursing ability of students and has a value and ethical role in nursing education that cannot be ignored.

## ABSTRACT

In this paper, the clinical efficacy of Dagliflozin was analyzed using intelligent data analysis techniques based on the increased prevalence of type 2 diabetes and the risk of cardiovascular disease in type 2 diabetic patients. Patients diagnosed with type 2 diabetes mellitus were selected as the study population, and the treatment was divided into two groups, basic education treatment and group treatment. SPSS26.0 software was used to statistically analyze the information and data, and the independent  $t$  test was used for comparison between groups, and the paired  $t$  test was used for comparison within groups. It was found that after 12 weeks of treatment, the FPG, 2h-PG and HbA1C levels decreased in both groups compared with those before treatment, and all of them achieved the predetermined glucose control goals, and the BMI values were lower than the overweight values, i.e., less than  $23\text{kg}/\text{m}^2$ , and significantly lower than those of the control group during the same period, with statistically significant differences, i.e.,  $P < 0.001$ .

## KEYWORDS

Type 2 diabetes mellitus; Intelligent data analysis; FPG; 2h-PG; HbA1C

## 1. INTRODUCTION

According to data released by the International Diabetes Federation, it is estimated that there will be nearly 550 million people with diabetes worldwide by 2030 and more than 629 million by 2045 [1-3]. In fact, not only is the number of people with diabetes increasing, but the number of people with diabetes projected by the Global Diabetes Survey is also constantly being adjusted. The 2009 Global Diabetes Survey predicts that the number of people with diabetes will reach 438 million in 2009. In 2030, it was raised to 552 million in 2011 and further raised to 578 million in 2019. The 2045 forecast has also undergone several adjustments. These alarming increases and rising forecasts mean that the prevention and control of diabetes has not really materialized, and the number of digital diabetics is still growing. The rapid increase in the number of patients not only causes physical and psychological damage and reduces the quality of life, but its associated complications also lead to a shortened life expectancy [4-5]. The main danger of diabetes is its complications, with microvascular and macrovascular complications being the main cause of disability and death in diabetic patients [6]. Cardiovascular disease also significantly increases the risk of death in patients with T2DM.

Diabetes mellitus is an independent risk factor for cardiovascular and cerebrovascular diseases, which is often associated with high-risk risk factors for vascular events [7]. The short-term and long-term effects of proteinuria in diabetic patients were compared in reference [8]. The literature [9] mainly conducted clinical trials on the safety and tolerability of empagliflozin in patients with type 2 diabetes. Type 2 diabetes has become a serious global public health problem, and the incidence of combined chronic kidney disease (CKD) is on the rise. There are no comprehensive clinical multi-drug safety guidelines for patients with T2DM combined with CKD in China or abroad. It is urgent to provide clinical pharmacists and patients in China with relevant guidelines, summarize information on dosage, relevant pharmacological characteristics, and medication use in special populations to serve the needs of clinical healthcare professionals for standardized medication use.

## **2. INTELLIGENT DATA-BASED ANALYSIS OF CLINICAL EFFICACY OF DAGLIFLOZIN**

### **2.1. SUBJECTS AND RESEARCH METHODS**

Patients diagnosed with type 2 diabetes mellitus in the endocrinology department of the downtown hospital were selected, and a total of 80 patients who met the criteria were informed of the purpose and content of this clinical study in advance. The experimental drugs were selected as Dagliflozin and Metformin Hydrochloride tablets. The treatment was divided into two groups, basic education and treatment and group treatment.

### **2.2. RESULTS OF DATA ANALYSIS**

#### **2.2.1. COMPARISON OF BLOOD GLUCOSE INDEX AND BMI BETWEEN THE TWO GROUPS**

A total of 80 subjects were studied in both groups, 40 in each of the two groups. There were 27 males and 13 females in the control group and 26 males and 14 females in the daguerreotide group. There was no statistical difference between the basic information of patients in the two groups. The comparison of blood glucose indexes before and after treatment between the two groups of patients is shown in Table 1. After 12 weeks of treatment, the FPG, 2h-PG and HbA1C levels of patients in both groups decreased compared with those before treatment, and all of them achieved the scheduled glucose control target, and the difference was statistically significant, i.e.,  $P < 0.001$ , indicating that the glucose-lowering treatment was effective in both groups. However, the post-treatment glucose index in the dagliflozin group was lower than that in the control group after treatment, i.e.,  $P < 0.001$ , suggesting that dagliflozin could further lower glucose. The BMI value after treatment in the dagliflozin group was lower than the overweight value, i.e., less than  $23 \text{ kg/m}^2$ , which was significantly lower than that in the control group during the same period, and the difference was statistically significant, i.e.,  $P < 0.001$ .

**Table 1.** Comparison of blood glucose indexes before and after treatment

Group	FPG	HbA1C	2h-PG	BMI
Control group				
Before treatment	8.78±0.79	8.34±0.62	15.43±1.23	25.34±2.56
After treatment	6.89±0.55	6.92±0.45	9.45±0.89	24.66±2.67
P	<0.001	<0.001	<0.001	0.487
Observation group				
Before treatment	8.88±0.68	8.34±0.62	15.02±0.89	26.42±2.67
After treatment	6.57±0.45	6.59±0.25	8.90±0.77	24.42±2.35
P	<0.001	<0.001	<0.001	<0.001

### 2.2.2. ANALYSIS OF CHANGES IN BLOOD LIPID LEVELS IN THE TWO GROUPS

The changes in lipid levels before and after treatment in the two groups are shown in Figure 1. Where A is the control group and B is the dagliflozin group. After 12 weeks of treatment, there was no significant change in LDL-C level in both groups compared with that before treatment, and there were significant differences in TC, TG and HDL-C levels in the dagliflozin group after treatment.

**Figure 1.** Changes in blood lipid levels before and after treatment

## 3. DISCUSSION

### 3.1. EFFECT OF DAGLIFLOZIN ON BLOOD GLUCOSE LEVELS IN PATIENTS WITH T2DM

Dagliflozin may be effective in improving glycemic control with the added benefit of lowering blood pressure and body weight. Several recent studies have also demonstrated the superior efficacy of dagliflozin in the glycemic control of T2DM patients with poor glycemic control. Unlike previous drugs that were dependent on the function of pancreatic B cells or tissue sensitivity to insulin, dagliflozin acts primarily on sodium-glucose co-transport proteins in the renal tubules, significantly reducing renal tubular glucose reabsorption to lower blood glucose. In addition, in addition to its mechanism of lowering blood glucose independently of insulin action, Macdonald FR et al. found that dagliflozin improved insulin sensitivity and islet B cell function in rats through animal model experiments, similar to the function of insulin potentiators.

Clinical studies have also found that that dagliflozin significantly improves muscle insulin resistance by lowering blood glucose concentrations in patients with T2DM.

### **3.2. EFFECT OF DAGLIFLOZIN ON BMI AND LIPID LEVELS IN PATIENTS WITH T2DM**

As a recognized risk factor, obesity is closely associated with a variety of diseases, including T2DM, hypertension, and cardiovascular disease. Several studies have reported the effectiveness of dagliflozin in reducing body weight and improving blood lipids. In a randomized, double-blind, multinational, phase 3 study in patients with poorly controlled metformin, co-administration of dagliflozin resulted in weight loss primarily through a reduction in fat mass, which accounted for approximately two-thirds of the total weight loss, compared to placebo. The study by Kannenkeril D et al. also showed increased skin sodium levels in patients with T2DM compared with those with simple essential hypertension. "In a recent study, through the mechanism of urinary sodium, the effect of sodium and water retention is reduced, and blood volume is reduced, thereby contributing to blood pressure reduction." The fact that SGLT-2 inhibitors lower blood pressure while increasing hemoglobin or hematocrit also supports this notion.

## **4. CONCLUSION**

Diabetes is a chronic disease caused by the long-term joint action of genetic and environmental factors. In recent years, with the change of lifestyle and dietary structure of our residents, the prevalence of diabetes is increasing year by year, which seriously endangers the health of residents and is an important public health problem facing China at present. Long-term chronic hyperglycemia can lead to a series of complications due to damage of tissues and organs such as eyes, nerves, kidneys and cardiovascular, which seriously endangers human health. Monitoring and controlling the blood glucose level in patients with diabetes plays an important role in reducing the incidence of diabetes, so it is necessary to analyze and evaluate clinical efficacy studies. In this paper, a comparative study of the clinical efficacy of dagliflozin was conducted using intelligent data analysis methods. The data showed that after 12 weeks of treatment, dagliflozin was effective in improving glycemic control with the added benefit of lowering blood pressure and weight, was effective in reducing the risk of death and worsening heart failure, and improved symptoms of heart failure, but there were no significant differences in tolerability or safety events. Dagliflozin has been shown to be effective in reducing body weight and improving lipids in patients with T2DM.

## ABSTRACT

In this paper, a new interactive platform for physiology wisdom education is constructed by using cloud computing technology according to the requirements of physiology education. The physiology wisdom education cloud platform needs to rely on big data environment, cloud computing and other technologies to integrate and store massive teaching resources. The overall architecture of the wisdom education cloud platform includes four core architectures: system layer, resource layer, application layer, and user layer, and each layer unifies the management, integration, and distribution of basic information to realize data sharing. The physiology wisdom education interactive platform is tested from two aspects: environment test and performance test.

## KEYWORDS

Smart education; Cloud computing; Teaching resources; Data sharing; Performance testing; Environment testing

## 1. INTRODUCTION

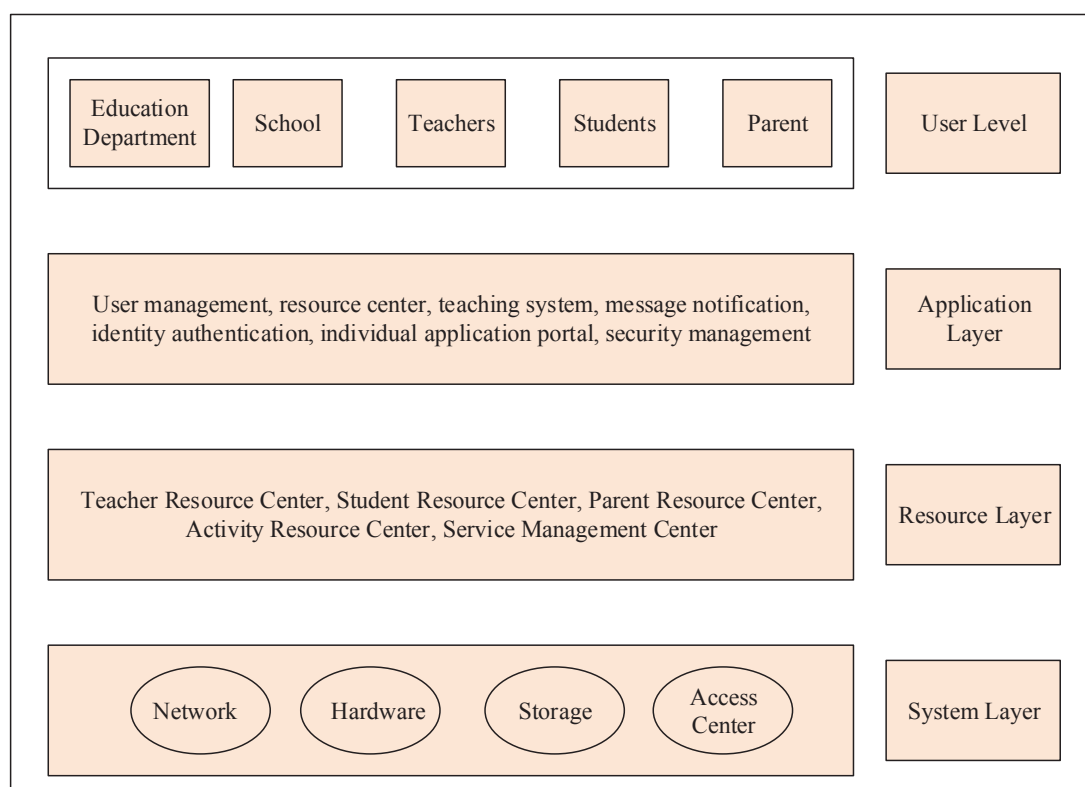

Smart education is an advanced education model that deeply applies information technology to educational field activities such as educational teaching, educational management and scientific research evaluation, and provides digital and intelligent support for the smooth implementation of educational teaching and the distribution and sharing of related educational resources, human, material and financial resources. The basic features of smart education are openness, sharing and collaboration [1-3]. Unlike traditional educational information systems, smart education provides good organization and management of various teaching equipment and educational resources [4]. A smart education platform is a one-stop smart education service platform that combines the concept and practical research of smart education and integrates teaching, learning, management, entertainment, and communication by relying on the Internet and using the construction of information technology as the basis of the educational environment [5-6]. The establishment of a smart education platform allows education departments, schools, teachers, students, and other people with learning needs and other workers in the education field to be in the same environment. Different educational work and learning tasks are accomplished according to different needs and permissions, thus achieving practical, comprehensive, and scientific development of smart education [7-8]. At this stage and for some time to come, the development of smart education focuses on the integration with cloud computing technology. Based on the big data computing and storage, resource virtualization and other capabilities provided by the cloud environment, it is possible to build stable, reliable and easily scalable education cloud services that meet the characteristics of smart education [9-10].

## 2. CONSTRUCTION OF THE PLATFORM

The physiology wisdom education cloud platform needs to rely on big data environment, cloud computing and other technologies to integrate and store massive teaching resources and provide personalized learning services for multiple subjects including teachers, students and parents. Smart education cloud platform helps break the limitation of time and space and helps students find teaching resources anytime and anywhere. Smart classrooms and smart campuses all provide the premise and foundation for the construction of a smart education cloud platform. The construction of smart education cloud platform should be designed as a whole in terms of hardware structure and software functions. Hardware structure includes servers, storage, user terminals, network devices, etc., and software functions include database development and education informatization deployment.

### 2.1. OVERALL ARCHITECTURE DESIGN OF PHYSIOLOGY SMART EDUCATION CLOUD PLATFORM

The overall architecture of physiology wisdom education cloud platform should include four core architectures: system layer, resource layer, application layer, and user layer. The system layer includes hardware and software systems such as big data systems, such as using cloud technology to do data collation, storage and promotion services, and using automated management systems to realize traffic distribution control, CPU automation management and storage automation management. The resource layer includes teaching resources such as data products. The application layer includes user management, resource center, teaching system, message notification, identity authentication, individual application portal, security management and other components, and is also equipped with a network identity unified authentication system. The user layer includes various types of objects using educational resources, such as educational management, schools, teachers, parents and students, and is handled by relevant departments such as development and management services. The overall architecture of the cloud-based physiology wisdom education interactive platform is shown in Figure 1.

**Figure 1.** Overall architecture of intelligent education interactive platform

## 2.2. DEVELOPMENT OF PHYSIOLOGY SMART EDUCATION CLOUD PLATFORM

The physiology wisdom education cloud platform should manage and integrate all the basic information in a unified way, and then distribute it reasonably in order to achieve data sharing. The technology of mutual sharing and data commons can be used in this platform to realize the unified management of data. For the system architecture of the platform, a multi-layer and multi-tier model is adopted and layered according to the different functions used. In each layer, different functions are implemented to divide the business requirements at different stages. In the development process, object-oriented technology is used to improve the malleability of the whole architecture, thus making the system development efficiency much higher.

For users, who may use a certain function repeatedly, this requires the development of the physiology wisdom education cloud platform system to be component-based to achieve the need for repeated calls to different functional sub-modules within the system. The design of the system is mainly implemented using SOA software architecture, so that the functions of subsystems can be somewhat simplified and improved in accuracy, thus distinguishing the functional data of different system modules and reaching the demand for modular services. As the whole platform in the process of operation, different sub-systems will produce different types of sub-data, in this cycle will form a huge number of background to ensure the accuracy and data integrity of the entire data volume by setting up real-time data change emergency module at the back end of each sub-function module output function.

## 2.3. TESTING OF THE PHYSIOLOGY SMART EDUCATION CLOUD PLATFORM

### 2.3.1. TEST ENVIRONMENT

The laptop is used as a mobile client to send HTTP requests based on SOA Web Service through the browser and the desktop computer to build a virtual machine. In the virtual machine, tomcat server is installed, development platform is installed, Hadoop and Hbase are installed and Hadoop environment is configured.

### 2.3.2. PERFORMANCE TESTING

The physical machine uses Win10 system, the virtual machine uses VMware, and the haproxy inverse proxy server. The load balancing test data of the service is shown in Table 1. When the current number of connections is 2, the bytes received and sent are 1172 vs. 1011, and the maximum concurrency is 3000.

**Table 1.** Functional test data

	Number of current connections	Service Status	Receiving/sending bytes	Maximum number of concurrent connections
frontend	2	OPEN	1172/1011	3000
web1	1	12m35sUP	734/556	-
web2	2	12m35sUP	416/285	-
backend	1	12m35sUP	1165/1005	3000

## 3. CONCLUSION

In this paper, a physiology wisdom education service model is designed using cloud computing technology, in which learners, teachers, educational organizations, training institutions, schools, cloud service platform developers, and cloud service platform providers build a healthy wisdom education interactive platform in their service model. It also introduces the environment building, development tool deployment, and service development release process carried out for platform implementation, and finally completes the testing of the physiology wisdom education interactive platform cloud services. The test results show that

the physiology wisdom education interactive platform built in this paper has good operational performance.

---

## ABSTRACT

In this paper, in order to improve the mental health of college students firstly, data mining and association rules are analyzed and the association planning mining process is obtained. Then, by analyzing the psychological state and characteristics of contemporary college students, the parallel relationship between college students' mental health and college students' cultural education is mined, and the integration of college students' cultural education and mental health education is based on association rule mining. Finally, the countermeasures for the parallelism and integration of cultural education and mental health education are obtained, which require the formation of self-reflective consciousness and the promotion of psychological regulation, as well as the need to face up to setbacks and cultivate resilient qualities, and also to be open-minded and learn to relieve oneself.

## KEYWORDS

Mental health level; Data mining; Association rules; Association planning mining; Cultural education

## 1. INTRODUCTION

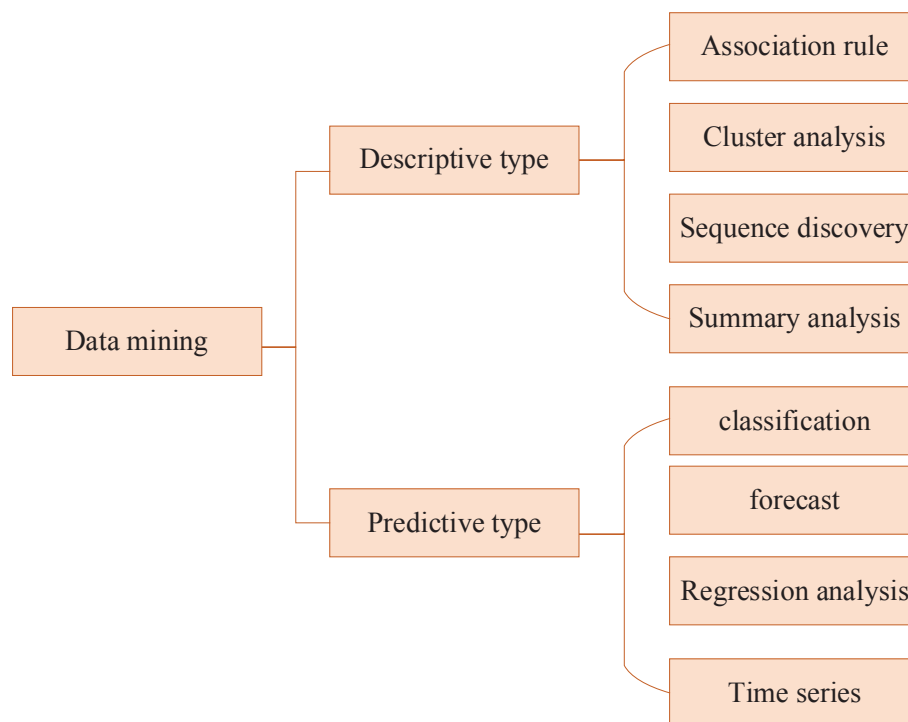

Culture is the eye and soul of the Chinese nation, and how far the Chinese nation can see and go depends on what kind of intellectual wisdom the national culture can bring, and in recent years, people have paid a lot of attention to "cultural literacy" [1-2]. Cultural literacy refers to the relatively fixed, basic and intrinsic qualities of human beings in the field of culture and education, which expresses the basic comprehensive abilities, technical level and personality characteristics of human beings in the relevant cognitive fields and their matching behavioral abilities, psycho-emotional and other fields of development [3-4]. The formation and enhancement of cultural literacy is also of great significance for the implementation of the strategy of strengthening the country through culture and talent [5]. To improve the cultural literacy of college students, to connote their values and moral cultivation, to enhance their cultural identity, and thus to improve their national and ethnic identity, mental health education is an important means to improve students' health and an important part of ideological education [6-7]. In the new era, higher vocational students show differentiated psychological problems. Therefore, higher vocational mental health education needs to actively adapt to the changes, take up the important mission of moral education, focus on the guidance of students' psychological problems, and promote the healthy growth of students' body and mind [8-9]. How to carry out mental health education activities with high quality and solve the psychological problems of students is a topic that needs further research in higher education institutions. In this paper, we combine data mining and association rules to sort out the mining process of

association planning, uncover the parallel relationship between college students' cultural education and mental health education, and integrate the two, focusing on the method of integration as well as its development.

## 2. DATA MINING AND ASSOCIATION RULES

### 2.1. DATA MINING

Data mining is the process of extracting knowledge from large, incomplete, noisy, imprecise, and random data that is implicit, unknown, and potentially useful. The introduction of this concept makes people aware of the very useful information and knowledge hidden in the "useless" data. The specific task representation of data mining is shown in Figure 1. The descriptive type of data mining describes the data in a summarized way, analyzes the relationships between the target data, and explores what is of interest to people.

**Figure 1.** Data mining specific task representation

### 2.2. ASSOCIATION RULES

Association rules are used to describe the interdependence and interrelatedness of a thing and other things. In layman's terms, it means that among multiple things, there is one or another special relationship between things, and these relationships have some intrinsic meanings to a certain extent, and these intrinsic meanings are analyzed and organized, so that they can be used as a criterion for judgment and decision making. Association rules describe the probability of something happening when another thing happens.

### 2.3. THE PROCESS OF ASSOCIATION PLANNING MINING

Association rule mining is to find all the strong association rules from the transaction database after passing two thresholds, minimum support and minimum confidence, given by the user. The association rule mining problem can be divided into two subproblems: mining frequent item factor sets and generating association rules. The process of association rule mining is shown in Figure 2. D is the transaction database to be mined, Algorithm-1 is the algorithm that represents the frequent itemset to be mined, and the algorithm is executed to obtain the frequent itemset. Algorithm-2 is the algorithm that represents the association rules to be generated from the generated frequent itemset. minsupport and minconfidence are the

minimum support and minimum confidence set by the user. The association rule R is all the association rules mined at the end of the whole process.

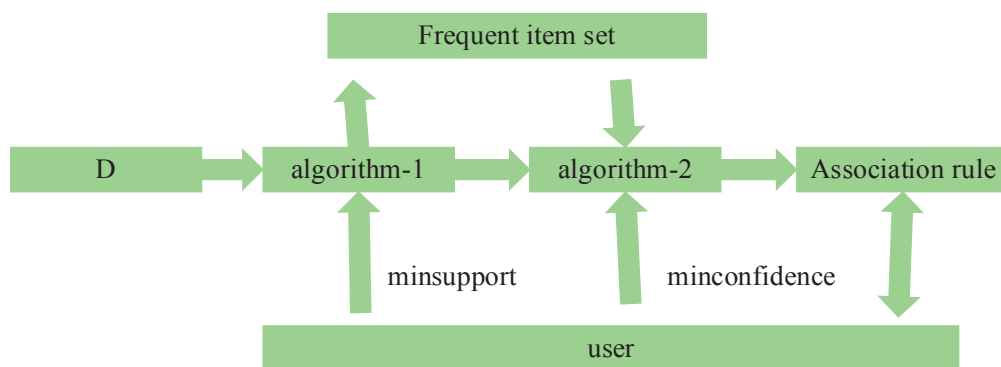

Figure 2. shows the process of association rule mining

### 3. INTEGRATION OF CULTURAL EDUCATION AND MENTAL HEALTH EDUCATION FOR COLLEGE STUDENTS

#### 3.1. PSYCHOLOGICAL STATE AND CHARACTERISTICS OF CONTEMPORARY COLLEGE STUDENTS

The development of Internet information technology has profoundly affected the mental health of college students. The Internet is a means of information dissemination, and the amount of information is extremely large, the information is mixed, and various ideologies intertwine and collide, making it difficult to distinguish, which has caused many negative effects on the values of college students. Utilitarian, hedonistic and consumerist values occupy the mainstream channels in the dissemination of information on the Internet and take up a large amount of valuable school time of college men and women, which can easily lead to their disconnection from society and affect their values and outlook on life, thus leading to their psychological problems. Parents are important members of the family, and their education and knowledge have a very important influence on the members of the family. The family environment is a mirror in front of which the psychological health of college students is undoubtedly reflected accurately.

#### 3.2. PARALLELISM AND INTEGRATION OF CULTURAL EDUCATION AND MENTAL HEALTH EDUCATION UNDER CORRELATION PLANNING EXCAVATION

At the present stage, the mental health education of college students mainly adopts western teaching materials and introduces western psychology education concepts and education methods, however, the effect is not satisfactory. After profound reflection, we were able to explore the essential causes of this problem in the development. The mental health education of a country and a nation must be built on the nation's own cultural values, and must be based on the development history and cultural heritage of the nation, and imported products will have the problem of unconformity and cannot be fully adapted to the mental health education of contemporary college students. Based on the excellent Chinese traditional culture, it is the right way to establish the social and psychological foundation of the whole nation with this as the support point. For college students, they have a high level of knowledge background, and their studies from elementary school to high school have also laid a good foundation for their understanding of traditional cultural texts, so they should dig deep into their traditional cultural heritage and play the positive role of traditional culture to help college students adjust their psychological state and establish a correct outlook on life and values. We should return to the tradition and give full play to the educational role of traditional culture on culture and psychology, especially in colleges and universities, we should promote traditional culture, remove the falsehoods and keep the truth, remove the roughness and extract the essence, so as to

cultivate the healthy psychological state of contemporary universities. Table 1 shows the psychological education embedded in the cultural education of college students and its promotion.

**Table 1.** Psychological education and development contained in cultural education

Psychological education resources contained in traditional culture	In contemporary society, the tendency of materialization is serious. Giving full play to people's subjective initiative, changing cognition and improving inner cultivation to cope with external pressure can make people calm.
Carry forward traditional culture to promote mental health water leveling	In cultivating and practicing Chinese traditional cultural concepts can help greatly Students to establish a correct view of the state, outlook on life, values, concepts of justice and interests, not only can improve their mental health level, but also to promote the internalization and practice of socialist core values is of great benefit.

#### **4. PARALLEL AND INTEGRATED MEASURES AND DEVELOPMENT OF CULTURAL EDUCATION AND MENTAL HEALTH EDUCATION**

##### **(1) Forming self-reflective consciousness and promoting psychological regulation**

In the development of mental health education for college students, students can be guided by the traditional culture's concept of "I think about myself three times a day" in the management of mental health education, so that students can form a self-reflective consciousness while receiving the penetration of mental health education concepts, so that in the subsequent learning process, they can change the way of mental health education cultivation and provide scientific control for the development of mental health education for college students. The development of mental health education of students is guaranteed and the scientific control of the development of mental health education of college students is realized.

##### **(2) Facing up to setbacks and cultivating the quality of resilience**

In the work of mental health education for college students based on traditional culture, the penetration of traditional cultural concepts enables students to have the courage to face up to setbacks, thus providing a guarantee for the development of mental health education for students. Teaching methods should be integrated scientifically to improve the level of mental health education for college students and lay the foundation for the development of mental health education for students in the new era.

##### **(3) Be open-minded and learn to relieve oneself**

In the development of student teaching work, students should be allowed to adjust their own mentality, not to be affected by the immediate failures, timely change the concept of learning, to provide protection for the implementation of student learning work planning, to achieve the scientific development of the arrangement of mental health education work for students, to provide protection for the development and implementation of mental health education work for students, to improve the quality of mental health education for college students, and to lay the foundation for promoting the development of mental health education for students Foundation.

Chinese traditional culture is rich in connotation, and combining excellent traditional culture with advanced mental health education theory and practice can more effectively solve the mental health problems of contemporary college students. Mental health education of college students is also an important foundation for realizing the inheritance of excellent Chinese traditional culture, which can play a positive role in the mental health education of contemporary college students, and ultimately, the excellent Chinese traditional culture can be better inherited and carried forward.

#### **5. CONCLUSION**

This paper combines data mining and association rules to design the mining process of association planning, based on which the parallel relationship between cultural education and mental health education of college students is mined, and the integration of cultural education and mental health education of college students is obtained to guide the mental health education of students with the concept of "I think about myself three times a day" in traditional culture. Management. In the work of mental health education for college students based on traditional culture, students are given the courage to face up to setbacks through the infiltration of traditional cultural concepts, thus providing a guarantee for the development of mental health education for students. We also hope that students will adjust their own mentality, not to be affected by the immediate failure, and timely change the concept of learning.

## ABSTRACT

In this paper, we analyze the magnetic resonance imaging MRI, which is a class of imaging device technology for medical examination made by using nuclear magnetic resonance phenomenon. A multiscale residual dual-domain attention network was constructed by fusing a multiscale residual learning block and a dual-domain attention unit based on a convolutional neural network and applied to the diagnosis of small hepatocellular carcinoma by magnetic resonance imaging. The results showed that the liver scan noise was lower in the control patients, and the difference was statistically significant ( $P < 0.05$ ), and the multi-scale residual dual-domain attention network based on multi-scale residuals could improve the diagnosis of small hepatocellular carcinoma magnetic resonance imaging.

## KEYWORDS

MRI; Convolutional neural network; Multiscale residual block; Multiscale residual block; Small hepatocellular carcinoma

## 1. INTRODUCTION

Small hepatocellular carcinoma is also called early stage hepatocellular carcinoma. The maximum diameter of a single cancer node is  $< 3$  cm, or the sum of the maximum diameter of two cancer nodes is  $< 3$  cm. Small hepatocellular carcinoma has mostly insignificant clinical symptoms, and clinical small hepatocellular carcinoma is mainly of beam-like type, which often has the role of infiltrative growth and swelling growth and is more harmful to patients. Early diagnosis and early treatment of small hepatocellular carcinoma are of great significance for disease treatment [1-3]. Clinically, patients with small hepatocellular carcinoma are mostly

combined with cirrhosis and chronic hepatitis. Patients' diseases generally go through regenerative nodules - atypical nodular hyperplasia - early carcinoma - hepatocellular carcinoma. Therefore, early differential diagnosis of liver disease plays an important role in disease treatment and can affect the prognosis of patients with liver disease. MRI of the liver is radiation-free, safe and has good soft tissue resolution, and has irreplaceable advantages for the detection of diffuse liver disease and focal liver disease. Most patients attending medical imaging departments are patients with liver disease, which requires attention to new imaging techniques and experience in liver disease, and the clinical diagnostic value of MRI enhancement and MRI plain scan for small hepatocellular carcinoma [4-6]. Convolutional neural networks have become a mainstream computational model for medical image analysis and a powerful tool for segmentation tasks. Automatic tumor segmentation methods based on convolutional neural networks do not require human intervention, but the network structure is too deep and the number of parameters is too large, which causes difficulties in network training and cannot effectively identify multi-scale tumor targets, resulting in low segmentation accuracy [7-9]. To address the problems in the current study, this paper proposes a multiscale residual two-domain attention fusion network and hybrid adaptive weight loss function applied to the magnetic resonance imaging diagnosis of small liver cancer.

## **2. MAGNETIC RESONANCE IMAGING DIAGNOSIS OF SMALL HEPATOCELLULAR CARCINOMA**

### **2.1. MAGNETIC RESONANCE IMAGING**

Magnetic resonance imaging MRI is a class of imaging equipment for medical examination made by using the phenomenon of nuclear magnetic resonance, magnetic resonance imaging technology. It is widely used in clinical medicine and medical research due to its advantages of no radiation and high resolution. Some advanced equipment manufacturers work with researchers to optimize the performance of MRI scanners and develop new components. Magnetic resonance imaging has obvious advantages as a non-invasive examination method applied to liver disease examination, but it also has certain limitations when it comes to examination. The results obtained from different sequences of magnetic resonance imaging can vary, and its operation technique requires high technical skills, and phenomena such as difficulties in patient participation and artifacts associated with implanted hardware can also adversely affect image acquisition.

### **2.2. MRI OF THE LIVER**

MRI of the liver is mainly performed in cross-sectional and coronal scans, and the conventional scan sequences include T1WI with homo- and antiphase sequences and T2WI with fat suppression sequences. MRI of the liver measures the signal difference between homo- and antiphase and allows quantitative analysis of liver fat content, but patients with intrahepatic iron deposits and mild fatty liver tend to have significant bias in the quantitative assessment of liver fat. In contrast, T2WI mostly uses fast spin-echo sequences, which enhance the degree of contrast based on the combination with fat suppression and effectively reduce the impact of the examination process on the abdominal wall and perihepatic fat.

## **3. MULTI-SCALE RESIDUAL TWO-DOMAIN ATTENTION NETWORK**

To address the current problems in small hepatocellular carcinoma-MRI tumor region segmentation, this paper proposes a multi-scale residual two-domain attention fusion network MSRDANet model, which performs tumor extraction in a single-stage segmentation mode and substantially reduces the number of model parameters on the basis of improving segmentation accuracy. The model has an encoder-decoder structure as the backbone architecture of the network, containing encoders (Conv1 to 5), fusion decoders (AConv5, AFNet4 to 1) and long-

hop connections for transporting encoded path feature maps. The network takes 4-channel images as input, performs 5-stage feature extraction and 4 times coded downsampling by multi-scale residual blocks, passes the final extracted feature map through 1 time dual-domain attention unit first, followed by upsampling by inverse convolution to recover the resolution and reduce the number of channels, while the coded path feature map and the upsampled feature map are fused by the decoder under the guidance of the dual-domain attention unit, after 4. Finally, the up-sampled feature map is further reduced by  $1 \times 1$  convolution, and the network is optimized by iterating through the hybrid adaptive weight loss function to finally output the 2-channel tumor segmentation map.

### 3.1. MULTISCALE ATTENTION LEARNING BLOCKS

Multiscale feature representation is essential in various vision tasks. More efficient feature representation can be obtained by embedding multi-scale feature extraction operators in a convolutional neural network. On the other hand, CNN can learn multi-scale features from coarse-grained to fine-grained naturally by a set of convolutional operators. The feature mapping information of each channel direction of the image is obtained through the multiscale network structure, while its channel dimension is compressed to extract spatial information from each channel at different scales. Second, the channel attention weights of the multi-scale feature map are extracted using the SEWeight module, and the corresponding channel attention weights are recalibrated using Softmax operations to establish remote channel dependencies. Finally, the recalibrated weights and the corresponding feature maps are subjected to the element-by-element product operation to obtain the multiscale feature maps as the output.

First, the input feature map is subjected to multiscale convolution with the following equation:

$$feat_i = Conv(k_i \times k_i)(inpt), i = 0, 1, 2 \dots S-1 \quad (1)$$

Where, the size of the  $i$  st convolution kernel  $k_i = 2 \times (i + 2) + 1$ ,  $feat_i \in R^{C \times H \times W}$  indicates the feature maps at different scales. The result after the multi-scale convolution operation is obtained from the following equation:

$$Feats = Cat([feat_0, feat_1, \dots, feat_{S-1}]) \quad (2)$$

where  $Feats \in R^{C \times H \times W}$  is the obtained multiscale feature map.

The channel attention information is extracted from the multiscale preprocessed feature map to obtain each channel weight information. The weight vector can be expressed as

$$w_i = SEWeight(feat_i), i = 0, 1, 2 \dots S-1 \quad (3)$$

where  $w_i \in R^{C \times 1 \times 1}$  is the attention weight.

### 3.2. DUAL DOMAIN ATTENTION UNIT

In order to realize the full utilization of effective features and the reduction and suppression of invalid features, to better realize the extraction of key detail information in the feature maps delivered by long-hop connections, to make more use of shallow spatial cues, edge information and early refinement features, so as to accomplish more valuable feature map fusion in the decoder, and to improve the problem of intra-class inconsistency and inter-class non-differentiation in semantic segmentation, the design of the dual-domain attention unit with attention mechanism for low-level features guided by high-level features is designed. The dual-domain attention unit is shown in Figure 1. Firstly, for the squeezing operation of global

information embedding, both global maximum pooling and global average pooling are used to perform, so as to achieve a more comprehensive retention of global spatial information, and secondly, for the stimulation operation, two fully connected layers are removed and replaced by two convolution operations, and the activation functions after convolution still use ReLU and Sigmoid functions.

**Figure 1.** Dual domain attention unit

## 4. EXPERIMENT AND ANALYSIS OF MIR REGION SEGMENTATION IN SMALL HEPATOCELLULAR CARCINOMA

### 4.1. EVALUATION INDICATORS

In this paper, the tumor segmentation accuracy was evaluated by three groups of metrics, namely region metrics, pixel metrics and distance metrics, and Table 1 shows the definitions of specific metrics and evaluation criteria.

**Table 1.** Definition and evaluation criteria of specific indicators

Evaluation index		Specific name	Definition representation	Evaluation criteria
Regional index	DSC	Dice Similarity Coefficient	Set similarity measure	The larger the value, the phase between the predicted region and the real region The higher the similarity, the better the segmentation effect IOU
	IOU	Intersection of Union	Split standard performance measures	
Pixel index	TPR	True Positive Rate	Predict the correct positive sample Proportion of total positive sample	The larger the TPR, PPV and ACC values are, the higher the sensitivity, accuracy and accuracy respectively, and the better the segmentation effect will be
	PPV	Positive Predictive Value	The prediction is in the positive sample Predict the rightratio	
	ACC	Accuracy	Predict the correct sample As of the total sample	
Distance index	HD	Hausdorff Distance	Measure between two sets of points Maximum mismatch	The smaller the value, the prediction region The closer we get to the real area, The better the segmentation

### 4.2. RESULTS AND ANALYSIS

The difference between the two groups of patients with high contrast resolution of CT examination images of the liver was not statistically significant ( $P>0.05$ ), and the difference in the uniformity of the scanned images was not statistically significant ( $P>0.05$ ). The difference was statistically significant ( $P<0.05$ ), the magnitude of the decrease in the low pair resolution of the scanned images and the jump in the scanned images of the patients in the observation group was significantly greater than that of the patients in the control group, the difference was statistically significant ( $P<0.05$ ), the CT examination image quality of the patients in the observation group was better and the effect of excessive radiation dose in the group was reduced, the difference was statistically significant ( $P<0.05$ ), the CT scan noise of the liver of the patients in the control group was lower, the difference was statistically significant ( $P<0.05$ ). The absorbed dose of control group patients far exceeded that of observation group patients, and the difference between the two groups was statistically significant ( $P<0.05$ ), so the use of multiscale residual two-domain attention network could improve the diagnostic ability of MRI

of small liver cancer.

## 5. CONCLUSION

In this paper, a multiscale residual dual-domain attention fusion network is proposed for the diagnosis of small hepatocellular carcinoma by magnetic resonance imaging. The network uses a multiscale residual block composed of multiscale convolution as the basic building block, and the dual-domain attention unit is incorporated into the network to guide the network to utilize favorable features more effectively and better achieve key information extraction and boundary preservation. The results showed that patients in the control group had lower noise on CT scans of the liver, and the difference was statistically significant ( $P < 0.05$ ), and the absorbed dose of patients in the control group far exceeded that of patients in the observation group, and the difference between the two groups was statistically significant ( $P < 0.05$ ), and the use of multiscale residual dual-domain attention network could improve the diagnostic capability of magnetic resonance imaging of small hepatocellular carcinoma.

## ABSTRACT

This paper combined the gray prediction model with the clinical data of the hospital to provide systematic care for patients with hepatocellular carcinoma intervention through health education, pain care, psychological care, dietary care and environmental care, and set up a comparison experiment in which those who underwent systematic care were set as the study group and those who did not undergo systematic care were the comparison group. The analysis of complications and pain conditions showed that the study group had a significantly lower complication rate than the control group, with a meaningful comparison of  $P < 0.05$ , and the pain perception index was significantly lower compared with the comparison group patients, with  $P < 0.05$ , and the prediction error based on the GM prediction model was within  $\pm 1$ .

## KEYWORDS

Gray predictive model; Systemic care; Hepatocellular carcinoma intervention; Complications; Pain perception

## 1. INTRODUCTION

Hepatocellular carcinoma, or malignant tumors of the liver, has a high incidence, and more than 200,000 people die from it each year worldwide, making it one of the serious diseases that threaten human life and health [1]. Currently, the pathogenesis of liver cancer is unclear and is widely believed to be caused by a combination of factors, such as alcohol consumption, cirrhosis, viral hepatitis, chemical carcinogens, and aflatoxin [2-3]. Interventional therapy is a

new type of minimally invasive procedure that can effectively improve patients' condition and prolong their survival time. However, interventional therapy is still an invasive treatment, and to a certain extent, it also affects the patient's body, thus affecting the surgical effect [4-5]. Therefore, giving certain nursing measures while performing interventions can help improve the success rate of the procedure. Tong, D. et al. closely observed patients to identify symptoms of hepatic encephalopathy and pain in a report of 40 patients with primary hepatocellular carcinoma combined with obstructive jaundice treated with hepatic puncture bile duct drainage interventions [6]. The literature [7] analyzed patients with cirrhosis combined with hepatocellular carcinoma who underwent intervention in the oncology department of the Second Hospital of Dalian Medical University and compared the satisfaction, quality of life score, postoperative complication rate and 20-month postoperative survival rate before and after the nursing intervention in the two groups. The literature [8] suggests that it is important to take steps to ensure that pain specialists and interventional radiologists are fully utilized to manage refractory cancer pain. In this paper, a comparative trial was designed for the effectiveness of the application of the clinical care pathway approach for patients undergoing hepatocellular carcinoma interventions by combining clinical data of patients undergoing hepatocellular carcinoma interventions and a gray prediction model to observe the incidence of complications and pain in patients undergoing hepatocellular carcinoma interventions by systematic care in the comparison group and the experimental group, and to make predictions based on the GM model.

## 2. GRAY PREDICTION MODEL

Uncertainty system is a manifestation of incomplete and inaccurate information caused by the limitations of human cognitive ability and economic and technological conditions. Gray system theory can establish linear differential equations based on partially known information by processing fuzzy and messy small sample data and using the least squares method to find out the laws that exist in the original sequence.

Let the number of residuals be:

$$G^{(0)} = (g^{(0)}(2), g^{(0)}(3), \dots, g^{(0)}(n)) \quad (1)$$

where the residual values:

$$g^{(0)}(k) = |x^{(0)}(k) - \hat{x}^{(0)}(k)| \quad k = 2, 3, \dots, n \quad (2)$$

The mean GM(1,1) model prediction for the residual series of Eq. (2) yields the residual prediction model:

$$\hat{g}^{(0)}(k) = \left\{ (1 - e^a) \left[ g^{(0)}(2) - \frac{\mu'}{a'} \right] e^{-a(k-1)} \right\} \quad k = 3, 4, \dots, n \quad (3)$$

The residual gray model was obtained by merging the mean GM(1,1) prediction model with the mean GM(1,1) residual prediction model (3):

$$\hat{h}^{(0)}(k+1) = (1 - e^a) \left[ x^{(0)}(1) - \frac{\mu}{a} \right] e^{-ak} + m(k+1)(1 - e^a) \left[ g^{(0)}(2) - \frac{\mu'}{a'} \right] e^{-ak} \quad (4)$$

Among them:

$$m(k+1) = \begin{cases} 1 & g^{(0)}(k+1) > 0 \\ -1 & g^{(0)}(k+1) \leq 0 \end{cases} \quad (5)$$

### **3. CLINICAL INFORMATION AND CARE METHODS**

#### **3.1. CLINICAL INFORMATION**

Eighty-eight interventional patients with hepatocellular carcinoma admitted to the interventional department of the hospital from January 2021 to October 2021 were selected for the study and divided into the study group and the control group. The two groups contained a total of 60 male and 30 female patients. The age ranged from 34 to 75 years, with a mean value of  $(55.58 \pm 9.73)$  years. The data comparison between the two groups of patient subjects was not significant ( $P > 0.05$ ), suggesting that statistical analysis can be performed later. Inclusion criteria were those who received hepatocellular carcinoma intervention for the first time, could provide sufficient clinical treatment information, were clinically confirmed and had passed pathological examination. Exclusion criteria were patients with reading, communication, or cognitive impairment, patients with psychiatric disorders, and patients who were breastfeeding. The differences were not statistically significant ( $P > 0.05$ ) when comparing the general data of the two groups and were comparable.

#### **3.2. NURSING METHODS**

In both groups, patients were treated with interventional therapy. In the control group, routine care was provided, including health education, diet and medication. In the observation group, systematic nursing care was implemented, which mainly included health education, pain care, psychological care, diet care and environmental care. Health education is to explain the basic knowledge of liver cancer to patients and family members, eliminate their doubts, and tell them the precautions of the disease and methods to prevent related complications, so as to continuously improve patients' awareness of self-protection. At the same time, according to the patient's condition, the advantages and disadvantages of interventional treatment, operation methods and operation procedures as well as possible adverse reactions during the procedure are told to the patient so that the patient can be prepared in advance. Pain care refers to the fact that patients with hepatocellular carcinoma are mostly accompanied by continuous pain in the liver area, plus after minimally invasive surgery, the excessive volume of edema of liver tissues and traction of liver envelope will also cause pain to patients, which causes great pain to patients. Patients are taught relaxation training, such as breathing adjustment method, muscle relaxation method and listening to music to relieve patients' pain, and appropriate analgesic drugs can be taken to relieve patients' pain when necessary. Psychological care is the nursing staff should actively communicate with patients, tell patients about the successful cases of the disease, eliminate patients' fears, answer patients' questions in time, make patients maintain a good state of mind and establish confidence in curing the disease. Dietary care is the nursing staff to make a scientific and reasonable diet plan according to the patient's condition, following the principle of eating less and more meals, focusing on low-salt, low-fat, high-protein and vitamin-rich foods, avoiding raw, cold, rough and stimulating foods, and also consuming more vegetables and fruits to accelerate the elimination of toxins. Environmental care is to ensure that the temperature and humidity of the ward are appropriate, ventilation is done on time, and bed sheets and bedding are changed in time to keep the environment clean and dry, especially to ensure the quietness of the ward, so as to provide a good recovery environment for patients.

#### **3.3. OBSERVED INDICATORS**

The liver function indexes of patients in both groups after nursing intervention were analyzed, including glutamate transaminase ALT, aspartate transferase AST, and Childpugh. The pain scores of patients in both groups after nursing intervention were counted, and the scores were inversely proportional to the patients' pain. the occurrence of complications in both

groups after nursing intervention was counted. Make a combination of gray prediction model and SPSS statistical software for processing and analysis, the measurement data were expressed as  $(\bar{x} \pm s)$  and compared by t-test, and the count data were expressed as rate (%) and compared by  $\chi^2$  test. The difference was considered statistically significant at  $P < 0.05$ .

#### 4. COMPLICATIONS AND PAIN IMPACT ANALYSIS APPLIED TO GRAY PREDICTION MODEL

##### 4.1. COMPLICATION OCCURRENCE AND ANALYSIS

Table 1 shows the comparison of complication rates between the two groups before and after instruction. The study group had significantly lower complication rates in the category of irritable insomnia, lower limb numbness, urinary disorders, and bleeding at the puncture site than the control group data comparison was significant ( $P < 0.05$ ). However, there was no significance in the data comparison between the two groups in terms of the incidence of hematoma complications ( $P > 0.05$ ).

**Table 1.** Comparison of complication rate before and after guidance (n/%)

group	dysuria	Lower limb numbness	Irritability and insomnia	Puncture bleeding	hematoma
Control group (n=45)	25 (55.56)	15(33.33)	12(26.67)	7(15.56)	3(6.67)
Research group (n=45)	10 (22.22)	5(11.11)	3(6.67)	1(2.22)	1(2.22)
$\chi^2$	8.115	5.212	6.115	3.868	0.332
P	0.002	0.022	0.015	0.038	0.565

Figure 1 shows the prediction analysis of the occurrence of complications in the two groups based on the gray prediction model. The difference between the results by the gray prediction model and the actual study of the occurrence of complications is not significant, and the error is within  $\pm 1$ , which is an acceptable error, so the occurrence of complications in the two groups can be predicted based on the gray prediction model.

**Figure 1.** Prediction of complications in the two groups by GM model

##### 4.2. PAIN SITUATION ANALYSIS

Table 2 shows the comparison of pain perception between the two groups after systematic nursing intervention, the AST, ALT, Child-pugh, and pain perception indexes of patients in the study group were significantly lower compared with those in the comparison group, with a significant advantage,  $P < 0.05$ , and the prediction error based on the GM prediction model was within  $\pm 1$ , which could be predicted, so the GM model could be used for the analysis of

systematic nursing on patients with hepatocellular carcinoma intervention inter-analysis of the effect of pain.

**Table 2.** Comparison of pain perception after systemic nursing intervention

Group	quantity	AST	ALT	Child-pugh	Aching
Research group	45	45.6 ± 5.2	46.3 ± 5.2	6.1 ± 1.1	4.1 ± 0.2
Control group	45	72.8 ± 6.1	74.8 ± 5.1	8.5 ± 1.4	8.8 ± 1.5
GM Research group	45	44.8 ± 5.1	46.8 ± 5.1	5.9 ± 1.2	4.6 ± 0.5
GM Control group	45	72.2 ± 5.9	73.3 ± 5.7	8.8 ± 1.3	9.2 ± 1.3
t		16.81	24.22	8.58	21.22
P		0.001	0.002	0.002	0.005

## 5. CONCLUSION

In this paper, a comparison experiment between two groups was set up combining gray prediction model and clinical data, using systematic care for the study group and not using systematic care for the comparison group, and complications and pain conditions were analyzed. It was concluded that the study group had significantly lower complication rates than the control group in the category of irritability and insomnia, lower extremity numbness, urination disorder, and bleeding at the puncture site data were comparatively significant. The AST, ALT, Child-pugh, and pain perception indexes were significantly lower in the study group patients compared to the comparison group patients, with a significant advantage at  $P < 0.05$ , and the prediction error based on the GM prediction model was within  $\pm 1$ , which could be predicted by the GM prediction model. Therefore, a systematic care pathway approach can be implemented for patients with hepatocellular carcinoma undergoing interventional therapy.

## ABSTRACT

This paper first compares CPM with IFT to introduce the competitive posture matrix analysis and its specific steps to analyze the competitive advantage of a company through its human resource management. Then the CPM model is applied to the performance management of human resources by analyzing the current situation of enterprise human resources management and performance management. Finally, the employee motivation mechanism of enterprise human resources is designed in conjunction with the CPM model. The results of the study show that enterprises need to develop goal management, form quantitative management, conduct job analysis, establish performance index system with scientific and systematic incentive mechanism, and use intrinsic compensation as an innovative area of employee motivation.

## KEYWORDS

CPM; IFT; Corporate human resources; Performance management; Employee incentives

## 1. INTRODUCTION

The competition between modern enterprises is ultimately the competition of talents is the competition of the comprehensive quality of human resources and the competition of the advantages and disadvantages of human resources allocation [1]. Along with the development of traditional personnel management to modern human resource management, the staff and consulting of human resource management, as well as the increasing role in the development and implementation of corporate strategies, more and more enterprises are aware of the role of human resources in the core competitiveness of enterprises, and human resource management has become the most powerful tool for enterprises to gain competitive advantage [2-3]. How to develop human resources as special resources, so that the enterprise can survive and develop in the competition, and can always maintain vigorous vitality and vitality, also must become the first priority of modern enterprise management [4-5]. Studies on employee motivation programs, performance management systems and employee participation in decision making have shown a strong positive correlation between the level of human resource management and the level of productivity of the company [6-7]. From ancient times to the present, many motivational approaches have been used and many motivational theories have been studied [8]. In the era of "knowledge economy", employees become the decisive force for the efficiency and development of enterprises, so the motivation of employees is especially important [9-10]. In this paper, we investigate the performance management and employee motivation mechanism of enterprise human resources with CPM model.

## **2. CPM MODEL**

### **2.1. CPM AND IFE**

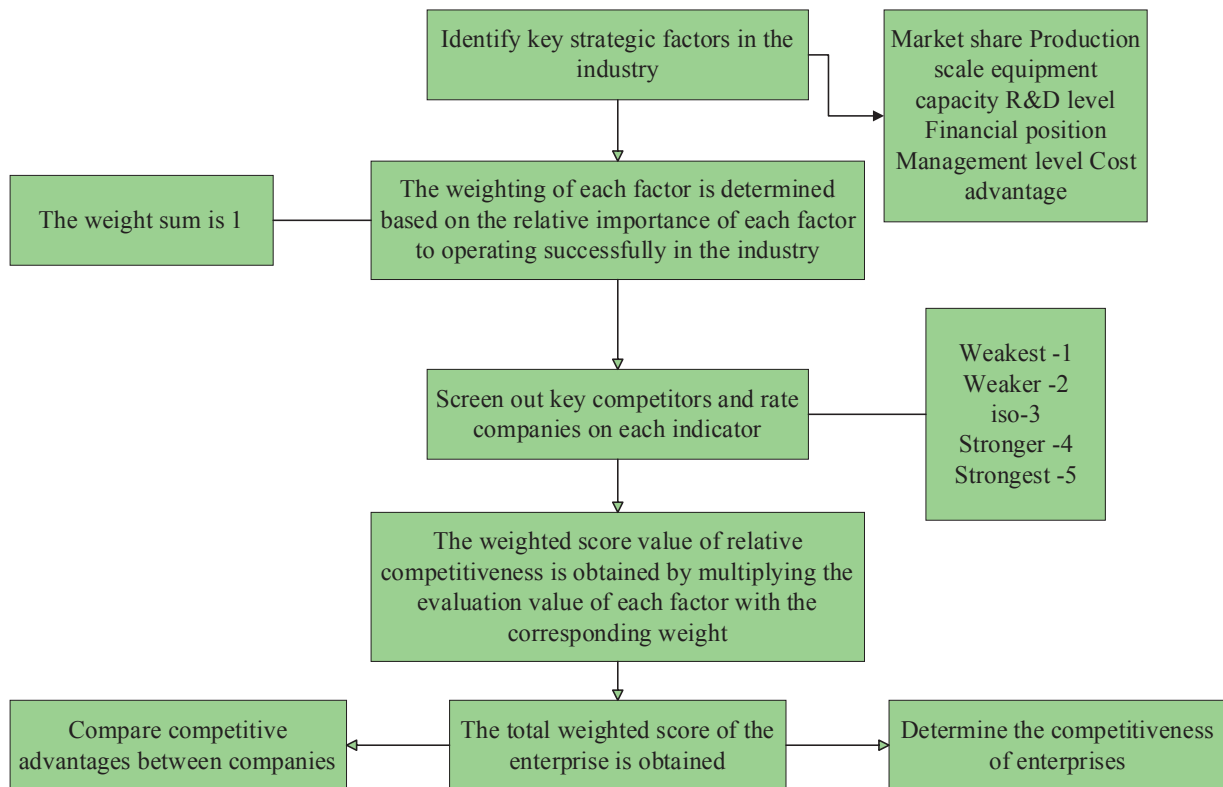

The competitive posture matrix, or CPM, is an analytical tool for internal and external environment analysis, which is mainly used to identify the strategic position of the company's main competitors in relation to the company, as well as to analyze the competitive advantages and competitive weaknesses specific to the company's main competitors. The only difference lies in the fact that the elements of the CPM matrix contain both internal and external dimensions, while the scores indicate the company's current strengths and weaknesses.

### **2.2. COMPETITIVE SITUATION MATRIX ANALYSIS**

It is an effective method to analyze the competition among companies in similar industries. It determines several key elements of competition among companies according to the nature of the industry, and lists the weights of these elements in the company's operation, and screens out the main competition objects similar to the evaluation object.

### **2.3. SPECIFIC STEPS OF THE COMPETITIVE LANDSCAPE MATRIX ANALYSIS**

The steps of the competitive dynamics matrix analysis are shown in Figure 1. Identify all important strategic elements in the industry, including market share, production scale, equipment capacity, cost advantage, management level, and R&D level. Based on the relative importance of each element to the successful operation in the industry, the weight of each element is determined, and the total weight is 1. Key competitors are selected, and the company is rated by each element, with the weakest being 1, the weaker being 3, the same being 3, the stronger being 4, and the strongest being 5, and then analyzed for their respective strengths and magnitudes. Each rating value is multiplied by the corresponding weight to obtain the weighted rating value of each element of each competitor. The total weighted score of the company is added up to get the total weighted score of the company, and the competitiveness of the company is judged in general, so as to determine the strength of the company's competitive ability and compare the competitive advantages between companies, and the competitive advantages of the company are analyzed through the enterprise human resource management.

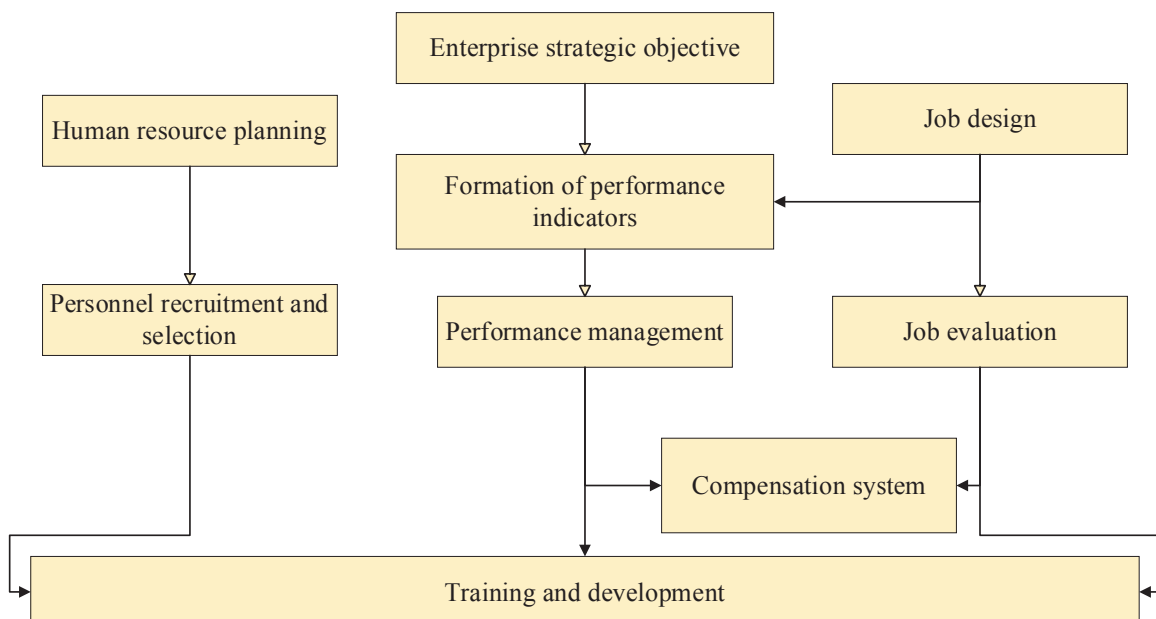

**Figure 1.** Steps of competitive situation matrix analysis

### 3. PERFORMANCE MANAGEMENT OF ENTERPRISE HUMAN RESOURCES COMBINED WITH CPM MODEL

#### 3.1. HUMAN RESOURCE MANAGEMENT

Human resource management is a multi-level and multi-faceted complex integrated management system actually is an organic system of human resource acquisition, integration, retention, motivation, control adjustment and development and utilization, which mainly includes sub-systems such as job analysis and job design, employee recruitment and selection, performance management, compensation management, training and development. The human resource management system is shown in Figure 2, and performance management belongs to the subsystem of human resource management.

**Figure 2.** Human Resource management system

### 3.2. PERFORMANCE MANAGEMENT

Performance management is the management of performance, a set of processes and regulations designed to ensure that an organization accomplishes its strategic goals. It can generally be understood in the following ways.

(1) Performance management is management, and performance management covers all functions of management planning, organizing, leading, coordinating, and controlling. Performance management itself is a complete cycle system within the enterprise, including several important components such as target planning, implementation coaching, evaluation checking, and return feedback etc. This cycle can also be divided into four stages such as performance planning, performance implementation, performance appraisal, and performance feedback.

(2) Performance management is mainly the management of employees' behavior and output, through the process of performance planning, implementation, assessment, feedback, motivation, training, etc., to realize the control of employees' work behavior and the management of their work output results.

(3) The purpose of performance management is to improve, and performance management involves organizational performance management, team performance management, and employee performance management. The sole purpose is to help employees personally, departments and enterprises to improve performance, so that sincere cooperation between managers and employees, timely and effective problem solving. Aiming at success and progress, the core of management is the continuous improvement of business and employee performance, and performance management usually requires a lot of investment in communication.

### 3.3. PERFORMANCE MANAGEMENT MEASURES COMBINED WITH CPM MODEL

The steps of performance management combined with the CPM model are shown in Figure 3. Performance management combined with the CPM model entails setting out management goals at the beginning of the management appraisal cycle and using performance data as a measure of goal achievement or non-achievement by the end of the appraisal cycle. By breaking down corporate goals into clearer, quantified sub-goals, coupled with top-down communication and information transfer, employees at all levels of the company understand the goals, and then manage and implement them to achieve effectiveness in helping the company implement its strategy. To effectively decompose the functions of the organization into positions, clearly define the purpose or mission of each position, specify the responsibilities and tasks to be performed by the position, and determine the basic requirements of the job holder. Establish a system of performance indicators with quantifiable or behavioral criteria for assessing and managing the performance of those being evaluated.

**Figure 3.** Performance management steps combined with CPM model

## 4. EMPLOYEE MOTIVATION MECHANISM OF CORPORATE HUMAN RESOURCES COMBINED WITH CPM MODEL

Employee motivation mechanism is the core of human resource management, which is the key factor to improve labor performance and management. Figure 4 shows the process of employee motivation mechanism. The intrinsic reason for motivation is whether it can meet the

intrinsic needs of individuals. According to the hierarchy of needs theory, human needs and expectations are constantly changing, so the ways and means of motivation need to be constantly innovated. The psychological needs and expectations of employees of different cultural levels, ages and positions are different. The use of many motivation theories to implement differentiated motivation for employees has practical and universal significance. Combined with the CPM model of enterprise human resources staff incentive mechanism, it is necessary to establish a scientific and systematic incentive mechanism, to realize the fairness of the salary system from multiple perspectives, to establish a perfect assessment system, to pay more attention to KPI to improve the corporate culture, and to use the intrinsic salary as an innovative area of staff incentive.

**Figure 4.** Process of employee incentive mechanism

## 5. CONCLUSION

This paper analyzes the steps of the CPM matrix analysis method and applies it to the performance management and employee motivation mechanism of corporate human resources, setting management goals to the end of the appraisal cycle, using performance data as a measure of whether the goals are achieved or not. Decompose corporate goals into clearer, quantifiable sub-goals and effectively break down the functions in the organization into individual positions and determine the basic requirements for job holders. Establish a performance indicator system with a quantified or behavioral standard system for assessing and managing the performance of the appraisees and a scientific and systematic incentive mechanism. Realize the fairness of the remuneration system from multiple perspectives, establish a perfect appraisal system, pay more attention to KPI to improve the corporate culture, and use intrinsic compensation as an innovative area for employee motivation.

## ABSTRACT

This paper analyzes the problems of real estate development management and the relationship between real estate and urban planning, and sorts out that urban planning plays a guiding, regulating, and coordinating role for real estate development management. Urban planning and real estate development management are considered as urban activity information, and a gray prediction model of urban activity information is established and sales volume and price are predicted. It is shown that the actual sales volume is within  $\pm 15\%$  of the predicted sales volume based on the GM model, and the simulated real estate price is within  $\pm 100\%$  of the predicted price based on the GM model.

## KEYWORDS

Real estate development; Urban planning; Grey forecasting model; Urban activity information; Price; Sales volume

## 1. INTRODUCTION

China has a relatively large population and, due to its limited land area, is prone to housing tensions in the course of urban development [1]. This is both an opportunity for development and a major challenge for the real estate industry, and in order to improve the competitiveness of enterprises in the real estate market, it is necessary to correct the problems that exist in real estate open project management [2-3]. After entering the new economic era, managers of real estate enterprises must change the measures of development management under the traditional economic era, and also change the traditional management concept [4-5]. In response to the development situation of social networking, the mechanism of urban planning is optimized and improved so as to promote greater economic efficiency of real estate enterprises and to improve their competitiveness [6-7]. The real estate industry is an important pillar of China's national economy, and improving the level of real estate development management can promote the standardized management of real estate projects [8]. The real estate industry has become one of the pillar industries in China and is the main way of urban construction and planning implementation, and the development of urban planning in China should be based on the characteristics of market economy and in-depth research on real estate development in order to improve planning and design, while the application of urban planning technology in real estate planning is also very promising [9]. In this paper, the relationship between urban planning and real estate development management is explored by combining gray prediction model.

## 2. THE RELATIONSHIP BETWEEN URBAN PLANNING AND REAL ESTATE DEVELOPMENT MANAGEMENT

### 2.1. PROBLEMS OF REAL ESTATE DEVELOPMENT MANAGEMENT

Although the real estate industry is developing relatively fast, the relevant system is not perfect and many development project management systems have large loopholes, which makes it difficult to improve the level of real estate development management and increases the difficulty of management. There are problems in the management of real estate development, such as urban planning is not reasonable enough, the slow transformation of old cities and the failure of infrastructure to meet the requirements of households. Many developers hoard land blindly, but fail to improve the utilization rate of land, which hinders the development of society and creates a development situation of rough land use. The planning and development management of many real estate projects suffer from the problem that the infrastructure construction cannot meet the requirements of the owners.

### 2.2. THE RELATIONSHIP BETWEEN REAL ESTATE AND URBAN PLANNING

After more than a decade of development, the real estate industry has become one of the pillar industries of the national economy. Expanding domestic demand is the foothold of economic development and a long-term strategic policy, and the urban housing market has great potential and high industrial relevance, which plays an important role in promoting structural adjustment and boosting economic growth. The relationship between real estate and urban planning is shown in Table 1. If urban planning is to serve economic development, real estate is bound to become an important research topic of urban planning.

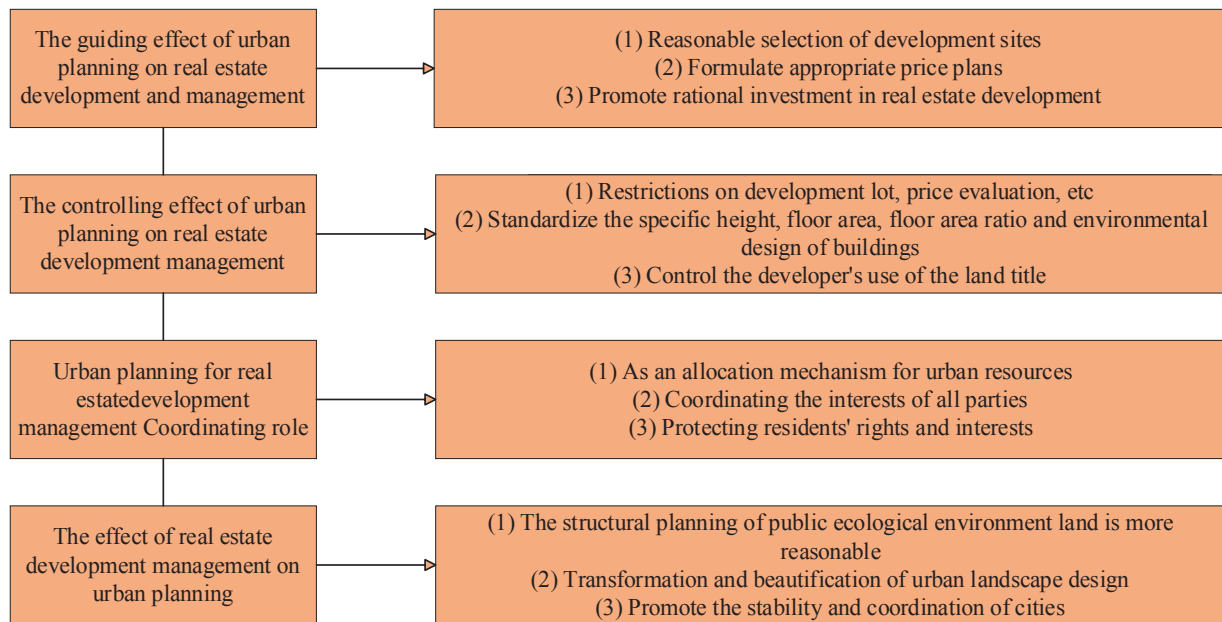

**Table 1.** The relationship between real estate and urban planning

The importance of real estate research to urban planning	Concrete performance
Real estate development is an important way of urban construction and planning implementation	(1) Real estate development is the main way and method of urban construction and planning implementation (2) The quality of real estate development is directly related to the quality of urban development (3) To do a good job in the guidance of development, in the planning management should strengthen the study of real estate
Real estate is an important aspect of the development of urban planning	(1) Real estate development is a very important part of urban economic problems (2) It is conducive to finding and mastering the regularity of urban development (3) It is of great significance to improve the operability of planning
Real estate promotes the renewal of the concept of the city	(1) Under the market mechanism, real estate is a normal thing and an important part of economic life (2) Planners should treat the real estate industry with positive attitude and upright spirit

### 2.3. THE RELATIONSHIP BETWEEN REAL ESTATE DEVELOPMENT MANAGEMENT AND URBAN PLANNING

Urban planning guides and constrains real estate development management through planning blueprints, and real estate development management realizes the grand blueprint of urban planning through building design and development. The two intersect and complement each other to achieve the common purpose of building a beautiful urban environment, creating a livable and comfortable living environment for the people, and realizing the long-term sustainable development of the city through different means. The relationship between real estate development management and urban planning is shown in Figure 1. The guiding role of urban planning on real estate development management, the controlling role of urban planning on real estate development management, the coordinating role of urban planning on

real estate development management, and the role of real estate development management on urban planning.

**Figure 1.** The relationship between real estate development management and urban planning

### 3. GRAY PREDICTION MODEL

#### 3.1. GREY FORECASTING OF URBAN INFORMATION ACTIVITIES

There is known and unknown information, and in fact there is something in between, i.e., uncertainty, which is the meaning of “white”, “black” and “gray”. In fact, a large number of problems in urban economic activity are characterized by “gray”, i.e., these systems have a significant part of known information and a significant part of unknown or unknowable information. The so-called “statistical” method often used in urban activities is actually a typical method of dealing with gray systems - the “white element” extraction of “gray systems”. “The data obtained by statistical processing is regarded as an “estimated value” of the actual problem, which is actually a “whitened value” of the gray element. Therefore, it is feasible to apply the gray prediction model to study the relationship between urban planning and real estate development management.

#### 3.2. ESTABLISHMENT OF GRAY PREDICTION MODEL

The gray prediction model is based on the theoretical idea of gray system, the discrete variables continuous with differential equation instead of differential equation with the generation of the number of series instead of the original time series of the original time series of randomness so that the process of change can be described for a longer period of time, and then establish the differential equation form = the model. The essence of the modeling is to establish the coefficients of the differential equation. The gray model prediction modeling process is as follows:

With N original data as:

$$X^{(0)} = (X^{(0)}(1), X^{(0)}(2), \dots, X^{(0)}(n)) \quad (1)$$

Doing a cumulative generation for  $X^{(0)}$ , i.e., doing 1-AGO, yields:

$$\begin{aligned}
 X^{(1)} &= (X^{(1)}(1), X^{(1)}(2), \dots, X^{(1)}(n)) \\
 &= (X^{(1)}, X^{(1)} + X^{(0)}(2), \dots, X^{(1)}(n-1) + X^{(0)}(n))
 \end{aligned}
 \tag{2}$$

The differential equation for the whitened form is established as

$$\frac{dX^{(t)}}{dt} + aX^{(t)} = \mu
 \tag{3}$$

Letting  $\bar{a} = (a, \mu)^T$ , by the least squares method, we obtain

$$\bar{a} = (B^T B)^{-1} B^T Y_1
 \tag{4}$$

Restore to obtain:

$$X^{(0)}(k) = X^{(1)}(k+1) - X^{(1)}k
 \tag{5}$$

#### 4. ANALYSIS OF THE RELATIONSHIP BETWEEN URBAN PLANNING AND REAL ESTATE DEVELOPMENT MANAGEMENT BASED ON GM MODEL

##### 4.1. ANALYSIS OF THE SALES RELATIONSHIP BETWEEN URBAN PLANNING AND REAL ESTATE DEVELOPMENT MANAGEMENT

Urban planning can have an impact on the sales of real estate development management. Based on the above theory, the data of real estate sales in a city for 8 years from 2004 to 2011 are used as the basis for forecasting the future real estate sales in the city. Table 2 shows the comparison between the gray prediction model and the actual real estate sales volume. The actual sales volume from 2004 to 2011 is within  $\pm 15$  of the GM prediction, which is an acceptable error. The urban planning policy will cause changes in the sales volume of real estate development management, which can be predicted using the GM model.

**Table 2.** Comparison between the GM model and actual real estate sales results

A given year	2004	2005	2006	2007	2008	2009	2010	2011
Actual sales	207.1	233.8	266.5	300.4	340.2	388.5	433.6	482.2
GM forecast	199.8	222.2	244.6	308.2	351.8	380.6	440.9	491.8

##### 4.2. ANALYSIS OF THE PRICE RELATIONSHIP BETWEEN URBAN PLANNING AND REAL ESTATE DEVELOPMENT MANAGEMENT

Urban planning regulates the price of real estate development management, and the annual average price of real estate in the city is forecasted by GM from 2016 to 2020 and compared with the actual price. Table 3 shows the forecast and error of the annual average price of real estate in the city. The property prices simulated using the GM model have a high degree of fit with the real property prices, with an error range of  $\pm 100$  or less, so the prices regulated by urban planning through real estate development management can be predicted based on the GM model.

**Table 3.** Forecast and error of the average annual real estate price in this city

A given year	2016	2017	2018	2019	2020
Real price	5820.2	7882.6	8589.2	8357.6	8488.9
Forecast price	5833.8	7866.9	8688.3	8338.9	8587.7
Residual error	13.6	-24.3	99.1	-18.7	98.8
Relative error	0.12	2.25	4.22	1.86	4.15

## 5. CONCLUSION

This paper sorts out the relationship between urban planning and real estate development management through the problems of real estate development management and the relationship between real estate and urban planning, and introduces a gray prediction model to analyze the sales volume and price regulated by urban planning through real estate development management. It is empirically concluded that the actual sales volume is within  $\pm 15$  error of the GM-based prediction, which is an acceptable error, and the policies of urban planning will cause changes in sales volume in real estate development management, which can be predicted using the GM model. The property prices simulated using the GM model have a high degree of fit with the real property prices, with an error range of  $\pm 100$  or less, and can be predicted based on the GM model for prices regulated by urban planning through real estate development management.

## **ABSTRACT**

This paper firstly constructs the evaluation method of high quality development and talent entrepreneurship system, and deeply discusses the comprehensive evaluation of innovative employment as well as talent entrepreneurship and high quality economic development. Then, it focuses on the construction of the education model of each higher education institution with the actual situation, and proposes the 6C education model, and the results show that the 6C education model is an effective model of employment education. The model improves students' overall quality as well as market competitiveness by cultivating their innovative thinking, entrepreneurial ability, school-enterprise collaboration and other aspects. The research in this paper proposes a feasible entrepreneurship education model for higher education institutions, which has important practical significance and value.

## **KEYWORDS**

Innovation and entrepreneurship; Comprehensive evaluation; 6C education model; Innovative thinking; School-enterprise collaboration

## **1. INTRODUCTION**

Talent is the core element of innovation, and there is an urgent need to deepen the reform of education and teaching, and accelerate the cultivation of an innovative talent team. From the central government to the education system, it has become a consensus to carry out comprehensive and in-depth education reform. As an important position for cultivating talents, higher education is also facing increasingly severe challenges in its educational pathway [1-2]. There are many problems in current talent education, such as insufficient educational resources, mismatch between talent cultivation and market demand, and insufficient innovation and entrepreneurship education [3-4]. Literature [5-6] explored the objectives and positioning of employment-related education in higher education and argued that education in this area should take cultivating innovative talents as the core goal. Therefore, promoting the innovation of education model has become one of the current reform priorities of schools [7]. This paper aims to explore the entrepreneurship education model under the orientation of high-quality development in higher education institutions, and discusses the strategies and ways of innovation of talent employment education model in terms of the objectives, contents, methods

and evaluation of education. Finally, this paper proposes the 6C innovative entrepreneurship education model in the context of current practical education.

## 2. COMPREHENSIVE EVALUATION OF INNOVATION AND ENTREPRENEURSHIP AND QUALITY DEVELOPMENT

Based on the mechanism of action and theoretical framework, this paper comprehensively analyzes the level of innovation and entrepreneurship and high quality development in time and space by constructing the innovation and entrepreneurship index system and high quality development index system.

### 2.1. HIGH QUALITY DEVELOPMENT EVALUATION METHOD

Due to the large number included in the index system, it will directly affect the comprehensive evaluation later. When measuring the comprehensive evaluation level of innovation and entrepreneurship and high-quality development, the indicator weight calculation method needs to be reasonably used to clarify the weight of each indicator to ensure the accuracy and reliability of the empirical conclusion. Therefore, the entropy value method is chosen to calculate the weights of each indicator. The detailed steps of indicator measurement are as follows:

#### (1) Standardized processing

When the indicator is positive, the formula is:

$$X_{ij} = \frac{x_{ij} - \min(x_{ij})}{\max(x_{ij}) - \min(x_{ij})} \quad (1)$$

When the indicator is negative, the formula is:

$$X_{ij} = \frac{\max(x_{ij}) - x_{ij}}{\max(x_{ij}) - \min(x_{ij})} \quad (2)$$

#### (2) Dimensionless standardization

To prevent the effect of "0" on the results after normalization. Therefore, let:

$$Y_{ij} = 0.999 * X_{ij} + 0.001 \quad (3)$$

#### (3) Determine the weights

The same metric is processed as:

$$P_{ij} = \frac{Y_{ij}}{\sum_i^n Y_{ij}} \quad (4)$$

Calculate the indicator entropy value as:

$$e_j = -k \sum_{i=1}^n P_{ij} \ln(P_{ij}) \quad (5)$$

where  $e_j \geq 0$ ,  $k = \frac{1}{\ln(n)}$ .

Determine the weights as:

$$W_i = \frac{g_j}{\sum_{j=1}^p g_j} \quad (6)$$

(4) Comprehensive evaluation indicators measured as:

$$U_i = \sum_{j=1}^p w_i Y_{ij} \quad (7)$$

## 2.2. INNOVATION AND ENTREPRENEURSHIP SYSTEM CONSTRUCTION

Innovative talent entrepreneurship and employment are the fundamental drivers of high-quality economic development, driving rapid and steady economic growth.

The innovation and entrepreneurship evaluation index system constructed in this paper is shown in Table 1. Entrepreneurial development also contains two parts: entrepreneurial input and entrepreneurial output. Entrepreneurial input reflects the government's input and support to enterprises. In this paper, we choose two indicators, the amount of private enterprise investment and the amount of construction capital investment, to visualize the input of entrepreneurship, and the output of entrepreneurship is expressed by the number of enterprise trademark applications and the number of new private enterprises.

**Table 1.** Innovation and entrepreneurship evaluation index system

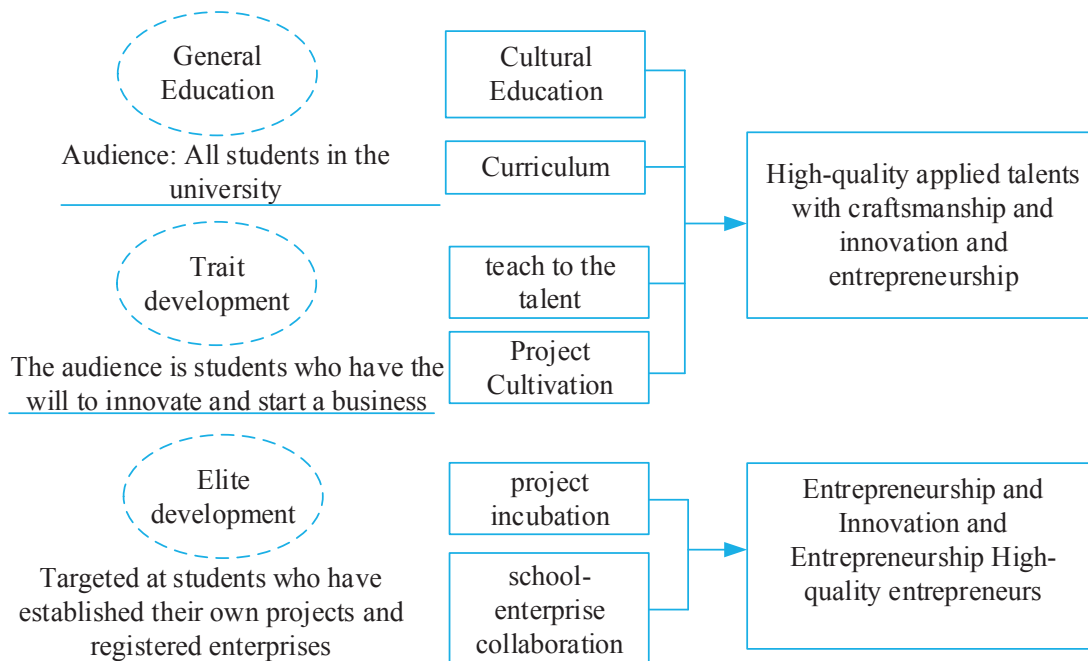

Primary Indicators	Secondary indicators	Three-level indicators
Innovative Development	Innovation input	Internal expenditure of R&D funds
		Number of technology development institutions
		R&D personnel full time equivalent
		Science and technology financial expenditures
Venture Development	Innovation output	Number of new product development projects
		Technology Market Turnover
		Main Business Income of High Technology Industry
		Number of patent applications
	Entrepreneurial Inputs	Amount of private enterprise investment
		Amount of construction capital investment
	Entrepreneurial output	Number of trademark applications by enterprises
		Sales revenue of new products
		Number of new private: enterprises

## 3. THE CONSTRUCTION OF INNOVATION AND ENTREPRENEURSHIP EDUCATION MODEL IN HIGHER EDUCATION

### 3.1. THE REALIZATION PATH

Integration, openness and upgrading are important features and desirable orientations for the high-quality development of education related to innovation employment and talent employment. In this paper, based on the purpose of optimizing the education system and upgrading the quality of talent training, the progressive dual-trend 6C education model is constructed as shown in Figure 1.

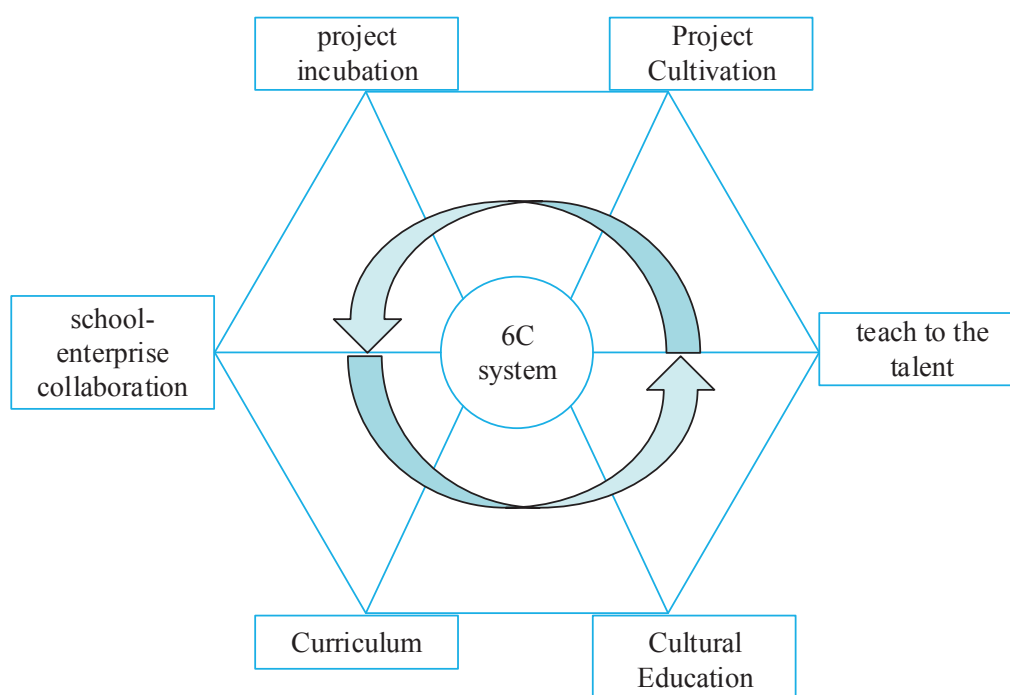

**Figure 1.** Progressive dual convergence 6C innovation and entrepreneurship education model

### 3.2. 6C INNOVATION AND ENTREPRENEURSHIP EDUCATION MODEL

The 6C innovation and entrepreneurship education model divides the student audience into three tiers: the first tier is all students, the second tier is students with innovation and entrepreneurial traits, and the third tier is entrepreneurs. 6Cs are interlinked to form a closed loop as shown in Figure 2, which promotes the output of high-quality innovation and entrepreneurial talents from six aspects: culture cultivation, curriculum cultivation, teaching according to the material, project cultivation, project incubation, and school-enterprise collaboration, cultivates high-quality applied talents with craftsmanship and innovation and entrepreneurship, and incubates high-quality entrepreneurs with entrepreneurial spirit and innovation. We will cultivate high-quality applied talents with craftsmanship and innovation and entrepreneurship.

**Figure 2.** 6C interlinking to form a closed loop

(1) Cultural education

This refers to creating an environment for innovation and entrepreneurship education, cultivating students' craftsmanship, and supplying spiritual nutrients for students' entrepreneurial practice.

(2) Curriculum education

This refers to the combination of explicit and implicit courses, the exploration of a student education integration curriculum model, and the holistic design of the curriculum to discover the depth and expand the breadth of nurturing.

(3) Teach students according to their abilities.

This refers to identifying students' innovative and entrepreneurial traits and teaching them according to their different levels of development. Entrepreneurs have unique character traits and personality characteristics, and have unique performance in innovative thinking, creative ability, risk appetite, and stress resistance.

(4) Project Cultivation

This refers to the process from the inclination of innovation and entrepreneurship to the practice of entrepreneurship. We promote innovation and entrepreneurship through competitions, and give birth to projects, polish ideas and perfect models in innovation and entrepreneurship competitions. Through the competitions, we explore project highlights, sort out operation processes and improve the quantity and quality of projects.

(5) Project Incubation

This refers to the establishment of a branded, characteristic and diversified campus innovation and entrepreneurship comprehensive incubation and practice platform or "crowdsourcing space", which is built by the school and enterprises in cooperation, with clear responsibilities and obligations and long-term mechanism.

(6) School-enterprise collaboration

This refers to the collaboration between institutions of higher education and influential enterprises in the industry to integrate their resources, develop management systems, establish collaborative education mode and implement collaborative education in terms of culture, teachers, curriculum and base construction of innovation and entrepreneurship education.

#### **4. CONCLUSION**

Through discussing the evaluation method of high quality development of higher education and the construction of employment education system, this paper deeply analyzes the comprehensive evaluation of both and puts forward the important role of education for high quality development. On this basis, it focuses on the construction of the education model related to talent entrepreneurship, proposes the 6C education model, and elaborates the realization path and specific realization methods of this model. Through practical exploration, the effectiveness and practical application value of the 6C education model are proved, and useful references are provided for the improvement of this model in the future.

## ABSTRACT

This paper discusses the importance of integrating information technology into the design of ideological and political teaching model, and discusses the role of information technology in the transformation of higher education, as well as the integration of information technology into the planning of the curriculum system of Civic and Political Science teaching and the development model of coupling and coordination and integration with Civic and Political Science education. Through the analysis of the system function and composition of the information platform of the university's thought politics education, the thought politics teaching model applying new information technology is discussed. The results show that by placing teachers and students in the information technology environment, a teaching model of Civics and Political Science classroom with clear process, high applicability and flexible use can be constructed. At the same time, it also provides a useful reference for the informationization change of ideological and political education in colleges and universities.

## KEYWORDS

Information technology; Ideology and politics; Educational change; Coupling and coordination; Integration and development model; Information technology platform

## 1. INTRODUCTION

In the information age, no one can deviate from the information, only with a strong awareness of information and information literacy, to adapt to the information age, lay the foundation for future development. At present, with the continuous development and popularization of information technology, political and ideological education is gradually moving towards informatization [1-2]. The application of information technology in education is increasing, and the information age has remarkable characteristics. People have more extensive channels to obtain information, and the amount of information is also very large, which can drive the development of education and is a powerful engine [3-4]. Information technology can provide more efficient education for colleges and universities [5]. Education informationization reform mainly focuses on the application of information technology in education [6-7]. Therefore, this study will comprehensively analyze the current situation of education and the problems existing in information reform from multiple perspectives, and discuss how to better use information technology to support the development of education.

## 2. INFORMATION TECHNOLOGY IS INTEGRATED INTO THE DESIGN OF IDEOLOGICAL AND POLITICAL TEACHING MODEL

### 2.1. THE ROLE OF INFORMATION TECHNOLOGY IN THE TRANSFORMATION OF HIGHER EDUCATION

First, the information age has led to the reconstruction of educational purposes

To the talent view of multiple intelligences theory, the cultivation of talent innovation ability and information literacy, and the emphasis on the all-round development of talent. As a tool of education, information technology not only promotes the reform of education system structure, but also integrates technology and curriculum. The development and driving of information technology are increasingly needed in education system.

Secondly, information related technology promotes the innovation of higher education concept

Information technology has the characteristics of cross-time and space, breaking the limitations of existing teachers and classrooms, through the establishment of a huge educational resource library, enhance the capacity of learning, alleviate the demand contradiction of the education market, so that learning is not limited to the classroom, and encourage students to create and think in learning.

Third, information related technology promotes the reform of higher education management

With the rapid development of information technology, higher education has entered the information age, and the management ideas and management methods of universities are also taking place quietly.

### 2.2. INFORMATION TECHNOLOGY IS INTEGRATED INTO THE CURRICULUM PLANNING OF CIVICS TEACHING SYSTEM

In the process of reforming the university's Civic Science course, we continue to explore and discover the curriculum content design and curriculum planning system with school-based characteristics that are applicable to the main channel of classroom teaching. The Civic Science Course initiative to turn to curriculum Civic Science, Shanghai as a pilot implementation of curriculum Civic Science, China series of curriculum Civic Design as shown in Table 1.

**Table 1.** Ideological and Political Design of Chinese Series Courses

university	curriculum	teachers	method	Value leadership
Shanghai University	Great Country Strategy	Gather a team of top teachers, emphasizing team organization and thematic teaching, with each thematic lecturer being a leading figure	Based on information technology, integrating teaching methods such as classroom lectures and feedback	Cleverly integrate the essence of Core Socialist Values into diversified classroom teaching
Fudan University	Governance			
Shanghai Jiao Tong University	Understanding China			
Tongji University	China Road			
Shanghai Normal University	Wen Dao China			

### 2.3. DEVELOPMENT MODEL OF INFORMATION TECHNOLOGY AND CIVIC EDUCATION INTEGRATION

Ideological and political education and information technology change in colleges and universities is a systemic two-way development project, the two originally belong to two different systems, under the role of coupling, so that the two form a composite organism.

### 2.3.1. SUBSYSTEM DEVELOPMENT LEVEL MODEL

The subsystem development level is the primary condition for the development of the coupled system, and is the basis for determining the coordinated development of the coupling. Therefore, the subsystem development level model can be calculated to derive the scores of relevant subsystems, thus providing a relevant basis for the construction of the coupling model.

Definition,  $F_a$  for college ideology and politics,  $F_b$  teaching information change, and its subsystem development level model is calculated by the formula

$$F_a = \sum_{j=1}^n U'_j W_i \quad (1)$$

$$F_b = \sum_{j=1}^n U_j W_i \quad (2)$$

Where,  $F_a$  and  $F_b$  take values in the range of  $[0, 1]$ ,  $U'_j$  is the standardized value of the  $j$ th index under the development level of ideology, politics and teaching informatization in universities.  $W_i$  is the index weight. The above formula leads to the assumption that the level of subsystem development is proportional to the values derived from  $F_a$  and  $F_b$ , and the larger the values of  $F_a$  and  $F_b$  under the condition of basic equality. The higher the level of order of the development level of teaching informatization and university ideology and politics, and vice versa, the lower.

### 2.3.2. COUPLED COORDINATED DEVELOPMENT MODEL

Coupling is a phenomenon in physics about two or more systems that are interconnected and developed in coordination with each other. It is generally divided into two types of positive coupling and negative coupling. And the coupling degree is the evaluation index of the importance degree of coupling between systems. The existing physics-based coupling model is used in the construction of the coupling degree model of ideology and politics and teaching informatization in colleges and universities. The calculation formula is:

$$C_n = \left\{ (u_1 \times u_2 \times \dots \times u_n) / \Pi(u_1 + u_2 + \dots + u_n) \right\}^{1/n} \quad (3)$$

Where,  $C_n$  denotes the value of coupling index, and the value range is  $[0, 1]$ .  $u_1, u_2, u_n$  denote the development indices of the subsystems of the two major systems, respectively.

When the value of  $C_n$  is between  $[0, 1]$ , the larger the value of  $C_n$ , the greater the coupling degree and tightness of the coupling between the two systems will be, showing a positive coupling trend. On the contrary, when the value of  $C_n$  is smaller, the coupling degree and the tightness of coupling between the two systems will be smaller, and the trend of negative coupling will be shown. Thus, it is deduced that the coupling degree between ideology and politics and teaching informatization in colleges and universities, is:

$$C_2 = \left\{ (u_1 \times u_2 \times u_3) / \Pi(u_1 + u_2 + u_3) \right\}^{1/n} \quad (4)$$

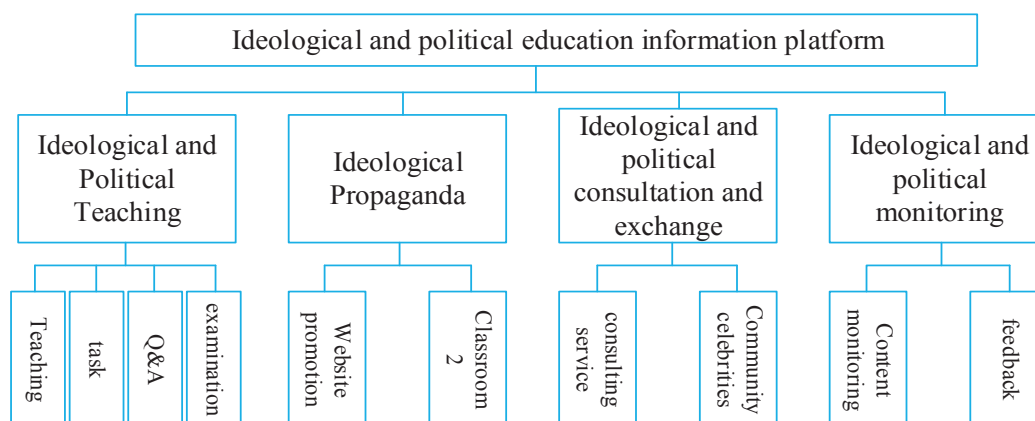

Among them,  $C_2$  indicates the coupling and coordination of the two systems of ideology and politics and teaching information technology in colleges and universities,  $u_1$  indicates the education subsystem of the coupling point.  $u_2$  represents the cultural subsystem of the

coupling point of the two, and  $u_3$  represents the value concept subsystem of the coupling point of the two.

### 3. INFORMATIONIZATION PLATFORM OF CIVIC AND POLITICAL EDUCATION IN HIGHER EDUCATION

#### 3.1. SYSTEM FUNCTIONAL ANALYSIS AND COMPOSITION

Because the contents of ideological and political education are diverse, the methods are diverse, and the education process is complex. Divided into subsystems, the functional structure of the system is shown in Figure 1.

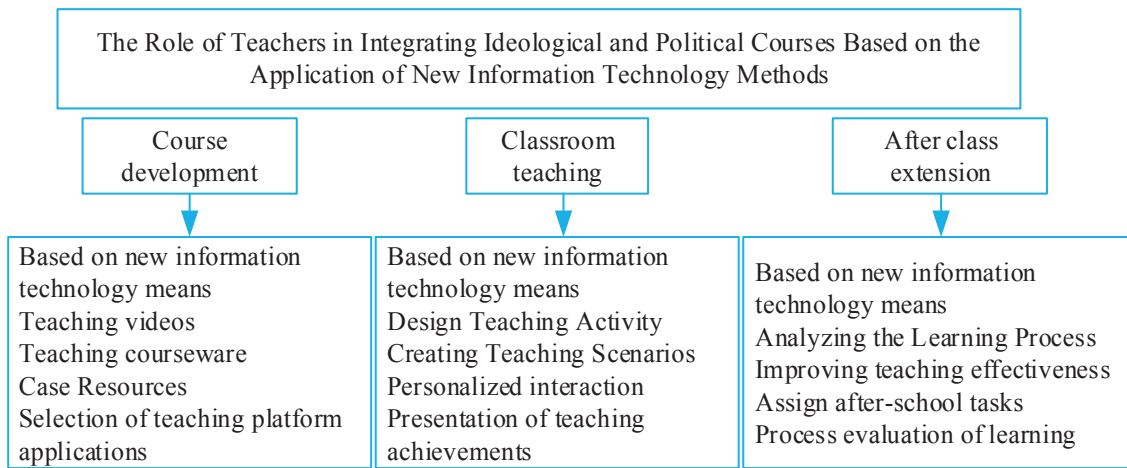

**Figure 1.** System Structure of Ideological and Political Education Information Platform

#### 3.2. CIVICS TEACHING MODE OF APPLYING NEW INFORMATION TECHNOLOGY

Figure 2 shows the design of the teaching model based on the application of new information technology tools into the Civic Science class. By analyzing the fit between information technology and Civic Science classroom teaching, the corresponding teaching objectives are set by combining the characteristics of the subject. By placing teachers and students in the information technology environment, a classroom teaching model with a clear process, high applicability and flexible use is constructed.

In the curriculum development stage, teachers make full use of new information technology to develop teaching resources to support teaching and learning, and need to have the ability to use technology proficiently to complete the basic knowledge teaching design required by the curriculum in conjunction with teaching priorities. In the classroom lecture stage, students are guided and encouraged to conduct inquiry-based learning and create certain scenarios to provide personalized instruction and ensure the integrity of the teaching content. In the post-class extension stage, internalize and transfer the classroom teaching knowledge, summarize the experience and shortcomings in the actual teaching process, and provide timely feedback on the completion of students' post-class tasks, analyze students' learning dynamics with the help of online teaching platform, and improve the teaching effect.

**Figure 2.** Design of Informationization Teaching Mode for Ideological and Political Education

#### 4. CONCLUSION

Based on the reform of ideological and political education of information technology, this paper discusses the application of information technology in ideological and political education in colleges and universities, puts forward a model of integrated development, and introduces the system function and composition of information platform for education. Through research, it is found that the application of information related technology in higher education has become a trend. In the application of teaching practice, the application of information technology can improve the quality, update the teaching form, and cultivate students' self-learning ability and innovation ability. At the same time, through the establishment of integrated development model, we can better promote the deep integration of ideological and political education and information technology.

# RESEARCH ON CHINA'S ECONOMIC DEVELOPMENT TREND UNDER THE BELT AND ROAD STRATEGY BASED ON NIIT SOFTWARE

---

Aimei Zhang\*

Jining Normal University, Ulanqab, Inner Mongolia, 012000, China

[jnsyzam123@163.com](mailto:jnsyzam123@163.com)

---

## ABSTRACT

This paper presents a detailed analysis of the measures of economic development in countries along the Belt and Road, including boosting domestic demand to promote employment, expanding exports to export production capacity, and promoting the transformation of industrial structure. Then, the impact mechanism of the Belt and Road on China's real economy is explored through parallel trend (NIIT) test analysis and event study method test analysis. The results show that the estimated economic development index of the interaction term Time\*Treat of the Belt and Road Initiative rises significantly above 0.2 after the implementation of the initiative in 2015. The interaction term Time\*Treat fluctuates somewhat at a later stage, but the overall trend of change is upward. The findings of this paper are important for understanding the role of NIIT software in the "Belt and Road" strategy and promoting China's economic development.

## KEYWORDS

Belt and road; Industrial structure; Economic development index; Parallel trends; Event study method; Interaction term

## 1. INTRODUCTION

China's economy has developed rapidly in the past decades and become the second largest economy in the world. With the "One Belt, One Road" strategy, China's economy has entered a new stage of development [1-2]. NIIT Software is a company that focuses on IT technical training, and it has a remarkable position and influence in the Chinese IT training market [3]. This study aims to reveal the new pattern of China's economic development by exploring the economic development trend of NIIT Software under the Belt and Road strategy, and to provide reference for related research [4]. In recent years, the development trend of China's economy has been extensively studied by scholars [5]. Among them, some scholars focus on the development trend of China's economy under the "One Belt, One Road" strategy [6-7]. Meanwhile, some scholars also focus on the role of NIIT software in the "One Belt, One Road" strategy [8]. In general, the current research on China's economic development trend covers many fields and perspectives, but the role of NIIT software in the "One Belt, One Road" strategy still needs to be explored in depth.

## **2. ECONOMIC DEVELOPMENT MEASUREMENT ANALYSIS OF COUNTRIES ALONG THE BELT AND ROAD**

### **2.1. THE POSITIVE EFFECT OF BELT AND ROAD ON CHINA'S ECONOMIC DEVELOPMENT**

#### **2.1.1. PROMOTE EMPLOYMENT BY BOOSTING DOMESTIC DEMAND**

China has been in a state of rapid development since its reform and opening up, and many developed countries are interested in China's huge labor resources and vast natural resources. The launch of the Belt and Road Initiative is a sign that China will be more open to international investment, which is a positive sign for foreign investors and may lead to a new wave of investment in China in the future.

#### **2.1.2. EXPANDING EXPORT OUTPUT CAPACITY**

China's economic growth has been dependent on labor-intensive industries, but with the country's rapid economic development, domestic labor costs have been rising. The idea of using cheap Chinese labor in developed countries is difficult to realize, and they are seeking new cheap labor resources from other countries. China, on the other hand, has accumulated much excess capacity as a result. This has resulted in a state of over-saturation in many heavy industries, which has had a significant negative impact on the use of resources.

Contrary to China's over-investment and under-consumption, most of the countries along the Belt and Road are developing countries with low levels of economic development. Exporting China's excess production capacity will avoid wasting resources on the one hand, and promote the infrastructure and social aspects of the countries along the route on the other.

#### **2.1.3. PROMOTE THE TRANSFORMATION OF INDUSTRIAL STRUCTURE**

The Belt and Road to boost domestic demand and expand exports are signs of good economic development, and the huge national capital investment will also bring more foreign investment to China. The joint development of local and foreign enterprises will lead to the rapid development of technology industries, especially the rapid development of some new high-tech industries, and accelerate the optimization and transformation of China's economic structure. At the same time, the establishment of ADB is also a great opportunity for the development of the financial sector. The goal of financial reform and deepening can be further realized.

### **2.2. CALCULATION OF INDICATOR MEASURES OF ECONOMIC DEVELOPMENT**

The economic development indicator system of Belt and Road countries established in this paper based on the G20 definition of economic development is shown in Table 1. This indicator system covers three aspects: infrastructure, R&D and innovation environment and transaction development dynamics. And this is used as the primary indicator, after which this paper uses the entropy value method to weight and comprehensively assess each secondary indicator of Belt and Road China, and finally arrives at the economic development index of China.

**Table 1.** Economic Development Indicator System of the Belt and Road Countries

Primary indicators	Secondary indicators
Infrastructure	Fixed broadband subscription rate
	Number of mobile phones per 100 people
	Secure Internet Server
	Percentage of individuals using the internet
	Mobile broadband subscription rate
R&D and Innovation Environment	R&D expenditure proportion
	Higher education enrollment rate
	Urban population share
	Number of resident patent applications
Transaction development momentum	Proportion of high-tech manufactured goods exports
	Proportion of ICT product exports

The calculation method of China's economic development index is as follows:

1) Normalization of indicators:

$$Z_{\lambda ij} = \frac{(X_{\lambda ij} - X_{\lambda \min})}{(X_{\lambda \max} - X_{\lambda \min})} \quad (1)$$

where  $\lambda$  is the year,  $i$  is the country, and  $j$  is the secondary indicator. Let there be  $m$  countries and  $n$  secondary indicators,  $2$  is the  $j$ th secondary indicator of the  $i$ -th country in year  $X_{\lambda ij}$ , and  $Z_{\lambda ij}$  is the dimensionless value of each secondary indicator.  $X_{\lambda \max}$  and  $X_{\lambda \min}$  are the maximum and minimum values of each secondary indicator in year  $A$ , respectively.

(2) Normalization of indicators:

$$P_{\lambda ij} = \frac{Z_{\lambda ij}}{\sum_{i=1}^m Z_{\lambda ij}} \quad (2)$$

3) Calculate the entropy value:

$$e_{\lambda ij} = -k \sum_{j=1}^m (P_{\lambda ij} * \ln P_{\lambda ij}), \quad k = \frac{1}{\ln m} \quad (3)$$

4) Calculate the heterogeneous numbers:

$$g_{\lambda ij} = 1 - e_{\lambda ij} \quad (4)$$

5) Calculate the weights of each indicator:

$$w_{\lambda ij} = \frac{g_{\lambda ij}}{\sum_{j=1}^n g_{\lambda ij}} \quad (5)$$

6) Calculate the evaluation score of individual secondary indicators:

$$S_{\lambda ij} = w_{\lambda ij} * Z_{\lambda ij} \quad (6)$$

7) Calculate the digital economy development index for the country in year  $\lambda$  :

$$H_{\lambda i} = \sum_{j=1}^n S_{\lambda ij} \quad (7)$$

### 3. A TEST ANALYSIS OF THE MECHANISM OF ACTION OF THE IMPACT OF BELT AND ROAD ON CHINA'S REAL ECONOMY

#### 3.1. PARALLEL TREND (NIIT) TEST ANALYSIS

To use the NIIT model the prerequisite assumptions must be satisfied that the covered and non-covered province samples have to have similar trends during the sample period prior to the implementation of the Belt and Road Initiative. The only characteristic difference between covered and non-covered provinces after the implementation of the initiative is that covered provinces are affected by the implementation of the Belt and Road Initiative while non-covered provinces are not affected by the implementation of the Belt and Road Initiative. However, in reality, once the Belt and Road Initiative is implemented, it is not possible to compare whether the trends of the covered and non-covered province samples are the same under the condition that they are not affected by the Belt and Road Initiative.

This paper uses a parallel trend test to analyze whether the FSR (real economy) of covered and non-covered provinces from 2010-2021 satisfy the prerequisites for using the double difference model, and the test results are shown in Figure 1. It can be seen that the change trends of covered and non-covered provinces are basically the same before the implementation of the policy in 2015, which satisfies the parallel trend test and meets the prerequisites of using the NIIT model for empirical testing. Although there is still a gap between the FSR of covered and non-covered provinces after the implementation of the policy in 2015, most of the Belt and Road Initiative covers the central and western regions, whose native financial industry and real economy development environment is weaker than that of the developed eastern regions.

Figure 1. Parallel Trend Test Chart

#### 3.2. EVENT STUDY METHOD TEST ANALYSIS

This paper uses the event study method to further examine the trends of the sample from 2010-2020 from before the implementation of the Belt and Road Initiative to the end. The trend of change using the event study method is shown in Figure 2, where the solid line represents the linear trend of the parametric model fit. It can be seen that the coefficient estimates before

the implementation of the Belt and Road Initiative in 2015 are all below 0.1 and none of the regression results are significant. This indicates that the trends of changes in the samples of covered and non-covered provinces before the implementation of the Belt and Road Initiative in 2015 are similar and no significant differences are seen. In contrast, the coefficient estimates of the interaction term Time\*Treat rise significantly above 0.2 after the implementation of the Belt and Road Initiative in 2015. the coefficient estimates of the interaction term Time\*Treat fluctuate somewhat in the later stages, with the overall trend of change moving upward, further indicating that the results of this paper pass the parallel trend test.

**Figure 2.** Change trend of event study

#### 4. CONCLUSION

The paper reveals the measurement of economic development and the calculation of index measures of economic development in countries along the Belt and Road by exploring the mechanism and impact of NIIT software under the Belt and Road strategy. It is found that the estimated economic development index of the interaction term Time\*Treat of the Belt and Road Initiative rose significantly above 0.2 after the implementation of the initiative in 2015. The interaction term Time\*Treat fluctuated somewhat in the later period, but the overall movement trended upward. It indicates that the Belt and Road strategy has positive effects on China's economic development, including boosting domestic demand to promote employment, expanding exports to export production capacity, and promoting the transformation of industrial structure. It is also found that the Belt and Road strategy, has a positive effect on the development of China's economy. Therefore, relevant departments should continue to promote the implementation of the Belt and Road Strategy to facilitate the sustainable development of China's economy.

## **ABSTRACT**

This paper focuses on the challenges and opportunities faced by financial accounting in the context of artificial intelligence, and proposes corresponding response strategies and intelligent financial accounting models. In terms of countermeasures for the development of financial accounting under the application of artificial intelligence, the application and impact of artificial intelligence technology in the field of financial accounting are explored from two perspectives: countermeasures for the development of financial personnel and risks for operators, respectively. The findings show that the application and development of AI technology in the field of financial accounting bring new opportunities and challenges, which require financial practitioners to continuously learn and update their knowledge and skills, as well as actively explore the intelligent financial accounting model to adapt to the new working environment and requirements.

## **KEYWORDS**

Artificial intelligence; Financial accounting; Development response; Operator risk; Financial practitioner

## **1. INTRODUCTION**

With the rapid development of artificial intelligence technology, financial accounting is facing unprecedented challenges and opportunities [1]. The application of artificial intelligence technology has brought new ideas and methods to financial accounting, and also brought unprecedented impact to traditional financial accounting [2-3]. The purpose of this paper is to explore the challenges and opportunities facing financial accounting in the context of artificial intelligence, and to provide some thoughts and insights for financial accountants [4]. Currently, several studies have explored the application and impact of AI technology in the field of financial accounting [5-6]. Some studies point out that AI technology can help financial accounting automate the processing and classification of accounting data and improve the efficiency and accuracy of data processing [7]. Also, AI technology can help financial accounting in risk assessment and decision making through data analysis and prediction [8]. In addition, other studies have reported that the application of AI technology has brought some impact on the traditional financial accounting career development model, and financial practitioners need to continuously learn and update their knowledge and skills to adapt to the new working environment and requirements [9].

## 2. COUNTERMEASURES FOR THE DEVELOPMENT OF FINANCIAL ACCOUNTING UNDER THE APPLICATION OF ARTIFICIAL INTELLIGENCE

### 2.1. COUNTERMEASURES FOR THE DEVELOPMENT OF FINANCIAL PERSONNEL UNDER THE APPLICATION OF ARTIFICIAL INTELLIGENCE

Artificial intelligence technology is with the development of science and technology and economic development, the formation of the inevitable product of history, now accounting artificial intelligence is still in the primary stage, the system still needs to be improved, the aspects involved is not enough. But with the further development of science and technology, accounting artificial intelligence will be applied more and more widely and deeply. The popularity of artificial intelligence will also put forward higher requirements on the level of professional knowledge and skills of financial personnel. But no matter when, human is always the master of the world, facing the challenge, we should correctly understand and actively face the arrival of accounting artificial intelligence.

(1) From basic accounting and other low-end personnel to high-end type of talent change

From the current development of the financial industry in practice, the positions of personnel engaged in basic accounting are saturated, and the reserve of senior talents is seriously insufficient.

(2) Transformation from traditional financial accounting to management accounting talents

Compared with artificial intelligence, human beings have the brain of subjective and active thinking. But artificial intelligence has only passively accept the arrangement given to it by human, it just wins to be more accurate and reduce mistakes.

(3) Become the designer and maintainer of AI accounting system

Accounting AI needs to be maintained and protected at a later stage, and the program is updated to better suit the needs of the company's development.

### 2.2. FINANCIAL ACCOUNTING OPERATOR RISK

Assume that  $X_1^*$  is the basic profit target to be achieved by the operator, and  $X_2^*$  is the profit target at the advanced profit margin level of the domestic counterparts. If the operator actually completes the profit  $X$  equal to  $X_1^*$ , the operator can get the base salary, if the operator actually completes the profit over  $X_1^*$  the operator can get the share of the excess, the share ratio is set to  $\beta_1$ . If the operator actually completes the profit over  $X_2^*$ , the excess is divided by  $\beta_2$ . In order to avoid excessive difference between the operator's annual salary income and the employee's income, generally  $\beta_1 \leq \beta_2$ , i.e., the operator's annual salary has certain marginal compensation decreasing nature. Thus the unadjusted operator's risk income  $S(X)$  is

$$S(X) = \begin{cases} \beta_1 (X - X_1^*) & X_1^* < X, X_2^* \\ \beta_1 (X_2^* - X_1^*) + \beta_2 (X - X_2^*) & X > X_2^* \end{cases} \quad (1)$$

This model is also applicable to loss-making companies, where  $X_1^*$  is zero if the operating objective is to turn around losses. If the operating goal is to reduce losses,  $X_1^*$  is a negative number.

The corresponding completion coefficient (adjustment coefficient) is calculated by the weighted average method, i.e. the weights of each assessment index are set according to their importance, and the weights of each index are  $W_i$ , the target value is  $b_i$  and the actual value is  $a_i$ . The formula for calculating the completion coefficient K of the assessment index is

$$K = \sum_{i=1}^n W_i \cdot \frac{b_i}{a_i} \quad (2)$$

After adjustment, the operator's income at risk was

$$S' = S(X) \cdot K \quad (3)$$

### 3. SMART FINANCIAL ACCOUNTING MODEL

#### 3.1. THE BASIC ELEMENTS OF INTELLIGENT FINANCIAL ACCOUNTING

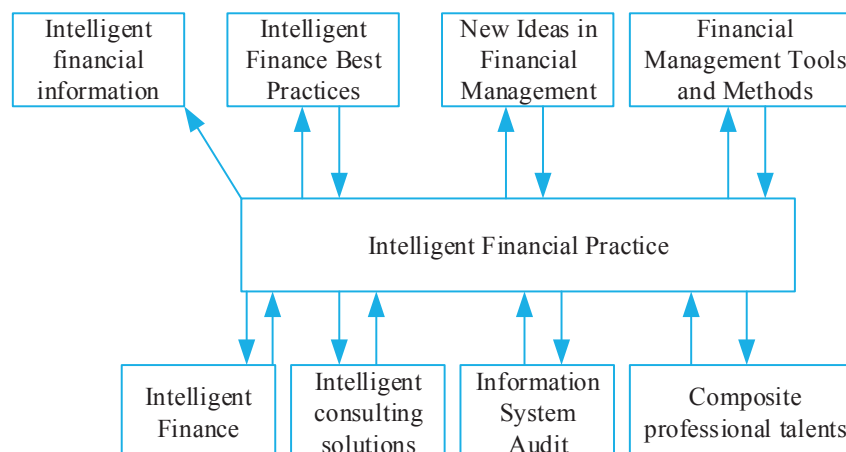

Intelligent financial accounting covers all areas of financial work, including financial work task design, financial work division, financial data measurement, financial scenario-based design, etc. Through intelligent articulation, it realizes budget management, accounting management, fund management, business management and so on. On the whole, there are three core levels of intelligent financial management:

The first is to realize professional in-depth analysis under the financial intelligence sharing mode.

The second is to realize intelligent business BI management based on platform architecture.

The third is the vertical extension based on artificial intelligence.

Figure 1 shows the overall framework of intelligent financial management. From the organizational structure, the basic framework of intelligent finance includes two categories, broad and narrow. The broad includes the application subject of intelligent financial management, industry organization, inner supply chain and so on. Although it adopts intelligence, the external environment still plays a dominant role, such as finance, audit, taxation, customs, industry associations, etc. The narrow sense of intelligent financial management generally includes the practice of intelligent finance in all kinds of enterprises or organizations, the purpose is to describe the financial application subject, and clarify the driving logical relationship that exists within the enterprise or organization.

**Figure 1.** Overall Framework of Intelligent Financial Management

### 3.2. COMPARISON BETWEEN TRADITIONAL FINANCE MODEL AND SMART FINANCE MODEL

With the development of society and changes in the market environment, the content of corporate finance has been expanded and extended, and some uncertainty factors must be included in the scope of internal control. In this way, the organizational objectives of financial management become very complex, resulting in the comprehensive expansion of financial management space and connotation. The financial personnel in this case, often only engaged in a single financial activities, making the efficiency of financial management is low. The intelligent finance through the data cloud platform, the integration of the various processes of financial management grouped together, both in terms of management quality and management efficiency, have a unique advantage. In this paper, the two are compared and the results are shown in Table 1.

**Table 1.** Comparison results between traditional and intelligent financial models

Leading Elements	Traditional Finance	Intelligent Finance
Values	Financial oriented	people oriented
Management philosophy	Specialization and standardization	systematization, specialization, and precision
fundamental theory	Traditional Financial Management Theory	Flexible Financial Management Theory
management system	Hierarchical department management	Diversified integrated managemen
Leading strategy	Low cost strategy	Diversified market leadership strategy
Pattern Method	Human resource led management model	Platformized management mode
organization structure	Hierarchical departmental single structure	The organic structure of multi organization coordination
Organizational kinetic energy	financial management	Financial management, coordination, and innovation
basic task	Establish financial order	Addressing the Development Needs of the Reform Era
Talent quality requirements	Accounting professionals	Comprehensive talents
management style	centralized management	Flexible management
Target structural features	Unilateralism	Organic structure

### 4. CONCLUSION

This paper mainly discusses the challenges and opportunities faced by financial accounting in the context of artificial intelligence, and proposes corresponding response strategies and intelligent financial accounting models. Through analyzing the application and impact of AI technology in the field of financial accounting, we found that the application of AI technology can effectively improve the efficiency and accuracy of financial accounting data processing and analysis, and also bring new ideas and methods to financial accounting. However, the application of AI technology will also bring certain impacts and challenges to the career development of financial accounting practitioners, which requires financial accounting practitioners to constantly update their knowledge and skills to adapt to the new working environment and requirements. In addition, there are certain differences between the traditional financial model and the intelligent financial model, which require financial accounting practitioners to enhance their learning and understanding. In summary, the application and development of artificial intelligence technology brings new opportunities and challenges for financial accounting, and this paper puts forward corresponding thoughts and suggestions to provide some insights for financial accounting practitioners.

## ABSTRACT

In this paper, the overall design of the meteorological disaster prevention and mitigation platform, including the architecture and technical architecture, provides the basis for the subsequent application of the improved hashing algorithm. A storage and transmission scheme for meteorological data based on the improved consistent hash algorithm is proposed, which improves the security and transmission efficiency of meteorological data by equivalence line order division and data grouping. The results show that the optimized storage and transmission of meteorological data by the improved consistent hashing algorithm improves the security and transmission efficiency of meteorological data, and provides more accurate and timely data support for meteorological disaster prediction and warning. The research results of this paper provide some reference and guidance for the construction of meteorological disaster prevention and mitigation service platform.

## KEYWORDS

Disaster prevention and mitigation platform; Architecture; Technical architecture; Hashing algorithm; Meteorological data; Equivalence line order division

## 1. INTRODUCTION

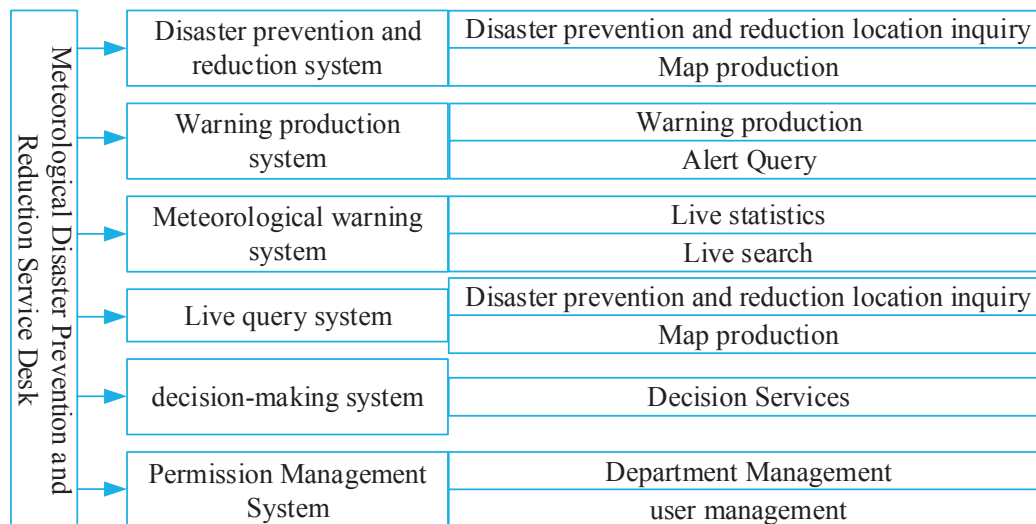

Meteorological disasters often bring huge losses to people's lives and properties due to their sudden and widespread nature. In order to predict and warn meteorological disasters timely and accurately, and prevent and reduce disaster losses, it is important to establish a meteorological disaster prevention and mitigation service platform [1-2]. However, the processing and storage of meteorological data face challenges such as large data volume and high data security requirements, and the traditional data storage and transmission methods can no longer meet the demand [3-4]. Therefore, developing a reliable and efficient data storage and transmission method is an important issue in the design of disaster prevention and mitigation service platforms [5]. Currently, data storage and transmission technology based on hash algorithm has become a research hotspot. As a technology widely used for data encryption and secure transmission, hash algorithm has the advantages of irreversibility, high efficiency, and security [6-7]. In the field of meteorology, some researchers have also applied hash algorithm to the storage and transmission of meteorological data, which improves the security and transmission efficiency of meteorological data [8]. Based on this, the purpose of this paper is to explore the application of data storage and transmission technology applying improved hash algorithm in the design of meteorological disaster prevention and mitigation service platform to improve the accuracy and timeliness of meteorological disaster prediction

and warning and reduce disaster losses.

## 2. OVERALL DESIGN OF METEOROLOGICAL DISASTER PREVENTION AND MITIGATION PLATFORM

The meteorological disaster prevention and mitigation service platform is a comprehensive business management platform to meet the needs of provincial meteorological environment monitoring, comprehensive analysis of data and information, forecast product production, and disaster prevention and decision-making services. It consists of several parts, such as comprehensive weather alarm system, product release system, disaster prevention and mitigation system, and decision service system.

The platform is designed and developed with B/S architecture, using SpringBoot+SpringCloud for the back-end, Ant Design of React for the front-end, and Docker technology system for compilation and release. Each functional subsystem is decomposed and microserviced, and the front-end and back-end are designed separately to finally realize the distributed development and deployment of the whole system. The overall structure of the meteorological disaster prevention and mitigation service platform system is shown in Figure 1.

**Figure 1.** System Structure of Meteorological Disaster Prevention and Reduction Service Platform

### 2.1. SYSTEM ARCHITECTURE

The system architecture of meteorological disaster prevention and mitigation platform is divided into 5 layers, namely, support layer, big data resource layer, application support layer, business application layer and user layer.

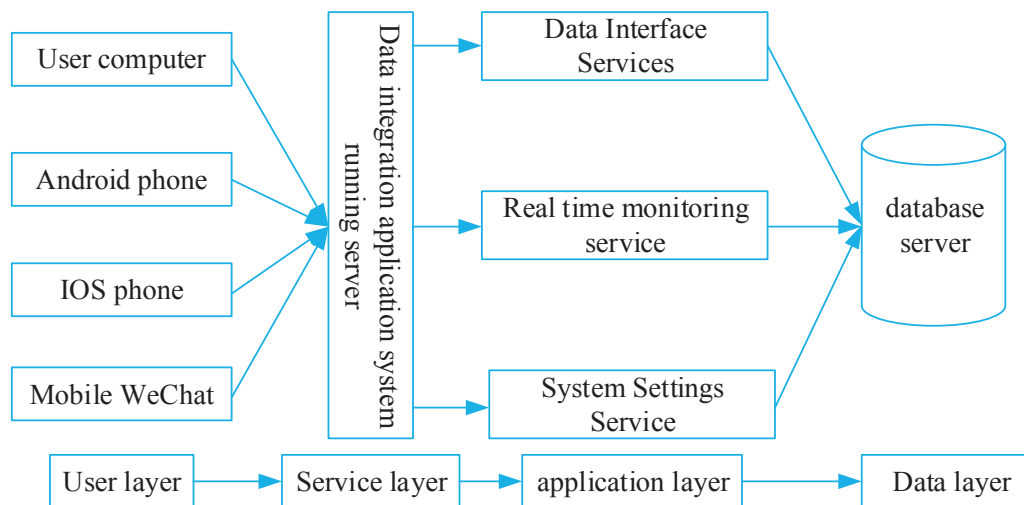

The platform construction mainly includes modules such as home page, data query, product production and release, forecast service products and system management.

Users are the service target of the system, providing various information services and management to administrators, business personnel and decision makers through the meteorological decision service platform.

### 2.2. TECHNICAL ARCHITECTURE

The client side uses browser mode to make the grassroots meteorological disaster prevention and mitigation data integration application system easier to use, without the need to install special software, which greatly reduces the maintenance and operation work of the whole system. The platform has a large number of users, and each software update iteration

will cause software adaptation differences due to different customer operating systems, so the current better solution is to use B/S architecture. Using a browser as an access tool is conducive to business personnel to obtain the business data required by their positions according to their roles. The architecture schematic of the system is shown in Figure 2.

**Figure 2.** Structure of Meteorological Disaster Prevention and Reduction Service Platform

### 3. WEATHER DATA STORAGE TRANSMISSION BASED ON IMPROVED HASH ALGORITHM

The idea of distributed data storage for electric power companies based on improved consistent hashing algorithm includes three steps, firstly dividing the weather distributed data into equivalent line order according to the temporal attribute characteristics of the data. The second uses consistent hashing algorithm to partition and group the meteorological data into appropriate distributed storage nodes. The third uses storage module technology to establish the weather data storage logical structure and physical structure, and allocates the weather data into the corresponding storage space according to the storage logic.

#### 3.1. EQUIVALENT LINE SEQUENCE DIVISION OF METEOROLOGICAL DATA

Meteorological data are closely related to the corresponding time constraints, such as the data produced during seasonal seasonal capturing by meteorological offices, and most of the data are closely related to the time constraints. Therefore, treating the corresponding timestamp of meteorological data as a core attribute of distributed data storage, and storing the data according to timestamp according to the actual needs of meteorological distributed data storage.

Let the binary of meteorological distributed data be temporal data, i.e., the effective time starting point of the data is always less than the effective time ending point. Its effective time period is determined by the starting and ending points of the data timestamp, so the points on the plane from the effective time starting point to the ending point of the meteorological data can be mapped, and the points on this plane are in one-to-one correspondence with the effective time period of the data, and the mapping relationship is expressed by the following equation:

$$u=(VTs, VT e) \quad (1)$$

Where,  $u$  denotes the two-dimensional time point corresponding to the effective time start to end plane of meteorological data,  $VTs$  denotes the effective time start on the

meteorological data time label, and  $VTe$  denotes the effective time end on the meteorological data time label.

It is assumed that there is a temporal mimetic relationship for the meteorological data, which is expressed by the following equation:

$$A_{TCP} = \langle P, W, L, Q \rangle \quad (2)$$

Suppose,  $H$  is the set of line sequence branches on the set of temporal proposed sequences, and the equivalent division of meteorological distributed data line sequences using the division rule is:

$$z = \beta \times \left( \sum_{i=1} \rho / g_{\min} \right) \quad (3)$$

### 3.2. WEATHER DATA GROUPING BASED ON IMPROVED CONSISTENT HASH ALGORITHM

In order to better achieve weather distributed data integrity, the weather data is grouped using a consistent hash algorithm based on data equivalence line order division. Before data grouping, the weather distributed data transmission control protocol connection is first processed to avoid corrupting the data during weather data transmission.

The subintervals of the grouping interval are determined using the improved consistency hashing algorithm and mapped to the corresponding subintervals of each interval according to the computing power of each group of nodes. Mapping each group of nodes to the whole meteorological data hash interval alternately in corresponding proportions, the mapping proportions are tabulated in the following equation:

$$\varepsilon = \rho / \sum_{i=1} \rho \quad (4)$$

Where,  $\varepsilon$  denotes the mapping ratio of the computing power of each group of nodes mapped to the corresponding subinterval of each interval. When there exists a set of meteorological data to be stored, the data hash is mapped to the corresponding subintervals according to the above process, and then the data is grouped to the corresponding nodes, thus realizing the data grouping based on the consistent hashing algorithm.

## 4. CONCLUSION

This paper applies the design and implementation of a meteorological disaster prevention and mitigation service platform with improved consistency hashing algorithm. By optimizing the storage and transmission scheme of meteorological data, it improves the security and transmission efficiency of meteorological data and provides more accurate and timely data support for meteorological disaster prediction and warning. The main conclusions of this paper are as follows:

(1) This paper designs a meteorological disaster prevention and mitigation service platform based on hash algorithm, including the architecture and technical architecture. The platform is efficient, reliable and secure, and provides more accurate and real-time data support for meteorological disaster prediction and warning.

(2) This paper proposes a meteorological data storage and transmission scheme based on improved hashing algorithm, including meteorological data equivalence line sequence partitioning and data grouping by improved causal hashing algorithm. By optimizing the storage and transmission of meteorological data, the data transmission efficiency and security

are greatly improved.

## ABSTRACT

This paper constructs a comprehensive landscape quality evaluation model based on the principle of hierarchical analysis method index screening, combined with the characteristics of landscape plant landscape, and establishes the landscape quality classification standard, so as to obtain scientific and detailed landscape quality scoring data. The formula of sensory experience of landscape design is summarized according to different sensory experiences, and the weight value of the factor layer of landscape plant landscape evaluation index is analyzed. For the two types of landscape design works, the subjective feelings of users on their sensory experience are explored. For the comprehensive weights of the factor layer, plant vernacularity is 0.550, species richness is 0.502, and plant growth status is 0.327. Therefore, the comprehensive quality evaluation model of landscape constructed in this paper evaluates the quality of visual communication design in landscape in a holistic way.

## KEYWORDS

Hierarchical analysis; Landscape; Quality evaluation model; Factor layer; Comprehensive weights

## 1. INTRODUCTION

With the advent of the information age, the main conflict between people and information has changed from how to get information to how to process it. On the one hand information explosion generates very much information [1-3]. On the other hand access to information has increased dramatically, and having a huge amount of information has become the norm for everyone [4-5]. Landscape is a perceived visual form object formed between people and the environment, a mutual relationship between subjective and objective, i.e., the art of space and

the art of vision, a comprehensive art that covers a variety of art forms [6-8]. Visual communication design is an innovation of graphic design, which is based on the visual beauty of its original form and highlights the expression and presentation of the design theme information [9-11]. The use of visual communication design for landscape effect expression helps to enrich the composition form and formal expression of landscape design and create a multicultural form of landscape design [12-13].

## 2. LANDSCAPE QUALITY EVALUATION MODEL AND SENSORY EXPERIENCE ASSESSMENT

### 2.1. ESTABLISHMENT OF LANDSCAPE QUALITY EVALUATION MODEL

#### 2.1.1. COMPREHENSIVE LANDSCAPE QUALITY EVALUATION MODEL

According to the principles of operability, systematicity, objectivity, representativeness, people-oriented and other AHP hierarchical analysis method index screening, combined with the landscape characteristics of garden landscape plants, from the ecological function, aesthetic function, service function and other 3 aspects of a total of 15 factor layers, the construction of garden plant community landscape effect evaluation model is shown in Table 1.

**Table 1.** Landscape effect evaluation model of garden plant community

Target layer (A)	Criteria layer (B)	Factor layer (C)
Plant landscape evaluation (A)	Ecological function (B1)	Plant Landscape Structure (C1)
		Plant growth status (C2)
		Species Richness (C3)
		Plant Life Type (C4)
		Plant Vernacularity (C5)
		Seasonal phase of plants (C6)
	Aesthetic function (B2)	Plant composition (C7)
		Harmony of plants (C8)
		Plant color (C9)
		Plant ornamental characteristics (C10)
	Service function (B3)	Aromaticity (C11)
		Popularity of science (C12)
		Safety (C13)
		Shade (C14)
		Iconicity (C15)

Let the overall landscape quality of the garden landscape be  $U$ , then:

$$\begin{aligned}
 U = & (X_1C_1 + X_2C_2, \dots, + X_6C_6)B_1 \\
 & + (X_7C_7 + X_8C_8, \dots, + X_{10}C_{10})B_2 \\
 & + (X_{11}C_{11} + X_{12}C_{12}, \dots, + X_{15}C_{15})B_3
 \end{aligned} \tag{1}$$

where  $C_1, C_2, \dots, C_n$  denotes the weight value of the factor layer relative to the criterion layer and  $B_1, B_2, \dots, B_n$  denotes the weight value of the criterion layer.

#### 2.1.2. LANDSCAPE QUALITY LEVEL CLASSIFICATION CRITERIA

In order to obtain scientific and detailed landscape quality scoring data, the results of professional evaluation of landscape quality were analyzed based on big data analysis technology, and the data were analyzed for reliability, and its Cronbach reliability coefficient was 0.982, which was greater than 0.8, indicating that the study was set up reasonably and had a high degree of credibility. The quality grade of each landscape factor and the overall landscape quality grade are divided into the following grades,  $3.5 < X \leq 5.0$  is excellent,  $3.0 < X \leq 4.0$  is good,  $2.5 < X \leq 3.5$  is average, and  $1.5 < X \leq 2.0$  is poor.

## 2.2. SENSORY EXPERIENCE ASSESSMENT

For the assessment of sensory experience of environmental art design, it is currently impossible to obtain an accurate assessment formula, and this section provides subjective measures for different sensory experiences in turn.

$Q$  is used to describe the overall environmental sensory experience assessment value,  $V$  is used to describe the visual,  $A$  is used to describe the auditory,  $F$  is used to describe the tactile,  $S$  is used to describe the olfactory,  $C$  is used to describe the experiencer's background,  $\Delta$  is used to describe the distracting factor, which is a reflection of the user's concentration on the experimental environment, and  $\theta_i$  is used to describe the perceptual weight of each sense with a cumulative value of 1. The maximum threshold of all perceptual weights must not exceed the perception level of that sense in the actual environment. The maximum threshold of all perceptual weights cannot exceed the perception level of the senses in the actual environment. From the background of landscape environment design experience, the following formula for landscape design sensory experience is summarized:

$$Q = \theta_V V(t) + \theta_A A(t) + \theta_F F(t) + \theta_S S(t) + \theta_C C(t) - \theta_\Delta \Delta(t) \quad (2)$$

## 3. LANDSCAPE INTEGRATED WEIGHTING ANALYSIS AND SENSORY EXPERIENCE EXPERIMENT

### 3.1. COMPREHENSIVE WEIGHTING ANALYSIS

Using yaahp software, the evaluation index weight data of 20 experts were integrated and their hierarchical total ranking was calculated based on the big data, and the values of the evaluation index weights of the landscape of garden plants are shown in Figure 1. Based on the index layer total ranking weight formula:

$$X_{ij} = W_{Bi} \times W_{ij} \quad (3)$$

Where  $W_{Bi}$  is the weight value of the target layer to the criterion layer,  $W_{ij}$  is the weight value of the criterion layer to the factor layer, and  $X_{ij}$  is the weight value of each indicator layer to the target layer.

In the evaluation of the plant landscape of the garden, the weight of the criterion layer is 0.4727 for ecological function, 0.3257 for service function and 0.3658 for aesthetic function. The combined weight of the factor layer is 0.550 for plant nativeness, 0.502 for species richness, 0.327 for plant growth state, 0.304 for plant landscape structure, 0.301 for safety, 0.273 for plant life type, 0.255 for science, 0.215 for plant harmony, 0.186 for iconicity, 0.174 for aroma, 0.158 for color, 0.144 for shade. These three factors together indicate that plant species, plant growth condition, and plant hierarchy are the most important factors affecting plant life. And plant hierarchy are the more important factors affecting the quality of plant landscape.

**Figure 1.** Weighting of evaluation indexes in the factor layer

### 3.2. SENSORY EXPERIENCE ASSESSMENT EXPERIMENT

Factors that affect the user's sensory experience of landscape design include user experience, knowledge and occupation. Different senses can also influence each other. For both types of landscaping works, users' subjective perceptions of their sensory experiences were explored. Based on the analysis of 50 visitors' evaluation by big data analysis technology, the average value of evaluation of landscape design is shown in Figure 2. In the sensory experience of landscape art design, for both types of landscape design works, the users' demand for visual, auditory and tactile senses is higher than that of smell.

**Figure 2.** Average value of evaluation of landscape design

## 4. CONCLUSION

Human perception of the outside world is done through vision. In the organization of the

outdoor environment and the shaping of the indoor spatial composition, the design of the landscape is built on the perception of human vision to plan the spatial composition of the landscape, as well as the components. In the comparison of diversity indices, the number of species of community plants, the number or cover of individual species, and the repetition rate of species are important factors that affect the plant diversity index.

Based on the evaluation study of landscape, this paper constructs an index system for landscape quality evaluation, and also uses AHP method and comprehensive index method to derive the ranking weights of each index about landscape quality evaluation system, and finally calculates the comprehensive index of landscape volume of gardens, which provides reference significance to other landscape quality evaluation.

## ABSTRACT

In this paper, a myosotor model was established, and the CMC method was used to calculate the downstream control signal of the central nervous system  $\alpha$  activation and regulate the upstream feedback signal from the myosotor to the central nervous system. Based on the characteristics of smart wearable sports monitoring devices, the sports and fitness smart wearable devices were selected as experimental data collection tools to provide scientifically accurate data for the proprioceptor model. The accuracy of the muscle shuttle model was verified by constructing a sinusoidal stretching experiment, and the results of the knee jerk reflex movement simulation were analyzed. The GmaxV score was greater than 80%, and the GmaxT and CORA scores were greater than 60%, confirming the prevalence of proprioception in motor feedback in the relationship between college sports and sports human science.

## KEYWORDS

Muscle shuttle model; CMC method; Upward feedback signal; Smart wearable device; Sine stretch experiment; Knee jump reflex movement

## 1. INTRODUCTION

With the progress of the times, experimental teaching of sports human science is being reformed and developed continuously. However, it also presents many problems in the middle, the experimental content is not innovative enough, the experimental teaching methods and methods are backward, and the equipment performance is relatively low [1-2]. These factors lead to the inability to meet the needs of sports science personnel training in all aspects [3]. Proprioception is an important sensory feedback means for human to perceive motor state and control autonomous movement [4-5]. In-depth investigation of its working principle and function is important for understanding how the brain controls and interacts with the limbs [6-7]. A neuromuscular motor simulation framework with proprioceptive control circuits was constructed by combining a proprioceptive model of real physiological structures with a model of human lower limb bone muscle dynamics [8].

In this paper, based on the use of big data information platform knowledge sharing to shape the scientific view of sports orientation, the aggregation effect of students' physical exercise

adherence value identity is brought into play to promote college students' exercise adherence under the premise of respecting students' individual behavioral differences [9-10].

## 2. ONTORECEPTOR MODEL BASED ON SPORTS HUMAN SCIENCE

### 2.1. MYOSIN MODEL

#### 2.1.1. MUSCLE SHUTTLE MODELING

The myosin is a proprioceptive organ that is mostly found in skeletal muscle. In typical mammalian lower limb muscles, tens or even hundreds of myosin filaments can be found parallel to extra-sarcomeric fibers. The muscle shuttle varies with muscle length during locomotion and plays an important role in motor sensation and perturbation sensation. The myosin model developed in this paper is based on the physiological structure of the myosin. The muscle shuttle contains three different muscle fibers, two long-nucleated muscle fibers, BAG1 and BAG2, and one short-chain fiber, CHAIN.

Assuming that stretching occurs mainly at the ends, it is possible to directly calculate the tension of the muscle fibers in its shuttle, avoiding the need to solve partial differential equations, and finally normalizing the activation frequency input based on the maximum frequency according to the needs of the Opensim motion simulation environment used, with the following specific mathematical model:

$$T = M^* L'' + \beta^* C^* \left( L - R - L_{sr}^0 * \text{sign}(L')^* \text{abs}(L')^a + K_{pr} * (L - L_{pr}^0 - L_{sr}^0) \right) + P \quad (1)$$

#### 2.1.2. PRIMARY ACTIVATION SIGNAL

The feedback signals transmitted from the muscle shuttle to the central nervous system are mainly primary activation signals  $I_a$ , and the intensity of secondary signals is relatively low. Therefore, the primary signal, which is the change in muscle length, is mainly considered in the feedback loop established in this paper, and the effect of the secondary signal is ignored. The expression of the feedback signal:

$$I_{aPrimary\_fferent} = G^* \left( \frac{1}{K_{sr}} - (L_{sr}^N - L_{sr}^0) \right) \quad (2)$$

The motor control loop framework developed in this paper assumes that their values are equal. The downstream control signal  $\alpha$  activation of the CNS is calculated using the CMC method and is input to the muscle shuttle as  $\gamma$  excitation in the feedback loop for modulating the upstream feedback signal from the muscle shuttle to the CNS.

## 2.2. SMART WEARABLE SPORTS MONITORING DEVICES

### 2.2.1. SPORTS AND FITNESS SMART WEARABLE DEVICES

With the continuous development of big data technology, intelligent wearable sports monitoring equipment is also under development. In order to obtain more accurate scientific feedback signal data transmitted from the muscle shuttle to the central nervous system, intelligent wearable sports monitoring equipment of the sports fitness category is used to monitor the wearer's sports condition in real time, and the athletes' sports change condition and muscle work degree can be captured more accurately by wearing such equipment. Through data statistics and analysis, the wearer can be guided in terms of exercise content, duration, interval time and exercise intensity.

## 2.2.2. BASIC USAGE BY UNIVERSITY STUDENTS

The common types of smart wearable devices used by college students for physical exercise are shown in Figure 1. Among them, the first and second are smart bracelet and smart watch, accounting for 37.9% and 33.6% respectively, ear-worn devices accounting for 11.1%, smart glasses accounting for 9.1%, smart shoes and socks accounting for 6.4%, and others accounting for 1.9%. According to the above data, we can analyze that smart bracelets and smart watches are the most used among college students' physical exercise population, and the application types have a trend toward ear-worn devices and smart glasses.

**Figure 1.** Types of smart wearable devices used

## 3. VALIDATION OF THE MUSCLE SHUTTLE MODEL

### 3.1. VALIDATION OF THE ACCURACY OF THE MUSCLE SHUTTLE MODEL

For the sinusoidal stretching experiment, the experimental conditions are mainly four as follows.

(1) The dynamic activation frequencies were set to 70, 100, and 125 pps, and the static activation frequencies were set to 0 pps.

(2) The static activation frequency is set to 70, 100, 125pps, and the dynamic activation frequency is set to 0pps.

(3) Static activation frequency is set to 70, 100, 125pps, dynamic activation frequency is set to 100pps.

(4) The dynamic activation frequency is set to 70, 100, 125pps and the static activation frequency is set to 100pps.

One of the typical experimental loading conditions was selected for simulation: dynamic activation frequency was 50pps and static was 0pps, and the CORA scores for proprioceptive muscle shuttle simulation and experimental comparison are shown in Table 1. The GMaxV, GmaxT, and CORA scores of the simulated results obtained in the paper were all greater than 80%, which indicates a good correlation between the experimental and simulated results. By simulating the loading of different activation frequencies and stretch patterns to evaluate the muscle shuttle model comprehensively, the simulation results and experimental results can

match well, and the model can be used to perform the construction of motor control loops.

**Table 1.** CORA scores for proprioceptive muscle shuttle simulations and experimental comparisons

Number	GMaxV	GmaxT	CORA
1	97.64%	94%	95.53%
2	92.08%	83.49%	81.20%
3	81.04%	94.80%	65.71%
4	31.09%	63.81%	74.82%
5	78.27%	89.52%	83.64%
Mean value	81.15%	94.17%	81.37%

### 3.2. ANALYSIS OF KNEE-JERK REFLEX MOVEMENT SIMULATION RESULTS

From the human physiological structure, the middle femoral muscle is located directly below the rectus femoris muscle, and it is more difficult to measure its electromyographic signal by surface EMG. Therefore, in this study, electrode pads were applied to the rectus femoris region of the thigh leg. In the human body, there is a redundant role of muscles, and there are many combinations of muscles firing for the same action. In addition, the position of the rectus femoris and the middle femoris muscles are closer and act synergistically when performing the knee jerk reflex, which has an effect on the distribution of the simulated muscle force and the measured EMG signal of the rectus femoris muscle, resulting in the mean value of the simulated activation before it is more consistent with the measured signal, and the objective assessment of the simulated knee jerk reflex activation and angle curve is shown in Table 2.

It can be seen from the score table that the maximum GmaxV score exceeds 80%, and the GmaxT and CORA scores also exceed 60%, indicating a certain degree of similarity between the two. From the comparison results of the experiment and simulation, the validation results of the motor feedback control loop are accurate and reasonable, while the knee-jerk reflex experiment confirms the prevalence of proprioception in motor feedback.

**Table 2.** Simulated knee-jerk reflex activation and angle curve objective assessment scores

Muscle	GMaxV	GmaxT	CORA
Knee Angle	81.53%	91.7%	71.37%
Rectus femoris activation	75.83%	64.52%	73.26%
Lateral Femoral Muscle Activation	80.23%	84.27%	74.27%
Medial Femoral Muscle Activation	88.92%	85.17%	85.59%

## 4. CONCLUSION

The proprioceptive motor feedback control loop proposed in this paper has a positive effect on further understanding of the human neuromotor control process. The nervous system mainly includes the central nervous system and the peripheral nervous system. The central nervous system, that is, the brain, generates motor control signals. The central nervous system, or the brain, generates motor control signals, which are transmitted through the spinal cord to the skeletal muscle effectors, where the muscles contract and drive the body to move, while the proprioceptors in the muscle tendons generate feedback signals. The feedback signals are transmitted to the brain through the spinal cord, and there are also low-level feedback control loops in the spinal cord that do not go through the brain, and these motor control pathways constitute our body's motor control system.

Therefore, the advantages of smart wearable devices are fully utilized to health college

students' sports condition, to promote fitness and entertainment, and to make sports life scientific. Thus, the purpose of stimulating sports interest, making health consciousness concrete, evaluating exercise effect and making sports goal clear.

## ABSTRACT

This paper firstly addresses the application of artificial intelligence-assisted technology in clinical decision-making in reproductive medicine, through which ectopic pregnancy can be effectively addressed. Secondly, a comparative analysis of the data of the control and treatment groups was conducted with the example of post-abortion patients in a people's hospital. Finally, the study was conducted by four indicators: postoperative bleeding time, bleeding volume, normal menstrual recovery time, and duration of abdominal pain. The results showed that in the treatment group, the percentage of their postoperative bleeding time  $\leq 5$  days was 48.33%, and the percentage of those with low bleeding volume was 55%. From the comparison of normal postoperative menstrual recovery time, the percentage of the treatment group with  $\leq 20$  days was 51.67%, and the percentage of those with abdominal pain duration  $\leq 3$  days was 35%. This indicates that Compound Yimu Oral Liquid helps in post-abortion recovery.

## KEYWORDS

Compound Yimu Oral Liquid; Artificial intelligence; Abortion; Postoperative recovery

## 1. INTRODUCTION

In recent years, with the development of anesthesiology, infusion, blood transfusion, knowledge of hydropower balance, and measures such as surgical modalities and infection control, the cesarean delivery rate has been on the rise year by year [1-2]. Although it has led to some reduction in perinatal morbidity, patients undergoing cesarean delivery are more prone to bleeding than after normal vaginal delivery and have poorer postpartum uterine regeneration, making them prone to unrelenting malignant dew, abdominal pain, secondary anemia, and infection [3-4]. This is mainly due to the large trauma of the damage caused by the severed smooth muscle fibers of the uterus during surgery, which leads to a significant decrease in uterine contractility, and is also associated with postoperative maternal pain and physical and psychological anxiety [5-6].

Medication abortion is an effective, safe and easy non-surgical treatment commonly used today, but the main adverse effects of medication abortion are incomplete medication abortion,

prolonged vaginal bleeding and heavy bleeding after abortion [7-8]. The causes of this problem are poor uterine contraction and impaired endometrial repair leading to intrauterine residues, and Chinese medicine has unique advantages in promoting the discharge of uterine cavity residues and endometrial repair after medication abortion to achieve hemostasis [9-10].

This paper analyzes the application of artificial intelligence assistive technology in clinical decision making in reproductive medicine as an entry point to solve the problem of ectopic pregnancy. Clinical observation of postoperative bleeding was carried out in two groups, control and treatment, using post-abortion patients from the S City People's Hospital as an example. The data were quantitatively analyzed in terms of four indicators: postoperative bleeding time, bleeding volume, normal menstrual recovery time, and duration of abdominal pain, respectively. The results showed that Compound Yimu Oral Liquid could effectively help post-abortion patients reduce intrauterine bleeding, shorten the duration of abdominal pain, and promote faster physical recovery ability of post-abortion patients.

## **2. APPLICATION OF ARTIFICIAL INTELLIGENCE IN CLINICAL DECISION MAKING IN REPRODUCTIVE MEDICINE**

Artificial intelligence technology is widely used in the medical field, medical clinical decision-making from personal experience-oriented, to based on evidence-based medical evidence, and then gradually change to a reliable decision-making model based on clinical data. AI can dig deeper into the correlation between medical data, and with the help of machine learning to parse past medical information can establish a model of disease occurrence, diagnosis and prognosis assessment, to assist clinical decision-making.

Artificial intelligence technology applied various machine algorithms and combined with the consultation data of ectopic pregnancy patients to construct a clinical decision system for ectopic pregnancy treatment, which gives individualized treatment decision suggestions based on the disease characteristics of ectopic pregnancy patients. The results showed that the decision accuracy was 98.26%, and the sensitivity and specificity were 96.54% and 98.17%, respectively. The use of this system assists clinicians in developing treatment plans for patients with ectopic pregnancy, which can effectively avoid outcomes such as death and infertility caused by inappropriate treatment. The use of artificial intelligence technology to assist in optimizing the timing of trigger injections may significantly increase the number of 2PNs obtained in 1 IVF stimulation cycle and the total number of available blastocysts, ensuring the safety of life for patients with ectopic pregnancy.

## **3. SELECTION OF RESEARCH SUBJECTS AND METHODS**

### **3.1. SELECTION OF RESEARCH SUBJECTS**

Patients who underwent medication abortion from October 2020 to May 2022 in S City People's Hospital were selected. Age 20-35 years, 35-50 days of menopause, pregnancy confirmed by urinalysis and B-ultrasound, consent to medication abortion and no contraindications. There were no other complications after medication abortion and further curettage after medication abortion was excluded. Patients were randomly divided into treatment and control groups of 60 cases each, with no significant differences in age, pregnancy, gestational sac size and days of menopause between the groups. The number of cases in each group that were finally not excluded from the study and were able to follow up and receive follow-up on time. The study was approved by the hospital ethics committee, and the cases selected as well as the study process met the ethical research requirements.

### **3.2. INCLUSION AND EXCLUSION CRITERIA**

Inclusion criteria:

(1) Women aged 20-35 years. (2) Days of menopause 35-50 days. (3) Women with intrauterine pregnancy confirmed by gynecologic ultrasound. (4) Voluntary request for medication to terminate pregnancy. (5) Normal menstrual cycle in the first trimester of pregnancy. (6) Not using steroid hormones for contraception. (7) Voluntarily participated in this study and were able to make timely follow-up and medical visits.

Exclusion criteria:

(1) Those with bleeding for more than 20 days after miscarriage or incomplete miscarriage requiring surgical removal. (2) Those with intrauterine residues detected by ultrasound. (3) Acute and chronic liver and kidney diseases, cardiovascular system, respiratory system, digestive system diseases. (4) Endocrine and hematological system diseases. (5) Breast and reproductive system tumors, combined with uterine fibroids or complications due to trophoblastic tumors. (6) Allergic or allergic to various drugs. (7) Contraindications to prostaglandin drugs. (8) Those with severe pregnancy vomiting. (9) Combined with anemia.

### **3.3. RESEARCH METHODOLOGY**

On the first day of abortion, patients were given mifepristone tablets 50 mg and 25 mg with warm water at 7 a.m. and 7 p.m., respectively, for 2 days, and came to the hospital on the morning of the third day to take misoprostol tablets 0.6 mg, with fasting and abstaining from food and water for 2 hours before and after taking the drug. After the embryo sac was expelled, the medication was administered according to the following groups. The experimental group was given Compound Yimu Oral Liquid (Henan Tai Long Co., LTD) twice a day, 20ml each time, for 7 days. In the control group, after the embryo sacs were expelled, 10 U of indocin was injected intramuscularly three times a day. Patients were followed up on day 7 and day 14 after medication abortion, and menstrual status was followed up one month after medication abortion. All patients recorded the number of days of vaginal bleeding, the amount of bleeding, the time from embryo sac expulsion to menstrual resumption, the duration and amount of menstruation, and the duration of abdominal pain. In addition, the Chinese medicine symptom efficacy criteria were formulated with reference to the Clinical Research Guidelines for New Chinese Medicines for the Treatment of Unrelenting Postpartum Dew, and the Chinese medicine evidence was observed.

In this study, SPSS software was applied for statistical analysis, and the measurement data were expressed by  $\bar{x} \pm S$ , and the difference between groups was tested by t-test, and the count data were tested by chi-square test, with  $P < 0.05$  indicating statistical significance.

## **4. EXPERIMENTAL RESULTS AND ANALYSIS**

### **4.1. COMPARISON OF POSTOPERATIVE BLEEDING TIME AND BLEEDING VOLUME BETWEEN TWO GROUPS OF PATIENTS**

The postoperative bleeding time and bleeding volume were compared for both groups of patients, and the results were obtained as shown in Table 1.

**Table 1.** Comparison of bleeding time and bleeding volume

Group	≤5d	6~10d	≥11d	Mean bleeding time(d)
Control group	7(11.66%)	31(51.67%)	22(36.67%)	8.52±1.31
Treatment group	29(48.33%)	25(41.67%)	6(10.00%)	5.36±0.83
<b>Group</b>				
Group	N	High	Medium	Low
Control group	60	28(46.67%)	21(35.00%)	11(18.33%)
Treatment group	60	7(11.67%)	20(33.33%)	33(55.00%)

From the comparison results of postoperative bleeding time between the two groups, the mean postoperative bleeding time of patients in the treatment group was significantly lower than that in the control group, and the difference was statistically significant ( $P<0.05$ ), and there were significantly more patients with uterine bleeding time  $\leq 5$  d in the treatment group than in the control group, and the difference was statistically significant ( $P<0.05$ ). From the comparison results of postoperative bleeding volume between the two groups, compared with the usual menstrual volume, the number of cases with less uterine bleeding in the treatment group was significantly more than that in the control group, and the number of cases with more volume was significantly less than that in the control group, and the difference was statistically significant ( $P<0.05$ ), and the difference in the number of cases with medium volume was not statistically significant ( $P>0.05$ ). Because motherwort contains alkaloids and flavonoids, which can effectively strengthen contractions and can regulate clotting factors in both directions. This indicates that by Compound Yimu Oral Liquid can effectively accelerate the repair of endometrium, effectively shorten the uterine bleeding time and reduce the bleeding volume after abortion.

#### 4.2. COMPARISON OF THE RETURN OF NORMAL MENSTRUATION AND DURATION OF ABDOMINAL PAIN AFTER SURGERY BETWEEN THE TWO GROUPS

In addition to the verification of the indexes of the patients' post-abortion bleeding time and bleeding volume, this section also aims at comparing the patients' post-abortion normal menstrual recovery time and the duration of abdominal pain as a way to verify the effectiveness of Compound Yimu Oral Liquid in post-abortion bleeding recovery. The results of their comparison were obtained as shown in Table 2.

**Table 2.** Normal menstrual resumption and duration of abdominal pain

Group	≤20d	21~40d	≥40d	Normal menstrual recovery time (d)
Control group	9(15.00%)	23(38.33%)	28(46.67%)	40.28±2.63
Treatment group	31(51.67%)	22(36.67%)	7(11.66%)	22.52±3.15
<b>Group</b>				
Group	≤3d	4~7d	≥7d	Duration of abdominal pain (d)
Control group	6(10.00%)	30(50.00%)	24(40.00%)	5.18±1.29
Treatment group	21(35.00%)	35(58.33%)	4(6.67%)	2.14±0.27

From the comparison of normal menstrual recovery time after abortion between the two groups, the patients in the treatment group had significantly shorter normal menstrual recovery time after abortion than the control group, and the difference was statistically significant ( $P<0.05$ ). For patients with normal menstrual recovery time  $\leq 20$  d, there were significantly more patients in the treatment group than in the control group, and the difference was statistically significant ( $P<0.05$ ). In terms of the duration of postoperative abdominal pain in the two groups, the duration of postoperative abdominal pain in the treatment group was significantly shorter

than that in the control group, and the difference was statistically significant ( $P < 0.05$ ). For patients with abdominal pain lasting  $\leq 3$  d, there were significantly more patients in the treatment group than in the control group, and the difference was statistically significant ( $P < 0.05$ ). This indicates that the oral application of compound Yimoucao can effectively help post-abortion patients to reduce the duration of contractions and abdominal pain.

According to traditional Chinese medicine, abortion belongs to the category of abortion. The abortion can directly damage the ramus and uterus, resulting in blood flow disorder, overflowing out of the veins, stagnant blood, and the new blood does not follow the normal path. Therefore, after abortion, we should eliminate stasis and create new blood, regulate menstruation and relieve pain. Compound Yimu Oral Liquid has the therapeutic effect of clearing heat and cooling blood, reducing uterine bleeding and stopping bleeding. The results of this study showed that the treatment group was better than the control group in shortening the duration of uterine bleeding, reducing the amount of bleeding, restoring normal menstruation and shortening the duration of abdominal pain. Also, because it is a pure natural drug with high safety, no adverse reactions were observed in all cases in this study.

## 5. CONCLUSION

In this paper, the application of artificial intelligence-assisted technology in clinical decision making in reproductive medicine was used as an entry point, and patients who underwent medication abortion from October 2020 to May 2022 in the People's Hospital of S. were selected for example analysis. Quantitative analysis of the data was performed by developing inclusion and exclusion criteria in two groups, the control group and the treatment group. The results showed that there was a significant difference in the postoperative bleeding time and bleeding volume between the two groups, with 48.33% of the treatment group using Compound Yimu Oral Liquid having less than or equal to 5 days of postoperative bleeding and 55% of those with less bleeding. In terms of the comparison of normal postoperative menstrual recovery time, the percentage of the treatment group with less than or equal to 20 days was 51.67%, and the percentage of those with abdominal pain lasting less than or equal to 3 days was 35%.

In conclusion, the administration of Compound Yimu Oral Liquid after abortion can effectively reduce vaginal bleeding, promote uterine regeneration, improve anemia, shorten the duration of uterine bleeding and abdominal pain, and accelerate the recovery of normal menstruation. It can also speed up the recovery of normal menstruation. Moreover, Compound Yimu Oral Liquid is made of traditional Chinese medicine, which has good safety and can better help patients recover after abortion.

## ABSTRACT

In this paper, firstly, we use MVC model to build a business administration platform for the new economic normal in the context of artificial intelligence, and analyze each module of the platform system architecture. Secondly, the K-nearest neighbor algorithm is used to classify and analyze the business administration data, so as to visualize the business administration data. Finally, in order to verify the effectiveness of the platform constructed in this paper, the timeliness and security tests are conducted. The results show that the service loading time of this platform is 1221.4ms, which is 14.87% and 17.73% lower than that of Kunpeng and Shenwei platforms respectively. With the increase of the number of users, the number of failures of this platform is 27 and 44 times less than that of Kunpeng and Shenwei respectively.

## KEYWORDS

Artificial intelligence; New economic normal; Business administration platform; K-nearest neighbor algorithm; Timeliness; security

## 1. INTRODUCTION

With the rapid development of social economy, China has entered the new economic normal, in this case, enterprises need to keep up with the times and innovate in order to achieve stable development. And it also needs to keep in line with the economic characteristics after the economic transformation and development, and combine with the actual situation of the enterprise itself, and then achieve sustainable and stable development [1-2]. Under the new economic normal, business administration personnel of enterprises need to consider the characteristics of market development, continuously optimize and reform the functions of business administration, innovate the content and form of work, solve the economic problems within the enterprise, relieve economic pressure, and promote the sustainable development of the enterprise [3-5].

The development of artificial intelligence can reasonably assess the existing foundation of current corporate business administration and seek strategic alliances for the innovation of corporate business administration system [6-8]. To a certain extent, this is conducive to the analysis of corporate business administration in the development of artificial intelligence to achieve reasonable resource allocation such as data and information sharing and complementary advantages. With the development of artificial intelligence, the content resources of corporate business administration analysis have a limited nature and are difficult

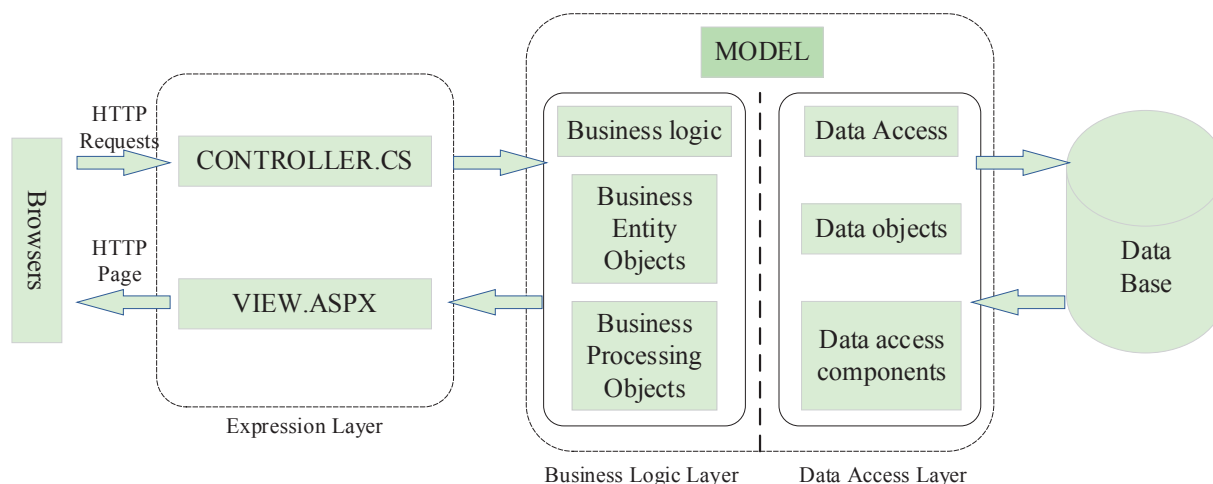

to replicate. The development of artificial intelligence has led to the rapid development of related industrial services, which has become an important trend in the future development of corporate business administration, and then realize the maximum benefits of corporate social economy [9-10].

## 2. ENTERPRISE BUSINESS ADMINISTRATION PLATFORM ARCHITECTURE BASED ON MVC MODEL

### 2.1. CONSTRUCTION OF ENTERPRISE BUSINESS ADMINISTRATION PLATFORM BASED ON MVC MODEL

The MVC pattern refers to Model-View-Controller, and its principle is to separate the input, logic processing, and output of the application by Model, View, and Controller, thus making the application be divided into three layers, namely Model, View, and Control.

The model layer is the main body of the application and is mainly responsible for the business data of the application. The view refers to the user interaction interface of the system. The controller is mainly responsible for receiving input and feeding data back to the interface to display and update the state of the model objects. The MVC design pattern is a widely used design pattern, and the application model of the enterprise business administration platform built by the MVC design pattern is shown in Figure 1.

**Figure 1.** Enterprise business administration platform based on the MVC model

### 2.2. PLATFORM SYSTEM ARCHITECTURE MODULE DESIGN

According to the actual business needs, the main functions of the business administration business service level built based on MVC model are enterprise registration management, administrative law enforcement case management, market supervision and management, trademark management, contract management and other basic functions. Through these functions, it provides easy, reasonable and professional solutions for business administration departments.

The system architecture is based on the MVC model, i.e. data access layer, business logic layer and presentation layer. The design implementation of each layer of the architecture can be described as follows:

(1) The presentation layer is to accept requests and return data results, and display the corresponding page with View.

(2) The business logic layer is responsible for processing the data obtained from the database and returning the results to the presentation layer.

(3) The data access layer is responsible for interacting with the database, making connections and other operations to the database, and returning the results to the business logic layer, which processes the data and cannot interact directly with the presentation layer.

### 2.3. CLASSIFICATION ANALYSIS OF INDUSTRIAL AND COMMERCIAL DATA BASED ON K-NEAREST NEIGHBOR ALGORITHM

Enterprise business administration platforms need to classify various business administration data, which in turn enables managers to make management decisions by visualizing the data. Classification methods are usually based on input data sets to construct a classification model that fits the input data well and correctly predicts the class labels of unknown samples. Therefore, the reason why the algorithm is trained by data, the goal is to use the process of model training to complete the construction of a model with good generalization ability. In this paper, the K-nearest neighbor algorithm is used for the classification analysis of the business administration data.

The nearest neighbor is a training set divided into several classes, and then in each class a number of points with representative properties are solved. The distance between point  $x$  and each representative point at prediction time, and the final predicted point  $x$  belongs to the class with the smallest distance from that representative point.

Let the industrial and commercial data be a classification problem with the number of categories  $m$  of  $w_1, w_2, \dots, w_m$ , with  $N_i$  representative points of each category and  $i = 1, 2, \dots, m$ , then the classification function is

$$g_i(x) = \min_k \|x - x_i^k\|, k = 1, 2, \dots, N_i \quad (1)$$

Where the corner of  $x_i^k$  is labeled  $i$  for category  $w_i$  and  $k$  for category  $w_i$  the  $K$ th of the  $N_i$  representative points.

The K nearest neighbor algorithm belongs to the generalization of NN, by calculating which class the majority of the  $k$  minimum distances of the predicted point  $x$  belongs to, and which class the predicted point  $x$  belongs to, when  $k = 1$ , the K nearest neighbor method is the nearest neighbor method.

In summary, the MVC-based business administration platform can effectively integrate business administration data and classify business administration data through K-nearest neighbors. It provides managers with visualization of business administration data, which enables them to understand business administration situation and make management decisions more intuitively.

## 3. TEST ANALYSIS OF ENTERPRISE BUSINESS ADMINISTRATION PLATFORM

### 3.1. PLATFORM TEST ENVIRONMENT

This section provides a brief introduction to this test environment to verify the performance of the enterprise business administration platform built on the MVC pattern in this paper.

The experimental test part of this paper is mainly in three different hardware architecture platforms for comparison, where the platform built in this paper in the choice of Dell OptiPlex 6080 small machine, ARM64 processor platform to choose Kunpeng server, domestic processor platform to choose Shenwei server. The specific configuration is shown in Table 1.

**Table 1. Hardware Testing Environment**

Platform	Host configuration	
Platform for this article	CPU Model	CPU Intel(R) Core™ i3-10300 CPU
	Number of CPU cores	4core CPU@2.4GHz
	Memory size	16G DDR4-2080
	Disk size	1.5TB
	Operating system version	Windows 10 21H2
ARM64 processor platform	CPU Model	Kun Peng 910
	Number of CPU cores	44 coreCPU@3.2GHz
	Memory size	256G
	Disk size	2.2TB
	Operating system version	Linux version 4.15.2-arm64-server
Domestic processor platforms	CPU Model	SW1528
	Number of CPU cores	8 coreCPU@2.4GHz
	Memory size	64G
	Disk size	2.8TB
	Operating system version	Linux node119 4.3.15-deepin-aere+

**3.2. ANALYSIS OF TIME-SENSITIVE PERFORMANCE TEST RESULTS**

This section takes the business administration data of a large enterprise as an example, and divides the data into ten data sets as a whole. Under the three different platforms given in the previous section, the service loading time of the three platforms under the ten data sets is counted and analyzed, and the results of the timeliness performance test are shown in Figure 2.

From the results of the three platforms, the average service loading time of the MVC-based enterprise business administration platform is 1221.4ms, which is 14.87% and 17.73% lower than that of the Kunpeng and Shenwei platforms respectively. This also shows that the enterprise business administration platform given in this paper can better realize the integration of enterprise business and industry business data, provide efficient work efficiency with faster access speed, and promote the efficient development of enterprise business administration. It can also provide managers with fast and reliable decision data, making enterprise business administration more in line with the development path of the new economic business model.

**Figure 2.** Time-sensitive performance test results

### 3.3. ANALYSIS OF SAFETY PERFORMANCE TEST RESULTS

Different numbers of abnormal users are set in the platform running environment and the number of simultaneous online users of the platform is adjusted to verify the security of the platform through the statistics of the number of failures of the platform running, and the experimental statistics are shown in Table 3.

**Table 3.** Platform Security Performance Test Data Sheet

Number of simultaneous online users	Exception User Settings	Shen Wei Platform	Kun Peng Platform	This article platform
300	10	1	0	0
	20	2	1	0
	30	4	2	0
600	10	2	1	0
	20	6	3	0
	30	9	5	1
900	10	3	3	0
	20	8	7	1
	30	13	9	2

From the security performance test results of the platform, it can be intuitively seen that as the number of simultaneous online users and the number of abnormal users increase, the more likely the platform will fail. After comparing with the Shenwei platform, it is found that the number of failures of the enterprise business administration platform built based on the MVC pattern in this paper is reduced by 44, and the number of failures is reduced by 27 compared with the Kunpeng platform. This shows that the MVC-based enterprise business administration platform can realize multi-user development and application, which can effectively improve the security of platform operation. And through the multi-user collaboration, it can further improve the efficiency of enterprise business administration.

### 4. CONCLUSION

In this paper, we built an enterprise business administration platform based on the MVC model and used the K-nearest neighbor algorithm to classify business data. In order to test the effectiveness of the enterprise business administration platform, a test analysis of the platform was conducted. From the results of the timing performance test, the average service loading time of the enterprise business administration platform built based on the MVC pattern is 1221.4ms, which is 14.87% and 17.73% lower than that of the Kunpeng and Shenwei platforms respectively. From the security performance test results, the number of failures of the platform in this paper is 44 and 27 times less than that of the Sunway platform and the Kunpeng platform, respectively. This shows that the enterprise business administration platform built in this paper helps innovation of enterprise business administration and improves its efficiency.

## ABSTRACT

This paper analyzes the construction objectives and basic characteristics of the positioning of leisure sports majors, and constructs the “one body and three wings” talent training model of leisure sports majors based on them. The evaluation index system is carried out for the effectiveness of the model, and the Delphi method is used to assign the importance degree and calculate the index weights. In order to illustrate the effectiveness of the “One Body, Three Wings” leisure sports personnel training model, data analysis was conducted by using examples. The results showed that the scores of talent training characteristics, teaching evaluation and practical courses were 9.9, 9.9 and 8.3 respectively. This shows that the “one body, three wings” talent cultivation model can effectively promote the cultivation of talent characteristics and the diversification of teaching evaluation.

## KEYWORDS

Sports power; Leisure sports profession; Talent training; Delphi method; Index weights; One and three wings

## 1. INTRODUCTION

With the continuous development of China's social economy, leisure sports are facing new opportunities and challenges, especially the demand for leisure sports professionals is also on the rise [1-2]. At present, the number of colleges and universities offering undergraduate programs in leisure sports is increasing year by year, and the colleges and universities are trying to explore the cultivation of leisure sports professionals that match the needs of society [3-4]. Scholars at home and abroad have made systematic researches on the curriculum structure, objectives, talent training and practical teaching about the cultivation of leisure sports majors, but there are still shortages in the cultivation combined with local and regional characteristics.

Higher undergraduate schools are the gathering place of youth, leisure physical education courses have the irreplaceable role of other courses, leisure physical education majors are the only path to cultivate excellent sports talents, and the quality of teaching in leisure physical education majors is directly related to the physical quality level of the next generation [5-6]. School recreational sports as an important part of a strong sports country, as part of school sports, the recreational sports education majors should reflect the historical responsibility and establish a sense of mission. Strengthening their basic skills, striving to learn the latest knowledge and improving their teaching practice is the requirement given to physical education

majors in the new era, as well as the guarantee for the future physical health development of youth [7-8].

## 2. CONSTRUCTION AND BASIC CHARACTERISTICS OF SENIOR UNDERGRADUATE LEISURE SPORTS MAJORS

### 2.1. RECREATIONAL SPORTS PROFESSIONAL POSITIONING CONSTRUCTION GOALS

Recreational Sports is a specialization in Physical Education under the category of Education. It is a profession with the main goal of cultivating the all-round development of human beings, requiring practitioners to be a composite talent with various abilities such as management, planning, promotion, publicity, operation and design. It is an application-oriented talent training in the fields of fitness and leisure, sports training, competition performance, as well as sports tourism and stadium operation. The focus includes outdoor sports, experiential education, and the planning and operation of various sports events. The positioning of the leisure sports major is shown in Figure 1.

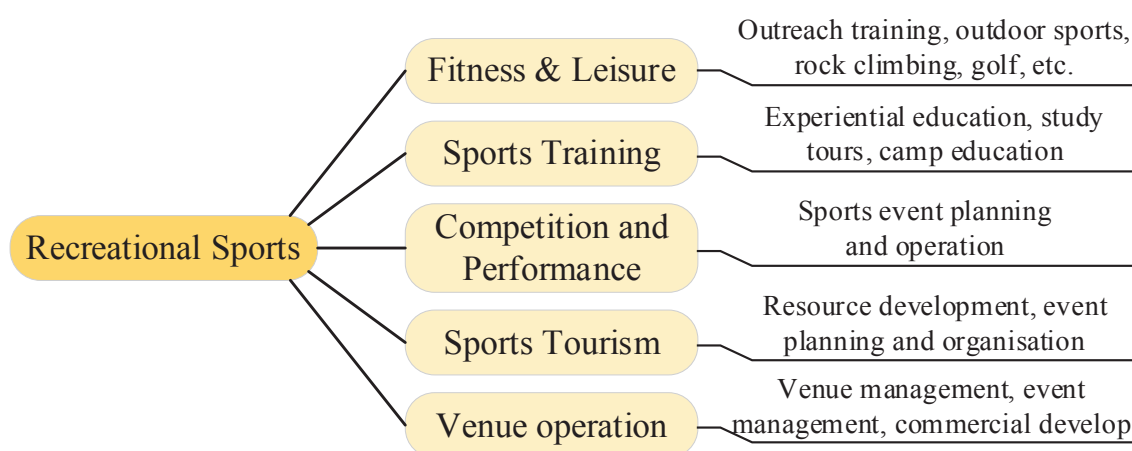

Figure 1. Recreational Sports Professional Positioning

### 2.2. BASIC CHARACTERISTICS OF TALENT TRAINING FOR LEISURE SPORTS PROFESSIONALS

On the basis of drawing on the characteristics of the cultivation of leisure sports professionals in colleges and universities in developed countries and regions such as the United States, the United Kingdom, Japan and Taiwan and understanding and analyzing the current situation of the cultivation of leisure sports professionals in China, this study mainly summarizes the characteristics of the cultivation of senior undergraduate leisure sports talents in terms of cultivation objectives, curriculum, teaching practices and evaluation subjects. Its specific characteristics are shown in Figure 2.

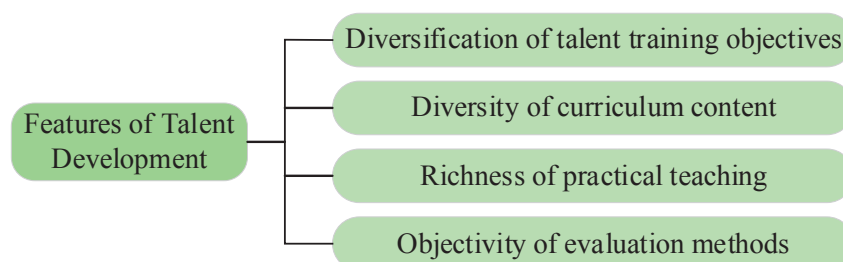

Figure 2. Basic features of the training of recreational sports professionals

(1) Diversification of talent cultivation objectives

The cultivation of talents in leisure sports should highlight the leisure nature, and emphasize

more on the cultivation of “general talents” and set the professional cultivation goal in the direction of sports and leisure management and promotion, consultation and planning, business management, social guidance and academic research.

(2) Diversity of curriculum content

The curriculum of leisure sports is organized in the mode of combining compulsory courses and elective courses, and penetrating general education courses and professional teaching courses.

(3) Richness of practical teaching

Recreational sports majors pay more attention to practical teaching and vocational teaching forms, pay more attention to cultivating students’ hands-on ability, and supplement the teaching of knowledge with rich and diverse practical teaching links.

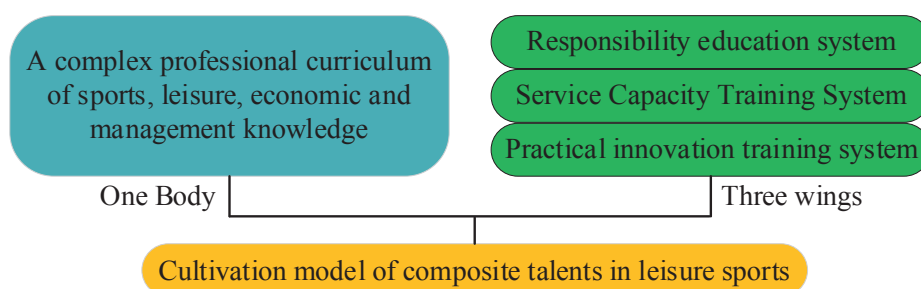

(4) Objectivity of evaluation method

The talent evaluation system of leisure sports majors is more objective and scientific, and the evaluation subjects are more diversified. We ask qualified and authoritative professional institutions to issue professional qualification certificates, and evaluate students as a whole by combining performance recognition and certificate recognition, which can not only stimulate students’ learning enthusiasm, but also help them grow and become successful.

### 3. SENIOR UNDERGRADUATE RECREATIONAL SPORTS TALENTS TRAINING MODE AND EVALUATION INDEX SYSTEM

#### 3.1. CONSTRUCTING “ONE BODY AND THREE WINGS” TALENT TRAINING MODE FOR LEISURE SPORTS PROFESSIONALS

With the rapid development of higher physical education, it is the key to accelerate the integration of educational resources from all parties, actively organize and implement the teaching practice of leisure physical education, and make efforts to build a complex talent cultivation model for leisure physical education majors. Based on the existing research, this paper proposes the construction of “one body and three wings” talent cultivation model for leisure sports majors. The framework of this talent cultivation model is shown in Figure 3.

**Figure 3** The “Three Wings” model for training talents in leisure sports

The “one body, three wings” leisure sports professional composite talent cultivation mode refers to the leisure sports professional composite talent cultivation mode with the body, leisure, economy and management knowledge composite as the main body, and the strong sense of social responsibility, innovation ability and service ability as the three wings.

#### 3.2. EVALUATION INDEX SYSTEM OF “ONE BODY, THREE WINGS” LEISURE SPORTS PROFESSIONAL TALENT TRAINING MODE

Based on the analysis of the training mode of leisure sports professionals, the “one body, three wings” training mode of leisure sports professionals is constructed. In this section, in order to better analyze the effectiveness of this model, the evaluation index system of “one

body, three wings” leisure sports professional talent cultivation model for higher education undergraduates is constructed as shown in Table 1.

**Table 1.** Evaluation Indicator System for the “One Body, Three Wings” Model

Primary Indicators	Secondary indicators	Coding
Training Objectives	Specific orientation of the training objectives	0.721
	Talent development characteristics	0.893
	Humanities and moral character	0.804
Curriculum and Teaching	Professional core courses	0.795
	Practical courses	0.553
	Variety of teaching methods	0.752
Quality Assurance	Effective assessment of teaching quality	0.579
	Innovation in teaching structure	0.693
	Diversity in teaching evaluation	0.616

In order to be able to analyze the indicators rationally, this section first uses the Delphi method to assign values to the indicators and then obtain the mean importance of each indicator. To find the weight of each assessment indicator in the first level of indicators, the corresponding mean value of importance is brought into the formula. That is:

$$w_1 = V / \sum V \quad (1)$$

Where  $w$  is the indicator weight and  $V$  is the average of the assigned importance of indicators determined by Delphi method.

#### 4. EMPIRICAL ANALYSIS OF “ONE BODY, THREE WINGS” LEISURE SPORTS PROFESSIONAL TALENT TRAINING MODEL

In order to test the effectiveness of the “one body, three wings” talent cultivation model for leisure sports majors, this chapter uses the evaluation index system to assess whether the scale is practical and whether the designed indexes are reasonable, and the training plan designated by the leisure teaching and research department of WH Sports College and the current situation of professional construction, and uses the evaluation standard scale to conduct a comprehensive assessment of the leisure sports majors in WH Sports College. The comprehensive assessment of the major was conducted, and the scores of each index were obtained as shown in Table 2.

This round of assessment adopts a 100-point system, with 0~59 being unqualified, 60~69 being qualified, 70~79 being good, 80~89 being excellent, and 90~100 being outstanding.

**Table 2.** Score for each indicator

Secondary indicators	Total score	Score	Missing points
Specific orientation of the training objectives	10	9.8	0.2
Talent development characteristics	10	9.9	0.1
Humanities and moral character	10	9.5	0.5
Professional core courses	10	9.6	0.4
Practical courses	10	8.2	1.8
Variety of teaching methods	10	9.3	0.7
Effective assessment of teaching quality	10	9.7	0.3
Innovation in teaching structure	10	9.5	0.5
Diversity in teaching evaluation	10	9.9	0.1

From the scores of each index, the total score of talent cultivation of leisure sports majors in WH Sports College is 85.4, and the result is excellent. This shows that the evaluation index system constructed in this paper can effectively analyze the effectiveness of the “one body, three wings” talent cultivation model, and also shows that the “one body, three wings” talent cultivation model can effectively promote the development of higher education undergraduate leisure sports professionals and provide high-quality talents for the promotion of a strong sports country. It also shows that the “one body, three wings” talent cultivation model can effectively promote the development of senior undergraduate leisure sports professionals and provide high-quality talents for the promotion of a strong country. The score of 9.9 for the cultivation of talents’ characteristics and diversification of teaching evaluation shows that the “one body, three wings” talent cultivation mode can effectively promote the development of leisure sports professionals’ characteristics and make the teaching evaluation more diversified. However, the evaluation score of the practical course is only 8.2, which indicates that although the teaching characteristics of the “one body, three wings” talent training model are good, the concept of practical course is not deeply implemented, which makes students have some concerns about the practical course of leisure sports. Therefore, the development of practical courses should be further strengthened in the subsequent reform process to promote the synergistic development of students’ theoretical knowledge and practical ability.

## **5. CONCLUSION**

With the continuous development of the era of big data, big data analysis has become an indispensable data analysis tool. In order to improve the quality of talent cultivation of senior undergraduate leisure sports majors, we must determine a scientific and suitable talent cultivation model. In this paper, starting from the construction and basic characteristics of senior undergraduate leisure majors, the “one body, three wings” talent cultivation model of leisure sports majors is constructed and its index evaluation system is given. In order to verify the effectiveness of this talent cultivation model, the quantitative analysis of the data was carried out with WH Sports College as an example. The results show that the “one body, three wings” talent cultivation model can effectively promote the characteristics of talent development and diversification of teaching evaluation methods, but there is still a need to further strengthen the optimization of teaching practice courses. The results show that the “One Three Wings” talent training model can effectively promote the characteristics of talent development and diversify teaching evaluation methods, but there is still a need to further strengthen the optimization of teaching practice courses.

## ABSTRACT

This paper constructs a framework for learning English speaking in colleges and universities driven by artificial intelligence technology. Adaptive strategies are introduced to analyze the teaching effectiveness of the English speaking learning framework in colleges and universities. The quantitative analysis of the data from the control and experimental classes was conducted in terms of the interest and initiative of students in learning spoken English. The results showed that the experimental class students' learning interest score was 9.65 greater than the control class' score of 4.82, and the learning initiative score was 9.92 greater than the control class' score of 5.05. This indicates that artificial intelligence technology can effectively promote the development of English speaking teaching.

## KEYWORDS

Artificial intelligence; College spoken English; Informatization; Adaptive strategy; BP neural network; Teaching effectiveness

## 1. INTRODUCTION

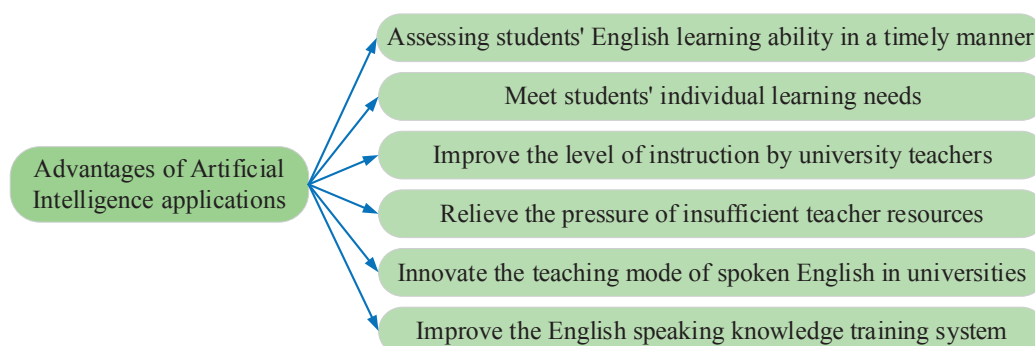

From the viewpoint of the goal and mode of talent cultivation in colleges and universities, it is mainly to cultivate skilled and quality talents to help students achieve better employment, so English, as a traditional basic subject, also mainly serves for students' employment [1-2]. Oral language teaching occupies a rather important position in the whole system of teaching Chinese as a foreign language or Chinese language education. Firstly, it is a basic course; secondly, it is a bridge between students' textbook knowledge and concrete practical application, which has a strong practical meaning and utilitarian color, but sometimes it is neglected. It is thought that high scores in exams and the ability to write good essays are the ultimate goal of teaching, but this is not really the case. In order to learn and use a language well, whether it is a native language or a second foreign language, the traditional teaching model of "early childhood linguistics" and passive learning habits are no longer enough. As a result, the teaching of oral language has been paid less attention, and the phenomenon of "deaf English" has long been found in English teaching, which is not conducive to the cultivation of students' comprehensive ability and hinders students' employment. The integration of AI-related technologies into teaching and learning has effectively improved the quality and level of teaching and learning and accelerated teaching and learning reform [3-4].

The blended teaching mode in the information-based environment has been continuously innovated in the teaching of spoken English in colleges and universities and has become a new teaching norm. Colleges and universities should tap and give full play to the potential of AI to make teachers become the guides of learning, enhance students' English learning

experience, change their learning mode, effectively improve teaching quality, and promote the reform of college English speaking teaching [5-6]. Nevertheless, AI products cannot replace teachers after all, and teachers should improve and innovate their teaching methods and strategies in the process of the continuous development of AI, perfect their teacher skills, follow the trend of the information era, and continuously integrate with AI in practical teaching [7-8]. Students should also cognize themselves scientifically according to the actual situation, make learning plans, and continuously improve their learning ability and English speaking skills with the aid of AI's learning functions, teacher teaching and online independent learning [9-10].

## 2. ADVANTAGES OF ARTIFICIAL INTELLIGENCE TECHNOLOGY

As an important platform for talent cultivation, colleges and universities must continuously improve their teaching level so that they can meet the demand for talents in social construction and development. As an important support for teaching innovation in colleges and universities, the fit between colleges and universities and artificial intelligence in the information technology environment has been increasing. Figure 1 shows the advantages of the application of AI in the teaching of spoken English in colleges and universities.

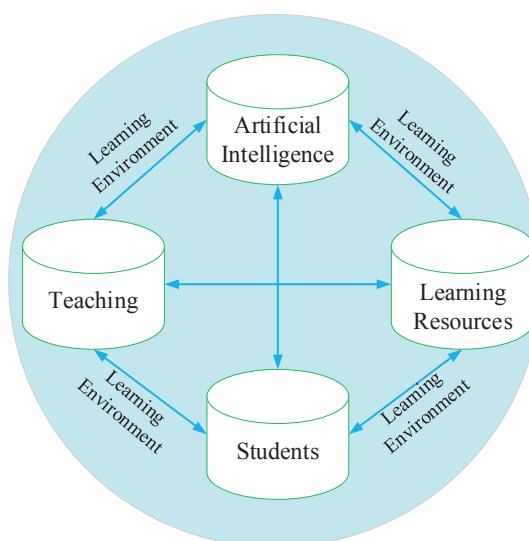

**Figure 1.** Advantages of Artificial Intelligence applications

## 3. ARTIFICIAL INTELLIGENCE-BASED TEACHING AND LEARNING FRAMEWORK

### 3.1. LEARNING FRAMEWORK

The core elements of AI-based college English speaking learning include teachers, students, learning resources and AI-technology supported learning environment, which are interconnected and interact with each other, and together constitute the conceptual framework of college English speaking learning as shown in Figure 2.

**Figure 2.** Conceptual framework for learning spoken English

In an AI-enabled learning environment, the role of teachers has changed, as they are no longer the sole source of knowledge or the sole presenter. Instead, they use AI technology to understand students' individual learning needs, personalize instructional design, and provide students with personalized learning assistance, transforming the old "indoctrination" teaching into individualized instruction. The role of students has also changed, as they no longer passively receive knowledge. Instead, they choose learning resources and learning paths that suit their needs in a personalized learning environment, and actively learn. Therefore, AI-based college English speaking learning is characterized by intelligence, personalization, diversity, collaboration and precision.

### 3.2. TEACHING EFFECTIVENESS EVALUATION BASED ON ADAPTIVE BP NEURAL NETWORK

In order to improve the speed of convergence of neural networks and reduce the complexity of the training process, this paper introduces momentum on the basis of general BP neural networks, so that the weights are updated by leaving the adjustment experience accumulated in the previous iteration without causing the divergence of the learning process. The gradient descent method of BP neural networks always accelerates the amount of correction in the same gradient direction, and when the correction is too much, momentum can make the correction decrease to keep the correction direction toward convergence, which acts as a damping effect. When the error surface shows abrupt ups and downs, it can reduce the oscillation trend and improve the training speed.

$$w_{ij}(t+1) = w_{ij}(t) - \Delta w_{ij}(t) - \alpha \Delta w_{ij}(t-1) \quad (1)$$

$$w_{ij}(t+1) = w_{ij}(t) - \eta(t+1) \frac{\partial C(t)}{\partial w_{ij}(t)} - \alpha \left( \eta(t) \frac{\partial C(t-1)}{\partial w_{ij}(t-1)} \right) \quad (2)$$

In addition, in general BP neural networks, the learning rate is taken to be constant by default, and too large or too small a learning rate is not well suited to the whole learning process of the network, so an adaptive learning strategy is introduced in this paper to improve it and ensure that the network is trained at an acceptable maximum learning rate. The learning rate is adaptively adjusted as:

$$\eta(t+1) = \begin{cases} \beta \cdot \eta(t), & C(t) > C(t-1) \\ \theta \cdot \eta(t), & C(t) < C(t-1) \\ \eta(t), & C(t) = C(t-1) \end{cases} \quad (3)$$

where  $\alpha$  is the momentum factor,  $\Delta w_{ij}(t-1)$  is the momentum term, which is also the weight correction of the previous iteration,  $\beta, \theta$  are constants and  $0 < \beta < 1 < \theta$ .

## 4. AN EMPIRICAL ANALYSIS OF INFORMATION-BASED TEACHING OF SPOKEN ENGLISH IN COLLEGES AND UNIVERSITIES

In order to verify the effectiveness of the application of the AI technology-driven informational teaching framework for spoken English in colleges and universities given in this paper, this chapter uses freshman students of a college English course in Guangdong Province as an example to conduct quantitative analysis of data on interest and learning initiative in spoken English.

### 4.1. EFFECTS ON STUDENTS' INTEREST IN LEARNING SPOKEN ENGLISH

In this study, adaptive BP neural network was used to derive the results of the effects of

students' interest in learning spoken English as shown in Table 1.

**Table 1.** The influence of students' interest in oral English learning

Class and grade	Before	After	T value	P value
Comparison class	4.82	4.82	0.0001	$\infty$
Experimental class	4.83	9.65	-12.18	0.0001
T-value	0.0001	-12.18		
P-value	$\infty$	0.0001		

In terms of the effect on students' interest in learning spoken English, before the experiment, the difference between the scale scores of the experimental and control classes was only 0.01, i.e., the two classes' students' interest in learning English was comparable and met the experimental requirements. After the experiment,  $P=0.0001 < 0.05$  for the experimental and control classes, which means the difference is significant. Moreover, the post-experimental learning interest scale score of students in the experimental class was 9.65 significantly greater than that of the control class, which was 4.82. Meanwhile, the  $p=0 < 0.05$  before and after the experiment in the experimental class, which means the difference is significant, implies that the students' interest in learning spoken English in the experimental class is significantly higher after the experiment.

#### 4.2. EFFECTS ON STUDENTS' INITIATIVE IN LEARNING SPOKEN ENGLISH

Before and after the teaching experiment, this study made a questionnaire survey on the students' English speaking learning initiative in the experimental and control classes. After the adaptive BP neural network was used to analyze and process the data of their scales, the results of the influence of students' English speaking learning initiative were obtained as shown in Table 2.

**Table 2.** The influence of initiative in oral English learning

Class and grade	Before	After	T value	P value
Comparison class	5.02	5.05	-0.31	0.724
Experimental class	5.04	9.92	-0.98	0.0001
T-value	-0.61	-10.03		
P-value	0.618	0.0001		

From the results of the influence of learning initiative, before the experiment, the experimental class and the control class  $P=0.54 > 0.05$  after t-test, which means the difference is not significant, i.e. the difference between the two classes' students' learning attitude initiative towards spoken English is not significant and meets the experimental requirements. After the experiment,  $P=0.0001 < 0.05$  for the experimental class and the control class, which means the difference is very significant. Meanwhile, the scale score of 9.92 in the experimental class was significantly greater than that of 5.05 in the control class, indicating that after the experiment, students in the experimental class had significantly more active and positive attitudes toward learning spoken English than those in the control class. This shows that with the drive of artificial intelligence technology, the information-based teaching of spoken English in colleges and universities can achieve good results.

## 5. CONCLUSION

In this paper, starting from the advantages of artificial intelligence technology in the informative teaching of spoken English in colleges and universities, we constructed a framework for learning spoken English in colleges and universities using artificial intelligence

technology, and introduced an adaptive strategy to optimize the BP neural network in order to analyze the teaching effect of this learning framework. In order to further verify the effectiveness of the college English speaking learning framework, data analysis was conducted with the freshman students of a university in Guangdong Province as an example. The results showed that the post-experimental learning interest scale score of the students in the experimental class was 9.65 significantly larger than that of the control class, which was 4.82. The learning initiative scale score of 9.92 for the experimental class was significantly greater than that of 5.05 for the control class. This shows that the AI technology-driven college English speaking informational teaching can effectively promote students' learning interest and learning initiative and realize the development of college English speaking informational teaching.

# THE DILEMMA AND THE PATH OF CULTIVATING “DUAL-TEACHER” TEACHERS IN THE CONTEXT OF DEEP LEARNING IN UNIVERSITIES

---

Min Xiao\*

School of Education, Yunnan College of Business Management, Kunming, Yunnan, 650304, China

[mindy\\_0422@163.com](mailto:mindy_0422@163.com)

---

## ABSTRACT

This paper takes the dilemma of “dual-teacher” teacher training mode in colleges and universities as the starting point and analyzes the specific reasons for the dilemma. In order to solve the dilemma, the evaluation index system of “dual-teacher” teacher training mode in colleges and universities is constructed, and the judgment matrix is constructed and tested for consistency by using hierarchical analysis. The quantitative analysis of the data was also carried out to verify the effectiveness of the evaluation index system. The results showed that the average percentages of very small, average and very large impact of the evaluation index system in this paper were 7.42%, 41.29% and 51.29%, respectively. This indicates that the index system of this paper can effectively promote the innovation construction of “double-teacher” teachers in universities.

## KEYWORDS

Dual-teacher; Teacher training; Hierarchical analysis; Judgment matrix; Consistency test; Evaluation index

## 1. INTRODUCTION

Teachers are the foundation of education and the source of education, and they are the key factor to determine the success or failure of national higher education reform in the new era. Since its reform and opening up, China has taken a series of measures to accelerate the modernization of higher education [1-2]. Nowadays, China’s higher education teacher training system has been basically constructed, and thanks to the improvement of the management system, the quality of teachers has been significantly improved, which provides a strong talent support for the reform and development of higher education. However, there are still many structural contradictions in the process of building the higher education teaching force in China, especially the lack of specialization and the shortage of high-quality “dual-teacher” teachers, which have become bottlenecks to the reform and development of higher education in the new era [3-4].

The construction of “double-teacher” team in colleges and universities is the key to reflect the direction of higher education reform and to cultivate students’ innovation and improve their practical ability. Therefore, the comprehensive promotion of the construction of “double-teacher” team in colleges and universities is a matter of the future development of education in colleges and universities, and it is also necessary to cultivate high-quality talents [5-6]. From the present stage, the strength of “double-teacher” teachers in colleges and universities is still not strong enough and their overall quality is not very high, which is a big gap with the

philosophy of running colleges and universities [7-8]. Moreover, students' deep learning needs the guidance of teachers' deep teaching, and the cultivation of teachers' deep teaching ability is an inevitable demand to effectively promote students' deep learning. Under the background of deep learning, how to get out of the dilemma of developing and cultivating "double-teacher" teachers in colleges and universities, and then better promote the innovative development of "double-teacher" teachers in colleges and universities is a problem that must be faced [9-10].

## 2. THE DILEMMA OF "DUAL-TEACHER" TEACHER TRAINING MODE IN COLLEGES AND UNIVERSITIES AND THE REASONS FOR ITS FORMATION

### 2.1. ANALYSIS OF THE DILEMMA OF "DUAL-TEACHER" TEACHER TRAINING MODE IN COLLEGES AND UNIVERSITIES

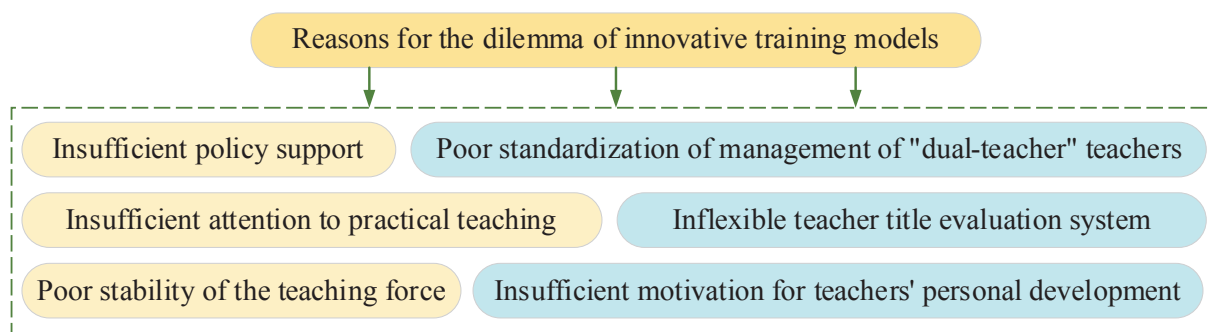

The development of "dual-teacher" teacher training mode to promote education innovation and reform is the trend of the country, and it is also the inevitable requirement to enhance the quality of college teachers. The innovative attempt to improve the effect of education in colleges and universities is the necessity of the innovation of "dual-teacher" teacher training mode in the background of deep learning. With the continuous development of university education, although the saying of "dual-teacher" teacher training is constantly put forward, there are still some problems that cannot be implemented, as shown in Figure 1.

**Figure 1.** The dilemma of "dual-teacher" teacher training model in higher education

### 2.2. REASONS FOR THE DILEMMA OF FORMING THE "DUAL-TEACHER" TEACHER TRAINING MODE IN UNIVERSITIES

At present, there are many problems in the construction of "dual-teacher" teachers in colleges and universities, the reasons of which mainly lie in the lack of necessary normal support from the state, the irregular management of "dual-teacher" teachers in colleges and universities, and the unstable evaluation system of titles of teachers in colleges and universities. The main reasons are that the state lacks the necessary normal support for teachers in colleges and universities, the management of "dual-teacher" teachers in colleges and universities is not standardized, the "dual-teacher" teachers in colleges and universities is not stable, and the evaluation system of titles of teachers in colleges and universities by education management departments is not sound. The specific performance is shown in Figure 2.

**Figure 2.** Causes of the dilemma of the training model

In view of the current problems of “dual-teacher” teacher training mode in colleges and universities, it is necessary to further strengthen the reform of “dual-teacher” teacher training mode in colleges and universities, promote the innovative development of “dual-teacher” teachers in colleges and universities, and provide guarantee for the improvement of students’ learning quality in the context of deep learning.

### 3. EVALUATION INDEX SYSTEM OF “DUAL-TEACHER” TEACHER TRAINING MODE IN COLLEGES AND UNIVERSITIES

#### 3.1. CONSTRUCTION OF THE EVALUATION INDEX SYSTEM OF “DUAL-TEACHER” TEACHER TRAINING MODE IN HIGHER EDUCATION

In order to further understand the strengths and weaknesses of the “dual-teacher” teacher training mode in colleges and universities, this section constructs an evaluation index system based on the existing research on the “dual-teacher” teacher training mode in colleges and universities. The evaluation index system is used to verify the effectiveness of the “dual-teacher” teacher training mode in colleges and universities and to provide a basis for its innovation and reform. The evaluation index system of “double-teacher” teacher training mode in colleges and universities is shown in Table 1.

**Table 1.** Evaluation index system of “dual-teacher” teacher training mode in higher education

Primary Indicators	Secondary indicators	Coding
Teacher Training	Teacher participation in the practice market	X1
	Practice Process Evaluation	X2
Teaching Evaluation	Standardisation of practice teaching	X3
	Overall teaching satisfaction	X4
	The proportion of practical teaching	X5
Overall satisfaction	Satisfaction of talent cultivation	X6
	Adaptability of talents to jobs	X7
	Suitability of teaching system	X8
Teaching Assurance Activities	Innovation of teaching contents	X9
	The degree of guarantee of teaching conditions	X10

The analysis of “dual-teacher” teacher training mode in colleges and universities through four aspects, such as teacher training, teaching evaluation, overall satisfaction and teaching guarantee activities, can include the influence of several factors on the construction of “dual-teacher” teachers to a greater extent, and promote the innovative development of college teacher team construction.

#### 3.2. CONSTRUCTING JUDGMENT MATRIX AND CONSISTENCY TEST

Ten experts with profound experience in university faculty development were invited to make a two-by-two comparison of the indicators at the same level and assign values to them. Due to the different roles, experiences, and perspectives of consideration, each expert compared the importance of each index differently. The mean values of different experts’ assignments between each index were taken by arithmetic averaging method, and all judgment matrices were assembled, and the final judgment matrix of mean values was obtained as

$$P = (a_{ij})_{n \times n} \quad (1)$$

where  $a_{ij}$  indicates the importance of factor  $i$  compared with factor  $j$ .

On the basis of the established weight judgment matrix, the eigenvectors of matrix  $P$  are calculated and normalized to obtain the weight vector of evaluation index  $i$  as

$$W_i = W_i / \sum_{i=1}^n W_i (i = 1, 2, \dots, n) \quad (2)$$

Since the subjective judgments of experts may be self-contradictory, resulting in inconsistencies in the judgment matrix. Therefore, in order to verify the validity of the expert-assigned data and ensure the accuracy and reasonableness of the calculation structure, it is necessary to conduct consistency test on each judgment matrix. If the consistency ratio is less than 0.1, it means that the judgment matrix meets the consistency requirement and the weight distribution of indicators at all levels is reasonable, otherwise, the expert needs to re-assign the questionnaire or discard the questionnaire.

#### 4. EMPIRICAL ANALYSIS OF “DUAL-TEACHER” TEACHER TRAINING MODEL IN UNIVERSITIES

##### 4.1. TEACHERS’ OVERALL EVALUATION OF THE “DUAL-TEACHER” TEACHER TRAINING INDEX SYSTEM

The author collected data by questionnaire from 200 teachers in School H using the “dual-teacher” teacher training evaluation index system, and analyzed the overall evaluation of teachers, and the results are shown in Table 2.

**Table 2.** Teachers’ overall assessment of the indicator system

Meeting the level of demand	Number of people	Percentage/%
Very high	14	7.00%
Relatively high	102	51.00%
Relatively low	79	39.50%
Very low	5	2.50%

In terms of the overall evaluation of the teacher training index system, the teachers surveyed were generally satisfied with the teacher training measures of School H. 58% of the teachers thought that the training measures implemented by the school met the teachers’ needs to a high or very high degree, while 39.50% thought that the teacher training measures met the teachers’ needs to a low degree. Among them, 58% of the teachers thought that the training measures implemented by the school met the teachers’ needs to a high or very high degree, 39.50% of the teachers thought that the training measures met the teachers’ needs to a low degree, and only 2.5% of the teachers thought that the school’s “dual-teacher” training measures were very low. Only 2.5% of the teachers thought that the school’s “dual-teacher” teacher training measures were very low. This indicates that the “dual-teacher” teacher training index system can effectively obtain the teachers’ expectations of the training mode, and then carry out targeted innovation and reform.

##### 4.2. TEACHERS’ SPECIFIC EVALUATION OF THE “DUAL-TEACHER” TEACHER TRAINING INDEX SYSTEM

Based on the index evaluation system constructed in the previous section, the weights of each index were determined by using hierarchical analysis, and the quantitative analysis of the data was carried out with three evaluation criteria: very small, average and very large.

**Table 3.** Teachers' specific evaluation of the indicator system

Coding	Very small	Fair	Very large	Coding	Very small	Fair	Very large
X1	0.63%	48.75%	50.62%	X6	5.45%	32.14%	62.41%
X2	10.64%	55.41%	33.95%	X7	8.95%	44.62%	46.43%
X3	8.64%	41.63%	49.73%	X8	12.13%	38.64%	49.23%
X4	2.17%	32.56%	65.27%	X9	1.96%	22.15%	75.89%
X5	18.65%	55.97%	25.38%	X10	4.98%	41.07%	53.95%

In terms of teachers' specific evaluations of the index system, the average percentages of very little, average, and very much influence were 7.42%, 41.29%, and 51.29%, respectively. Among them, the highest evaluation of the "dual-teacher" teacher training model is the overall teaching satisfaction, which accounts for 65.27%. This indicates that the evaluation system of "dual-teacher" teacher training mode constructed in this paper is reasonable and can cover all the factors of "dual-teacher" teacher training mode in colleges and universities, which can help promote the further development of "dual-teacher" teacher training mode in colleges and universities. It can help promote the further development of "dual-teacher" teacher training mode in colleges and universities.

## 5. CONCLUSION

This paper analyzes the dilemmas and causes of the "dual-teacher" teacher training mode in colleges and universities, constructs an evaluation index system based on it, and uses hierarchical analysis to calculate the index weights. In order to further verify the effectiveness of the evaluation index system in the training mode of "double-teacher" teachers in colleges and universities, data analysis was conducted in School H as an example. The results showed that the teachers in this school were generally satisfied with the "dual-teacher" teacher training measures, and 58% of the teachers thought that the training measures implemented by the school met the teachers' needs to a high or very high degree. In terms of the specific evaluation of the index system, the average percentages of very little, average and very much are 7.42%, 41.29% and 51.29% respectively. Thus, the evaluation index system of "double-teacher" teacher training mode in colleges and universities constructed in this paper can provide a comprehensive analysis of the problems in teacher training in colleges and universities and provide effective theoretical support for "double-teacher" teacher training in colleges and universities.

# A STUDY ON THE ARTISTIC POPULARIZATION OF CLASSICAL PIANO WORKS BASED ON THE ERA OF HUMAN-COMPUTER SHARING

---

Nan Wang\*

School of Art and Design, Inner Mongolia University of Science and Technology, Baotou,  
Inner Mongolia, 014010, China

[wangnanol@163.com](mailto:wangnanol@163.com)

---

## ABSTRACT

With the full development of human-computer sharing technology, it also provides the possibility for the popularization and development of the art of classical piano works. The current social emphasis on art is also an important means to promote the popularization of classical piano art, and on the basis of the analysis of the current situation of the social attitude towards classical piano art, the countermeasures for the popularization of classical piano art works are proposed from the perspective of society as a whole. The popularization of piano art can also play a role in the dissemination of classical art, and at the same time make the classical piano art itself become more full, three-dimensional and heavy, and realize the value of piano art itself.

## KEYWORDS

Human-computer sharing; Classicalism; Piano works; Art popularization

## 1. INTRODUCTION

In recent years, in the popularization stage of art education, the importance of piano art education has become more and more prominent, and more and more people are learning piano and using piano as a carrier to cultivate their musical and artistic qualities, which promotes the inheritance and development of piano art and boosts the popularization of art education [1-3]. As the saying goes, teaching has a method, and for piano teaching, artificial intelligence has been developed continuously, and the education industry has the figure of artificial intelligence. Adding the teaching content of artificial intelligence in the college piano teaching classroom not only can stimulate the interest of piano learners, but also can mobilize the enthusiasm of piano learning and improve the quality of piano art learning [4-5].

Using an artificial intelligence-based approach, the literature [6] investigated the direction of exploration and innovative development of piano performance teaching in universities. The authors studied the current situation and prospects of the application of artificial intelligence in the field of music education, and also explored how to use artificial intelligence technology to improve the efficiency and quality of piano performance teaching. The study is of great significance to promote the innovation and development of music education. The literature [7] investigated the effect of using a hybrid metaheuristic AI model in simulating the water flow process in piano key weirs. The authors studied the principles and applications of the hybrid metaheuristic AI model and analyzed the accuracy and efficiency of the model in simulating the water flow process. The study has important implications for the design of piano key weirs and water flow control, and provides references and insights for the application of hybrid metaheuristic AI models in the field of hydrology. The authors of the literature [8] investigated

the design principles, technical features and functional modules of the system and discussed its application in piano performance teaching. The study aims to optimize the interaction and feedback mechanism of piano performance teaching by applying artificial intelligence technology to improve students' learning effectiveness and interest. The research is important for promoting the innovation and development of music education.

## 2. THE CURRENT SITUATION OF CHINESE SOCIETY'S LOVE FOR CLASSICAL PIANO ART AND COUNTERMEASURES

### 2.1. THE CURRENT SITUATION OF CHINESE SOCIETY'S LOVE FOR CLASSICAL PIANO ART

Recently more and more piano art researchers focus on implanting classical music into piano art, seeking new piano art feelings and piano creation elements. The popularization of piano art can also play a role in the dissemination of classical art, and at the same time make classical piano art itself become more full, three-dimensional and heavy, realizing the value of piano art itself. In terms of the need to understand the current situation of our society towards piano art, the thesis first sets up a system of indicators and measures them.

The authors conducted a survey on some social personnel, and the analysis of the current situation of the popularization of piano art among social personnel is shown in Figure 1. It can be seen that according to the survey most personnel like music, but just do not have the corresponding conditions. Some people use their spare time to learn the corresponding musical instruments especially piano learning, piano learning still occupies a certain proportion of the surveyed people, especially for students who have more spare time. According to the survey society people still have a certain demand for piano art, there is a majority of people who want to learn piano expertise, and the enthusiasm for learning is also relatively high, most of the people want to attend and participate in learning piano.

**Figure 1.** Analysis of the current situation of the popularization of piano art among social workers

### 2.2. COUNTERMEASURES FOR THE POPULARIZATION OF PIANO ART IN CHINA

Based on the results of the above statistical analysis and combined with relevant experts, industry professionals and the author's practical observations, etc., this thesis proposes

countermeasures for the popularization of piano art in China from the perspective of the needs of social personnel.

(1) There is a need to offer piano courses that are adapted to different levels of social personnel, these courses include basic piano professional courses, piano courses for promotion level, elective courses for improvement level and specific piano courses for specific needs. The learning life of Chinese citizens should be enriched by these different levels of piano courses adapted to the different levels, abilities and levels of social personnel. In particular, it is necessary to control the overall need for musical level in China, and thus achieve the goal of establishing a planned with curriculum.

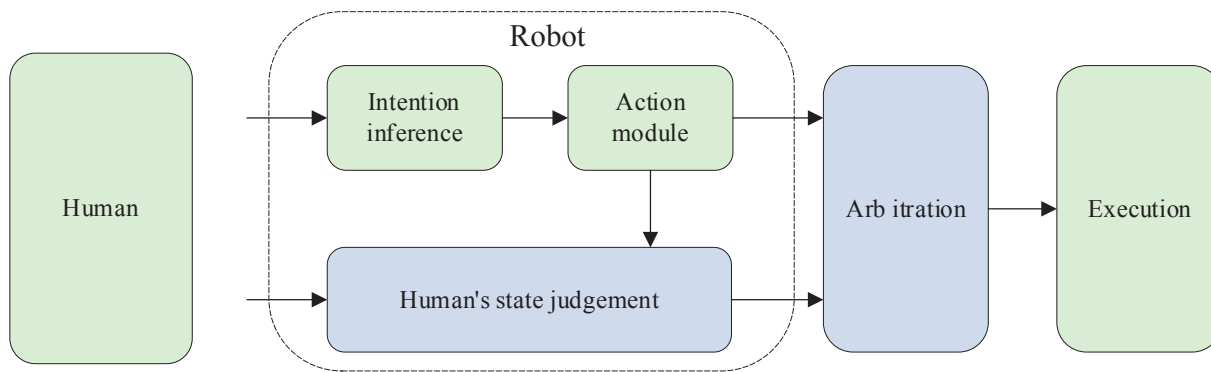

(2) It is necessary to develop, in particular, piano art competitions mainly for non-musical social citizens. The competition should concentrate on improving the piano art level and enhancing the love of piano art among social people of different levels, ages, interests and hobbies, tapping the musical potential of social people through piano performance and appreciation, cultivating their comprehensive quality in piano, and giving social people, especially non-professional social people, a clearer understanding of the art of brass piano.

(3) Need to improve the piano teaching content and piano teaching methods for social workers. For the physiological and psychological characteristics of social personnel, piano lessons that can trigger their interest should be offered. Therefore, it is necessary to focus on the study of the psycho-physiological characteristics of social workers. To find out the content and methods of piano teaching that can adapt to the characteristics of social workers of specific ages and levels, especially to pay attention to the interest of social workers in piano and the cultivation of corresponding piano ability.

### **3. POPULARIZATION OF PIANO ART BASED ON HUMAN-COMPUTER SHARING**

#### **3.1. HUMAN-MACHINE SHARED AUTONOMY**

Many control tasks are difficult for machines due to the partial observability of the environment and the imprecision of system parameters, while it is also difficult for humans to accomplish some human-machine systems alone due to their limited rationality and physical limitations (e.g., lack of multidimensional control capabilities) Some human-machine systems solve such problems by combining human decisions and machine decisions, and refer to this model as human-machine shared autonomy. The human-machine sharing under part-time effective human decision making is shown in Figure 2. The action selection module calculates the adaptive weights for arbitrating human-machine decision making and determines the decision to be made when shared control is taken, the human decision effectiveness judgment module is used to determine whether the human decision is invalid and whether it needs to be switched from shared control of the human and machine to separate control of the machine, and the arbitration module decides the final execution of the controlled system based on all the above information action. The blue area, i.e., the validity judgment module of the human decision and the arbitration module, is the main contribution of the human-machine shared

**Figure 2.** Human-Machine Sharing under Part-Time Effective Human Decision Making

### 3.2. INTRODUCING INTELLIGENT PIANOS TO IMPROVE TEACHING QUALITY

At present, artificially intelligent piano technology is gradually maturing, so music teachers need to introduce artificially intelligent pianos in the classroom according to the teaching content and the basic state of the students, which can have an auxiliary effect on classroom teaching, teachers can mobilize students' learning enthusiasm when using artificially intelligent pianos, and both teachers and students should actively participate in the piano teaching and acting practice process. The teacher needs to act as a supervisor and guide when the students are using the relevant intelligent piano, and can solve the students' problems in the first place when they have problems in learning. Therefore, the premise of introducing intelligent pianos into the classroom among music classroom teaching requires that music teachers first take a basic use course for students to be able to guide them in learning artificial intelligence sex technology products. For example, one of the most important elements of piano teaching in colleges and universities is the teaching of rhythm. In the traditional general music classroom teaching, students tend to improve their sense of rhythm by repeating the exercises many times, but this is less efficient. However, when using artificial intelligence piano, students are able to practice rhythm in different ways through software facilities with the help of artificial intelligence technology, which can effectively improve the teaching efficiency and can use the intelligent piano to achieve the intended music teaching goals.

### 4. CONCLUSION

In the context of the era of human-computer sharing, the content of popular teaching of classical piano art needs to keep pace with the times. In education, it responds to the educational development needs of the era of talent training, plays a pedagogical role in the direction of classroom teaching, and improves the quality of design education and promotes the reform and innovation of the system of design piano art popularization education.

## ABSTRACT

This paper combines big data technology, analyzes the research of coupling innovation of Civic Education and labor education under the vision of big data analysis, the important role of labor education in promoting the formation of values of Civic Education, the cultivation of Civic spirit and Civic consciousness, and the improvement of Civic skills in colleges and universities, and the labor skills in the era of artificial intelligence to realize the combination of physical and mental labor. And targeted to put forward the value and strategy of integrating labor education into Civic Education in the new era, so as to have a positive impact and cultivate socialist builders and successors with comprehensive development of moral, intellectual, physical, social and aesthetic skills.

## KEYWORDS

Civic education; Labor education; Coupling innovation; Teaching strategy; Value

## 1. INTRODUCTION

In the era of artificial intelligence, higher vocational labor education keeps an open attitude, pays attention to the changing labor forms, closely combines with social and economic development, and is given a new definition of connotation [1]. Labor education is an important part of socialist education system, and the purpose of labor education in colleges and universities is to cultivate students' labor quality, habits and spirit, lead them into labor practice, cultivate their spirit of hard work and hardship, take effective measures to strengthen labor education, and incorporate labor education into the whole process of student education and talent training [2-3]. Civic education in colleges and universities is an important carrier for students to grow and become successful and develop their habits [4]. Promoting the integration of labor education and teaching of Civics and Political Science is the focus of implementing the task of moral education in colleges and universities can manifest the contemporary value of labor education [5].

The literature [6] examines the history, content, and educational philosophy of the adult and labor education movement in Sweden. The authors review the movement's origins, development, and influence, and analyze its curriculum, teaching methods, and educational goals. The study aims to provide references and insights for adult and labor education in other countries and regions by understanding the history and experiences of the adult and labor education movement in Sweden. The literature [7] investigated the management mechanism of university ideological and political education in an international educational cooperation model. The authors discussed the challenges and opportunities facing university ideological

and political education in the context of internationalization and analyzed the current problems and shortcomings in the management of university ideological and political education. The study aims to propose a more effective and adaptive management mechanism of university ideological and political education in order to strengthen the ideological and political education and international exchange ability of university students. The literature [8] analyzed the influence of the marriage market on individuals' education and labor supply decisions, and explored the influence of factors such as the ratio of the number of men and women in the marriage market and the income gap on individuals' education and labor choices. The study aims to gain insight into the link between the marriage market and the labor market, and provide useful references and suggestions for individuals' education and career development.

## **2. RESEARCH ON COUPLING INNOVATION OF CIVIC EDUCATION AND LABOR EDUCATION UNDER THE PERSPECTIVE OF BIG DATA ANALYSIS**

### **2.1. THE IMPORTANT ROLE OF LABOR EDUCATION IN ADVANCING CIVIC EDUCATION IN COLLEGES AND UNIVERSITIES**

Civic education coupled with labor education and combined with course content has an important influence on college students to establish correct labor values, and labor education applied to college Civic Education is shown in Figure 1.

(1) To improve the comprehensive quality of college students in labor exercise, so as to promote the overall development of college students in labor education. In building the curriculum system of colleges and universities, the construction of the curriculum can be led by the curriculum thinking and politics, which can effectively combine theory and practice, and realize labor education in the curriculum practice while cultivating both moral and technical skills, so as to have a positive impact and cultivate moral, intellectual, physical, aesthetic and social development. In the construction of the curriculum system of colleges and universities, the construction of the curriculum is led by the curriculum thinking politics.

(2) In the construction of professional courses, the university curriculum Civics always insists on running through the concept of moral education, takes professional practicality as the entrance, takes labor education as the carrier to implicitly cultivate the labor spirit and labor consciousness of university students in professional courses, couples the labor practice in professional courses effectively with the four education of moral, intellectual, physical and aesthetic, and truly cultivates the new era workers with comprehensive development.

(3) The coupling of Civic Education and Labor Education in colleges and universities in the era of artificial intelligence can make students understand the social division of labor scientifically and establish the concept of labor equality. Improve students' labor skills to serve the needs of social and economic development. Labor skills in the era of artificial intelligence realize the combination of physical and mental labor. In the process of solving the cross-border work problems and contradictions brought about by the era of artificial intelligence, the labor work and methods in the era of artificial intelligence are used to encourage students to actively innovate and start their own businesses and spontaneously participate in the construction of socialism with Chinese characteristics in the new era.

**Figure 1.** Labor Education Applied to Civic Education in Universities

## 2.2. RESEARCH ON COUPLING INNOVATION OF CIVIC EDUCATION AND LABOR EDUCATION IN UNIVERSITIES

In the personnel training program of digital media technology in Guangxi National Vocational College, the coupling of civic education and labor education its body curriculum is shown in Table 1. In the process of combining college Civic Education with practical courses, the digital media technology major has been emphasizing on enhancing the practical ability of digital media professional college students as the core construction goal of the major, holding tightly to the Civic attitude and Civic skills education into the professional course experiments and professional comprehensive practical courses, motivating students to participate in various types of digital media technology professional class competitions at all levels with professional ideals, strictly requiring students with professional norms in the three-year In the process of study, students are strictly required to obtain certificates related to digital media technology, cultivate the spirit of thinking and politics in the training conducted by the school-enterprise cooperation, and enhance the sense of professional responsibility through job shadowing practice in enterprises and institutions related to the profession.

**Table 1.** Civic education and labor education integration of its body curriculum

Course Name	Opening semester	Course Nature
Civic Education	Semester 1, 2, 3, 4	Required public course
Design Composition	Second Semester	Professional Foundation Courses
Digital Graphic Design	Third semester	Professional Foundation Courses
Web Design and Production	Third semester	Professional Foundation Courses
Information Layout Design	Fourth semester	Professional Foundation Courses
3D model and material	trimester	Professional Core Courses
Non-linear editing	3rd semester	Professional Core Courses
Web special effects production	4th semester	Professional Elective Courses
Stereoscopic Creative Composition	Fifth semester	Professional Elective Courses

## 3. RESEARCH ON THE INTEGRATION OF LABOR EDUCATION INTO THE CIVIC EDUCATION OF COLLEGES AND UNIVERSITIES IN THE NEW ERA

### 3.1. THE VALUE OF INTEGRATING LABOR EDUCATION INTO THE TEACHING OF CIVICS IN COLLEGES AND UNIVERSITIES

The coupling of labor education and the teaching of Civics is an important carrier for students to grow and develop their talents and habits, and promoting the coupling of labor education and the teaching of Civics is a focus point for colleges and universities to implement the task of establishing moral education can highlight the contemporary value of labor education, and the value of integrating labor education into the Civics class of colleges and universities is reflected as shown in Figure 2.

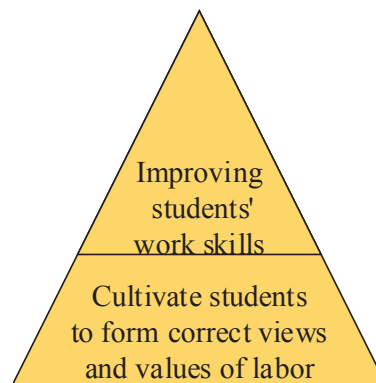

(1) Cultivate students to form correct concept and value of labor

Strengthening labor education can cultivate students to form correct labor concept and value, which is the proper meaning of moral education in colleges and universities. The coupling of labor education and teaching of Civics can make students further establish labor consciousness and enhance labor concept. (2) To improve students' labor skills

(2) Improving students' labor skills

Labor education has significant practical properties, and its organizational activities include not only theoretical lectures and theoretical analysis, but also planned and purposeful practical activities, which allow students to get exercise and improve their labor skills in production labor.

**Figure 2.** The value of integrating labor education into college Civics courses

### **3.2. STRATEGIES FOR INTEGRATING LABOR EDUCATION INTO TEACHING CIVICS IN THE NEW ERA**

To promote the integration of labor education into the teaching of Civics and Political Science class, we must respect the law of education, make efforts in “integration mechanism”, “education system” and “education content”, and consciously explore the synergistic path of labor education and Civics and Political Science class teaching, but in the practice of labor education, colleges and universities still face many problems, which seriously affect the effect of labor education, and propose the strategy of integrating labor education into Civics and Political Science class teaching in the new era as shown in Figure 3.

(1) Establishing the concept of labor

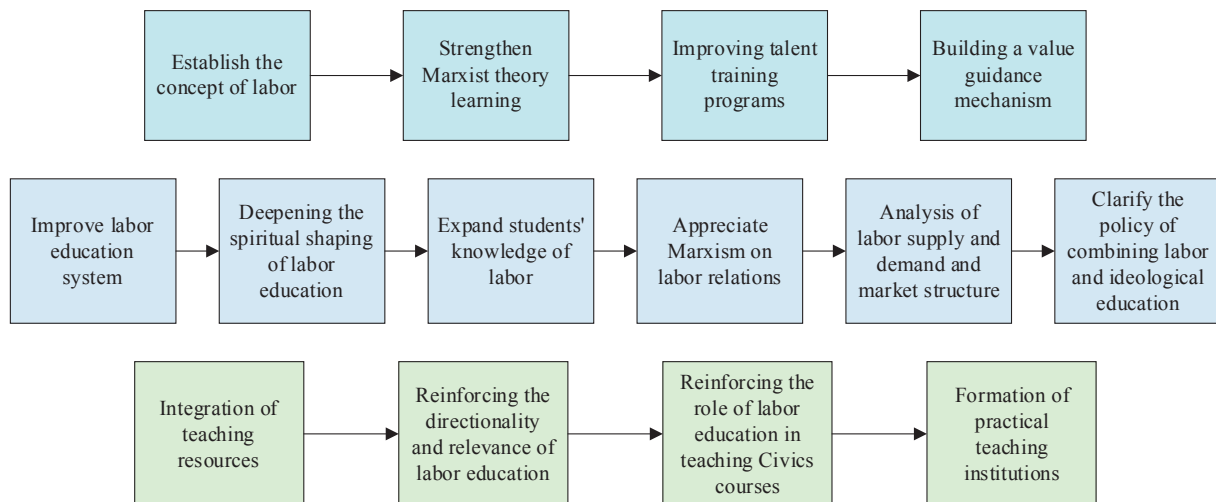

Only by continuously strengthening the study of Marxist theory and Xi Jinping’s socialist thought of the new era can college students appreciate the meaning of “labor creates value” and “labor creates itself”. Only by continuously strengthening the study of Marxist theory and the socialist ideology of Chinese characteristics in the new era of Xi Ping can college students appreciate the connotation of “labor creates value” and “labor creates itself” and truly understand the practical significance and value of labor education.

(2) Improving labor education system

In the context of the new era, to strengthen labor education, it is necessary to combine the development rules of college students in the new era and the development trend of social labor, and to carry out or design labor education activities through teaching methods such as heuristic inquiry, thematic, and seminar, so as to build a scientific and reasonable education system. In the teaching of Civics and Political Science, teachers should correct students’ cognitive deviations in labor dynamics, labor concepts and labor emotions from the perspective of value identity and emotional identity, lead students to form correct and healthy labor values, and deepen the spiritual shaping and moral guidance of labor education.

### (3) Integration of teaching resources

Although labor education and practical teaching of Civics and Political Science are consistent, it is necessary to take practical teaching resources as the “foundation” of their integration. Only through “resource interchange” and “resource sharing” can colleges and universities realize the organic integration of labor education and Civics class teaching, better play the role of labor education in Civics class teaching, build labor spirit education resources, and strengthen the directionality and target of labor education. In the background of the new era, colleges and universities should actively organize academic exchanges, forums and lectures to promote the spirit of craftsmen and model workers, so as to make students feel the power of role models and make labor spirit become a source of motivation for students’ professional development and academic growth.

**Figure 3.** Strategies for integrating labor education into teaching Civics in the new era

## 4. CONCLUSION

Driven by the integration of new media technology in the era of artificial intelligence, the digital media technology major continues to innovate, develop and improve the quality of talent training. Driven by the whole staff and whole process of education in curriculum thinking and politics, labor education is effectively integrated into the development of moral, intellectual, physical and aesthetic education of professional courses, which has an important role in cultivating well-rounded socialist builders and successors.

---

## ABSTRACT

As a typical resource province and a key node in the “Belt and Road” initiative, Gansu faces the difficult task of green development and ecological protection. This paper firstly constructs the DEA model of non-expected output based on the data of each prefecture-level city in Gansu from 2008 to 2019, and determines the index system of green economy development efficiency. The results show that government support, tourism development level and energy consumption level play a suppressive role on green economic development efficiency in Xinjiang, and average education level and foreign trade level play a promotional role on green economic development efficiency. This study enriches the green development program in Gansu and has important theoretical guidance.

## KEYWORDS

DEA model; Empirical analysis; Indicator system; Green economy; Development efficiency

## 1. INTRODUCTION

Especially, as sustainable development has received more and more attention from countries around the world, the green economic development model guided by the concept of sustainable development has become a global focus [1]. How to achieve sustainable economic development while improving and protecting the natural environment has become a development challenge for all countries, especially for China, the challenge is even more severe [2]. Although China is a vast country, it has a large population, a serious shortage of resources per capita, a large amount of development resources depend on imports, and a large area of the central and western regions are ecologically fragile and face a serious situation of ecosystem imbalance [3-4]. Therefore, for China, vigorously developing green economy is the inevitable choice for China's economic development, and it is the necessary way to take sustainable development [5]. Scientific assessment of regional green economy development efficiency is not only beneficial to the environmental protection supervision of green economy, but also conducive to the development of differentiated energy conservation and emission reduction policies, which is of great theoretical and practical significance to make the green economy bigger and stronger [6-7].

The authors of the literature [8] studied the concept and importance of green real estate and analyzed the challenges and opportunities faced in the development of green real estate in China. The study aims to promote innovation and sustainability in the development of green real estate in China, and to provide reference and suggestions for the government and related organizations in making decisions. The authors of the literature [9] studied the concept and significance of green economy and analyzed the problems and challenges in green economy

development. The study aims to measure the development capability and effectiveness of the green economy by establishing a sustainable development evaluation system, and provide a scientific basis for the government to formulate relevant policies and measures. The authors of the literature [10] studied the concept and application of industrial Internet of Things and analyzed the prospects of its application in the food industry. The study aims to explore the green development model and the application of industrial IoT technology in the food industry.

## 2. GREEN ECONOMIC DEVELOPMENT EFFICIENCY IMPACT INDEX SYSTEM BASED ON OPTIMIZATION DEA MODEL

### 2.1. OPTIMIZATION OF DEA MODEL

The DEA model for non-expected output was calculated as:

$$\rho^* = \min \frac{1 - \frac{1}{m} \sum_{i=1}^m \frac{s_1^-}{x_{i0}}}{1 + \frac{1}{s_1 + s_2} \left( \sum_{r=1}^{s_1} \frac{s_r^g}{y_{r0}^g} + \sum_{r=1}^{s_2} \frac{s_r^b}{y_{r0}^b} \right)} \begin{cases} x_0 = X\lambda + s^- \\ y_0^g = Y^g\lambda - s^g \\ y_0^b = Y^b\lambda + s^b \\ s^- \geq 0, s^g \geq 0, s^b \geq 0, \lambda \geq 0 \end{cases} \quad (1)$$

The global Moran index expression is shown in equation (2):

$$I = \frac{n \sum_{i=1}^n \sum_{j=1}^n \omega_{ij} (x_i - \bar{x})(x_j - \bar{x})}{n \sum_{i=1}^n \sum_{j=1}^n \omega_{ij} (x_i - \bar{x})^2} \quad (2)$$

The spatial autocorrelation was tested for significance using the standardized statistic  $Z(I)$  with the test formula shown in equation (3):

$$Z(I) = \frac{I - E(I)}{\sqrt{VAR(I)}} \quad (3)$$

Where,  $E(I)$  and  $VAR(I)$  are the expected and variance values of the global Moran index.

The local Moran index is used to do local spatial autocorrelation analysis, which is used to reflect the connection between a region and its surrounding areas, and to analyze whether there is local spatial agglomeration and the magnitude of the degree of association and other related spatial issues, and the local Moran index expression is shown in Equation (4):

$$I_i = \frac{x_i - \bar{x}}{S^2} \sum_{j=1}^n \omega_{ij} (x_j - \bar{x}) \quad (4)$$

### 2.2. GREEN ECONOMIC DEVELOPMENT EFFICIENCY MEASUREMENT INDEX SYSTEM

By comparing the efficiency of green economic development between cities and towns in Gansu, it is found that there is a big difference in the level and trend of green economic development efficiency in each region, and the indicator study affects the level of green development in Gansu with the indicator system shown in Table 1.

**Table 1.** Ideological and political education and labor education

Type	Indicator Name	Indicator Symbols
Indicator System	Government Support	X1
	Economic Development Level	X2
	Current status of industrial structure	X3
	Tourism development level	X4
	Average education level	X5
	Foreign trade level	X6
	Energy consumption level	X7

### 3. EMPIRICAL ANALYSIS OF THE FACTORS INFLUENCING THE EFFICIENCY OF GREEN ECONOMIC DEVELOPMENT

#### 3.1. DESCRIPTIVE STATISTICS

By collating the data of seven influencing factors indicators of green economic development efficiency in Gansu from 2008-2019, the results of descriptive statistics are shown in Table 2.

**Table 2.** Statistical description of impact factor indicators for 2008-2019

Indicator Name	AVG	Max	Min	SD
Government Support	0.3938	1.4242	0.0251	0.3188
Economic Development Level	4.4434	18.8856	0.3927	3.4327
Current status of industrial structure	0.0527	1.1234	-2.1504	0.2433
Tourism development level	0.0842	0.7825	0.0000	0.1078
Average education level	0.1584	0.3818	0.1016	0.0392
Foreign trade level	0.1898	1.7048	0.0004	0.2553
Energy consumption level	1.2341	5.0076	0.0973	1.1474

#### 3.2. CORRELATION ANALYSIS

Before regressing the panel data, correlation analysis and correlation significance test of each explanatory variable are needed to test the closeness of each variable and avoid the problem of multicollinearity among variables. The results of correlation analysis of green economic development efficiency are shown in Figure 1. The correlation analysis results show that although the correlation between two variables is significant, the correlation coefficients between the explanatory variables are small, and the absolute value of the coefficients does not exceed 0.5, which indicates that the possibility of causing multiple cointegration problems among the explanatory variables is not significant.

**Figure 1.** Results of Green Economy Development Efficiency Correlation Analysis

### 3.3. REGRESSION ANALYSIS

The results of regression analysis were carried out as shown in Table 3.

(1) From Gansu as a whole, there is a negative correlation between the proportion of general government budget expenditure, the proportion of tourism income, energy consumption per unit of GDP and green economic development efficiency, while the proportion of school students, the proportion of total import and export and green economic development efficiency values are positively correlated.

(2) From the regional perspective, the green economic development efficiency value of Longbei region is significantly and positively correlated with the proportion of school students and significantly and negatively correlated with energy consumption per unit of GDP. There is a significant negative correlation between the ratio of broad government budget output and income and expenditure to energy consumption per unit of GDP, and the share of total import and export.

**Table 3.** Regression analysis of factors influencing the efficiency of green economy development

#### 4. CONCLUSION

In this paper, we read a large number of references, collected a large amount of data, and established a model of optimized DEA to study the factors influencing the efficiency of overall and regional green economic development in Gansu. The efficiency value of green economy development in Xinjiang is significantly and positively correlated with the percentage of school students and the percentage of total import and export, the percentage of tourism income, and the energy consumption per unit of GDP. In the future development, we will not only consider the economic growth, but also pay attention to the protection of the environment, so that the economy, environment and society can develop in a coordinated way, and promote the improvement of the efficiency of green economic development in Gansu and even in the whole country.

## ABSTRACT

The construction of parking facilities lags far behind the growth rate of automobiles, resulting in a huge gap between the supply and demand of parking spaces and making parking difficult to become another problem in the development of urban road traffic. Intelligent parking guidance system is proposed, which is mainly composed of functional modules and database. The cell phone client provides users with real-time traffic flow path planning, parking lot navigation, parking space data update, parking space navigation, reverse car finding and other functions, realizing an intelligent parking guidance system integrating indoor and outdoor. Finally, simulation tests are conducted to verify the feasibility and stability of the intelligent parking guidance system functions. This study can provide numerous experiences and references for many researchers, and it is also hoped that the design can be proposed to continuously optimize the design of parking lots in China, so that many people can alleviate the burden of difficult parking.

## KEYWORDS

Intelligent parking; Guidance system; Real-time traffic flow; Parking space data update

## 1. INTRODUCTION

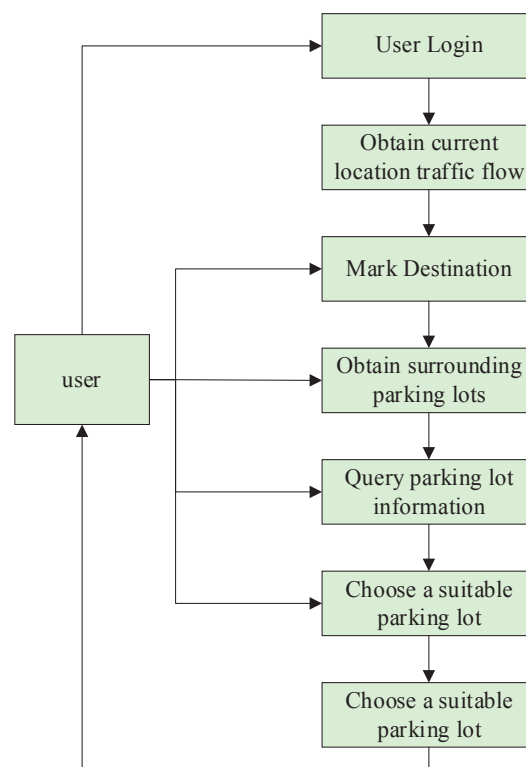

Currently, China's urban motor vehicle holdings are increasing and so is the demand for parking spaces [1]. Due to various reasons, insufficient attention has long been paid to the urban parking problem, making it increasingly prominent after accelerated urbanization and a key factor in the urban traffic congestion problem [2-3]. In addition to the restrained regulation of urban parking management problems at the level of policies and regulations, it is also gradually recognized that in the absence of the possibility of rapid large-scale expansion of parking facilities, advanced parking information management systems need to be established using information technology to alleviate the current parking problems [4-5]. Through some practice of parking management in developed countries, it is proved that the establishment of urban parking information management system, reasonable distribution of traffic flow and giving full play to the existing road network capacity can organize urban traffic scientifically, effectively solve the problem of urban parking difficulties and improve the level of urban parking management [6-7].

The authors of the literature [8] studied the severity of urban parking problems and the limitations of existing solutions, and proposed an urban parking guidance system based on deep data mining techniques. The study aims to improve the accuracy and efficiency of urban parking guidance system through limited perception and deep data mining techniques, and provide a more intelligent and convenient solution for urban parking management. The authors of the literature [9] studied the concept and application of intelligent parking information systems and analyzed their impact on drivers and urban traffic management. The study aims to inform and advise the government and related agencies for decision making by evaluating the benefits drivers get from smart parking information systems, while contributing to the realization of smart cities and sustainable development. The authors of the literature [10] studied the concept and application of smart parking system and discussed in detail the role and application of wireless modules in this system. The study aims to improve the efficiency and reliability of the smart parking system by using modern technologies such as wireless modules to provide a more intelligent and convenient solution for urban traffic management.

## 2. RESEARCH ON REAL-TIME TRAFFIC FLOW PATH PLANNING AND PARKING SPACE DATA UPDATE

### 2.1. REAL-TIME TRAFFIC FLOW PATH PLANNING

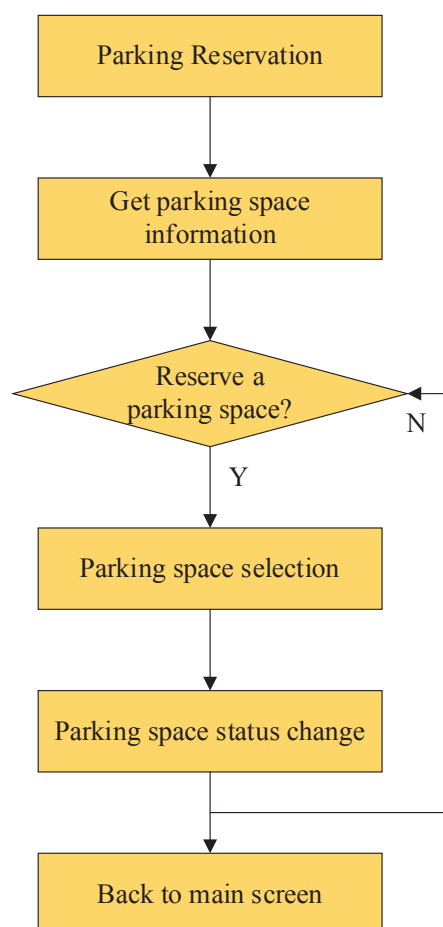

The real-time traffic flow path planning module is used to display real-time traffic flow and locate to the current location, and get the parking information and real-time traffic flow around the current location or the specified destination on the map. The logic of real-time traffic flow path planning function is shown in Figure 1. The secondary development is realized on the external interface of Gaode Map navigation. Download the SDK of Gaode Map, put the relevant files into the corresponding location, and in the layout file, add the layout control of Gaode Map for the secondary development of the relevant functions on Gaode Map. Gaode Map and Android smartphones provide users with GPS positioning, electronic maps and other functions. Using these functions, the main interface of the system client is selected to view the real-time traffic flow around the destination, as well as the optimal path planning to reach the parking lot.

**Figure 1.** Real time vehicle flow path planning functional logic

## 2.2. CAR PARKING DATA UPDATE

The function of the parking space data update module is to facilitate the parking user to get the specific parking space information, and then can choose a free parking space for the scheduled parking function, this function is mainly to solve the parking guidance process, the possibility of changes in the status of the parking space, to prevent the parking user after layers of guidance to reach the parking space, the parking space has been parked phenomenon. Parking data update logic function diagram as shown in Figure 2, parking users can drive into the parking lot to obtain the overall information of the current parking lot, set the parking interface inside the four components TextView components indicate the parking lot, the location of the parking lot, the number of parking spaces remaining in the parking lot and parking fee information. The parking user can select the appropriate parking lot and view the empty parking space. The physical structure is given in the form of a floor plan, which gives the approximate parking situation of the parking lot. Then it is refined to select the preferred parking space for reservation or direct parking function.

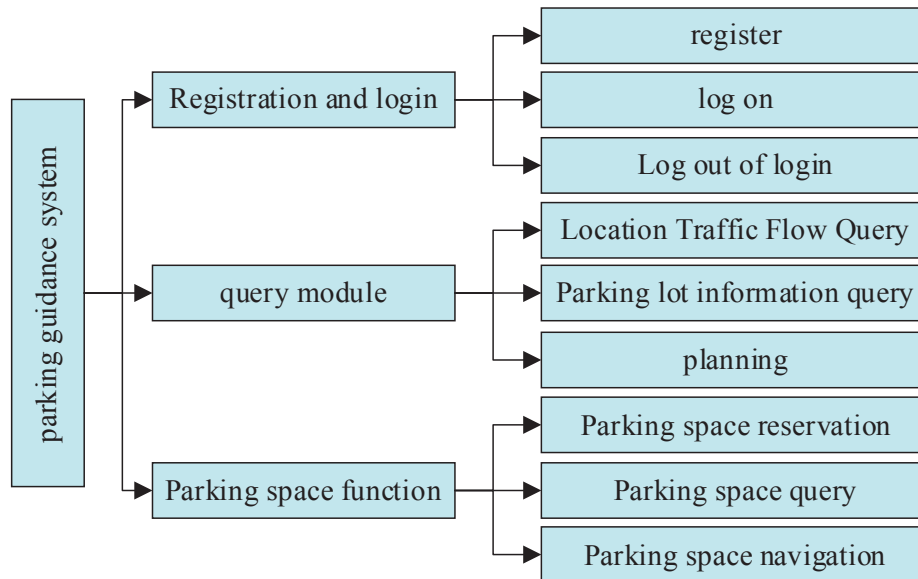

**Figure 2.** Parking space data update logic function

## 3. INTELLIGENT PARKING GUIDANCE SYSTEM DESIGN RESEARCH

### 3.1. SYSTEM FUNCTIONAL MODULE DESIGN

Through the previous analysis of the parking guidance system requirements, the functional requirements of the system are clarified, and the system mainly solves several key problems encountered by users in the parking process: First, users can obtain the current positioning and the surrounding parking information through the system, including the fee, the number of remaining parking spaces and other information, and can position the user to carry out parking lot navigation functions. Secondly, users can view the specific parking information and reserve parking spaces after selecting a parking lot. Third, the user can obtain the current indoor

location after selecting a parking space, and provide the user with the path planning and navigation to the specific parking space. Fourth, users can quickly find their cars through the reverse car search function, and fifth, users can self-service in the process of querying parking lots, reserving parking spaces, and navigating parking spaces. Based on the analysis of the above requirements, the functional design of the intelligent parking guidance system based on Android platform is obtained as shown in Figure 3.

**Figure 3.** Functional Design of Intelligent Parking Guidance System on Android Platform

### 3.2. DATABASE STORAGE MODULE DESIGN

Database module is mainly to achieve the storage of system data, the system is through the MySQL database for data storage, mainly because MySQL database occupies less memory, free and open source and easy to use, suitable for small and medium-sized enterprise system development of data storage. The functions of the whole intelligent parking guidance system should be fully open to the manager, so that the manager can update the parking information more conveniently and timely to achieve more effective parking space guidance for the client users.

### 3.3. INTELLIGENT PARKING GUIDANCE SYSTEM TESTING

The system test is mainly for the parking management platform and cell phone client. The test uses Navicat tool to manually input relevant data into MySgl database to verify the relevant functions of the parking management platform and cell phone client, and the test environment is shown in Table 1.

**Table 1.** Intelligent parking guidance system testing

type	model
CPU	Intel Skylake Xeon Platinum 8163 25GHz 4 pit
Memory	16GB
operating system	Window7 32 position
database	MYSQL 5.7
development tool	Notepad, GCC

After successful login, it enters the main interface of the system. The main interface shows the simple attempt of parking lot and the usage of parking resources, and the administrator switches between the main interface, user information management interface, parking space

information management interface, parking lot information interface and user parking record inquiry interface through buttons to view, inquire and modify the corresponding information. The test process is as follows:

(1) Enter a user name in the search box of the user information interface and check the search results

(2) Delete a parking space in the parking information management interface, and check the results displayed on the interface

(3) Enter a parking space number in the parking record management interface to view the parking record information.

The mobile client provides users with parking space guidance and information viewing services. Users can enter the main interface of the service by entering their account number and password on the login screen, and perform corresponding services by clicking the corresponding buttons. The testing process of the mobile client is as follows:

(1) Login to the system with the registered account and password to enter the main interface of the client service.

(2) Click Personal Center in the service main interface to view personal information display.

(3) Go back to the main interface, click Parking Information View, and check the parking information display.

(4) Back to the main interface, click the parking space guide button, select the walking exit and parking lot entrance in the parking space allocation interface, and then click OK to view the parking space guide path display.

#### **4. CONCLUSION**

The design of the intelligent parking guidance system improves the security and operational efficiency of the parking lot, the implementation of the system effectively reduces the burden of the staff, and also reduces the burden of the driver, and can meet the requirements of various large and small parking lots, in the future development process, the system must be able to be better promoted, the current design has a strong reference value and practical value, also has a strong social significance, in the future, I hope the system can be applied to various parking lots, so as to better meet the needs of the people.

## ABSTRACT

In this paper, we firstly determine the communication nodes based on DLAPGF algorithm and use the improved interactive information feedback to obtain the information of communication nodes, then propose the performance gain factor based on the final completion time of communication nodes, and use the task exchange and task migration operation to realize the dynamic adjustment strategy based on the gain factor, which improves the node priority, then the load dynamic balancing DLAPGF algorithm is analyzed. The results show that the distribution of the final NLCT is still relatively concentrated when there are working nodes joining and exiting, which indicates that DLAPGF can make good handling of the load dynamic balancing of communication traffic.

## KEYWORDS

DLAPGF algorithm, Gain factor; Dynamic load balancing; Node priority

## 1. INTRODUCTION

With the continuous improvement of computer performance and the development of high-speed computer networks, distributed systems have a powerful computing capability, and an excellent load-balancing strategy is necessary to make reasonable use of this capability [1]. Load balancing is one of the core problems to be solved by distributed systems and has significant theoretical and practical significance [2]. As the system operates, certain nodes are assigned many tasks while others have relatively few tasks, producing a system load imbalance [3-4]. The goal of load balancing is to rationally and transparently redistribute the system load among the nodes to achieve the optimal overall system performance [5].

The authors of literature [6] studied the concept and application of dynamic planning, and analyzed how to balance the economic interests of network operators and energy interests of

mobile users in dynamic planning, to achieve energy efficiency balance between network operators and mobile users, and to provide technical support and guarantee for sustainable development. The authors of literature [7] studied the concept and application of multi-core embedded systems and analyzed how to achieve dynamic application allocation and resource balancing in multi-core embedded systems to achieve resource balancing and dynamic application allocation in multi-core embedded systems to improve the performance and efficiency of the system. The authors of the literature [8] studied the concept and application of dynamic load balancing and proposed a heuristic technique to achieve the goal of improving energy efficiency in the presence of dynamic load balancing, which aims to achieve a balance between dynamic load balancing and energy efficiency by designing suitable algorithms and strategies.

## 2. NODE PRIORITY-BASED DYNAMIC LOAD BALANCING DLAPGF ALGORITHM

### 2.1. LOAD BALANCING OBJECTIVES

Most studies do not consider the tasks that need to process data, so the communication overhead of transmitting data is not addressed, and very few studies address job migration costs. Most of them consider that the ideal state of the system is to distribute the tasks equally according to the computational capacity of each working node, then the most ideal load for

each working node  $i$  is  $deservedLoad_i = A * i, I, A = \frac{\sum_{i=0}^{n-1} i,load}{\sum_{j=0}^{n-1} j, I}$ ,  $A$  the load of the

computational capacity and when  $i,load > (1 + \varepsilon_1) * deservedLoad_i$ , this working node will be a heavy load node and when  $i,load < (1 - \varepsilon_2) * deservedLoad_i$  this working node will be called a light load node. Their final goal so that each node can obtain a load of  $deservedLoad_i$ , considering node priority and error, minimizing  $|deservedLoad_i - i,load|$  as the goal of the load balancing problem. Since the tasks involve purely computational tasks and tasks that require data processing, the uncertainty of the nodes where the data to be read by the same tasks that require data processing makes this balancing objective not applicable to the environment mentioned in this paper. The final completion time of all tasks of each working node has been mentioned in the task allocation process as the sum of the computation time of all tasks assigned to it, the transmission time of data, the transmission time of the last task result and the local time of the working node, i.e:

$$NLCT = \sum CT + TT_{data} + TT_{result} + LT \quad (1)$$

Minimizing  $NLCT$  as much as possible can improve the performance of communication traffic. Since the existence of errors does not guarantee the absolute minimum of  $NLCT$  and the absolute equality of all  $NLCT$ , the communication traffic load balancing algorithm can be achieved by minimizing the variance of  $\max(NLCT)$  and  $NLCT$ , which is expressed as

$$s^2 = \frac{1}{n} * \sum_{i=0}^{n-1} (\overline{NLCT} - NLCT_i)^2 \quad (2)$$

It is difficult to obtain the minimum value of  $s^2$  in practice, and obtaining non-minimum  $s^2$  does not necessarily guarantee the balance between working nodes  $NLCT$ , while it is easier to understand the load balance condition between working nodes by calculating the distribution

of each  $NLCT$ . Therefore, the concentration of  $NLCT$  distribution is used as a judgment of the load balance between working nodes.

## 2.2. PERFORMANCE GAIN FACTOR

Whether making task migration operation, or task exchange operation, will cause some communication cost, all comprehensive consideration of communication node priority and other issues, through the calculation to determine whether there is a performance gain before the corresponding operation, this paper will be the gain value is called the performance gain factor.

The final completion time  $NLCT_j$  from the start of the transmission of task  $t_i$  at information collection node  $i$  to the completion of task  $t_i$  at work node  $j$  that receives task  $t_i$  cannot exceed the final completion time  $NLCT_i'$  when node  $i$  does not migrate task  $t_i$ , i.e:

$$NLCT_j < NLCT_i' \quad (3)$$

$$NLCT_j = CT_{ij} + TT_{kj} + (NLCT_j' > (LT_j + TT_{ij}) ? NLCT_j' : (LT_j + TT_{ij})) \quad (4)$$

## 2.3. DYNAMIC BALANCING OPERATION

Assuming that working node  $i$  satisfies the start condition of load balancing operation, it will get the information of partner nodes according to the acquisition method of task exchange operation and store it in  $S$ . Then it will achieve dynamic balancing according to the communication load gain factor.

### (1) Task exchange operation

Work node  $i$  first fetches the tasks in task list  $L$  that need to process data and they satisfy that the data to be read is on a work node in  $S$ . Then, the tasks that need to process data on these worker nodes are found, and they also need to satisfy that the data to be read is located on worker node  $i$ . Finally, swap operations are performed on these tasks according to whether they satisfy the performance gain factor or not. That is, the tasks whose data to be processed are on the corresponding work nodes are selected for the task swapping operation. If there are multiple tasks that can be swapped with a single task, then the one with the largest performance gain factor is selected for swapping.

### (2) Task migration operation

For the task migration operation, it only involves sending tasks from work node  $i$  to a work node  $NCLT$  smaller than itself. This is not considering the task that needs to process data that satisfies the following condition, which reads data located on work node  $i$ , i.e. both task and data are on work node  $i$ .

## 3. COMMUNICATION TRAFFIC LOAD DYNAMIC BALANCE EMPIRICAL ANALYSIS

### 3.1. EXPERIMENTAL ENVIRONMENT

This chapter presents a simulation implementation of the algorithm execution process on a PC using JAVA language. The homogeneous system is no longer verified in the simulation process, and the heterogeneous system is directly considered, including the heterogeneity of the working nodes and the heterogeneity of the network, i.e., the computational capacity of each working node varies, and the network bandwidth and delay at each standard network distance also vary. The main parameters used in the simulation include the working node parameters, task parameters and network parameters, and the working node parameters are

shown in Table 1 and the task parameters are shown in Table 2.

**Table 1.** Work node parameter table

Parameters	Description
$N$	Number of working nodes 300 working nodes
$C$	Maximum processing capacity, the time range for processing unit tasks is [0.2, 1], i.e., [1, 5] unit tasks per second
$\mu_1$	Strong node smell value, 0.9
$\mu_2$	Weak node queue value, 0.6
$tp$	The working nodes record the computational power with a period of 30s
$cn$	Each work node records the 5 most recent historical values of its own computational power setting the work node computational power history impact factor to 0.2
$\alpha$	Number of working nodes 300 working nodes
$\beta$	$\alpha + \beta = 1$ , Then the current impact factor of the computational power of the working node $\beta$ is 0.8

**Table 2.** Task Parameters

Parameters	Description
TN	Number of tasks to be assigned 1000
Task size	That is, the number of tasks per unit is included, assuming that the size varies in the range [50, 400].
Task td size	Assume that each task takes up the same space, 1MB
Task fn	Because of the data placement policy involved in the actual environment, a random approach is used here, i.e., a work node with id [0,N-1] is randomly selected
Task file	According to the normal distribution, $\mu = 100MB$ , $\alpha = 10MB$

### 3.2. PERFORMANCE INDICATORS

The balance between communication nodes refers to the difference in the completion time of each node for a set of submitted tasks, and the balance between communication nodes is analyzed by analyzing the distribution of each  $NLCT$ . If more  $NLCT$  are concentrated in a smaller range, it means that the load between working nodes is more balanced, and it is also considered that this load balancing algorithm is more efficient.

$$NLCT = \sum CT + TT_{data} + TT_{result} + LT \quad (5)$$

This includes the computation time for all tasks, the time to read the data, the time to transmit the results and the local time of the working node.

### 3.3. RESULTS AND ANALYSIS

Figure 1 depicts the effect of joining and withdrawing of communication nodes on the balance between each communication node. From the figure, it can be seen that the distribution of the final  $NLCT$  remains more concentrated in the presence of communication nodes joining and withdrawing, which can indicate a better balance between communication nodes. By observing the effects of communication node joining and withdrawing on the completion time of load dynamics balancing and system balancing, it can be seen that DLAPGF can make good handling of load dynamics balancing.

**Figure 1.** The effect of joining and dropping communication nodes on balance

#### 4. CONCLUSION

Along with the development of computer technology and network technology, the volume of data and services has been growing, promoting the development of distributed parallel computing. An important issue in distributed parallel computing is the load balancing problem. Based on the above problems, this paper proposes an efficient load balancing algorithm, which obtains information with high accuracy and low communication overhead, and fully considers the node priority problem. DLAPGF handles the dynamic load balancing of communication traffic, and the experimental results verify that DLAPGF can make good handling of load dynamic balancing.

## ABSTRACT

In this paper, the preparation of bimetallic composite blanks is studied by finite element simulation method. Then the focus is on the density distribution of carbon steel chips in the pressing process, and the density distribution map of carbon steel chips is obtained by numerical simulation of the pressing process, and the corresponding analysis is carried out. The results show that the distribution of carbon steel chip density in the embryo preparation is relatively uniform throughout the stainless steel shell, and the difference between the maximum and minimum density is only 0.003%. In the range of pressing force 0-45 kN, the relative density of carbon steel chips from the finite element simulation is greater than the actual experimental measured value, while after the pressing force is greater than 45 kN, the experimental measured value starts to be greater than the finite element simulation again, but the difference between them is not significant. Therefore, these findings provide a strong reference for further process optimization.

## KEYWORDS

Bimetallic composite blanks; Finite element analysis; Carbon steel chips; Process optimization; Stainless steel

## 1. INTRODUCTION

Bimetallic composite blanks are a composite structure composed of two different materials with the advantage of having different properties in different parts, and they are widely used in

many fields in manufacturing, such as aerospace, automotive, and energy [1-2]. Numerical simulation and process optimization play an important role in the preparation of bimetallic composite blanks [3]. Numerical simulation is a method of virtual simulation of the material preparation process using computer simulation techniques, which can predict and analyze key parameters such as forming behavior, mechanical properties and internal tissue evolution of bimetallic composite blanks [4-5]. Numerical simulations can help researchers to gain insight into the preparation mechanism of composite blanks, optimize the composition and structural design of the material, and improve the efficiency and quality of the preparation process [6].

In the literature [7], the forming process of stainless steel/carbon steel bimetallic composites was analyzed and predicted by numerical simulation methods. They developed a suitable numerical model using the finite element method to analyze and predict the forming process of stainless steel/carbon steel bimetallic composites by numerical simulation methods. Jia, Y et al. prepared 40Cr/Q345B bimetallic blanks using centrifugal casting technique and then studied the mechanical behavior and tissue evolution of 40Cr/ thermal deformation behavior of Q345B bimetallic blanks [8].

## 2. FINITE ELEMENT SIMULATION OF THE PREPARATION PROCESS OF BIMETALLIC COMPOSITE BLANKS

The process of preparing the rolled blanks, especially the effect of carbon steel chip pressing is one of the important factors affecting the composite effect of stainless steel/carbon steel chip core laminate, so it is necessary to study and analyze the pressing process. In this subsection, the finite element simulation was carried out with MARC software to analyze the density distribution of the pressed billet (carbon steel chip) inside the stainless steel tube. MARC software has a special window POWDER for powder material definition in the material properties definition column, and the MARC software uses the Shima model in the treatment of the plastic yield criterion of the powder body, as follows. In the study of the carbon steel swarf pressing process, the carbon steel swarf is considered as an isotropic "compressible continuum" following the principle of mass invariance:

$$F = \frac{1}{\gamma} \left( \frac{3}{2} \sigma^d \sigma^d + \frac{p^2}{\beta^2} \right)^{\frac{1}{2}} - \sigma^y \quad (1)$$

Where  $\sigma^y$  - is the one-way yield stress (MPa).  $\sigma^d$  - is the stress deflection amount (MPa)  $p$  - is the hydrostatic pressure (N).  $\gamma, \beta$  - are material parameters, which are functions related to temperature and relative density, respectively.

When the temperature changes to 0, the value of  $\gamma, \beta$  can be found directly using the following equation:

$$\gamma = \rho^{5.5} \quad (2)$$

$$\beta = [6.25(1 - \rho)]^{-0.5} \quad (3)$$

Where  $\rho$  - relative density.

## 3. ANALYSIS OF DENSITY DISTRIBUTION OF CARBON STEEL CHIPS AFTER PRESSING

Different pressing force sizes were set, and the pressing force was gradually increased from 0 to the set value at each pressing, and then maintained. The changes in the cloud diagram of the relative density of Q235 carbon steel chips during the pressing process were observed,

and then the changes in the volume of carbon steel chips and the relative density distribution at the end of pressing were analyzed. With the application of 55 MPa pressure, for example, the closer the location to the press head, that is, the more upward position of the relative density of carbon steel chips is the largest, 53.82%, and the density of carbon steel chips at the bottom of the stainless steel shell is the smallest, 53.74%, but the difference is not large, only 0.1%. This is due to the pressing, the upper part of the carbon steel chips first contact with the indenter, the first force, in the upper part of the deformation before the pressing force is transferred to the lower part, the lower part of the carbon steel chips began to deformation, has been transferred to the bottom of the stainless steel shell carbon steel chips, but because the deformation process is faster, so the bottom of the relative density of carbon steel chips and the top of the difference is not large. The carbon steel chip density in the entire stainless steel shell are relatively uniform distribution, the difference between the maximum and minimum density is only 0.003%, indicating that the density of carbon steel chips in the entire stainless steel shell after the completion of pressing is almost equal. Cross-sectional carbon steel chip density distribution is also relatively uniform, there is no significant difference and distribution pattern. The distribution of the density of carbon steel chips after pressing affects the final composite effect of stainless steel/carbon steel chip composite plate, the more uniform the density distribution of carbon steel chips in the stainless steel shell, the more uniform the composite effect of the composite plate cladding base layer after rolling, so the simulation results can predict the final composite effect of the composite plate after rolling.

At the end of each simulation of pressing, the average value of the relative density of carbon steel chips under this pressure is extracted and calculated. Figure 1 shows the graph of the relative density of carbon steel chips as a function of pressure for the finite element simulation, and it can be seen that as the pressure setting value increases, the value of the relative density of carbon steel chips increases at the end of the simulation, and after the pressure increases to a certain value, increasing the same pressure, the increased value of the relative density of carbon steel chips begins to decrease and the curve begins to flatten out.

**Figure 1.** Simulated pressure versus relative density of carbon steel chips

To compare the FEM simulation results with the experimental results, it is necessary to multiply the pressure of the FEM simulation with the cross-sectional area of the carbon steel chip to obtain the value of the pressing force, and put the two results into the same coordinate system, and the results of the pressing experiment and the FEM simulation are shown in Figure 2. It can be seen that in the range of pressing force 0-45kN, the relative density of carbon steel

chips from the finite element simulation is greater than the actual measured value from the experiment, and after the pressing force is greater than 45kN, the measured value from the experiment starts to be greater than the value from the finite element simulation again, but the two trends are consistent and the error is not large, which indicates that the finite element simulation value matches well with the experimental measured value, which also proves that the finite element simulation is This also proves that the material parameters used in the finite element simulation are more accurate and match with the actual ones. With this result as the basis, it is possible to establish different sizes of billet models for finite element simulation, to predict the density distribution of carbon steel chips within the large billet during actual production, the relationship between the pressing force and the density of carbon steel chips, and to show that the material parameters used can continue the finite element simulation study for the subsequent rolling experiments.

**Figure 2.** Comparison of pressed experimental and simulated results

#### 4. PROCESS OPTIMIZATION STRATEGY

##### (1) Designing reasonable chip core shape and size

The influence of different chip core shapes and sizes on the quality of bimetallic composite blanks is analyzed by numerical simulation, and the optimal chip core shapes and sizes are selected. Reasonable chip core shape and size can provide good contact area and contact performance, which is conducive to effective cold welding bonding.

##### (2) Control compound temperature and pressure

Through numerical simulation analysis of the composite behavior under different temperature and pressure conditions to determine the best composite process parameters. Reasonable composite temperature and pressure can improve the bond strength and interface quality of bimetallic composite blanks.

##### (3) Optimize the heat treatment process

Optimize the heat treatment process for the stainless steel/carbon steel composite blanks. Simulate the temperature and stress fields during the heat treatment process through numerical simulation to determine the appropriate heat treatment temperature, holding time and cooling mode to obtain the desired structure and properties.

##### (4) Optimization of rolling process

During the rolling of the composite billet, the effect of rolling force and deformation temperature is analyzed by numerical simulation to determine the best rolling process parameters. The optimized rolling process can improve the interfacial bonding performance and overall performance of the bimetallic composite plate.

## 5. CONCLUSION

In this study, the key problems in the preparation process of bimetallic composite blanks are investigated in depth through numerical simulation and process optimization, and effective improvement schemes are proposed. These research results are of great significance to promote the development and application of bimetallic composites. Future research can further explore more accurate simulation methods and more effective process optimization strategies based on the results of this study to achieve a higher level of bimetallic composite blank preparation and application.

## ABSTRACT

The purpose of this paper is to explore the application of deep learning in ideological and political education to help cultivate high quality talents. First, deep learning reflects the orientation of quality education and helps cultivate students' higher-order thinking and innovation ability. In this regard, this paper puts forward the conception of educational paradigm transformation, including the unified analytical method of history and logic, basic theoretical framework, social foundation, multidisciplinary and multi-paradigm transformation research and academic system research paradigm and action system way of thinking. Finally, the paper concludes that it is committed to promoting educational paradigm transformation, so as to better contribute to the implementation of the fundamental task of building moral character and cultivating high-quality talents.

## KEY WORDS

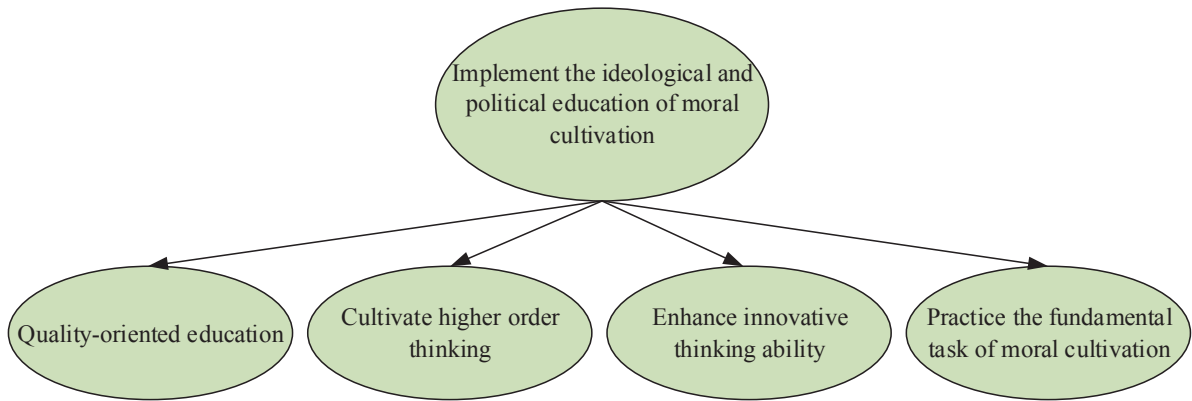

Deep learning; Moral education; Paradigm transformation; Innovative thinking; Quality education

## 1. INTRODUCTION

In recent years, the importance of education such as ideology and political awareness has been increasingly recognized and emphasized, and also gradually become one of the mission tasks of universities [1-2]. Deep learning as an emerging educational tool has also been increasingly emphasized in discipline education and talent training [3-4]. With the help of deep learning technology, education can better implement the fundamental task of establishing moral education and cultivate high quality talents with sensitive thinking and outstanding ability [5-6]. The literature [7] used intelligent technology to study the management system framework of civic thought education, including four aspects: work leadership system, curriculum management system, special activities development system, and level evaluation system. The main part of the study in the literature [8] examines the paradigm of education, and the authors analyze the shortcomings of the traditional model of didactic education and present the need for the transition to a modern educational model.

## 2. THE APPLICATION VALUE OF DEEP LEARNING IN THE TEACHING OF IDEOLOGY AND POLITICS IN COLLEGES AND UNIVERSITIES

In the perspective of deep learning, the goal of ideological and political education is to implement moral education. The methods and techniques of deep learning can be applied to all aspects of ideological and political education, in which the ideological and political education process of implementing moral education is shown in Figure 1.

**Figure 1.** Process of ideological and political education

### **2.1. REFLECTING QUALITY EDUCATION ORIENTATION**

The fundamental task of education includes the focus on nurturing people with moral values, and teachers should clarify the direction of nurturing people accordingly and target core literacy development goals. Quality education aims to promote students' continuous learning so that they can apply their existing knowledge to new situations, which fits with deep learning. Therefore, the application of deep learning in teaching related to cultivating students' moral quality can promote the development of quality education, and quality education can also react to deep learning, and the two can promote each other.

### **2.2. DEVELOP STUDENTS' HIGHER-ORDER THINKING**

In the context of the new college entrance examination, teachers applying the concept of deep learning can cultivate students' higher-order thinking, help improve students' logical reasoning ability, allow students to apply what they have learned flexibly, and promote the improvement of students' ideological and political learning level and academic performance. Teachers apply the concept of deep learning in ideology and politics teaching can enable students to analyze problems comprehensively and propose new ways to solve them in the process of learning. Deep learning meets the requirements of the college entrance examination reform and enables students to transition from shallow learning to deep learning and then achieve the goal of developing higher-order thinking.

### **2.3. ENHANCE STUDENTS' CREATIVE THINKING SKILLS**

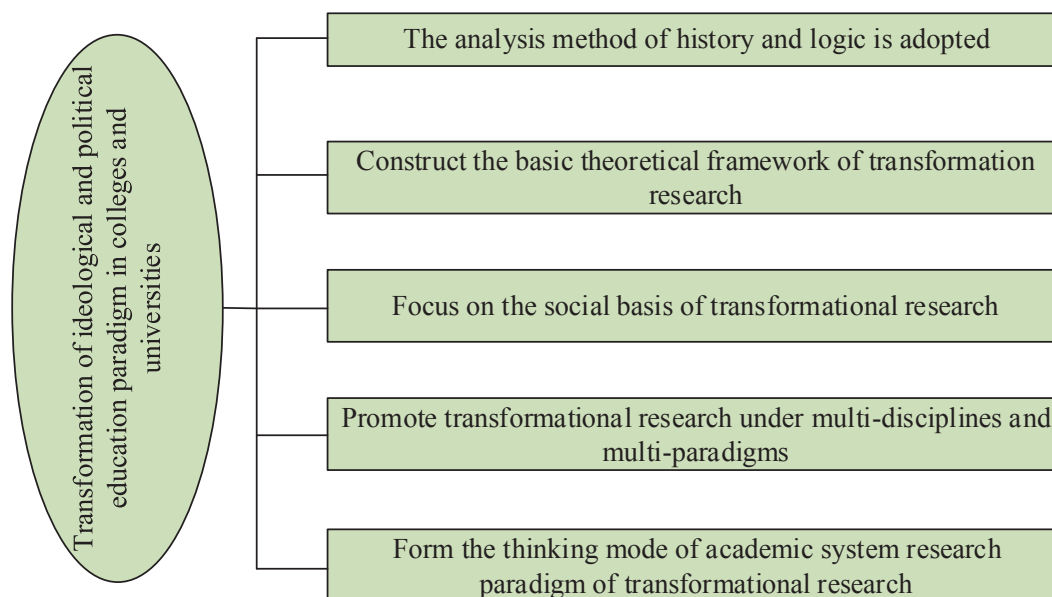

At the present stage of college ideology and politics teaching, there are relatively few teaching activities carried out under the deep learning perspective, which can hardly meet the learning needs of students. Following the law of cognitive development of college students, deep learning activities pointing to innovative development goals can enhance students' innovative thinking ability. Teachers should discuss current news and real cases with students and encourage them to use their ideological and political knowledge to solve problems, so as to enlighten their creative thinking and make them put forward their own ideas through analysis and judgment, which can improve their creative thinking ability.

### **2.4. PRACTICING THE FUNDAMENTAL TASK OF ESTABLISHING MORAL EDUCATION**

To establish moral education, as the name implies, is to take moral education as the first, through positive education to guide, sensitize and inspire people. Teachers should impart efficient methods of learning ideological and political knowledge to students, change the traditional thinking of exam-oriented education, improve students' moral cultivation, let students improve their moral level while learning knowledge, and give full play to the advantages of deep learning to cultivate students' good ideological and moral qualities.

### 3. IDEOLOGICAL AND POLITICAL EDUCATION PARADIGM TRANSFORMATION RESEARCH CONCEPT IN UNIVERSITIES

The paradigm transformation of ideological and political education under the perspective of deep learning is a current issue that needs to be urgently explored, and its steps are divided into five, as shown in Figure 2.

**Figure 2.** Steps of ideological and political education paradigm transformation

#### 3.1. HISTORICAL AND LOGICAL UNIFICATION OF THE ANALYTICAL APPROACH

Using the unified analysis of history and logic to study the modern transformation of education requires following the principle that the historical development of education is consistent with the logical existence, and examining the historical development and modern transformation in the vision of the Party's ideological and political education history. At the same time, logical assumptions and presuppositional reflections are needed to answer key questions such as whether political education is in transformation, the motives and paths of transformation. Finally, it is necessary to pay attention to the logical order of categories and the consistency of temporal order, and to study the elements of transformation of ideological and political education, such as functional orientation, functional role, educational content, carrier methods, institutional mechanisms, etc.

#### 3.2. CONSTRUCTING A BASIC THEORETICAL FRAMEWORK FOR TRANSFORMATION RESEARCH

Transformation of ideological and political education is a major trend in the development of theory and practice in the field of ideological and political education, and the connotation of modern transformation of ideological and political education is a prerequisite issue that needs to be explained in the research on modern transformation of ideological and political education. The diversity of research themes reflects that the academic community has not yet found a point, resulting in more words such as "improve" and "strengthen" in the central documents, while the socialized language uses words such as "innovation" and "development". The study of modern transformation of ideological and political education has not formed an authoritative linguistic expression, as a result, more words such as "innovation" and "development" are used in the central documents, and more words such as "modernization" are used in the social language. The study of modern transformation of ideological and political education is a socio-historical process of the generation of elements, structures and functions of ideological and political education system, which requires the establishment of a theoretical analysis

framework. The transformation of ideological and political education is a general concept and analytical tool, including the transformation of form, the adjustment of structure, the increase of elements, etc., and also includes conversion, change, innovation, improvement, and development.

### **3.3. FOCUS ON THE SOCIAL BASIS OF TRANSFORMATION RESEARCH**

It is very important to pay attention to the social basis of modern transformation of ideological and political education, and only by revealing the modern transformation of education from the social perspective can the academic value and practical significance of the study of modern transformation of education be better enriched and realized. Ideological education needs to interact with society from a sociological perspective and reveal the basic horizon of its modern transformation. At the same time, the current social context of China cannot be ignored. Therefore, it is necessary to combine elements of social environment while examining the modern transformation of society.

### **3.4. PROMOTE TRANSFORMATIVE RESEARCH IN MULTIPLE DISCIPLINES AND PARADIGMS**

Research on ideological and political education needs to be interdisciplinary and comprehensive, drawing on the theoretical achievements of related humanities, such as history, sociology, economics, philosophy, and political science. At the same time, research on ideological and political education needs to establish independent disciplinary consciousness and disciplinary self-awareness, get out of the misconception of simple concept transplantation and method application, and constantly use multidisciplinary thinking methods and cross-disciplinary research paradigms to conduct research, unify experience summary and theory construction, combine academic research with realistic care, and highlight its topicality.

### **3.5. FORMATION OF THE ACADEMIC SYSTEM RESEARCH PARADIGM AND ACTION SYSTEM WAY OF THINKING FOR TRANSFORMATION RESEARCH**

The use of educational systems thinking is a fundamental requirement of educational systems methodology and a fundamental way of thinking for conducting modern transformation research in education. This requires analyzing and studying the interaction between ideological and political education and social systems from a systemic viewpoint and constructing an all-temporal view of educational system research. Under this view, it is necessary to consider the close connection between the educational system and the social environment system and to study the modern transformation of education holistically. In addition, the elements, structure, and functions of the educational system are studied from a holistic perspective using systems thinking, and an academic systems research paradigm and an action systems thinking paradigm accepted and recognized by the academic community is formed so that people can develop a systems way of thinking in order to evoke a new understanding and grasp of the transformation of this educational system.

## **4. CONCLUSION**

This paper puts forward the application value of deep learning in college ideological and political education, including reflecting the orientation of quality education, cultivating students' higher-order thinking ability, enhancing students' innovative thinking ability and practicing the fundamental task of establishing moral education, and further discusses the conception of paradigm transformation of college ideological and political education. Through the analytical method of unifying history and logic, constructing the basic theoretical framework of transformation research, focusing on the social foundation of transformation research, promoting transformation research under multi-disciplinary and multi-paradigm, and forming

the academic system research paradigm and action system way of thinking of transformation research, this paper provides theoretical references and practical paths for promoting the transformation of this educational paradigm. Finally, this paper argues that introducing deep learning into education teaching and combining the ideas of transformation research is expected to stimulate students' thinking ability, improve their innovation ability and ability to deal with complex situations, and thus contribute to the cultivation of high quality talents.

## ABSTRACT

The purpose of this paper is to discuss the current situation and service upgrading measures of university intelligent library service under the environment of “Internet+”. Through sorting out and analyzing the services of university intelligent libraries, the paper proposes four upgrading measures for the intelligent service mode of university libraries in “Internet+”: enhancing user privacy protection, creating subject-specific data information, enhancing digital information service and creating “library+” service mode. The implementation of these measures will further promote the improvement of the service level and mechanism of university intelligent libraries.

## KEYWORDS

Smart library; Internet+; Service upgrade; Privacy protection; Digital informatization

## 1. INTRODUCTION

With the rapid development of information technology, digitalization, networking and intelligence have become the mainstream trend of current social development [1-2]. In this background, intelligent library plays an extremely important role as part of the digital construction of universities [3-4]. Nowadays, university library services in the “Internet+” environment are no longer the functions of simple borrowing and data acquisition in the traditional mode, but need to meet the increasing knowledge needs of readers through more intelligent, personalized and specialized services [5-7]. The literature [8] explored the development of a smart library project that aims to provide information and library services for educational and scientific activities. Pandey, J et al. investigated how to implement a smart library system using Internet of Things (IoT) technology. and explored how sensors and network technologies can be combined to monitor, collect and manage various data in the library, including book locations, circulation records, and environmental temperature and humidity [9].

## **2. INTELLIGENT LIBRARY SERVICE WORK IN UNIVERSITIES**

### **2.1. APPLICATION SERVICES OF INTELLIGENT SPACE CONSTRUCTION AND FACILITIES AND EQUIPMENT**

With the help of modern architectural design aesthetics, the smart space construction of the smart library uses information technology resource facilities and intelligent and convenient equipment to achieve space construction and improvement. Smart building is the core, including smart building, environmental monitoring and purification, lighting system, green ecology, etc. Personalized demand scene space includes virtual reality book library, VR space, intelligent reading kiosk, naked eye 3D space, etc. Facility and equipment applications include mobile terminals, smart wear, sensing, security, special equipment, such as 3D printing equipment, drones, etc.

### **2.2. SMART LIBRARY TECHNOLOGY SERVICES**

Libraries form the results and products of smart library application level through 5G network technology, AI, IoT, cloud computing, big data, artificial intelligence, blockchain and other new generation information technology. Through these, the technical support of comprehensive perception, ubiquitous interconnection, pervasive computing and convergent application is provided for university smart libraries. 5G network technology can be applied to library smart venue construction, intelligent security, main branch library construction, mobile library, etc. By combining with AI artificial intelligence technology, intelligent inventory robots and online intelligent consultation robots are designed. The combination with blockchain technology can protect intellectual property rights, implement data resource sharing, generate knowledge resources, and protect readers' personal information.

### **2.3. SMART LIBRARY PLATFORM SERVICES**

The Smart Library Platform is an open platform that provides comprehensive services for librarians, patrons and affiliated institutions based on new technologies. The platform includes central knowledge base, cloud computing, virtualization, intelligent interview, librarian wisdom service, reader application service and library service platform. Among them, the central knowledge base, cloud computing and virtualization platform adopts a new generation of Internet microservice technology architecture and supports cloud services, multi-terminal application development and open interface services. The reader application service platform provides convenient, perceptive, fine and fast services for readers. The platform realizes the concept of unified resources, unified services, cross-border integration and open sharing, which is in line with the comprehensive service idea of smart library.

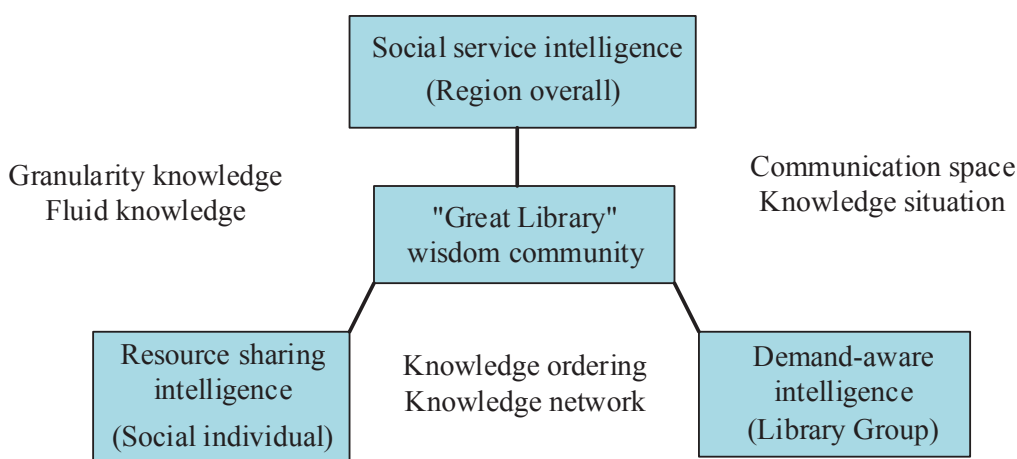

### **2.4. SERVICE MECHANISM OF SMART LIBRARY**

The composition of smart libraries is user-centered, and the services provided are designed to meet the needs of users. In order to meet the needs of users at different levels, targeted services should be provided according to the differences of customers. Specifically, the level of users' needs can be simply divided into general services, deep knowledge services and innovative services. In addition, the main role of smart libraries is to provide resources, and the effectiveness of the services can be further enhanced if the resources can be shared among each other. Therefore, a common sharing atmosphere should be formed within the library industry, and in this process, new technologies such as Internet of Things and blockchain are used to build an open ecology. The smart library service system is shown in Figure 1.

**Figure 1.** Service mechanism of smart library

In terms of service strategy, smart libraries aim to create an intelligent learning environment for users. The core of achieving this goal is to effectively suppress the heuristic cognitive load of users by building a smart environment to achieve a deep integration between “space”, “people” and “resources”. The logical architecture of the strategy of intelligent library services is shown in Figure 2.

**Figure 2.** Intelligent service strategy logic of intelligent library

### 3. UPGRADING MEASURES FOR THE INTELLIGENT SERVICE MODE OF “INTERNET+” UNIVERSITY LIBRARIES

#### 3.1. ENHANCE USER PRIVACY PROTECTION

With the rapid development of smart devices, library mobile services make library smart services more convenient, however, big data and cloud computing bring threats to users’ privacy and security. In order to protect users’ privacy, I suggest adding a login password process when users read online, logging out their login and browsing records after they finish reading, and strengthening security protection and encryption when collecting and organizing data. In this way, the “Internet+” university library intelligent service mode can be truly recognized by users.

#### 3.2. CREATE INFORMATION ON DISCIPLINE SPECIALTY DATA

The “Internet+” college library wisdom service model can enable subject specialized faculty members to create subject specialized data information through the Internet. College libraries can hire professional and technical personnel to manage the data of subject specialties together with subject specialties faculty members. Facing the expanding needs of school students, each subject specialties should be given certain modification authority and modified by each subject leader, so that the data of subject specialties in college libraries can be

constantly updated and improved to meet the needs of school students for subject specialties knowledge. The librarians of universities can provide certain consultation services for students through the thematic tracking and information pushing of disciplines and specialties, provide certain thematic consultation for students' graduation design, and push the data and information resources and reference materials that students need in graduation design directly to students.

### **3.3. ENHANCE DIGITAL INFORMATION SERVICES**

In order to better serve the majority of users, university libraries must increase the construction of digital information services, through the application of "Internet +" technology to provide strong support for the construction of digital information services. For example, cell phone APP, palm library, online reading and other services can be developed. The offline and online services such as paper book inquiry, reservation and renewal can also be launched. It can also promote audio books and multimedia playback, so that users can "read" with their ears and their eyesight is protected.

### **3.4. CREATE A "LIBRARY+" SERVICE MODEL**

Internet technology can provide services for the infrastructure of university libraries and create a "library+" service model. In this model, a large amount of data can be sorted and summarized to make library management smarter, easier and more orderly. For example, university library staff can use "Internet+" technology to provide users with proprietary IDs and cards, so that users can store, borrow, and check out a series of activities for themselves. This will not only enable users to use books, materials and information safely and effectively, but also save relevant information in time, and finally provide comprehensive services for users' work and study.

## **4. CONCLUSION**

This paper analyzes the intelligent library services of universities and proposes four upgrading measures to promote the intelligent service mode of university libraries in the "Internet+" environment. These measures include enhancing user privacy protection, creating subject-specific data information, enhancing digital information services and creating a "library+" service model. The implementation of these measures can improve the service level and mechanism of university libraries to meet the needs of the digital era. In addition, it is also necessary to focus on user privacy protection to ensure information security and to improve the social influence and status of university smart libraries by attracting more users. In conclusion, the upgrading measures proposed in this paper are to meet the development trend of university library services in the digital and intelligent environment in order to better meet the growing information needs and service demands of users.

## ABSTRACT

This paper first emphasizes the role of digitalization in promoting the advanced industrial structure by analyzing the composition of the industrial structure in the eco-economic zone. Among them, digitalization factors that drive new product development and influence the supply and demand of professionals are considered to be important driving forces for achieving advancedization. A series of digital transformation strategies are then proposed to address the needs of industrial restructuring in the eco-economic zone. These strategies include promoting the construction of digital infrastructure, fostering new digital industry dynamics, strengthening digital technology innovation and application, focusing on the training of digital talents, and increasing policy support. Therefore, by adopting these strategies, the optimization and upgrading of the industrial structure of the eco-economic zone can be promoted to achieve sustainable development goals.

## KEYWORDS

Eco-economic zone; industrial restructuring; Digital transformation; Product development; Infrastructure development

## 1. INTRODUCTION

Digital transformation has become an important trend in global economic development, and for eco-economic zones, digital transformation is also an important means to promote their industrial restructuring [1-2]. In the past few years, China's digital economy has grown faster than the traditional economy, and digital transformation has become a necessary tool to promote economic transformation and upgrading [3]. With the adjustment of industrial structure in the eco-economic zone, digital transformation has also gradually become an important way to promote industrial upgrading and transformation in the eco-economic zone [4]. Therefore, in order to realize digital transformation and promote industrial upgrading in ecological economic zones, the strategies and modes of digital transformation must be explored in order to promote the sustainable development of digital economy and realize the optimization and upgrading of industrial structure in ecological economic zones [5-6]. The literature [7] focuses on the impact of digital transformation in terms of data-driven operations management and organizational management in industrial practices. The authors show that digital transformation offers opportunities for companies in terms of organizational structure, employee training, and technology experimentation, but also brings negative impacts, such as challenges in organizational culture and security and legal issues in the application of technology. The literature [8] focused on the impact of urbanization and industrial structure on carbon emissions in the Huaihe River Basin eco-economic zone. Researchers found that with

the acceleration of urbanization and the optimization and adjustment of industrial structure, the total carbon emissions in the region showed a trend of rising and then falling. Among them, urbanization has a significant positive effect on carbon emissions, while industrial restructuring has a significant negative effect on carbon emissions.

## 2. COMPOSITION OF THE INDUSTRIAL STRUCTURE OF THE ECO-ECONOMIC ZONE

The Yellow River Delta Ecological Economic Zone has developed into an efficient ecological economic zone with resource-based industries as its pillar industries, while focusing on the development of peripheral industries, service industries, etc. The total value of agriculture in the economic zone in 2021 is 29.385 billion yuan, accounting for 6.86% of Shandong Province, a slight decrease compared to last year, and the level of agricultural mechanization is relatively backward compared to other regions, and traditional agriculture still accounts for A large proportion of the. The gross value of the secondary industry was 340.165 billion yuan, accounting for 13.46% of Shandong Province, an increase of 0.4 percentage points, mainly relying on the strong industrial base of petrochemical industry. The gross value of tertiary industry is 172.169 billion yuan, accounting for 8.17% of Shandong Province, basically the same compared with last year, but the low proportion of the situation still needs to be improved. Since the establishment of the Yellow River Delta Efficient Ecological Economic Zone in 2008, the development of the primary industry has been relatively stable, while the secondary and tertiary industries have both increased significantly, as shown in Figure 1. In order to promote the development of regional industrial clusters, rationalize the industrial structure, give full play to the advantages of traditional agricultural base, consolidate the strong strength of industry, encourage the development of new logistics and service industries, and promote the overall economic development.

Figure 1. Gross product of the three main industries in the eco-economic zone

## 3. DIGITIZATION OF INDUSTRIES IN ECO-ECONOMIC ZONES FOR ADVANCED INDUSTRIAL STRUCTURE

### 3.1. PROMOTE NEW PRODUCT DEVELOPMENT FOR ADVANCED

Moore's law indicates that the development speed of new products continues to increase over a certain period of time, while the frequency of updates accelerates. As the core of the digital economy, information technology represents the essence of the digital economy and conforms to Moore's Law of information technology. With the development of digitization of industries in the eco-economic zone, the innovation and application of digital technologies

promote the emergence of new goods, which in turn give rise to new industries. As the digitization of industries in the eco-economy zone increases, digital technology innovation and application in enterprises become increasingly mature, and new products are able to meet new needs of people. Companies will take the initiative to improve the productivity of new products and rely on the competitiveness of new products to expand their market share and sales ratio. After a period of competition and elimination, traditional industries that lack competitive advantages will reduce the number of traditional products produced, while some traditional industries in the eco-economic zone will be replaced by new industries that are more competitive. The emergence and development of new industries is conducive to the upgrading of industrial structure. At the same time, in the process of digitization of industries in the eco-economic zone, the development and application of new digital technologies improve the old ones, enhance the quality of similar products or improve the experience of similar services. In this way, the products and services become more competitive in the market and more in line with consumer needs, and to a certain extent, promote the advanced industrial structure.

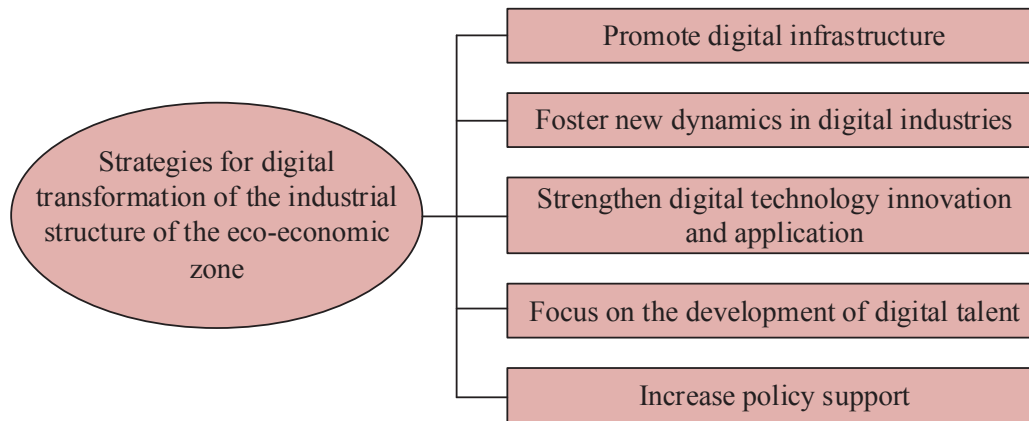

In addition, the in-depth application of digital technology within the eco-economic zone industry can effectively recover idle resources and provide more ways to utilize them. Taking platform technology in digital technology as an example, enterprises can share idle resources to other enterprises to improve resource allocation efficiency. The rich sharing channels provide a quality environment for technological innovation and promote product development.

### **3.2. INFLUENCE THE SUPPLY AND DEMAND OF PROFESSIONALS TO PROMOTE HEIGHTENED**

The deepening application of the twin technologies of the digital economy, such as artificial intelligence, in the primary industry can effectively promote the improvement of productivity in the primary industry. However, the nature of primary industry products determines the stability of its market demand, and the demand quantity remains unchanged while reducing the demand for labor factors related to quantity, which will release a certain degree of labor in the primary industry. The released labor force can be put into the production process of other industries after the corresponding talent training, thus improving the employment structure and thus contributing to the advanced industrial structure of the eco-economic zone. Finally, as the digitization of industries in the eco-economic zone leads to the reorganization of industrial chains, the corresponding division of labor will also undergo certain changes, which in general will make the division of labor more detailed, clearer and more explicit, and the new labor positions will put forward new requirements for the labor force, while the reallocation of labor factors caused by this demand will also have a certain positive impact on the industrial structure of the eco-economic zone.

## **4. STRATEGY OF DIGITAL TRANSFORMATION OF INDUSTRIAL STRUCTURE IN ECOLOGICAL ECONOMIC ZONE**

With the industrial restructuring of the eco-economic zone, digital transformation has become an important tool to promote economic transformation and upgrading. Below are some digital transformation strategies to help eco-economic zones achieve industrial upgrading and transformation. The key steps in the digital transformation process in the Eco-Economic Zone are shown in Figure 2.

**Figure 2.** Key steps in digital transformation

#### **4.1. PROMOTE DIGITAL INFRASTRUCTURE DEVELOPMENT**

Digital infrastructure is the foundation of digital transformation, including high-speed communication networks, data centers, cloud computing, etc. To achieve digital transformation, the eco-economic zone must accelerate the construction of digital infrastructure, including the construction of 5G networks, the promotion and application of technologies such as the Internet of Things and the industrial Internet.

#### **4.2. CULTIVATE NEW DYNAMIC ENERGY OF DIGITAL INDUSTRY**

Eco-economic zones need to cultivate new development drivers in the digital economy, such as the Internet, Internet of Things, smart manufacturing, and artificial intelligence. These new industries can help transform and upgrade the local economy and enhance its development momentum.

#### **4.3. STRENGTHEN DIGITAL TECHNOLOGY INNOVATION AND APPLICATION**

To promote digital transformation, eco-economic zones need to actively develop digital technologies and apply them to actual production and operation. This can include the research and development of digital technologies, the application of new technologies, digital marketing, digital management, etc.

#### **4.4. FOCUS ON THE CULTIVATION OF DIGITAL TALENTS**

To promote digital transformation, the eco-economy needs to strengthen the training and introduction of digital talents. We need to train talents who can handle the importance of data and digitization, train talents with digital technology and digital management skills, and prioritize attracting innovative and high-end talents so that the digital economy can grow and develop.

#### **4.5. INCREASE POLICY SUPPORT**

In order to promote digital transformation, the eco-economic zone needs to increase support for the digital industry. Policies to encourage the development of the digital economy can be formulated, and special financial support, tax incentives and other policy support can be provided to digital enterprises and projects to promote the healthy and rapid development of the digital economy.

In summary, the above five aspects are all important strategies to promote digital transformation, and ecological economic zones can make targeted plans based on their actual conditions to promote economic restructuring and achieve industrial upgrading and transformation through digital transformation.

## 5. CONCLUSION

Digital transformation of the industrial structure of eco-economic zones can promote advanced industrial structure, promote new product development and influence the supply and demand of professionals, thus achieving a higher level of industrial development. Digital transformation plays an important role in the industrial restructuring of eco-economic zones. By making rational use of digital technologies and promoting the implementation of digital transformation strategies, the optimization and upgrading of the industrial structure of eco-economic zones can be achieved, further promoting sustainable economic development.

[jean.sky@163.com](mailto:jean.sky@163.com)

---

## ABSTRACT

With the development of society, people are demanding more and more comfort and beauty from their indoor environment. The application of natural elements has received wide attention because of the visual, ecological and cultural effects, as well as the psychological and functional values they bring to human beings. Starting from the analysis of the interior effects of natural elements, this paper discusses the embodiment of the value of natural elements in interior spaces and illustrates the way of applying natural elements in interior hard and soft furnishings through examples of architectural decorative interior design. It is found that the use of natural elements can breathe life and vitality into the interior environment, as well as meet people's psychological needs and practical use needs. In interior design, the application of natural elements has become an important design trend, bringing new thinking and possibilities to modern interior design.

## KEYWORDS

Natural elements; Interior design; Ecological effect; Cultural effect; Psychological value; Functional value

## 1. INTRODUCTION

With the continuous improvement of people's living standard, people's demand for indoor environment has gradually changed, no longer being simple accommodation and workplace, but paying more attention to comfort and aesthetics [1-2]. Meanwhile, with the advent of the new media era, people's desire for natural environment has become stronger [3]. Natural elements have a unique charm and can bring a sense of comfort and relaxation to people [4]. Therefore, the use of natural elements in interior design is receiving more and more attention and research [5-6]. Ling, J showed that the rapid development of the decoration industry has created a good space for interior decoration, and the public pays more attention to the integration of natural elements in the process of interior decoration [7]. The literature [8] explored how to create an interior environment that is beneficial to human health and well-being by incorporating natural elements such as plants, water and rocks and by using natural colors, soft lighting and natural materials.

## 2. THE DESIGN CONCEPT OF NATURAL ELEMENTS IN THE INTERIOR ENVIRONMENT

### 2.1. ANALYSIS OF THE INDOOR EFFECT OF NATURAL ELEMENTS

#### 2.1.1. THE VISUAL AESTHETIC EFFECT OF NATURAL ELEMENTS IN INTERIOR SPACE

Introducing natural elements into the interior space creates a spatial environment that is similar to that of nature. Plants, water features, rocks and other natural elements in the interior space form a sense of space, form, color and sound, etc., which greatly enrich the expressive power of the interior space environment, delighting the eyes and the mood and generating infinite reverie.

#### 2.1.2. ECOLOGICAL EFFECT OF NATURAL ELEMENTS IN THE INTERIOR SPACE

In the indoor space, the ecological function of outdoor natural elements is similar to a mechanized air regulator, which can not only play the role of purifying air and improving climate, but also improve the virtuous cycle of indoor space environment. At the same time, natural elements can be utilized in the building in the way of space constructed in layers, which can play a role in adding greening rate to the current situation of high urban population, tight living land and less public green space environment.

#### 2.1.3. THE CULTURAL EFFECT OF NATURAL ELEMENTS IN INTERIOR SPACE

As we all know, art and design is a kind of culture, and the two are inseparable from each other. The famous British anthropologist Malinowski, taking the functionality of culture as a principle, divided the cultural phenomenon into four main elements: material culture, language, spiritual culture, and social organization. As art design is the creation of material form, it belongs to the material culture phenomenon, and in the social form, cultures have been interpenetrating and influencing each other since the beginning. Therefore, natural elements not only make the interior space closer to nature, but also add to the artistic atmosphere and cultural connotation of the interior environment. The analysis table of the indoor effect of natural elements is shown in Table 1.

**Table 1.** Indoor effects of natural elements

Analysis of the indoor effects of natural elements	Aesthetic effects in the interior	Visual centrality
		Softening the interface
		Contextualising
		Filling the space
	Indoor ecological effect	Purification
		Health promotion
		Local environmental regulation
	Indoor cultural effects	Regional character
		Style
		Cultural context

### 2.2. THE VALUE OF USING NATURAL ELEMENTS IN INTERIOR SPACE

#### 2.2.1. AESTHETIC VALUE OF THE USE OF NATURAL ELEMENTS IN INTERIOR SPACE

Analyzed from the aesthetic point of view of indoor space, natural elements such as plants, water features and rocks have good aesthetic value, such as the image beauty, shape beauty,

color beauty of natural elements, as well as the smell beauty of plant elements, the auditory beauty of water elements, etc., which not only beautify the indoor space environment, but also improve the taste of the overall interior style.

### 2.2.2. THE PSYCHOLOGICAL VALUE OF USING NATURAL ELEMENTS IN INTERIOR SPACE

The appreciation of natural elements in the room can also suppress symptoms of over-excitation of the sympathetic nervous system, such as hypertension. The positive and healthy emotions induced by the natural environment can also greatly enhance people's performance in activities that test creativity and hyperactivity. Viewing the natural environment can lower blood pressure and regulate heart rate, which is a very effective way to relieve mental stress and psychological pressure for the stressed urban population.

### 2.2.3. FUNCTIONAL VALUE OF NATURAL ELEMENTS IN INTERIOR SPACE

Due to the increasing flexibility of modern indoor space, the integration of indoor and outdoor space makes the space penetrate and extend each other, and natural elements act as the connecting piece of the transitional space. Therefore, the configuration of indoor plants should echo the outdoor space, which can produce spatial continuity; the design of water bodies in the transitional space can play the role of connecting the indoor and outdoor spaces. Through the use of glass walls or bay windows, the outdoor scenery is introduced into the indoor space and becomes a part of the indoor spatial environment. The list of indoor values of natural elements is shown in Table 2.

**Table 2.** Indoor values of natural elements

The interior value of natural elements	Aesthetic values	Reflecting artistic beauty
		Enriching interior colour
		Create a sense of mood
	Psychological value	Psychological conditioning
		Satisfies the desire to return to nature
	Functional value	Spatial separation
		Spatial cascading
		Spatial definition
		Spatial buffering

## 3. THE APPLICATION OF NATURAL ELEMENTS IN ARCHITECTURAL DECORATION INTERIOR DESIGN

### 3.1. APPLICATION OF NATURAL ELEMENTS IN INTERIOR HARD DECORATION

#### (1) Top decoration

For the interior space, the top surface decoration is for the ceiling or shed roof decoration. In interior design, the top surface of the space can also be designed and shaped adequately. For example, to renovate and design the roof of some solid wood structures, the beams and columns can be directly displayed by renovating them, followed by decorative materials in the color of the original wood to make the whole decoration more textured and further reshape the interior space so that it can be organically integrated with the natural environment.

#### (2) Interior wall decoration

The walls of the interior space can be divided for the overall interior layout, so that different interior spaces belong to different functions. For the interior wall decoration, when the choice

of wall paving materials, you can also choose masonry for stacking, the color of these masonry has dark and light, and the volume of different sizes, so that the wall design will also be full of changes, showing the natural form, so that people can get a rustic feeling.

### (3) Column decoration

When decorating the column surface, it is usually done by carving, whitewashing, or choosing some decorative items to paste. For example, the main body can be made into the form of a tree trunk, and a paint with imitation bark texture is used on the column. And to make the design style of the column and the overall interior design style has unity, people in such an indoor environment, like walking and wandering in nature, more with a pleasant, relaxed mood.

### (4) Floor decoration

As the most basic indoor space interface, ground decoration can be carried out on the basis of different functional areas and changes in ground design. For example, when arranging the scene, you can also consider a certain theme, for different local areas, carry out the corresponding design, and choose some animal and plant forms into it, and according to the different colors and materials, the collage of patterns, the design of some special patterns of different shapes, to further make the indoor space with better decorative.

## **3.2. APPLICATION OF NATURAL ELEMENTS IN INTERIOR SOFT FURNISHINGS**

### (1) Interior furniture decoration

Furniture, as the main object that sets off the interior environment, is an important aspect of interior decoration. The shape, color, and material of the furniture affect the overall style of the interior space. For example, most of the B&B interior furniture style is relatively rustic, while many of the city's major hotels have more luxurious interiors, and the style of furniture used in the two is completely different.

### (2) Decorative fabrics

In the interior soft decoration, decorative fabrics can also play a very good decorative effect, such as curtains, carpets, dolls, chair cushions, etc. are common decorative fabrics in the interior space. These decorative fabrics made of natural materials are not only soft and comfortable, but also can bring a warm and comfortable feeling to the whole building interior space. Generally speaking, the decorative fabrics used in different architectural spaces will be different, for example, the house used for meeting and talking can use wall carpets and other objects to decorate the walls, so that the decorative effect and the function of the room in harmony, so that people can naturally relax in such an indoor environment.

### (3) The artwork furnished

Artwork can further accentuate the atmosphere of the room, reflecting the taste of the room owner. From the current interior decoration commonly used in decorative items, one is mainly practical, both decorative furnishing supplies, such as utensils, sculptures, etc. Among them, the vessels used to hold things and can be made into leaf shape, as if people in nature with leaves to hold food, as interesting. Another kind is purely for decorative furnishings, such as bionic specimens, handicrafts, etc. For example, in the process of designing an art exhibition hall in Beijing, the designer made specimens of bird feathers and used them as decorations for the hall because of the local white bird festival.

### (4) Lighting fixtures

In the interior decoration, lamps and lanterns not only play the role of lighting, but also the main products to set the atmosphere, with the effect of decorating the interior environment.

Some buildings use lamps and lanterns that are hand-woven, which can reflect the beauty of craftsmanship while inheriting the weaving technology. Some buildings make full use of the light and shadow effect of the lamps to decorate the room, so as to bring out the atmosphere of the room, such as adding some wall wash lamps that can assist the decorations to show the effect of burning flame or water flow.

#### **4. CONCLUSION**

This paper shows that the application of natural elements in modern interior design has become an important design trend by analyzing the design concept and effect of natural elements in the interior environment, and the way they are applied in architectural decoration interior design. The application of natural elements can bring more life and vitality to the interior environment, while satisfying people's needs both psychologically and in terms of practical use. Therefore, in the process of interior design, designers should pay more attention to the application of natural elements in the interior, and create a more comfortable, safe and healthy interior space through clever combination and application.

## ABSTRACT

Big data provides an innovative path for the integration of intelligent party building and civic education. This paper constructs the structural level of the intelligent party building system based on big data technology, and designs the functions and boundaries of the system from four levels: technology, data, application and users. With the help of big data analysis on the integration of party building and thinking education for nurturing people, the problems and integration effects of collaborative nurturing are discussed. In terms of the guidance of collaborative parenting, 65.42% of the study sample failed to meet the standard. In teaching practice, a larger proportion of teachers are not clear about how to bring into play the integration of intelligent party building and civic education. This study can provide a reference for the integration of party building and thinking education.

## KEYWORDS

Intelligent party building; Civic education; Big data analysis; Collaborative education; Teaching practice

## 1. INTRODUCTION

Wisdom party building in higher education mainly relies on diverse technical means, such as the Internet, to better realize the reliable transmission of information. Moreover, in the actual integration of party building work, it is possible to understand the situation of party building activities and to regulate reliability according to the actual work in order to facilitate the development of targeted measures for better regulation and control, which will reflect the role of wisdom [1-3]. At the same time, in the context of the stable development of big data, students can use the Internet to obtain information without the constraints of time and space [4-5]. Party building in higher education can have a certain understanding of the dynamic situation of party members through the use of a variety of data and information, which helps to scientifically optimize the mode of Civic Education, effectively integrate online and offline forms, and effectively improve the integration effect of intelligent Party building and Civic Education [6-7]. Feng, L et al. proposed a path optimization method based on deep learning for the integration innovation of Civic Education, which helps the Civic transformation of thinking [8]. Wang, N researched that there is a problem of insufficient integration in college Civic Education and used hierarchical analysis to construct a recommended method for Civic Education [9].

## 2. ESTABLISHMENT OF INTELLIGENT PARTY BUILDING SYSTEM IN COLLEGES AND UNIVERSITIES BASED ON BIG DATA

### 2.1. HIERARCHY OF BIG DATA SMART PARTY BUILDING SYSTEM STRUCTURE

The structure of the intelligent party building system of colleges and universities refers to the form of connection between several elements that make up the intelligent party building system of colleges and universities. The intelligent party building system of colleges and universities in the era of big data is a three-dimensional and multi-level network structure covering four layers of technology, data, application and users. The layered structure of big data wisdom party building system is shown in Table 1. At the technical level, with the upgrade and addition of information technology such as big data, cloud computing and artificial intelligence, the optimization of the intelligent party construction system in colleges and universities has a more powerful technical support. At the level of data resources, building a party construction data resource base with massive information is the basis for the construction of intelligent party construction system in colleges and universities, which includes basic information data, decision analysis data, business data and service data of teachers, students and party organizations at all levels. At the application level, the intelligent party construction system of colleges and universities integrates various applications such as talent cultivation, discipline construction, scientific research, social service and cultural construction. At the user level, the party committee of the university, party organizations at the college level, party branches of teachers and students, faculty members and student party members belong to four levels, with intersecting and independent user needs and functional requirements.

**Table 1.** Big Data Smart Party Building System Layered Structure

Levels	Application or object
User Layer	Party organizations at the faculty level, faculty and student awareness branches, staff and student members
Application Layer	Talent cultivation, discipline construction, scientific research, social services
Data Layer	Basic information data, decision analysis data, JUE organization activity data
Technical Layer	Big data, Internet, Internet of things, cloud computing, artificial intelligence

### 2.2. BIG DATA WISDOM PARTY BUILDING SYSTEM BOUNDARY DESIGN

Openness is one of the important features of the system. In the era of big data, the characteristics of information technology determine the openness of university wisdom party building system. Big data focuses on the correlation relationship between things, and the college wisdom party building system in the era of big data is an open system that explores the correlation relationship. It breaks through the limitation of traditional university party construction in time, space and territory, and relies on open network environment and data mining technology to collect and summarize the party construction data scattered in various departments and units. Through the data sharing platform, it realizes the integration between it and the external environment, so that the party construction big data resources gradually move toward open platform and open content.

### 2.3. EVOLUTION OF BIG DATA SMART PARTY BUILDING SYSTEM

The system has dynamic characteristics and evolution marks the movement, change and development of the system. The intelligent party building system of universities in the era of big data has dynamic evolutionary characteristics. The dynamism of the system is expressed by the fact that the external environment and internal conditions of the system are constantly evolving and developing. From the external environment, the core of intelligent party construction in colleges and universities is party construction, and with the development of the

times and changes of party conditions, the party construction work in colleges and universities should also keep pace with the times. From the internal conditions, the intelligent party construction system in colleges and universities is a complex system integrating people, technology and resources. In terms of technical update, the information technology such as big data, Internet of things and cloud computing, which is relied on for the construction of the intelligent party construction system in colleges and universities, is developing at a high speed, and the iterative upgrade of advanced technology forces the construction of the intelligent party construction system in colleges and universities to be updated continuously.

### 3. ANALYSIS OF THE INTEGRATION OF INTELLIGENT PARTY BUILDING AND CIVIC EDUCATION

#### 3.1. ANALYSIS OF THE PROBLEM OF INTEGRATING PARTY BUILDING AND CIVIC EDUCATION TO EDUCATE PEOPLE

Based on the big data analysis of the fusion of intelligent party construction and Civic Education in colleges and universities, the problems of Civic Education in colleges and universities at this stage are shown in Figure 1. The integration problem of party construction and thinking and politics is the most urgent one, accounting for 74.35%. This indicates that the current thinking and political education is often easily detached from party building and fails to bring into play the effect of synergistic education of the two. In terms of the guidance of collaborative education, 65.42% of the study samples failed to meet the standard. In teaching practice, a larger proportion of teachers are not clear about how to bring into play the integration of intelligent party building and civic education.

Figure 1. Problems of thinking and educating people in colleges and universities

#### 3.2. ANALYSIS OF THE INTEGRATION EFFECT OF INTELLIGENT PARTY BUILDING AND CIVIC EDUCATION

In the process of party building work, relevant staff actively use modern Internet and computer technology to carry out their work, integrate party building with modern science and technology, and realize the sharing of information resources. In the process of nurturing people in colleges and universities, there are two focuses, one is knowledge nurturing and the other is ideology nurturing. And party construction as the main way of ideological nurturing, colleges and universities should also actively take advantage of the development of the times when carrying out nurturing work with the help of party construction, and use intelligent party construction for education. The synergistic effect of ideological education and intelligent party

construction in colleges and universities is shown in Figure 2. Through the integration of smart party construction and ideological education, students' moral education has improved by 12.6%, the correctness of values has improved by 9.4%, and the motivation of study has improved by 10.9%. The integration of smart party construction and ideological and political education in colleges and universities is helpful to both the formation of correct concepts and the cultivation of moral literacy of students, and also has a positive effect on the improvement of students' comprehensive quality and awareness of maintaining socialist development.

**Figure 2.** Synergistic effect of Civic Education and Smart Party Building

#### 4. THE INTEGRATION PATH OF INTELLIGENT PARTY BUILDING AND CIVIC EDUCATION

The traditional mode of ideological and political education in colleges and universities is mainly based on teachers' oral lectures and ideological and political classroom lectures and college counselors' talks with students, which has certain limitations. Teachers in the front line of party building and ideological and political work in colleges and universities can innovate the carrier and explore new paths, actively use new platforms, such as Learning Power, microblogs, weibo, video open class, offline theme activities, etc., to exchange ideas and information with students and guide them to think deeply about social and current affairs and three attitudes. In actual teaching, teachers should pay attention to the latest data on the Internet that carry positive social energy, analyze and evaluate them, give play to their value, improve the attractiveness of teaching resources, and guide students to internalize their political identity. Party building and ideological and political workers can recommend various kinds of software that help students' political learning and cultural enhancement among student groups, and guide students, especially some party activists and reserve members, to use fragmented time to receive political theoretical knowledge and cultural classics.

#### 5. CONCLUSION

The era of big data provides help for education reform, but is equally laced with implications that need to be widely appreciated. In this paper, the structural level of the smart party building system is constructed based on big data technology, and the system boundary of smart party building is designed. Through the integration of smart party construction and Civic Education, students' moral education has improved by 12.6% and the correctness of values has increased by 9.4%. At the stage of practical teaching in colleges and universities, the integration of intelligent party construction and civic education is an inevitable trend of education reform, and the importance of model innovation should be strengthened and the use of teaching resources should be expanded. With the guidance of cognitive education, we lay the foundation for

intelligent party building and cultivate students' core values.

## ABSTRACT

The traditional assessment method of ideological and political theory class in colleges and universities has been unable to meet the requirements of the information technology era. In this paper, based on the exploration of the transformation of informatization of the theory class of college ideological and political education, the teaching information of ideological and political theory class is collected on the multi-data chain network based on the operation records of different user roles. Through the feedback of the learning process, the informatization assessment mechanism of the Civics and Political Science class is established. The indexes of the informatization assessment mechanism increased on average 0.204 in validity compared with the traditional model. The informatization assessment mechanism can effectively develop a comprehensive evaluation of students' level of Civics.

## KEYWORDS

Multiple data chains; Operational records; Teaching information; Learning process feedback; Ideological and political assessment in universities; Information-based assessment

## 1. INTRODUCTION

The goal of higher education is to cultivate socialist builders and successors who develop morally, intellectually, physically and aesthetically in an all-round way, and in order to effectively implement the fundamental task of establishing moral education, colleges and universities need to adapt to the background of the information age are beginning to implement educational teaching reform [1-2]. Assessment and evaluation is a necessary part of ideological and political theory courses in colleges and universities, which connects the two aspects of teachers' teaching and students' learning, and is an important means of teaching and learning for both teachers and students [3-4]. At present, the Internet and education are deeply integrated, the process of education informatization is continuously promoted, traditional teaching methods are undergoing profound changes, and technological innovation in the field of education has promoted the emergence of various informatized teaching tools, which provides new ideas for the assessment and evaluation of Civics and Political Science courses [5-7]. At present, there are still some obvious problems in the evaluation of students' academic assessment in Civics and Political Science courses. Facing the objective problems, colleges and universities must have a keen awareness and firm reform power, actively use the new opportunities and tools given by the informationized teaching environment, explore the optimization strategies of assessment and evaluation of Civics and Political Science courses, and continuously promote the scientificization of the assessment and evaluation process of Civics and Political Science courses [8].

Who should assess and evaluate the Civics course is an important issue. The traditional view is that the lecturer is the ex-officio subject of assessment and the only subject of assessment [9-10]. Nowadays, this old concept is changing, and both teaching management and Civics teachers gradually realize the unscientific nature of the single assessment and evaluation subject. If only the classroom teachers are involved in assessment and evaluation, students can only passively accept the results of teachers' assessment [11-13]. This model makes students just a learner and receiver of knowledge in teaching activities, and they do not participate in teaching management. In this paper, we propose a multi-data chain network assessment mechanism for information-based teaching to address the above problems.

## **2. MULTI-DATA CHAIN NETWORK OF COLLEGE CIVIC EDUCATION**

### **2.1. INFORMATION TRANSFORMATION OF CIVIC EDUCATION THEORY CLASS IN HIGHER EDUCATION**

#### **2.1.1. SMART TEACHING PLATFORM**

With the rapid development of information technology, the Internet and education are being deeply integrated, and college students growing up in the informationized environment have undergone profound changes in both learning habits and cognitive styles, with mobile learning and independent learning becoming the mainstream trend. In line with this learning trend, various smart learning platforms have emerged.

#### **2.1.2. INFORMATION-BASED TEACHING FOR CIVICS TEACHERS**

The development trend of education informatization objectively requires both sides of teaching, especially teachers, to improve their informatization ability. Specifically, informatization ability includes the basic information literacy appropriate to the information age, the ability to master the use of information technology tools and software, the ability to access and manage information resources, the ability to integrate information technology with the curriculum, etc.

#### **2.1.3. FEEDBACK ON THE LEARNING PROCESS**

The science of assessment and evaluation inherently requires that learner information be recorded throughout the process. It is extremely unscientific to focus solely on summative assessment and to use a single test paper to determine grades. It is because it erases students' daily accumulation, ignores their growth process, and tends to emphasize commonalities over individuality when evaluated in a uniform manner. Civics teachers can increase the supply of teaching resources through classroom interactive tools, so that learners can learn anytime and anywhere becomes a reality.

### **2.2. INFORMATION COLLECTION OF CIVIC THEORY CLASSES BASED ON MULTIPLE DATA CHAINS**

The relevant data collection content involved in the management of college Civics courses is based on the operation records of different user roles. Therefore, the sub-module of course management belongs to OLTP. In the OLTP scenario, in order to facilitate the simplification of the data extraction process, a fuzzy data model of student information is established, and it is extracted based on the system logs. The student information space model is shown in Equation (1), and the course information space model is shown in Equation (2).

$$S = \begin{bmatrix} S_{11} & \cdots & S_{1a} \\ \vdots & \ddots & \vdots \\ S_{b1} & \cdots & S_{ab} \end{bmatrix} ab \quad (1)$$

$$T = \begin{bmatrix} t_{11} & \cdots & t_{1a} \\ \vdots & \ddots & \vdots \\ t_{b1} & \cdots & t_{ab} \end{bmatrix} x b \quad (2)$$

Where  $S$  is the student ID number,  $b$  is the course name, and  $x$  is the instructor ID number.

This information is stored in the data table of MySQL database to facilitate the system to use the uniqueness of ID to query the information of students and teachers as the model data basis for establishing the correlation table.

### 2.3. INFORMATION-BASED ASSESSMENT SYSTEM OF THE CIVIC THEORY COURSE IN HIGHER EDUCATION

The analysis and extraction of information data should construct a course evaluation index system according to the teaching objectives of the college Civics course, clarify the assessment content factors, construct weights and account for the evaluation levels. Firstly, the individual factors of each assessment content are assigned the corresponding weights  $a_k (k=1,2,3)$  to meet  $a_k \geq 0$ . Secondly, the fuzzy evaluation matrix of individual factors in the assessment content is established to represent the fuzzy relationship between the evaluation of the set of factors  $R$ :

$$R = \begin{bmatrix} r_1 & \cdots & r_n \\ \vdots & \ddots & \vdots \\ r_3 & \cdots & s_{3n} \end{bmatrix} \quad (3)$$

where  $r_n$  is the  $n$ th term of the selected individual factor and  $s_{3n}$  is the  $3n$ th term of the selected individual factor.

The single-factor fuzzy evaluation only reflects the influence of one factor on the evaluation results, there is one-sided, need to consider the influence of all factors, in order to come up with a more reasonable assessment results.  $R$  of the  $n$  line response  $n$  factors  $U_n$  influence the degree of the evaluation of the evaluation elements. This leads to a fuzzy comprehensive evaluation  $B$ :

$$B = A \square R = [a_1, a_2, a_3] \cdot \begin{bmatrix} r_1 & \cdots & r_n \\ \vdots & \ddots & \vdots \\ r_3 & \cdots & s_{3n} \end{bmatrix} = [b_1, b_2, b_3] \quad (4)$$

Where,  $A$  is the value of weights taken. The assessment content, i.e., attendance, daily assessment, and stage formative assessment results, are taken as three evaluation indexes, and the results of the evaluation indexes are calculated using the weighted average method. The results of the evaluation indexes are calculated by using the weighted average method. First, they are normalized to the weights of each item, and then multiplied by their corresponding percentage scores for a weighted average, which is the final score of the course for students.

### 3. ANALYSIS OF THE APPLICATION OF INFORMATIZATION ASSESSMENT OF COLLEGE CIVIC THEORY COURSE

#### 3.1. ANALYSIS OF THE REASONABLENESS OF THE INFORMATION ASSESSMENT MECHANISM

In order to explore the effectiveness of the information-based assessment mechanism of college ideological and political education theory class based on multi-data chain network, it is compared with the traditional assessment methods. The comparison of different assessment methods of ideological and political science classes is shown in Figure 1. According to the feedback from different classes, compared with the traditional assessment mechanism, the informatization assessment method is more scientific, and the rationality is increased by 14.52% on average. The information-based assessment mechanism is a developmental assessment made by continuous observation and recording of the whole process of student learning, which can effectively motivate students to learn to help them regulate their own learning process and give them a sense of accomplishment to enhance their confidence, thus transforming them from passive recipients of assessment to active participants of the assessment subject.

Figure 1. A comparison of different assessment methods for Civics courses

#### 3.2. ANALYSIS OF THE EFFECTIVENESS OF THE INFORMATION ASSESSMENT MECHANISM

In order to determine whether the information assessment mechanism of Civic Education theory class combined with multivariate data chain network can truly and effectively reflect the actual level of students, this paper uses fuzzy comprehensive evaluation to comprehensively verify the assessment indexes. The validity of the assessment indexes of the Civic Education theory course is shown in Figure 2. The indicators of the information assessment mechanism relative to the traditional model in terms of validity increased on average by 0.204. The traditional teaching and evaluation of ideological and political courses are too one-sided and do not really explain the ideological and political course performance of the education students, which is not conducive to the background information of the ideological and political course teaching reform education.

**Figure 2.** Validity of assessment index of Civic Theory course

#### **4. THE REFORM PATH OF INFORMATIZATION ASSESSMENT OF COLLEGE CIVIC THEORY COURSE**

With the advancement of information technology, it is possible to make effective adjustments based on the previous grading standards, and then to achieve comprehensiveness, as well as to carry out targeted reform of teaching evaluation with the advantage of information sharing. The teaching evaluation of ideology and politics in colleges and universities can be completed with the help of many different information technologies to complete a comprehensive assessment, integrating the usual grades, practical behavior and final grades to a great extent, while adjusting the ratio of the three, especially for the practical and usual grades link to make the corresponding increase, avoiding formalization and highlighting the authenticity.

#### **5. CONCLUSION**

In the context of informatization, this paper collects teaching data related to ideological and political theory courses in colleges and universities through a multi-data chain network and establishes an informatized assessment system through a quantitative approach. Compared with the traditional assessment mechanism, the informatization assessment method is more scientific and the rationality is increased by 14.52% on average. In the age of informatization, teachers take advantage of many different current advanced technologies to achieve a great degree of enrichment and diversification of evaluation subjects. It is necessary to draw on not only teachers' evaluation, but also students' own evaluation and mutual evaluation among students. The evaluation system is more and more comprehensive, transparent, and effectively recognized in its objectivity.

# STUDY ON THE OPTIMIZATION OF THE ECONOMIC MANAGEMENT MODEL OF ENTERPRISES COMBINED WITH MARGINAL ANALYSIS

---

Guohua Liu\*

Graduate School, Lyceum of the Philippines University-Manila, Manila, 0900, Philippines

[15632375324@163.com](mailto:15632375324@163.com)

---

## ABSTRACT

Under the new economic situation, the model of enterprise economic management needs to be further optimized. This paper proposes a framework for economic efficiency audit in enterprise economic management based on marginal analysis, and explores the calculation method of marginal profit under unconstrained conditions. The equimarginal law is constructed for the constrained conditions, and the marginal analysis curve of production and sales is established through incremental analysis. For the marginal analysis of a regional metalworking enterprise A, the profit of the enterprise is to be maximized, i.e., the value of the derivative function of the marginal profit function is to be zero. The value of independent variable  $x$  satisfying this condition is 220, and the maximum profit is 31.08 million yuan. The marginal analysis can provide a quantitative reference for the economic management of the enterprise.

## KEYWORDS

Marginal analysis; Marginal profit; Incremental analysis; Enterprise economic management; Efficiency audit

## 1. INTRODUCTION

Under the market economy system, enterprises are facing huge pressure of survival and competition [1-2]. Enterprise economic management work should be constantly innovated, and at the same time combined with enterprise strategic planning, it can make enterprise economic management work more smoothly and better regulate enterprise economic activities, so that enterprise economic management activities can be more relevant to the development of enterprises in the new situation [3-5]. Enterprise economic management work is an important part of the daily management of enterprises [6]. Enterprise managers should improve the efficiency of enterprise economic management by establishing a good economic management concept and improving the efficiency of enterprise economic management to achieve the purpose of improving the economic efficiency of enterprises [7-8].

With the improvement of information technology, more and more emerging technologies are used in enterprise economic management. Santoro, G et al. applied big data analysis to enterprise economic management and designed a big data deployment framework for the business management of retailer enterprises [9]. Oyewo, B et al. oriented to the economic management of consulting firms, analyzed the effect of data applications on the improvement of business competitiveness using least squares regression with respect to big data technology [10]. Globocnik, D et al. proposed an integrated management framework for corporate strategic planning and business models, which provides a scientific decision-making process for goal planning [11]. Brenner, B proposed a sustainable business management model based on a

reconstructionist and value-sharing reasoning framework [12]. This paper, on the other hand, applies marginal analysis to the optimization of economic management of enterprises, and empirically analyzes the management decision of profit maximization of enterprises by exploring the analysis of different constraint scenarios with a typical enterprise.

## 2. ECONOMIC MANAGEMENT OF ENTERPRISES BASED ON MARGINAL ANALYSIS METHOD

### 2.1. MARGINAL ANALYSIS METHOD

Marginal analysis decision method is one of the basic research methods in economics and plays a considerable role not only in theory, but also in practice. The mathematical principle of the marginal analysis method is simple. For the discrete case, the marginal value is the ratio of the amount of change in the dependent variable to the amount of change in the independent variable. For the continuous case, the marginal value is the value of the derivative of the dependent variable with respect to some independent variable. So the meaning of the margin itself is the rate of change of the dependent variable with respect to the independent variable, or the amount of change in the dependent variable when the independent variable changes by one unit. The marginal analysis decision method embodies the idea of forward-looking decision making and is a central tool in the search for optimal solutions.

### 2.2. MARGINAL ANALYSIS OF ENTERPRISE ECONOMIC EFFICIENCY AUDIT

#### 2.2.1. UNCONSTRAINED CONDITION

Profit maximization is the fundamental goal of the firm's decision making considerations. Profit maximization is obtained at the point where marginal profit is equal to zero, which is also the difference between marginal revenue and marginal cost:

$$MB = MR - MC \quad (1)$$

The economic decision of the enterprise can thus be evaluated in such a way that such economic activity is desirable as long as the marginal revenue is greater than the marginal cost. Under unconstrained conditions, the amount of input of resources is optimal and economic efficiency is maximized when the value of marginal profit is zero.

#### 2.2.2. WITH CONSTRAINTS

The following optimality law can be obtained for the constrained case. Under the constrained condition, the marginal benefits per unit increase in resources are equal in all directions, and the constraints are satisfied at the same time, and the total benefits of resource allocation are optimal. This law is also called the law of equal margins. The calculation of the extreme value with constraints is modeled and normalized to obtain:

$$\begin{cases} \min f(x) \\ g_j(x) \geq 0 \end{cases} \quad (2)$$

where  $f(x)$  is the objective function and  $g_j(x)$  is the constraint.

If  $g_j(x^{(k)}) = 0$ , then  $g_j(x)$  is the acting constraint at the point  $x^{(k)}$ . According to the Kuhn-Tucker condition, the desired extremal point  $x^*$  should satisfy

$$\begin{cases} \nabla f(x^*) - \sum \gamma_j \nabla g_j(x^*) = 0 \\ \gamma_j g_j(x^*) = 0 \\ \gamma_j \geq 0 \end{cases} \quad (3)$$

where  $\gamma_j$  is the Lagrangian multiplier.

The extreme value point of the objective function can thus be obtained. When the resource under consideration is money, the constrained optimality law is that the marginal benefit of each additional dollar in each direction is equal while the constraint is satisfied. If the funds are used to purchase resources, and the prices of resources in each direction are constant, respectively, the constrained optimization law is that the ratio of marginal benefits to prices in each direction is equal to a constant while satisfying the constraint.

### 2.2.3. INCREMENTAL ANALYSIS

Incremental analysis is a variation of marginal analysis, which involves an incremental amount of change in the independent variable. The exact rate of change of the function formed by this trace change is

$$f'(x) = \frac{f(x + \Delta x) - f(x)}{\Delta x} \quad (4)$$

The above equation is the concept of marginality, which is mathematically expressed as a derivative. Incremental analysis is the analysis of the impact of a certain decision on revenue, cost or profit. The decision referred to here can be a large number of changes in variables, including discrete, jump changes, or non-quantitative changes. For example, the value of the change in variables caused by different decisions is analyzed by comparing different technical conditions and different environments. The marginal analysis curve of production and sales is shown in Figure 1. Marginal analysis can be used to determine the optimal goal of production and operation. The optimal goal of production and operation of an enterprise, such as the lowest cost and the most profit, can be determined by using the method of marginal analysis to determine its optimal marginal point. For example, the production volume that can make the enterprise achieve the lowest cost, what is the sales volume that can realize the most profit, etc.

**Figure 1.** Marginal analysis curve of production and sales

### 3. STUDY OF MARGINAL ANALYSIS OF ENTERPRISE ECONOMIC MANAGEMENT

#### 3.1. EMPIRICAL ANALYSIS OF ENTERPRISE ECONOMIC MANAGEMENT

In order to propose an optimal model of enterprise economic management based on marginal analysis, this paper takes a certain enterprise in a certain region as a case study. There is a metalworking enterprise A in a certain region, which needs to produce a batch of metalworking products in a production quarter under the market demand. The marginal analysis of economic management for enterprise A is shown in Table 1. Let  $x$  be the output of the product, the total cost function of the metal parts needed to produce this product is  $C(x) = 0.9 * x^2 + 82 * x + 5600$ , and the total revenue function is  $R(x) = 0.62 * x^2 + 165 * x$ . The ultimate goal of the enterprise is to maximize the profit of the enterprise, that is, to make the marginal profit function to achieve the maximum. The first step is to make the marginal revenue equal to the marginal cost, or marginal profit is zero, that is, the value of the derivative function of the marginal profit function is zero. The value of the independent variable  $x$  under this condition is 220, and then the rate of change of marginal revenue should be less than the rate of change of marginal cost, which translates into a marginal function of  $d^2L / dx^2 = -0.45 < 0$ , so the requirement is met. The value of  $x$  obtained above is brought into  $L(x)$  to obtain the maximum profit of the enterprise of 31.08 million yuan.

**Table 1.** Marginal analysis of economic management of enterprise A

Variables	Function	Fetch/ 10000 yuan
Total Costs	$C(x) = 0.9 * x^2 + 82 * x + 1600$	63200
Total Revenue	$R(x) = 0.62 * x^2 + 165 * x$	66308
Profit	$L(x) = -0.28 * x^2 + 83 * x - 1600$	3108
Marginal profit	$L'(x_0) = \lim_{\Delta x \rightarrow 0} \frac{L(x_0 + \Delta x) - L(x_0)}{\Delta x}$	-
Marginal revenue	$M_R(x) = 1.25 * x + 180$	455
Marginal Costs	$M_C(x) = 1.7 * x + 90$	464

#### 3.2. OPTIMIZATION OF THE MODEL OF ENTERPRISE ECONOMIC MANAGEMENT

For enterprises with different business models, in the process of actual optimization decision making, it is necessary to initially decide on each decision goal and to divide in detail the goals of pending problems and subsequent work implementation. In particular, in the process of applying marginal contribution analysis and safety analysis methods, it is necessary to make a detailed classification of each production and management activity and to divide the decision objectives and economic efficiency output target values from the top down. From the perspective of management accounting and senior management, the decision targets are decided, and the threshold of profit and loss values are also divided in detail, and the marginal contribution values and safety margins are compared and analyzed to ensure that each internal product pricing and other business decision items can be implemented smoothly. In the process of deciding each business decision objective, it is necessary to make a detailed classification of decision objectives and methodological tools in the process of comparative analysis of data indicators such as total, average and marginal behavioral volumes, combined with actual business management data information and the current status of the company's activities.

### 4. CONCLUSION

The optimal application of marginal analysis in economic management requires binary and ternary statistical analysis of various business data within the enterprise, the development of

business decision targets at different stages, and the hierarchical use of marginal contribution and safety margin analysis methods. Traditional data processing technology can no longer meet the needs of the times, and for this reason, enterprises must strengthen their understanding of the importance of data technology. The value of data analysis technology in enterprise economic management is brought into play by improving relevant talent management mechanisms, building information platforms, and optimizing internal controls, thus promoting sustainable development of enterprises while enhancing their core competitiveness.

# ANALYZING THE ROLE OF TOURISM ENGLISH TRANSLATION ON TRADITIONAL CULTURE TRANSMISSION USING GAME THEORY

---

Feng Li\*

School of Foreign Languages, Jinling Institute of Technology, Nanjing, Jiangsu, 211169, China

[lifeng\\_781220@163.com](mailto:lifeng_781220@163.com)

---

## ABSTRACT

Starting from cultural communication and tourism English translation, we analyze the role of tourism English in traditional cultural communication. This paper constructs a basic framework of game theory based on three levels of strategy, participants and benefits, and classifies the results of cultural games into assimilation type and integration type. On the basis of the cultural game, the role of tourism English translation on traditional cultural communication is studied from different levels. The average degree of influence of tourism English translation on traditional cultural communication reached 0.324, and tourism English translation should play its role of cultural communication to meet tourists' needs to understand Chinese culture.

## KEYWORDS

Game theory analysis; Cultural game; Traditional cultural communication; Tourism English translation; Assimilation type

## 1. INTRODUCTION

In the context of today's rapid social development, China's tourism industry is rapidly progressing and gradually moving toward internationalization [1-2]. In order to better welcome foreign tourists and bring high quality tour guide services to them, the tourism industry needs to strengthen the application of cross-cultural awareness in the introduction of attractions as well as in the translation process. Different countries are very different in terms of region and culture [3-5]. Therefore, tour guides should not simply use direct translation in the translation process, which can result in inaccurate translations and misunderstandings. Rather, the attractions and the specific things in the attractions should be presented in an easy-to-understand manner according to cultural awareness, cultural differences between different languages and different countries, and language differences [6]. Some studies point out that English translation is almost an essential presence in transnational tourism, and how to properly understand cultural differences between cross-international and accurately translate cultural terms of tourist attractions becomes an important skill for English translation in every tourist attraction [7]. Other studies have argued that different cultures have different effects on English translations of tourist attractions [8]. Translation researchers have suggested that in applying cross-cultural awareness to English translations of tourist attractions, it is necessary to try to preserve the information and content in the text under the purpose orientation of the tourist text [9].

## 2. GAME THEORY MODEL OF CULTURAL COMMUNICATION

### 2.1. CLASSICAL GAME THEORY MODELS

#### 2.1.1. BASIC FRAMEWORK OF GAME THEORY

Game theory, also known as response theory, is a branch of operations research, which mainly uses mathematical tools to study how each decision maker makes a decision in favor of himself or a group of decision makers based on the information he has. It originated from economics and is now commonly used in social, political and transportation fields. The three elements of participants, strategy sets and benefits form a game pattern. The participants are the subjects of the game, not only individuals, but also make a group of people, organizations, companies and governments, where the set of participants of a  $n$ -person game is expressed as

$$N = \{1, 2, \dots, n\} \quad (1)$$

A strategy set is, as the name implies, the set of all strategies, where the set of strategies of participant  $i (i \in N)$  is denoted by  $S_i$ . The set of strategies of all participants is denoted as

$$S = \{S_1, S_2, \dots, S_n\} \quad (2)$$

The combination of strategies for all participants is expressed as

$$s = \{s_1, s_2, \dots, s_n\} \quad (3)$$

The outcome after a game is called the gain, which can be some quantitative value or some utility that can be quantified, such as satisfaction. The vector of gains for all participants is expressed as

$$u = \{u_1, u_2, \dots, u_n\} \quad (4)$$

A typical game can be expressed as follows:

$$G = \{N; S_1, S_2, \dots, S_n; u_1, u_2, \dots, u_n\} \quad (5)$$

#### 2.1.2. TYPES OF CULTURAL GAMES

When culture A and culture B play a game, the dominant culture forces itself into the weaker culture, so that the receiving culture cannot play its subjectivity. Thus, the dominant culture replaces the original cultural factors, resulting in the essential change or even disappearance of the latter, which is then assimilated and integrated. This is the result of assimilation in the cultural game. After the game between culture A and culture B, the two cultures are influenced by each other to different degrees and integrated, but both still retain their own cultural components. This is the result of the integration of the culture game.

## 2.2. CHARACTERIZATION OF CULTURAL GAMES

### 2.2.1. PARTICIPATING SUBJECTS

In the cultural game, the cultural strength and influence of the participating subjects of different cultures vary. The first is the inequality of the culture owned by the participating subjects, including the cultural resources and cultural traits, etc. An open, inclusive and innovative culture must be more competitive and influential than a closed, conservative, backward and xenophobic culture. The second is the inequality in the ability of participating subjects to use cultural resources. Some countries rely on their strong political and economic strength, have the priority of acquiring information and the monopoly of shaping the discourse, and use humanistic exchanges and commodity trade to occupy the initiative of cultural export

and put their own culture in a strong position.

### 2.2.2. NON-ZERO COINCIDENCE OF GAME FORMS

In the era of globalization, the forms and means by which different cultures participate in the game are increasingly diverse, and the fierce competition and game between cultures often unfold in a mild and hidden cooperative manner. It is often hidden in the process of international cultural communication, exchange and cooperation through the appearance of commodities and capital.

### 2.2.3. GAMING PROCESS

The game between cultures is a complex process in which static and dynamic games coexist, and the participants in the cultural game respond to each other by judging each other's strategies and behaviors, which is dynamic in nature. However, such responses usually do not occur simultaneously, and the culturally dominant party adopts more covert and diverse game tactics, so that the culturally disadvantaged party lacks prevention and cannot formulate timely response strategies, resulting in continuous cultural erosion.

## 3. GAME ANALYSIS OF TOURISM ENGLISH ON TRADITIONAL CULTURE COMMUNICATION

### 3.1. ANALYSIS OF DISSEMINATION CHANNELS

English translation for tourism is a special cross-cultural communication channel. With the continuous development of tourism, most overseas tourists travel to China with the main purpose of not only viewing historical monuments but also, to a large extent, to learn about the customs of foreign countries and cultures. The role of tourism English translation on cultural communication channels is shown in Figure 1. With the gradual improvement of all aspects of tourism English translation, the richness of traditional cultural transmission pathways increases from 0.509 to 0.914. After the adjustment of game theory analysis, the richness is adjusted to a shift from 0.541 to 0.824.

**Figure 1.** The role of tourism English translation for cultural transmission channels

### 3.2. CULTURAL EXCHANGE ANALYSIS

In Chinese, the most important feature of tour guide words is the extensive use of adjectives decorative words to attract tourists. The influence of tourism English translation on traditional cultural communication is shown in Figure 2. Based on the analysis of game theory, the average degree of influence of tourist English translation on traditional cultural communication reaches 0.324. Through tourist English translation, tourists can understand the historical and cultural connotation of China and enjoy the beautiful scenery while providing them with more

cultural information.

**Figure 2.** The role of tourism English translation for traditional cultural exchange

### 3.3. ANALYSIS OF CULTURAL FEEDBACKS IN THIS PAPER

In the process of cultural gaming, it is more the result of the integration of cultural gaming. Tourism translation often has to highlight its historical and cultural accumulation and national cultural characteristics, which in turn promotes the development of local culture. The promotion effect of tourism English translation on the development of local traditional culture is shown in Figure 3. Through the results of the game analysis of both cultures in the process of tourism English translation, the development degree of native culture is enhanced by 12.7% on average. Tourism translation can promote the development of native culture in each tourism region of China, thus realizing the spread of native culture.

**Figure 3.** The role of English for tourism in the development of traditional culture

## 4. CONCLUSION

Based on the basic framework of game theory, this paper constructs a cultural game model and analyzes the role of tourism English translation on traditional culture communication from three levels: communication pathway, cultural exchange and cultural feedbacks. After the adjustment of the game theory analysis, the richness of traditional culture communication channels is adjusted to a shift from 0.541 to 0.824.

English translation for tourism is an effective way of cultural communication that crosses nationalities, cultures and languages to facilitate exchange and communication among people

around the world. Tourism English translation provides a channel for international cultural exchange. Through tourism English translation, the profound cultural connotation hidden in scenic spots can be expressed, helping overseas tourists to understand the human landscape as well as the cultural connotation, so that overseas tourists can improve their own cultural literacy in tourism.

# DYNAMIC PANEL ANALYSIS OF THE IMPACT OF CONSUMPTION ENVIRONMENT ON CONSUMPTION LEVEL OF RURAL RESIDENTS

---

Jianjun Zhu\*

Wuxi Vocational Institute of Commerce, Wuxi, Jiangsu, 214153, China

[thtgxovf@163.com](mailto:thtgxovf@163.com)

---

## ABSTRACT

This paper explores the mechanism of the influence of natural, economic and social environments on the consumption of residents, and then empirically investigates the growth of rural residents' consumption by establishing a dynamic panel model. The dynamic characteristic relationship between consumption environment and rural residents' consumption level is examined by adopting the VEC model which is a VAR model containing cointegration constraints and applying it to the effect of rural residents' consumption level with cointegration non-stationary time series. The results show that each 1% increase in village residents' income will promote their consumption to increase by 0.031%. The research in this paper has theoretical and practical implications for strengthening the improvement of rural residents' consumption level and promoting rural economic development.

## KEYWORDS

Dynamic panel model; Rural consumption; Cointegration constraint; VAR model; Time series

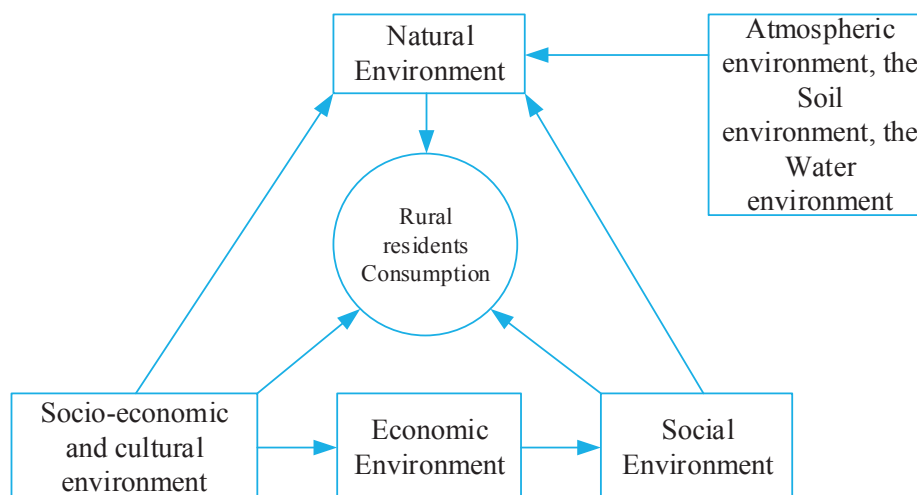

## 1. INTRODUCTION

With the unbalanced and insufficient economic development in urban and rural areas, rural residents face many challenges to improve their consumption level, among which the consumption environment is one of the important factors [1-2]. Changes in the consumption environment can directly affect the consumption behavior and consumption level of rural residents [3]. Past studies have concluded that changes in the consumption environment have a significant impact on the consumption levels of rural residents [4]. For example, building better transportation, communication, and logistics networks can provide rural residents with more convenient and faster consumption channels and services, thus stimulating their consumption potential [5-6]. Some scholars also believe that urban-rural integration and the development of digital economy can bring more consumption choices and consumption experiences to rural residents, which in turn can promote consumption upgrading and optimization of consumption structure [7]. However, changes in the consumption environment may also trigger some consumption risks and adverse consumption effects, such as information asymmetry and vicious competition, which may also have a negative impact on the consumption level of rural residents [8-9]. Therefore, a comprehensive analysis of the impact of the consumption environment on the consumption growth of rural residents can help establish more effective countermeasures to help build the rural economy.

## 2. THE MECHANISM OF CONSUMPTION ENVIRONMENT AFFECTING RURAL RESIDENTS' CONSUMPTION

### 2.1. IMPACT OF NATURAL ENVIRONMENT ON RESIDENTS' CONSUMPTION

The influence of consumption environment on residents' consumption is a complex and dynamic process, and the influence of natural environment, economic environment and social environment on residents' consumption has corresponding links, and the general model of the influence of consumption environment on rural residents' consumption is shown in Figure 1.

**Figure 1.** Model of the influence of consumption environment on rural residents' consumption

The natural environment is particularly important for rural residents' consumption, as the abundance of natural resources and the state of the natural environment determine the level of supply and processing of material resources for rural consumption, as well as consumer preferences for consumer goods. Currently, China's rural areas are generally a combination of traditional smallholder economy, modern cooperative economy and market economy, and industries such as planting, breeding, and related processing and distribution of agricultural products need good natural environment support.

According to consumption theory, the income of residents is an important factor in determining their consumption. The natural environment, which consists of natural resources such as land, on which rural residents depend, has an important impact on their consumption behavior and can directly regulate consumption by influencing consumption demand and consumption perception. It also indirectly affects consumption expenditure and consumption structure in the case of deterioration of the natural environment and residents' poor expectations of future income.

### 2.2. IMPACT OF ECONOMIC ENVIRONMENT ON RESIDENTS' CONSUMPTION

The economic environment has a clear impact on the growth movements of the population's consumption. On the one hand, economic growth is intuitively reflected in the increase of residents' income, and the increase of consumption due to the increase of income is the main mode of growth of residents' consumption. On the other hand, economic growth is also reflected in the government's ability to provide public services and improve the level of infrastructure construction. The improved construction of roads, railroads, communications and trading markets due to the increased level of economic development is of great importance in increasing the enthusiasm of rural residents for consumption, promoting the progress of consumption behavior and improving the consumption structure. In this context, the positive

development of the economic environment means that the residents' consumption upgrade is guaranteed to a certain extent.

### 2.3. THE INFLUENCE OF SOCIAL ENVIRONMENT ON RESIDENTS' CONSUMPTION

The main development trend of the current society is informationization and innovation. The national release of mass entrepreneurship, innovation and information technology development outline all list innovation and information development as the main value trend of the current social development. As a result of the development of material life and the gradual increase in the level of social needs, product quality and quality have become the key to the satisfaction of people's material needs. As a result, lean production, which is more practical, has become an important direction for the development of enterprises under the social development trend. In this process, rural residents began to increasingly transform to adequate consumption of material needs, especially in the context of the consumer economy, social consumption culture gradually formed, rural residents of advanced consumption needs such as cars, buildings, etc. in this process, so it can be seen that the social environment has a corresponding impact on rural residents consumption.

## 3. DYNAMIC PANEL ANALYSIS OF CONSUMPTION GROWTH OF RURAL RESIDENTS

### 3.1. MODEL SETTING AND ESTIMATION METHODS

In classical consumption theory, Dusenbery's relative income hypothesis suggests that residents' consumption is constrained by their past consumption habits and exhibits a strong ratchet effect, i.e., residents' consumption in the previous period will have a shock on current period consumption. Static panel models cannot interpret the impact of such shocks on residents' current period consumption, and this paper introduces a one-period lag of the explanatory variable rural residents' consumption escalation rate to set a dynamic panel model:

$$\begin{aligned} \ln csug_{it} = & \beta_0 + \beta_1 \ln csug_{it-1} + \beta_2 \ln rrd_{it} + \beta_3 \ln rkn_{it} + \beta_4 \ln ryn_{it} \\ & + \beta_5 \ln ncj_{it} + \beta_6 \ln cpr_{it} + \beta_7 \ln ltx_{it} + \varepsilon_{it} \end{aligned} \quad (1)$$

Considering that the model contains one period lags of the explanatory variables, there may be endogeneity problems leading to the inability to obtain consistent parameter estimates, so the VEC model adopted in this paper is a VAR model with cointegration constraints, which is mostly applied to model non-stationary time series with cointegration relationships. p-order VAR model is:

$$Y_t = A_1 Y_{t-1} + \dots + A_p Y_{t-p} + B X_t + \varepsilon_t \quad (2)$$

where  $Y_t$  is an m-dimensional nonsmooth  $I(1)$ -series,  $X_t$  is an n-dimensional deterministic variable, and  $\varepsilon_t$  is a new interest vector. After deformation, this can be rewritten as

$$\Delta Y_t = \sum_{i=1}^{p-1} \Gamma_i \Delta Y_{t-i} + \Pi Y_{t-1} + B X_t + \varepsilon_t \quad (3)$$

where,  $\Gamma_i = \sum_{j=i+1}^p A_j$ ,  $\Pi = \sum_{i=1}^p A_i - I_m$ , then the above equation is the vector error correction

(VEC) model for the growth of village consumption.

### 3.2. ANALYSIS OF MODEL EMPIRICAL RESULTS

The empirical analysis session uses OLS estimation methods to estimate moments for the dynamic panel model and the robustness model, and the results are obtained as shown in Table 1.

**Table 1.** Results of the empirical analysis of the model

	VEC model	VAR model
	1.005(115.238)	0.938(155.419)
	0.025(101.775)	0.289(15.51)
	0.031(13.389)	0.029(9.37)
lnSN	0.386(14.75)	0.041(79.92)
lnAB	0.051(5.663)	0.036(12.57)
lnDA	0.056(10.21)	0.069(5.38)
AR(1)	0.008	0.218
AR(2)	0.061	0.336
Sargan Test	0.875	0.903

Among them, it shows that the dynamic panel model set up in this paper has a good analysis effect. At the 1% significance level, the growth of residents' income has a significant positive effect on promoting consumption, and each 1% increase in rural residents' income will promote their consumption to increase by 0.031%. Meanwhile, the consumption environment variables set in this paper-*lnSN*, *lnAB*, and *lnDA* all have positive correlations on the consumption growth of rural residents, among which the social security level has a higher utility in promoting the consumption growth of rural residents. This is followed by natural environmental conditions, and finally, transportation and communication. The results indicate that accelerating the establishment of social security mechanism in rural areas can reduce rural residents' investment in medical care and pension, and more part of the increase in income will be transferred to consumption. It will promote the rise of rural consumption level and the formation of rural consumption market, which is important for boosting domestic demand to drive social and economic growth.

#### 4. CONCLUSION

This paper investigates the influence of consumption environment on rural residents' consumption level through dynamic panel analysis. In terms of the mechanism of consumption environment affecting rural residents' consumption, the impact of natural environment, economic environment and social environment on residents' consumption is analyzed. In terms of the dynamic panel analysis of rural residents' consumption growth, this adopts a model setting and estimation method, and the empirical results of the model are analyzed. It can be concluded that the consumption environment has a significant effect on the consumption level of rural residents, and the growth of residents' income has a significant positive effect on promoting consumption at the 1% significance level, and each 1% increase in rural residents' income will promote their consumption by 0.031%. Therefore, the government should strengthen the protection and enhancement of rural residents' income, while focusing on improving the rural consumption environment and optimizing rural financial services in order to promote the improvement of rural residents' consumption level.

## ABSTRACT

This paper firstly elaborates the importance and necessity of the reform of physical education teaching in colleges and universities, and then analyzes the specific contents of informatized physical education, the way of integrating physical education teaching with information technology and the advantages of informatized physical education teaching. Finally, the effect of using informationized PE teaching in colleges and universities was analyzed through the indicators of teachers' and students' attitude perceptions towards the integration of information technology into PE teaching and the satisfaction of informationized teaching. The results showed that the percentages of teachers and students who were satisfied with the teaching effect were 37% and 46% respectively, and those who were very satisfied were 4% and 17%, and the teachers and students were satisfied with the effect of information technology teaching. This study helps to promote the modernization and development of physical education teaching in colleges and universities.

## KEYWORDS

Pedagogical reform; Information technology; Physical education; Attitude perception; Integration approach; Satisfaction

## 1. INTRODUCTION

With the progress of society, more and more colleges and universities have started to apply information-based teaching in the process of physical education, so as to innovate teaching methods and improve teaching quality [1-2]. Sports informatization teaching is to deepen the development and extensive use of sports teaching information resources with the support of various modern information means such as computers, multimedia and network communication. Through an efficient and intelligent multimedia information processing platform, the rich educational resources and sports information are transmitted to the frontier terminal of sports education by using the high-speed transmission network medium to complete the transmission of educational information between the educator and the educated, so as to achieve the expected goals of sports education [3].

The realization of information-based teaching of college physical education can create a good teaching context for modern physical education and stimulate the learning interest of college students [4]. At the same time, with the characteristics of information technology intelligence, openness and interactivity, it creates a learning environment for students to search and analyze problems independently and to develop their ability to obtain and process information independently [5].

Zhang Y et al. studied the construction of an information-based teaching system for young

teachers and explored the teaching effect of the platform, and the results showed that the teaching platform was effective [6]. Ma Z et al. used information technology in physics teaching, and the results showed that information technology improved the effectiveness and teaching efficiency of the classroom and stimulated students' interest in learning [7]. Guo-rong S et al. analyzed the influence of the environment on teachers' IT teaching ability, explored specific influencing factors, and made targeted recommendations [8].

## **2. REFORM OF INFORMATION-BASED COLLEGE PHYSICAL EDUCATION**

### **2.1. INFORMATION-BASED PHYSICAL EDUCATION**

Informational physical education refers to the creation of an informational teaching environment through the effective integration of information technology into the physical education process.

Informatization can also be referred to as digitalization, and digital physical education can be understood at two levels: broad and narrow. In a broad sense, digital physical education refers to the use of digital technologies such as multimedia, computers and networks by teachers and students in a digital environment to digitize physical education knowledge and content for use in physical education practice. In a narrow sense, digital physical education refers to the process of physical education knowledge transmission in which teachers use digital resources as the medium of instruction and use digital technology characteristics and advantages to reproduce actions, practice skills and correct techniques in physical education classroom teaching.

The informatization of physical education means that in physical education, teachers make use of informatization teaching facilities and technology to make students' learning process realize digital experience of words, images and senses, and the teaching link changes from simple memory of movements to knowledge comprehension and memory to achieve good interaction between teaching parties, improve teaching quality and efficiency, and enhance students' physical quality.

Physical education informatization is defined as the process of integrating modern multimedia technology, computer network technology and other informatization resources into the physical education teaching process, creating a good teaching environment, improving teaching and learning methods and means to better accomplish the goals of physical education, and finally realizing the modernization of physical education.

### **2.2. ADVANTAGES OF INFORMATION-BASED EDUCATION AND TEACHING**

The knowledge of information-based teaching is comprehensive, and the webpage covers the content of all areas of physical education, with clear knowledge points that can be learned at a glance, without the limitation of time and space in physical education classes. Students can use their spare time to learn physical education knowledge in dormitories or classrooms by using the Internet or cell phones to search for physical education learning websites. Being able to pre-study before class and review after class is helpful for mastering sports skills. Be able to communicate and exchange with teachers through the Internet in a timely manner, not just limited to class time. Being able to watch videos of my technical movements through multimedia is helpful to be able to continuously improve movement techniques. Can implement what the teacher said in class into the form of text and video images, through the network to students to show. The ability to supplement the teacher's lectures in a timely manner. It is a better means of communication with students in a timely manner. Can improve the intellectualization of the faculty.

### 2.3. USE OF INFORMATION-BASED TEACHING METHODS IN PHYSICAL EDUCATION

In this paper, the effect of information-based teaching reform of college physical education was studied in School A as an example. A total of 850 questionnaires were distributed and 802 were collected. Figure 1 shows the different aspects of PE teaching informatization. It can be seen that physical education teachers have used information-based teaching in different physical education teaching sessions. Among the 60 teachers who had used informatization teaching, 48 teachers used informatization teaching in the technical teaching of physical education movements, such as using multimedia to play technical movement videos, accounting for 80% of the total sample, which is the highest percentage. Thirty-six teachers used it for student assessment, such as organizing student physical education test items and scores into electronic files. 23 teachers used it for distance physical education, such as uploading videos of their physical education classes to the website. 20 teachers used it for managing and scheduling physical education classes, such as using a physical education management system. Two teachers also use it for other aspects, such as lesson planning.

**Figure 1.** The links to informing physical education

Figure 2 shows the occasions of information technology in physical education. When you were asked “If you have used information technology teaching in PE, in what environment”, 39 teachers chose “seminar or open class”, accounting for 65% of the highest percentage. This data reflects that most teachers use information technology teaching in PE because they want to create a good visual effect and classroom atmosphere through information technology teaching under the pressure of public class or seminar class, but they neglect to apply information technology teaching from its essence and to explore the unique teaching function of information technology teaching in a deeper way.

Thirty-two teachers chose “daily classroom teaching”, accounting for 52% of the total sample. Twenty-six teachers chose “lesson preparation”, accounting for 42% of the total sample. Sixteen teachers chose “extracurricular activities”, accounting for 28% of the total sample. These three data indicate that the overall application of information technology in physical education is good in daily physical education classroom teaching, but the application frequency is low in “extracurricular activities”.

**Figure 2.** Occasions for informing PE teaching

### **3. THE EFFECT OF USING INFORMATION TECHNOLOGY IN PHYSICAL EDUCATION IN COLLEGES AND UNIVERSITIES**

#### **3.1. TEACHERS' AND STUDENTS' PERCEPTIONS OF ATTITUDES TOWARD THE INTEGRATION OF INFORMATION TECHNOLOGY INTO PHYSICAL EDUCATION**

The level of interest of teachers and students in information technology education and teaching directly affects the frequency of application in classroom teaching and the effectiveness of education and teaching. A survey was conducted to investigate the attitude perceptions of teachers and students about the integration of information technology into aerobics teaching, and the details are as follows.

Willingness is the most basic and fundamental factor, which is the driving force for a person to want to reach his or her goal. Figure 3 shows teachers' and students' willingness to teach with information technology. Teachers and students are very interested in using information technology in aerobics teaching with 12.3% and 28.5% respectively, 59.7% and 41.9% respectively are interested in incorporating information technology, and 29.6% and 24.8% respectively have an average degree of willingness. It can be seen that teachers and students in colleges and universities have a high willingness to integrate information technology in teaching, which can speed up the pace of aerobics information technology teaching reform to a certain extent.

**Figure 3.** Willingness of teachers and students to teach with information technology

### 3.2. ANALYSIS OF SATISFACTION WITH INFORMATION-BASED TEACHING

The effectiveness of education and teaching is the key to measure the quality of information technology teaching in aerobics. A survey was conducted on the satisfaction level of teachers and students regarding the effectiveness of information technology teaching during and after the epidemic era, and the details are as follows.

Figure 4 shows the satisfaction level of teachers and students with the effectiveness of aerobics informatics teaching during the epidemic. According to the related analysis results, it can be seen that the percentage of 60 teachers and 300 students who were satisfied with the teaching effect as average were 45% and 20%, the percentage of those who felt satisfied were 37% and 46%, and those who were very satisfied were 4% and 17%, only 11% and 12% of teachers and students were dissatisfied with the teaching effect, and 3% and 5% of teachers and students presented a very dissatisfied attitude. It can be concluded from the analysis that teachers and students are satisfied with the effectiveness of information technology teaching, where the overall satisfaction of teachers is lower than the overall satisfaction of students.

**Figure 4.** Satisfaction levels of teachers and students

#### **4. CONCLUSION**

This paper explores the ways and advantages of information technology teaching, and analyzes students' and teachers' attitudinal perceptions of information technology integration into physical education and satisfaction with information technology physical education. The following conclusions are drawn:

In terms of attitudinal perception, 12.3% and 28.5% of teachers and students were very interested in the degree of willingness to use information technology in teaching, and 59.7% and 41.9% were interested in the willingness to integrate information technology. Both teachers and students in colleges and universities hold a high willingness to integrate information technology in teaching and learning.

In terms of and satisfaction with the teaching effect, 60 teachers and 300 students expressed satisfaction with the teaching effect accounting for 37% and 46%, respectively, while those who were very satisfied were 4% and 17%. The satisfaction level of teachers and students with the effectiveness of information technology teaching was good, where the overall satisfaction level of teachers was lower than the overall satisfaction level of students.

## ABSTRACT

This paper firstly introduces the importance and significance of the integration of legal education and curriculum Civics, and introduces the current challenges of the integration of legal and curriculum Civics. Then, an iterative integration optimization algorithm based on the path of the integration of law and curriculum thinking and politics is proposed, which continuously optimizes the curriculum design and education methods through iterative integration optimization algorithm for several iterations until the best integration effect is achieved. Then, a training system and a moral cultivation program were established for the integration of law and curriculum thinking and politics. Finally, the effectiveness of the integration of law and curriculum thinking and politics was evaluated through teacher feedback and student feedback. The average score of teachers' evaluation is  $3.48 \pm 0.32$ , and the average score of students' evaluation is  $3.68 \pm 0.15$ , which indicates that teachers and students think that the effect of integrating law education with curriculum thinking and politics is good. The research of this paper has certain practical significance and academic value for promoting the integration of legal education and curriculum thinking and politics.

## KEYWORDS

Iterative fusion optimization algorithm; Legal education; Curriculum thinking; Moral education; Integration effect; Training program

## 1. INTRODUCTION

Legal education in China's universities is an important part of higher education. It is an educational activity with the content of imparting legal knowledge, training legal thinking and cultivating qualified legal professionals [1-2]. Influenced by the properties of the legal profession itself, legal education is closely related to many aspects of society such as politics, economy, culture, science and technology, etc. The level of legal education, the development trend will eventually be the result of the role of comprehensive social factors [3].

Vigorous development of education and science should effectively strengthen the ideological and moral construction to provide clear objectives, namely, to adhere to educational innovation, deepen educational reform, optimize the educational structure, reasonably allocate educational resources, improve the quality of education and management, and comprehensively promote quality education [4-5]. Xu H et al. used big data technology to establish an intelligent system for law studies to test the learning efficiency of students [6]. Metallidou C I et al. studied the syllabus content of undergraduate legal studies and developed a course and suggested its inclusion in the undergraduate curriculum of technical universities

[7].

## **2. IMPORTANCE AND SIGNIFICANCE OF THE INTEGRATION OF LEGAL EDUCATION AND CURRICULUM THINKING AND POLITICS**

### **2.1. THE IMPORTANCE OF INTEGRATING LEGAL EDUCATION AND CURRICULUM CIVICS**

Law is not morally uninvolved, as positivist jurisprudence points out, but is an institutional being with close ties to morality. The proposition of the relationship between law and morality has long been apparent in the controversy between Hart and Fuller, with Hart insisting on the separation of morality from law, while Fuller returned to the natural jurisprudence tradition, arguing that law has a moral character and that law and morality cannot be separated. Then later Hart also changed his attitude slightly and considered law as the minimum morality. Therefore, law and morality can not only coexist, but must coexist and integrate in nature. To sum up, we can see that there is a complex, close and overlapping relationship between legal education and Civic Education. In terms of nature, they overlap. In terms of function, they complement each other. In terms of purpose, both are aimed at safeguarding the interests of the ruling class, at achieving the various great goals of socialism with Chinese characteristics in the new era, and ultimately at safeguarding the common interests of all people.

### **2.2. THE SIGNIFICANCE OF INTEGRATING LEGAL EDUCATION AND CURRICULUM THINKING AND POLITICS**

The political attributes of the law profession are very strong, which also makes the function of nurturing people in the law profession course Civics more powerful and has a very prominent content. In the process of teaching law majors, it is not only necessary to make students understand and master more professional knowledge, but also to actively guide students to grasp the correct political direction, which is the only way to make the teaching of law majors more relevant and characteristic, and also to achieve a greater breakthrough in cultivating students' comprehensive quality. Thus, in this sense, the connotation of Civic Education in law courses is firstly reflected in the ability to effectively cultivate students' political awareness and political stance. This also requires the majority of law course teachers to have strong political quality, to integrate more ideological and political elements in the process of teaching, and to maximize the cultivation of students' comprehensive quality.

It is an important part of the training of legal professionals in the new era, which meets the needs of training legal professionals, meets the requirements of socialist colleges and universities, is conducive to promoting the sustainable development of students, and can promote the construction of the three-wide education mechanism.

## **3. THE PATH OF INTEGRATION OF LAW AND CURRICULUM THINKING POLITICS COMBINED WITH ITERATIVE FUSION OPTIMIZATION ALGORITHM**

### **3.1. ITERATIVE FUSION OPTIMIZATION ALGORITHM**

In order to improve the performance of the overall fusion algorithm and to achieve a better global search capability for the operations borrowed from the GA algorithm, this paper introduces the concept of iteration in the GA/PSO fusion algorithm and applies iteration to the population initialization and mutation operations. Since the density of the iterative orbit points generated by the Tent mapping is uniformly distributed and the iteration speed is faster compared with other mappings, the Tent mapping is used here to generate the iterative sequence for initialization. The Tent mapping iteration equation can be described by the following equation.

$$l(n+1) = \mu(1 - 2|l_n - 0.5|), 0, l_0, 1 \quad (1)$$

where  $\mu$  is the bifurcation control parameter,  $\mu \in [0, 1]$ , when  $\mu = 1$ , the Tent mapping is in a fully iterative state and traverses the entire  $[0, 1]$  interval. The basic steps of iterative initialization can be described as follows. First initialize the number of individuals in the population  $m$ , the range of values of the population variable  $[x_{\min, j}, x_{\max, j}]$ , and set  $k = 0$ . Write equation (2) in the following form:

$$l_j^{(i+1)} = \mu(1 - 2|l_j^{(i)} - 0.5|), j = 1, 2, L, D \quad (2)$$

Where  $j$  – iterative variable ordinal number,  $i = 1, \dots, D$ ;  $i$  – particle population ordinal number  $i = 0, 1, \dots, m$ ;  $l_j$  – iterative variables,  $0 \leq l_i \leq 1$ ; make  $\mu = 1$  in the Tent mapping, and generate an iterative variable by iterating with equation (2) according to the iterative search of the probability back idea. Then make  $i = 1, L, m$ , the initialization of the whole population can be completed.

Here, the population is initialized by iterative initialization, and unlike the BS algorithm, the GA mutation operation does not use the traditional method of changing the “0, 1” sequence, but adopts a re-iterative initialization method, i.e., when an individual is selected for mutation, it is re-initialized using an iterative method.

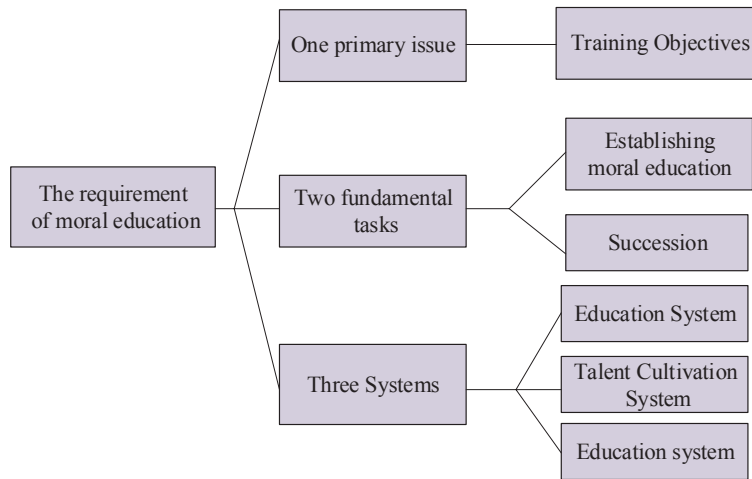

### 3.2. THE PATH OF INTEGRATION OF LAW AND CURRICULUM THINKING AND POLITICS

In this paper, we use an iterative fusion optimization algorithm to combine the fusion of course Civics and law knowledge to construct a path of fusion between law and course Civics. The algorithm continuously adjusts the parameters by iteration, so that the fusion effect gradually reaches the optimal state. The specific fusion method is as follows.

(1) The cultivation program is closely focused on the requirements of moral education

The real state of education function is not static, but a dynamic process of activity. The process of education is always permeated with value science or cultural science, which aims at value construction and meaning interpretation. In this process, the inner world of the individual is constantly undergoing spiritual transformation. The process of education is not only a process of knowledge acquisition, but also a total life activity in which all psychological factors, such as knowledge, emotion and intention, are fully activated and involved. Only in this way education ceases to be a mere ladder of knowledge and becomes an intermediary form of soul awakening and personality cultivation.

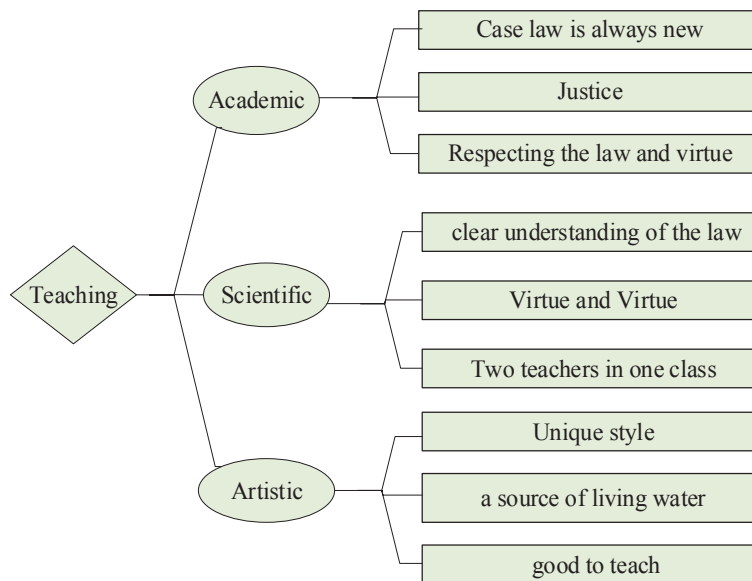

Law professional education is closely related to the practice of national rule of law construction, and the curriculum of law professional is the main position of law education. In order to significantly improve the level of education and teaching, teaching innovation should identify with “one primary issue” and “two fundamental tasks” and construct “Three systems”. The primary problem that needs to be solved in the cultivation of legal talents is what kind of people to cultivate, and legal education should shape the spirit of socialist rule of law character, so we should adhere to the fundamental task of establishing moral education, and take the cultivation of socialist builders and successors as the fundamental task. At the same time, we should build an education system of comprehensive cultivation of moral, intellectual, physical, social and aesthetic development, form a higher level of talent cultivation system, and improve the system of whole staff cultivation, whole process cultivation and all-round cultivation. Specifically as shown in Figure 1.

**Figure 1.** The pathway of moral development through the training system

(2) Efforts to improve the quality of classroom teaching in law courses

Professional courses are directly related to the quality of higher education personnel training, and course learning has an important position in the professional education system. The improvement of teaching quality is formed on the basis of long-term moral education and the accumulation of experience in legal professional education. The law professional curriculum has a comprehensive, integrated and fundamental role. Curriculum teaching innovation and the integration of ideology and politics of law professional courses should not only complete the teaching content of professional courses, but also complete the ideological and political education objectives, or more accurately expressed as, the ideological and political education objectives are integrated with the knowledge transfer and ability cultivation of law professional. In the process of construction of teaching innovation and integration of ideology and politics in the curriculum, the spiritual character of socialist rule of law talents, the ability to study and think about theoretical issues of law as well as the reality of the rule of law, the professional ethical quality of dedication to social justice, loyalty to law and truthfulness in three cultivation effects are the judgment criteria for improving the quality of teaching in law courses. The basic idea of integrating classroom teaching innovation with the construction of Civics, on the other hand, is to allow students to complete inquiry-based learning under the guidance of teachers. Figure 2 shows the three levels of classroom teaching quality improvement.

**Figure 2.** Three levels of classroom teaching quality improvement

### (3) Transformation of the “student-centered” teaching model

The audience of course teaching is students, and the task of cultivating students’ learning ability cannot be derogated from in any way, but rather from the beginning of the course, students’ learning ability should be continuously exercised in a progressive way. The essence of student-centeredness is to focus on the acquisition of knowledge and the acquisition of abilities by students. Student-centeredness is not to subvert the dominant position of teachers in the classroom, but to require that the core of teachers’ teaching and training process is the quality of student training. Student-centeredness can be enriched in the teaching and learning process, for example, by developing second and third classes that focus on competency development and value guidance to complement the knowledge transfer in the first classroom, forming a training loop and implementing a developmental view of education and training along with continuous improvement.

## 4. ANALYSIS OF THE EFFECT OF THE INTEGRATION OF LAW AND CURRICULUM THINKING AND POLITICS

The questionnaire feedback on the effect of Civics teaching practice was conducted for 94 teachers and 100 students in H university respectively in the process of Civics construction practice of law courses, as follows.

### 4.1. ANALYSIS OF TEACHER EVALUATION FEEDBACK

As can be seen from Table 1, the average score of teachers in the five aspects of “the degree of attention to curriculum thinking and politics, the degree of integration of curriculum thinking and politics, the construction effect of curriculum thinking and politics, students’ acceptance of the content of this course thinking and politics, and the degree of help of this course to students” is  $3.48 \pm 0.32$ , which also suggests that although teachers think that the degree of help of curriculum thinking and politics to students is high, there is still room for improvement in the daily teaching process. The average score of  $3.48 \pm 0.32$  for the five aspects of “how helpful the course is to students” also suggests that although teachers think the course is helpful to students, there is still room to improve the attention and integration of the course in the daily teaching process. On the other hand, it also indicates that the construction of the course Civics should be made concrete and avoid abstraction, and the teaching of Civics should be combined with current national events, students’ training goals and social needs, and focus on cultivating students’ independent thinking ability and correct three views. Table 1 shows the feedback from teachers on the construction of Civics in law courses.

**Table 1.** Faculty feedback on the construction of the Civics in Law course

Survey Items	5 Score	4 Score	3 Score	2 Score	1 Score
Degree of attention to curriculum thinking and politics	10(10.64)	22(23.68)	40(42.57)	10(10.63)	12(12.78)
Degree of integration of curriculum thinking and politics	9(9.59)	34(36.46)	32(34.35)	14(14.84)	5(5.35)
Effectiveness of Curriculum Civics	10(10.69)	35(37.25)	44(46.85)	5(5.34)	0
Students’ acceptance of the content of this course	11(11.76)	33(35.56)	45(47.45)	5(5.35)	1(1.08)
How helpful the course is to students	25( 26.65)	40(42.56)	26(27.89)	2(2.16)	1 point

### 4.2. STUDENT EVALUATION FEEDBACK

The content of students’ evaluation includes 12 aspects: “family and national spirit, traditional cultural identity, socialist core values, moral integrity, sound personality, intellectual ability, epistemology and methodology, critical thinking, innovation consciousness, academic integrity, positive communication, and respect for the elderly and children”, with scores from 1

to 5 indicating the impact of the current curriculum thinking and teaching. The average score is  $3.68 \pm 0.15$ , with the highest being moral sentiment and the lowest being intellectual ability. The average score is  $3.68 \pm 0.15$ . The highest score is moral sentiment and the lowest is intellectual ability.

## 5. CONCLUSION

This paper constructs a path of integration of university legal education and curriculum thinking based on iterative integration algorithm planning, and analyzes the integration effect teaching. The following conclusions are drawn:

The average score of teachers in the five aspects of “the degree of attention to curriculum thinking and politics, the degree of integration of curriculum thinking and politics, the effect of the construction of curriculum thinking and politics, students’ acceptance of the content of curriculum thinking and politics, and the degree of help of this course to students” is  $3.48 \pm 0.32$ , which means that teachers think that curriculum thinking and politics is more helpful to students.

The average score of students’ evaluation is  $3.68 \pm 0.15$ , with the highest being moral sentiment and the lowest being intellectual ability. It indicates that the students’ feedback is generally good and the integration of course Civics in legal education is effective.

Kashi University, Kashi, Xinjiang, 844006, China

[volojia2013@126.com](mailto:volojia2013@126.com)

---

## ABSTRACT

This paper firstly elaborates the main contents and teaching concepts of production-oriented approach. Based on this, a hybrid teaching model of Russian listening based on production-oriented approach is proposed to enhance students' listening ability and language expression ability by combining online and offline teaching. Finally, the teaching effect of this model was analyzed by comparing the students' listening scores before and after. The results showed that the average of students' listening scores was 14.7345 in the pre-test and 19.7834 after using this teaching method, indicating that the production-oriented approach is suitable for teaching Russian listening to students. The study of this paper has important reference value for Russian language education and blended teaching reform.

## KEYWORDS

Production-oriented approach; Russian listening; Blended teaching; Big data; Teaching model; Teaching philosophy

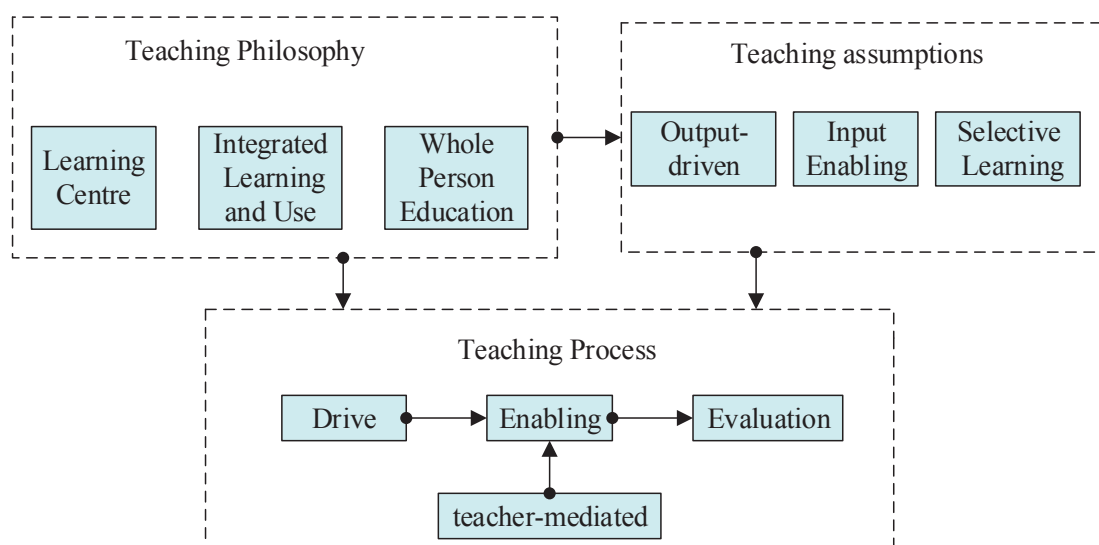

## 1. INTRODUCTION

Foreign language learning differs in many ways from the learning of other subjects, and it has always been a difficult task for many students due to various complex factors [1-2]. Russian, on the other hand, belongs to the Indo-European and Slavic language family, which is both very different from Chinese and has many differences from Russian, so Russian is more difficult for our students to learn and master [3-4]. Traditional research on foreign language teaching focuses more on how teachers teach and ignores the influence of students' individual factors such as intelligence, personality, cognitive style, motivation, and learning strategies on learning outcomes [5]. This results in the disconnection of foreign language teaching research from practice, which both hinders the development of foreign language teaching and affects the improvement of students' ability to actually use foreign languages [6]. Zinchenko, Y. P et al. studied the influence of information processing speed, memory capacity and intellectual factors on Russian language learning using a comparative experimental approach using regression analysis [7]. Ovchinnikova I V et al. studied the psychological characteristics of Russian language learners, and the study showed that Russian language learning has an important contribution to motor skills, visual perception, and communicative learning [8].

## 2. THEORY AND PRACTICE OF PRODUCTION-ORIENTED APPROACH

### 2.1. MAIN ELEMENTS OF PRODUCTION-ORIENTED APPROACH

The production-oriented approach is a teaching theory oriented to teaching objectives, which mainly includes teaching philosophy, teaching assumptions, and teacher as mediator. The teaching philosophy is divided into learning-centered, learning-use integration and whole-person education, which turns classroom teaching into a “learning-centered” classroom teaching pattern with the application of theoretical knowledge as the main content, aiming to cultivate comprehensive development of high-quality talents. Output-driven and input-driven are the main components of the teaching assumptions. Output-driven is mainly for higher level learning, which not only helps students to enhance their language fluency, but also tests the correctness of learners’ teaching assumptions. The teaching philosophy, teaching assumptions and teaching process of the output-driven method are shown in Figure 1.

**Figure 1.** production-oriented approach philosophy, assumptions and processes

### 2.2. TEACHING CONCEPT OF PRODUCTION-ORIENTED APPROACH

The innovative teaching philosophy guided by the production-oriented approach consists of three components: learning-centeredness, learning-use integration, and whole-person education.

The “learning center” in the production-oriented approach challenges the concept of “student-centeredness”, which advocates that classroom teaching and learning are conducted in a way that prepares the ground for effective learning to occur.

The “learning-use theory” does not completely deny the importance of teaching materials, but advocates the combination of learning while using, learning while using, and learning while using, combining input learning and output tasks, and linking the two organically. “The “learning and use in one” approach hopes to integrate learning and use, to develop students’ ability to use Russian as a whole, to use textbooks and texts as a means to learn to complete output tasks in Russian. The aim of the program is to develop students’ ability to analyze and solve problems in Russian.

According to the “holistic education theory”, humanistic goals can be achieved in three ways. First, the topics of output tasks are carefully chosen. Output topics can be divided into two categories: internal and external. Internally, they are conducive to students’ own development of a correct outlook on the three concepts and help them grow up healthy and strong. Externally,

it is conducive to the spread of Chinese culture and civilization, enhancing the country's soft power, and cultivating students' social responsibility to promote cultural exchange between China and foreign countries and introduce China to the world. Second, input materials are carefully chosen to serve the output tasks. The input materials echo the topics, involving both internal and external. Internally, they are language materials with a high level of ideology and a positive outlook. Externally, they are materials that are topical and focus on national and world events. Third, the organization of teaching activities is cleverly designed. For example, through group activities to cultivate students' spirit of unity and cooperation or organize debate competition mode, so that students can appreciate their opponents and cooperate with their teammates in competition.

### **3. DESIGN OF A BLENDED RUSSIAN LANGUAGE TEACHING MODEL BASED ON THE PRODUCTION-ORIENTED APPROACH**

The production-oriented approach is based on the assumption that learners are "output-driven", i.e., they output their own language first, emphasizing the importance of output. When students become aware of their output difficulties and identify their own shortcomings, the teacher then provides input that is relevant to the output goal and the student's output difficulties, helping each student to effectively improve himself or herself and achieve self-improvement. "Input facilitation requires teachers to find a series of tasks that are appropriate for students and that fully engage students' interest and motivation, so that input and output tasks complement each other and improve students' overall learning.

In the early stage of teaching, the teacher briefly explained the theory of production-oriented approach to the students in the experimental class, and encouraged them to export more of what they had learned to achieve the teaching effect of "use for learning" and "use for learning". At the same time, students were taught to use the Feynman method of learning, i.e., the concept that "the best student is the one who can tell what he or she has learned". In each teaching practice, the teacher first pushes the relevant teaching video through the WeChat group two days before the class. The online platform posts pre-class tasks for students to actively participate in online discussions to stimulate their interest in what they are about to learn. The students pre-study the content on their own through the online platform. The day before the lesson, the teacher posts listening questions online to find out the students' level of pre-reading and interest in the unit.

The classroom allows students the flexibility to use their cell phones to complete a series of teaching activities posted online and offline by the teacher with the help of the online platform. For example, group-based analysis of important and difficult points of the text is conducted so as to cultivate students' awareness of their goals. Problem-oriented, group seminars are conducted for the problems and issues encountered by students in their learning, so as to cultivate students' awareness of problem identification and problem-solving ability, thus achieving the purpose of promoting learning through use. Throughout the process, teachers provide timely evaluation and positive encouragement.

The online platform allows students to continue their learning in depth after the lesson, including critical thinking exercises, post-lesson consolidation quizzes, and essay summaries and compare-and-contrast activities aimed at strengthening students' relatively weak Russian language skills and improving their Russian language output.

### **4. ANALYSIS OF THE EFFECT OF MIXED TEACHING OF RUSSIAN LISTENING**

In this paper, we will analyze students' listening tests in School A as an example. In order to ensure the reliability and validity of the listening test questions, the test questions used in this study before the experiment are from the listening section of the Russian language test in

the 2019 National Higher Education Entrance Examination. After marking the papers, the pre-test scores of the experimental and control classes will be analyzed by using the professional software SPSS, so as to determine whether the listening levels of the two classes are comparable before the experiment and to provide data support for determining the two classes as the sample for the experiment.

The pre-test scores of the two classes were counted and analyzed using SPSS software. Table 1 shows the statistical comparison of the pre-test paper scores of the two classes.

Table 2 shows the results of the independent sample t-test. The mean value of the pre-test scores in the experimental class was 14.7345 and the mean value of the scores in the control class was 14.6127, which shows that there is not much difference between the listening scores of the two classes. The results of the independent sample t-test include the results of Levene's test for the variance equation and the results of the t-test for the mean equation, as shown in the table. Levene's test for the variance equation has two hypotheses of assuming equal variances and assuming unequal variances. Sig=0.545>0.05 in the Levene's test of the variance equation, which shows that the sample variances of the pre-test scores of both the experimental and control classes are chi-square. At this point, we can focus on Sig=0.765>0.05 in the t-test of the mean equation, which indicates that there is no significant difference between the Russian listening scores of the two classes in the pre-experimental period. The 95% confidence interval of the last part of the difference score shows that there is a 95% probability that the mean falls between [-1.5206-1.7856], and the middle value of the upper and lower limits can contain 0, indicating that the mean of the difference between the two classes before the experiment can be 0. From this data we can conclude that the difference between the Russian listening scores of the two classes in this study before the experiment was negligible and the students' listening levels were comparable and could be selected for the study.

**Table 1.** Statistical comparison of pre-test paper results between the two classes

Classes	N	Mean value	Standard deviation	Standard error of the mean
Experimental Classes	78	14.7345	4.80245	0.60567
Control Classes	76	14.6127	4.46240	.56670

**Table 2.** Independent samples t-test results

	Equation of variance Levene's test				t-test for the mean equation				
	F	Sig	t	df	Sig.(double test)	Mean Difference	Standard error value	Lower limit of 95% confidence interval	95% Confidence Interval Upper limit
Assuming equal variances			0.135	124	0.765	0.1356	0.7325	-1.5206	1.7856
Assume variances are not equal	0.2334	0.545	0.156	122.445	0.765	0.1367	0.7323	-1.5203	1.7834

To further test whether there is a significant difference between the pre and post test data of the experimental class and the control class, so as to verify whether the experimental use of production-oriented approach is significantly more effective in improving students' listening performance than the control class using the traditional listening teaching method. Table 3 shows the statistical comparison between the pre and post test papers of the experimental

class.

Table 4 shows the results of the paired sample test. The mean listening scores of the students in the experimental class were 14.7345 in the pre-test and 19.7834 in the post-experiment, from which it can be concluded that the mean Russian listening scores of the experimental class improved significantly before and after the experiment of this study. The data  $T=-7.546 < 0.05$  in the t-test of the listening scores of the experimental class on the pre- and post-tests indicate that there was a significant difference in the listening scores of the students in the experimental class before and after the experiment. The listening scores of the students in the experimental class who applied the production-oriented approach in listening teaching improved significantly compared with those before the experiment.

**Table 3.** Statistical comparison of test paper results before and after the experimental class

Experimental Classes	N	Mean value	Standard deviation	Standard error of the mean
Pre-test	78	14.7345	4.80245	0.60567
Post-test	78	19.7834	5.03456	0.63567

**Table 4.** Paired sample test results

	Mean value	Standard deviation	Standard error of the mean	Lower limit of difference	Upper limit of difference	t	df	Sig.(double measurement)
Pre-test results - Post-test results Results	-5.0456	-5.0778	-0.0268	-6.5789	-3.4879	-7.546	-7.6778	0.000

## 5. CONCLUSION

This paper firstly investigates the specific connotation and teaching concept of production-oriented approach, and discusses the way of using production-oriented approach in Russian listening teaching, the process of using it and the effect of using it. The following conclusions are drawn:

The average listening score of the students in the experimental class was 14.7345 in the pre-test and 19.7834 in the post-test, which shows that the average listening score of the experimental class in Russian language has improved significantly before and after the experiment of this study. The data  $T=-7.546 < 0.05$  in the t-test of the listening scores of the pre and post-tests of the experimental class indicate that the listening scores of the students in the experimental class applying the production-oriented approach have improved significantly compared to the pre-experimental period.

# APPLYING MULTI-OBJECTIVE PLANNING TO ANALYZE THE INNOVATIVE PATH OF INTEGRATING CURRICULUM THINKING INTO COLLEGE PHYSICAL EDUCATION

---

Wangming Chen\*

Guangzhou College of Technology and Business, Guangzhou, Guangdong, 510850, China

[cwm1789@163.com](mailto:cwm1789@163.com)

---

## ABSTRACT

This paper proposes an innovative path of applying multi-objective planning analysis to address the difficulties in the integration of Civics in college physical education courses. Firstly, the steps and principles of multi-objective planning are studied. Then, under the guidance of multi-objective planning algorithm, a specific path for the implementation of the thought politics of college physical education courses is proposed around four dimensions of moral responsibility, moral environment, moral principles and moral system. Finally, the effect of integrating curriculum thinking politics into college physical education was analyzed based on indicators such as students' health, course gains and ideological changes. The results show that 52% of them think that they have improved their learning attitudes and 45% of them think that they have gained good moods and emotions. Another 80% of students thought that the study of curriculum Civics had a positive impact on ideological values. This study is of great value to promote the reform of physical education teaching in colleges and universities and to promote talent cultivation.

## KEYWORDS

Multi-objective planning; Curriculum thinking; Physical education; Ideological value; Innovative path; Integration effect

## 1. INTRODUCTION

School physical education and ideological and political education are both important components of school education, among which, ideological and political education is fundamental to the implementation of moral education and school physical education is a fundamental project to realize the fundamental task of moral education and improve the comprehensive quality of students [1-2]. Integrating school physical education into ideological and political education can not only realize the disciplinary development requirements of ideological and political education close to students, close to life, and close to social reality, enhance the affinity and relevance of ideological and political education, but also be more conducive to the implementation of the goal of school physical education and ideological and political education to establish morality and educate people [3].

Under the requirements of the new era, ideological and political education is in urgent need of developing new educational models, exploring new educational methods, tapping new teaching resources, and developing new teaching platforms [4]. The exploration and research on the integration of school physical education into ideological and political education came into being, which is both a reflection on the traditional ideological and political education based on theoretical indoctrination and an attempt to improve ideological and political education in

the new era [5-6]. TalaghirLG et al. studied the methods of physical education teaching reform and proposed that curriculum ideology should be integrated into physical education and that an assessment system should be established to evaluate the teaching effectiveness. WanshengZ proposed that a system of moral education curriculum objectives and activities should be established to bring moral education curriculum back to life and infiltrate moral education in the teaching of life and other subjects [7-8].

## 2. THE IMPLEMENTATION PATH OF THINKING POLITICS OF PHYSICAL EDUCATION CURRICULUM BASED ON MULTI-OBJECTIVE PLANNING

### 2.1. MULTI-OBJECTIVE PLANNING ALGORITHM

The path planning problem studies the planning of an optimal path given a goal and a cost. Different combinations of conditions and objectives give rise to different planning problems, such as planning with multiple objectives is multi-objective planning, and planning where losses can be abstracted as yes or no is 0-1 planning.

Before building the model, a preliminary analysis of the strategy for goal selection is first made according to the generalized graph model.

The objective function is:

$$J_1 = S_0 + N_d K + \frac{1}{2} P_w \left( W_0 + W_c - \sum_{i=1}^{D_0} c_i W_i \right) + \frac{1}{2} P_f \left( F_0 + F_c - \sum_{i=1}^{D_0} c_i^j F_i \right) - (W_0 P_w + F_0 P_f + 2W_c P_w + 2F_c P_f), j = 1, 2, 3 \quad (1)$$

The objectives are therefore:

$$X^* = \arg \max J_1(c_i^j, W_i, F_i) \quad (2)$$

Where  $W_i$  is the material decision variable,  $c_i^j$  is the main decision variable, and  $F_i$  is the factor decision variable.

### 2.2. INNOVATIVE PATH FOR THE IMPLEMENTATION OF CIVIC GOVERNMENT IN PHYSICAL EDUCATION COURSES IN COLLEGES AND UNIVERSITIES

This paper adopts a multi-objective planning algorithm to combine the goal requirements of physical education curriculum and Civic Education to construct the implementation path of Civic Education in physical education curriculum. And the implementation process is divided into four dimensions: responsibility of establishing morality, environment of establishing morality, principles of establishing morality and system of establishing morality, and the implementation path is established from three major principles: improving the quality of teachers of university public physical education course thinking politics, optimizing the teaching environment of university public physical education course thinking politics and executing university public physical education course thinking politics.

#### (1) Strengthen the responsibility of establishing morality

Physical education teachers should do self-internalization of professional knowledge and improve their thinking and political cultivation. Do keep abreast of the frontier of sports knowledge and explore the depth of research, with a sense of mission and responsibility. To deeply understand the importance of the course Civics, and actively guide students to establish correct values, outlook on life and worldview in physical education. Physical education teachers should focus on the combination of knowledge transfer and value leadership, so as

to educate people throughout the whole process. Fully guarantee that teaching objectives, teaching content, teaching methods and teaching evaluation can play the effect of Civic Education.

### (2) Improving the moral environment

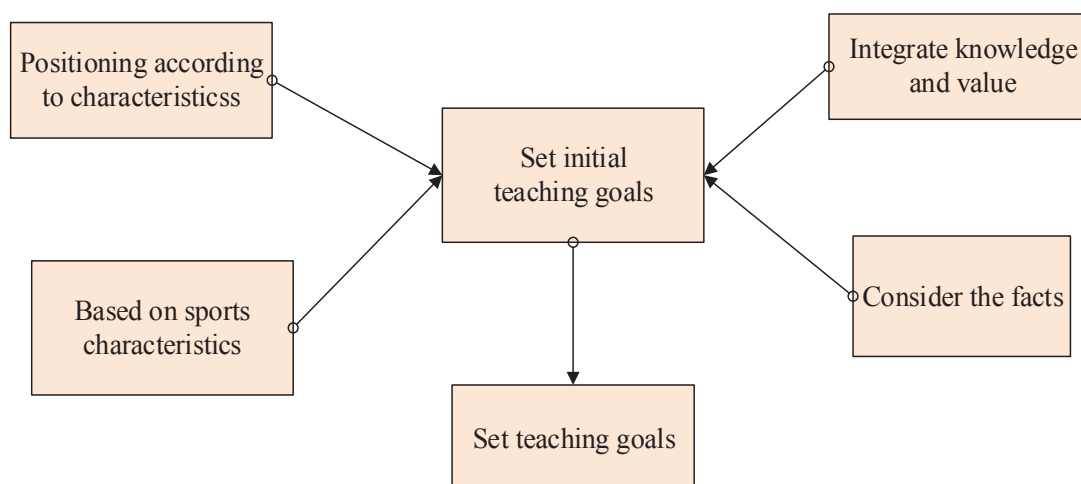

The teaching environment of physical education class as an external factor has a certain influence on the effect of course development. The school strengthens the policy incentive and the provision of venue facilities conditions is the material guarantee to optimize the university public physical education course thinking and teaching environment, teachers actively create a good physical education classroom culture atmosphere is the basis for optimizing the university public physical education course thinking and teaching environment.

### (3) Clearly establish the principle of morality

Civic politics of physical education courses should serve the training objectives of physical education. On the basis of completing the teaching objectives of physical education classes, we should appropriately and reasonably integrate the ideological and political education objectives in order to achieve the effect of course ideology for sports professional training objectives. Physical education course Civics should be in line with the law of student growth. Civic politics of physical education course should conform to the law of teaching and educating people. Understand the students' acceptance level while following the development and cognitive law of things, and at the same time to comply with the law of moral education, to eliminate the indoctrination teaching.

### (4) Constructing a moral system

In order to achieve good results in the implementation of university public physical education course thought politics only theoretical guidance is not enough, need to go deep into the teaching practice to do a good job in the design and implementation of physical education course thought politics. The teaching design of physical education course Civics includes setting the teaching objectives of the course Civics, sorting out the content of physical education Civics, innovating teaching methods and improving the teaching evaluation system, etc. to build a comprehensive system. Figure 1 shows the teaching goal setting.

**Figure 1.** Setting of teaching objectives

### 3. ANALYSIS OF THE EFFECT OF INTEGRATING CIVICS INTO COLLEGE PHYSICAL EDUCATION

#### 3.1. ANALYSIS OF THE IMPACT OF PHYSICAL EDUCATION COURSE CIVICS ON STUDENTS' HEALTH

The impact of the implementation of the physical education course Civics on the students' own health status needs to be paid attention to. The teaching of physical education should take the development of students' physical and mental health as an opportunity to strengthen students' ideological and moral cultivation, so that students can master physical skills while strengthening their bodies and minds.

Figure 2 shows the impact of the implementation of the physical education curriculum on the health status of students. It can be seen that 65% of the total number of students chose "improve sleep quality", 58% of the total number of students chose "promote learning efficiency", 55% of the total number of students chose "boost spirit", 52% of the total number of students chose "improve learning attitude", and 52% of the total number of students chose "gain good mood and emotional well-being". 55% of the total number of students, 52% of the total number of students who chose "improve learning attitude", 45% of the total number of students who chose "gain good mood and emotion", and 45% of the total number of students who chose "improve social adjustment ability". The number of students who chose "improve social adjustment ability" accounted for 29% of the total number of students, and the number of students who chose "other" accounted for 5% of the total number of students. Through the physical education course Civics students' own health status has improved significantly in all aspects, especially in study attitude, sleep quality, study efficiency and mental state.

**Figure 2.** The impact of the implementation of Civics in PE lessons on students' health status

#### 3.2. ANALYSIS OF STUDENTS' GAINS IN PHYSICAL EDUCATION CLASSES

Physical education teachers in colleges and universities provide comprehensive training for students in other aspects such as physical health, athletic ability, professional skills, sports knowledge, moral quality, and quality spirit. Table 1 shows the gain of students' ideological and political education.

Students are able to feel and learn from all these aspects, especially the physical health, athletic ability, professional skills and sports knowledge brought by physical activities, and students gain a lot from them.

The ideological and political education that students gained through the physical education activities was significant. The percentage of those who gained patriotism was 68%. The percentage of those who were able to feel the spirit of selflessness and dedication in physical education courses was 59%. The percentage of those who can feel the spirit of collectivism in physical education activities is 78%. The percentage of those who can reflect the spirit of hard work and endurance is 76%. 78% of those who can reflect the spirit of aggressiveness. 65% can feel the sense of rules. 60% can feel the awareness of safety. 51% of those who can feel the sense of integrity.

**Table 1.** Students' ideological and political education gains

Options	Number of people	Proportion
Patriotism	496	68%
Selflessness	430	59%
Collectivism	569	78%

### 3.3. ANALYSIS OF STUDENTS' IDEOLOGICAL CHANGES AFTER SPORTS CIVIC EDUCATION

After the education of sports thinking, the students' thoughts have changed significantly, and this paper uses a questionnaire to analyze the changes in students' thoughts. Among them, "1" represents the change of the proposed ideas, "2" represents the change of the proposed ideas, "3" represents the change of the proposed ideas, "4" represents the change of the proposed ideas, "5" represents the change of the proposed ideas, "4" represents the change of the proposed ideas, "5" represents the change of the proposed ideas. "4" represents the changes in the proposed ideas, "5" represents the changes in the proposed ideas, and "5" represents the changes in the proposed ideas.

After the implementation of the Civic Politics of Physical Education curriculum, students have undergone the above-mentioned ideological changes, and in general, students' ideological perceptions have improved accordingly. The implementation of the Civic Science and Politics of physical education has a greater role in guiding the development of students' minds, and through the reasonable integration of Civic Science and Politics education and physical education by teachers, students can be taught to develop their minds in a good way, so that the development of students is in line with the needs of national development personnel. Students occupy a large proportion of the patriotic change of mind, accounting for more than 80% of the total number of students. Ideas such as respecting teachers and establishing the right values account for 80% of the total number of students. Sports has its own characteristics, unlike other disciplines, which mainly rely on theoretical education, students will encounter various difficulties and challenges in sports practice, and their bodies, spirits and minds are subjected to different degrees of load, thus it can be seen that sports activities have a better role in promoting the development of students' correct sports values. Figure 3 shows the

changes of students' thinking after sports thinking education.

Figure 3. Changes in students' thinking after sports thinking education

#### 4. CONCLUSION

This paper analyzes the path of integration of Civics in college physical education courses based on multi-objective planning algorithm planning, and analyzes the effect of Civics integration into college physical education teaching from indicators such as student gains and changes in students' minds. The following conclusions are drawn:

In terms of the impact of the physical education course Civics on students' health, 58% of students think that the study of course Civics promotes learning efficiency. 65% think it improves sleep quality. 52% think it improves learning attitude. 45% think it gains good mood and emotion.

In terms of students' gains, the percentage of those who gained patriotism was 68%. The percentage of those who could feel the spirit of selflessness in the physical education program was 59%. The percentage of those who can feel the spirit of collectivism in sports activities is 78%. The percentage of those who can reflect the spirit of hard work and endurance is 76%. The ideological and political education effect that students reaped through physical education course activities was significant.

## ABSTRACT

This paper analyzes the stability and improvement strategies for new energy power systems, which include static voltage stability analysis method, dynamic voltage stability analysis method and nonlinear dynamics analysis method, and uses AC voltage control to improve the small disturbance synchronous stability. To further improve the system stability, the load characteristics of the power system are predicted using system damping retrospective evaluation. The results show that among the three inter-regional oscillation modes of the actual system, mode I has the widest involved range and the smallest damping ratio of 0.0410, and the oscillation frequencies of mode I and mode II are relatively close, with a difference of 0.08 Hz. This indicates that the system damping retrospective evaluation method can predict the load characteristics of the power system.

Power system; Voltage stability analysis; AC voltage; Load characteristics; Damping traceability evaluation

## 1. INTRODUCTION

With the accelerated industrialization of the world, the development of national economies and industries has become overly dependent on fossil energy sources, leading to an increasing problem of energy crisis, which seriously threatens the survival and development of human

beings [1-2]. In order to achieve efficient use of energy, reduce environmental pollution, and lower the operating costs of energy systems, research on the integrated use of various forms of energy, such as electricity, gas, and heat, has begun [3]. The concept of integrated energy systems has been proposed in recent years [4]. The traditional electric, natural gas, and thermal systems are basically planned and analyzed separately, lacking coordination among them, and suffering from low energy utilization [5-6]. IES, on the other hand, can achieve coordinated planning and optimal operation among multiple energy sources, improve the safety and self-healing capability of the social energy supply system, promote the efficient utilization of energy, reduce the operating cost of the whole energy system, and achieve sustainable development [7-8].

In this paper, the stability of the new energy power system is firstly analyzed, which leads to the voltage stability analysis method and the improvement strategy of AC voltage control for small disturbance synchronous stability. Next, the concept, principle, characteristics and classification of charge prediction are described, and the load characteristics of the power system are predicted by using the system damping retrospective assessment method. Finally, the effectiveness of the proposed generator damping assessment method under a multi-machine system is verified by a real system simulation analysis. The results show that the system damping retrospective evaluation method predicts the load characteristics of new energy power systems.

## 2. STABILITY IMPROVEMENT STRATEGY OF NEW ENERGY POWER SYSTEM

### 2.1. VOLTAGE STABILITY ANALYSIS METHOD

The small disturbance analysis method is based on Lyapunov stability analysis, and therefore has a solid and rigorous theoretical support. Power systems are usually described by nonlinear differential algebraic equations, in which the differential equations link the dynamic characteristics of the system components. When the system is subject to small disturbances, the differential equations can be linearized at the equilibrium point, and the system voltage stability can be analyzed by determining the nature of the eigenvalues of the system state matrix. The differential algebraic equations of the power system are as follows:

$$\begin{cases} \dot{x} = f(x, y, p) \\ 0 = g(x, y, p) \end{cases} \quad (1)$$

Where,  $x$  is the system state variable,  $y$  is the system algebraic variable, and  $p$  is the system control variable.

Linearization of equation (1) at the equilibrium point yields

$$\begin{cases} \Delta\dot{x} = A\Delta x + B\Delta y \\ 0 = C\Delta x + D\Delta y \end{cases} \quad (2)$$

By eliminating the algebraic variables in equation (2), the standard equation of state is obtained as follows:

$$\begin{cases} \Delta\dot{x} = J\Delta x \\ J = A - BD^{-1}C \end{cases} \quad (3)$$

where  $J$  is the coefficient matrix.

## 2.2. AC VOLTAGE CONTROL FOR SMALL DISTURBANCE SYNCHRONIZATION STABILITY IMPROVEMENT STRATEGY

AC voltage control is used to regulate the AC side voltage of converters, which helps to support the AC system voltage and improve the dynamic response performance of the grid. However, the dynamic behavior of the AC voltage can destabilize the system.

In the traditional synchronous motor stability analysis process, the synchronous motor electromagnetic torque is usually decomposed into damped torque component and synchronous torque component, and the synchronous stability is discriminated by the magnitude of the two torque components. When the motor system lacks sufficient damping torque, the system will produce oscillatory instability, and when the motor system lacks sufficient synchronous torque, the system will suffer from non-periodic slip instability of the rotor angle. Only when the motor has sufficient synchronous torque and damping torque, i.e., the torque vector is in the first quadrant, the system stability can be guaranteed. Similarly, damping and restoring force can be used in the analysis of the effect of converter AC voltage control on synchronous stability. If the phase-locked loop can be equated to an ideal rotor, the end-voltage axis component can be decomposed into a damping component and a restoring force component. Both the reduction of the damping component and the reduction of the restoring force will undoubtedly reduce the synchronization stability of the system. Table 1 shows the stability comparison between the conventional synchronous machine and the grid-following converter.

**Table 1.** Stability comparison of conventional synchronous machine and grid-following converter

The relationship between torque and stability of conventional synchronous machines	Relationship between damping, restoring force and stability of grid-type converters
Decomposition of electromagnetic torque into damped and synchronous torque components	Decomposition of the q-axis AC voltage into damping and restoring force components
1. Lack of damping torque will lead to oscillation instability of the system 2. Lack of synchronizing torque will lead to non-periodic slip instability of the system	1. Lack of damping will lead to oscillatory instability of the system 2. Lack of restoring force will lead to non-periodic slip instability of the system

## 3. INTEGRATED NEW ENERGY POWER SYSTEM LOAD FORECAST ASSESSMENT

### 3.1. LOAD FORECASTING

Load is the amount of electricity demand, the total load of the power system is the sum of the total power consumed by all the power-using equipment in the system. Electricity load forecast, that is, power demand forecast, is the basis of power planning and design, is the preparation of power supply planning, power balance of the premise and arrange the basis of power grid infrastructure projects, only do a good job of this work, power supply planning, substation layout, network planning to be more in line with the actual. Forecasting work should be based on frequent investigation and analysis, collection of information on economic and social development and the development of construction of various industries, full study of electricity consumption, load historical data and development trends for measurement, in order to make the forecast results have a certain degree of accuracy. Table 2 shows the basic information of electric load forecasting.

**Table 2.** Basic information of power load forecast

Load Forecasting Principles	(1) Knowability Principle; (2) Possibility Principle; (3) Continuity principle; (4) Similarity Principle; (5) Feedback principle; (6) Systematic Principle
Characteristics of load forecasting	(1) Inaccuracy; (2) Conditionality; (3) Temporal; (4) Multi-programming
Classification of load forecasting	(1) Classified by time period, they are usually classified into long-term, medium-term, and short-term load forecasts. (2) It can be classified by industry into urban residential load, commercial load, rural load, industrial load, and other loads for load forecasting. (3) The characteristics are further divided into maximum load, minimum load, average load, peak-to-valley load difference, peak load average, low load average, flat load average, network-wide load, bus load, load rate etc.

### 3.2. SYSTEM DAMPING TRACEABILITY ASSESSMENT METHOD IMPLEMENTATION PROCESS

The value of GDLF determines the amplitude of the generator damping contribution, and the sign of GDLF determines the positive or negative damping provided by the generator. A negative GDLF indicates that the unit of interest injects additional transient energy into the system, which is detrimental to the system damped oscillations, and a positive GDLF indicates that the unit of interest consumes the transient energy of the system oscillations, which is beneficial to the system damped oscillations. Therefore, by calculating the energy structure of the system in the mode of interest through the MCSSD method proposed in this chapter, and then obtaining the GDLF of each generator, the generator damping can be finely evaluated. The calculation of the GDLF is based on the system energy trajectory, and the source of the trajectory can be either the time domain simulation output calculation or the PMU real measurement signal calculation, therefore, the above generator damping evaluation method has online application potential, and the main process of the method is as follows.

(1) The online monitoring of contact line power is used to determine whether the system is experiencing weakly damped or negatively damped low-frequency oscillations.

(2) If continuous oscillation occurs in the system, for generators in the oscillation region, the relevant generator PMU measurement signals are selected according to the data requirements for calculating generator dissipation energy.

(3) The oscillation characteristic parameters and the decoupled oscillation information of the mode of interest are obtained by the MCSSD method.

(4) Based on the generator dissipation energy distribution in the energy structure, the dissipation energy of each generator element is calculated, and then the total dissipation energy of a single generator is obtained.

(5) The GDLF of the generator in the mode of interest is calculated, and the damping contribution of each generator during the oscillation is evaluated according to the ranking of the GDLF index, and the information is fed back to the auxiliary decision system.

### 3.3. ACTUAL SYSTEM ANALYSIS

In this section, the effectiveness of the proposed generator damping evaluation method under a multi-machine system is verified through a real system simulation analysis. The system is divided into four regions, where the northern region is an equivalent system interconnected to other regions of the system through two 50 kV contact lines, No. I and No. II. Under the base operation mode, the power delivered from the central region to the northern region in the actual system is 100 MW. eigenvalue analysis of this actual system shows that there are three important inter-regional oscillation modes in the system under the base operation mode, and Table 3 identifies and calculates the eigenvalue results.

**Table 3.** Identification and eigenvalue calculation results

Model number	Frequency/Hz		Eigenvalue calculation		Oscillation participation area
	MCSSD	Prony	f/Hz	$\xi$	
I	0.876	0.862	0.87	0.0410	{West South Central} vs {North}
II	0.962	0.957	0.95	0.0619	{South West} vs {Central Central}
III	1.285	1.292	1.25	0.1437	{Western Central} vs {Southern North}

Among the three inter-area oscillation modes, mode I has the widest involved range and smaller damping ratio, and the oscillation frequencies of mode I and mode II are closer. A 200-ms three-phase short-circuit fault is set at the midpoint of mode II to excite the inter-area oscillation mode of the system, and the speed deviation signal of unit G1 at the Holling River pit is analyzed by the MCSSD method and the Prony method, and the obtained mode information is listed in Table 3. By comparing with the results of the eigenvalue calculation and the Prony analysis, it can be seen that the MCSSD method can effectively extract the system oscillation mode.

Under the basic operation mode, the fault form remains unchanged, and the GDLF calculated for each mode according to the mode decoupling information of each electrical quantity, for a certain mode, some units provide positive damping and some units provide negative damping with different amplitudes, so that the decentralized evaluation of damping during low-frequency oscillation can be realized according to the calculation results of GDLF.

#### 4. CONCLUSION

Starting from the stability improvement strategy of new energy power system, this paper describes the voltage stability analysis method and the differential algebraic equations of power system to improve the small disturbance synchronous stability using AC voltage control. In order to predict the load characteristics of the integrated new energy power system, a system damping retrospective evaluation analysis is performed. The eigenvalue analysis of the actual system shows that among the three inter-regional oscillation modes, mode I has the widest involved range and the smallest damping ratio of 0.0410, and the oscillation frequencies of mode I and mode II are relatively close to each other with a difference of 0.08 Hz. The results show that the decentralized evaluation of damping during low-frequency oscillation can be achieved based on the calculation results of GDLF. This shows that the load characteristic prediction method based on the retrospective evaluation of system damping can extract the oscillation signal characteristics of the elastic charge.

## ABSTRACT

This paper firstly analyzes the structure and function of the new energy power system and gives its optimal scheduling strategy. Secondly, the modeling approach for the power and load probability of the new energy power system is addressed. Finally, four optimization strategies, DMPC, SMPC-HC, SRHC and PBC, are compared and analyzed for different uncertainty levels. The results show that with a 15% error in the prediction value, the operating cost increase rate of SRHC strategy is only 4.15% and the voltage violation rate is only 1.52%, which is 71.99% and 77.28% lower than that of DMPC strategy, respectively. This shows that the voltage stability of the new energy power system can be ensured by the SRHC strategy and the security of power supply of the power system can be promoted.

## **1. INTRODUCTION**

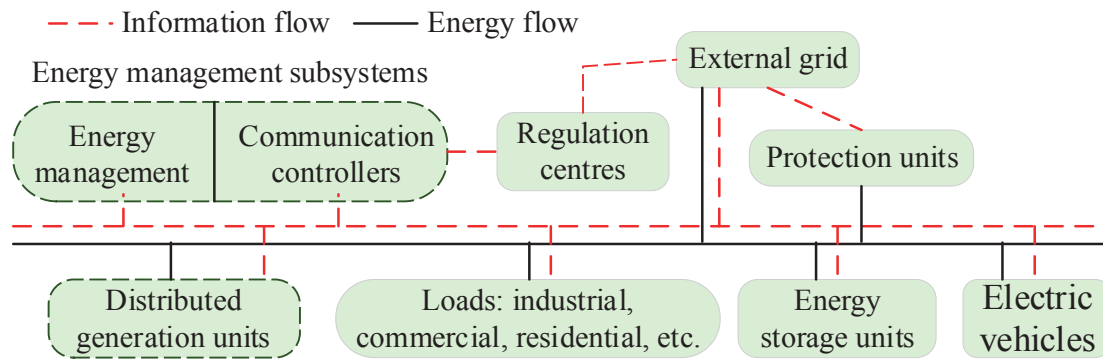

As the pace of social development in the world is gradually accelerating, the energy crisis and environmental pollution problems are becoming more and more serious around the world. China is now in a period of rapid development, and is also facing the current situation of fossil energy depletion, energy shortage, serious environmental pollution and ecosystem destruction [1-2]. In this context, the problems of insufficient resource reserves and environmental damage caused by the traditional centralized power supply model are gaining attention. At the same time, the low energy efficiency conversion of traditional fossil energy sources has led to excessive emissions of pollutants, which in turn have led to extreme weather conditions such as photochemical smog, acid rain, and haze. These many energy security issues are forcing China to adjust its energy structure and change the status quo of the previous single form of power generation that consumes too much non-renewable resources [3-4]. Therefore, new energy technologies with the advantages of unlimited, renewable, clean and environmental protection and high efficiency of power generation have gradually received widespread attention at home and abroad, and governments have incorporated the development of clean energy into their national development strategies, and renewable energy will be the top priority for sustainable development in all countries and will be the main driver to promote the current energy transition [5-6].

The development and promotion of new energy applications is an effective means to adjust the energy consumption structure, reduce carbon emissions and accelerate the realization of the “double carbon” goal. The integration of new energy generation into the power supply system can not only realize energy saving and emission reduction, but also alleviate the problem of new energy consumption. The energy storage system helps to improve the energy utilization of regenerative braking energy in the traction network [7-8]. Introducing new energy generation and energy storage system together into the power supply system can reduce the power quality problems such as negative sequence caused by three-phase voltage unbalance and guarantee the power supply safety of the power system [9-10]. However, because new energy generation is influenced by the timing and location, there are a series of uncertain factors, so how to effectively improve the power supply safety of new energy power system under the consideration of uncertain loss factors is an urgent problem to be solved.

## **2. OPTIMAL SCHEDULING ARCHITECTURE OF NEW ENERGY POWER SYSTEM CONSIDERING UNCERTAINTY**

### **2.1. NEW ENERGY POWER SYSTEM ARCHITECTURE AND FUNCTIONS**

A typical new energy power system is a small power generation and distribution system consisting of energy storage devices, distributed power sources, loads, energy conversion devices and control and protection devices. The new energy power system can be connected to the distribution grid as a whole to interact with the external grid, or it can operate independently to achieve internal energy supply and demand balance. As the most frequent interaction with users in the energy system, the new energy power system can sense the needs of users.

**Figure 1.** New energy power system architecture

As the nerve center of the whole energy system, the new energy power system regulation and control center can collect information of each device in the power system, such as load information, tariff information, each distributed micro-source output, energy storage status and real-time electricity demand. And through the regulation means to the overall scheduling of the system to ensure the stable operation of the system and power supply safety, reduce operating costs, to achieve the purpose of energy optimization management.

## 2.2. NEW ENERGY POWER SYSTEM OPTIMAL SCHEDULING STRATEGY

The optimal scheduling of new energy power system means that the energy management unit can coordinate energy storage devices, distributed controllable power generation units, interaction with the grid, electric vehicle charging and discharging scheduling and other parts of the microgrid to achieve the maximum utilization of renewable energy in the new energy power system, peak reduction and valley filling through interaction with the grid, to achieve the minimum overall operating cost and the maximum overall benefit to society, and to improve the safety of the power supply system. The objectives include The stochastic operation optimization model of active power distribution system is an operation optimization model built on the basis of deterministic operation optimization model, considering the uncertainty of system parameters and input uncertainty. The optimization modeling of active power distribution system mainly includes distributed unit modeling and distribution network modeling. Among them, distributed units mainly include distributed photovoltaic, distributed wind power, distributed controllable generating units, distributed battery energy storage, shunt adjustable reactive power compensation capacitors, and on-load regulators. SRHC has lower control cost, smaller voltage violation probability and better voltage steady-state regulation performance.

## 2.3. NEW ENERGY POWER SYSTEM POWER SUPPLY AND LOAD PROBABILITY MODELING

The wind speed is random, and the wind speed varies in different regions and seasons. In practical applications, the two-parameter Weibull distribution is often used to represent wind speed, and its probability density function and probability distribution function are expressed as

$$f(v) = \frac{k}{c} \left(\frac{v}{c}\right)^{k-1} \exp\left[-\left(\frac{v}{c}\right)^k\right] \quad (1)$$

$$F(v) = 1 - \exp\left[-\left(\frac{v}{c}\right)^k\right] \quad (2)$$

Where  $k$  is the shape factor of Weibull distribution,  $c$  is the scale factor of Weibull distribution, and  $v$  represents the wind speed.

The power-wind speed function relationship of the wind turbine roughly satisfies the following segmental function:

$$P_{wind} = \begin{cases} 0, v < v_{ci} \text{ or } v > v_{co} \\ k_1 v + k_2, v_{ci} \leq v \leq v_{co} \\ P_r, v_r \leq v \leq v_{co} \end{cases} \quad (3)$$

Where  $k_1 = P_r / (v_r - v_{ci})$ ,  $k_2 = -k_1 v_{ci}$  and  $v_{ci}, v_r, v_{co}$  denote the cut-in wind speed, rated wind speed and cut-out wind speed, respectively, and  $P_r$  denotes the rated active power output of the wind turbine.

In PV power generation, the PV active output is closely related to the light intensity. Here, assuming that it is only related to the light intensity and that the light intensity approximately obeys the Weibull distribution  $w(k_s, c_s)$ , the active output of PV power generation can be expressed by the following equation:

$$P_s = P_{s\_rate} \frac{S}{S_r} (0 \leq S \leq S_r) \text{ or } P_{s\_rate} (S_r < S) \quad (4)$$

Where,  $S_r$  is the rated value of light intensity,  $P_{s\_rate}$  is the rated value of PV active output.

The load of the new energy power system has random fluctuations and is often described by a normal distribution in the calculation:

$$f(P) = \frac{1}{\sqrt{2\pi}\sigma_P} \exp\left(-\frac{(P - \mu_P)^2}{2\sigma_P^2}\right) \text{ and } f(Q) = \frac{1}{\sqrt{2\pi}\sigma_Q} \exp\left(-\frac{(Q - \mu_Q)^2}{2\sigma_Q^2}\right) \quad (5)$$

where  $\mu_P, \mu_Q, \sigma_P, \sigma_Q$  is the mathematical expectation and mean squared deviation of the active and reactive loads, respectively.

### 3. ANALYSIS OF NEW ENERGY POWER SYSTEM VOLTAGE OPTIMIZATION ALGORITHM CONSIDERING UNCERTAINTY

To analyze the performance of the four optimization strategies DMPC, SMPC-HC, SRHC, and PBC under different uncertainty levels, several different prediction error standard deviation scenarios of 5%, 10%, and 15% are set here. Table 1 gives the cost escalation and voltage constraint violations for these four types of methods under the three uncertainty scenarios. The operating cost escalation rates given in the table are calculated based on the PBC operating costs at the same level of uncertainty.

**Table 1.** Comparison of optimization strategies under different uncertainty scenarios

	Uncertainty level	5%	10%	15%
<b>DMPC</b>	Operating cost escalation rate	12.25%	13.48%	14.82%
	Voltage constraint violation rate	2.87%	4.13%	6.69%
<b>SMPC-HC</b>	Operating cost escalation rate	5.53%	7.18%	--
	Voltage constraint violation rate	0.01%	0.02%	--
<b>SRHC</b>	Operating cost escalation rate	3.76%	4.03%	4.15%
	Voltage constraint violation rate	0.82%	0.95%	1.52%
<b>PBC</b>	Operating cost(¥)	906.82	931.65	989.64
	Voltage constraint violation rate	0.00%	0.00%	0.00%

From the comparison of the results of the optimization strategies of the four new energy power systems under different uncertainty levels, it is clear that the operating cost of the PBC approach increases gradually as the uncertainty level grows as a response to the fluctuation of the new energy power system and load power. Compared with the DMPC approach, the voltage regulation performance and operating cost of SRHC are significantly higher.

The voltage constraint violation rate decreases from 2.87% for DMPC to 0.82% for SRHC when the standard deviation of the prediction error is 5% of the predicted value, and from 6.69% to 1.52% when the standard deviation of the prediction error increases to 15%. In the scenario where the standard deviation of the prediction error is 10% of the predicted value, it costs 3.15% more to run SMPC-HC compared to the SRHC method. When the standard deviation of the prediction error increases to 15%, SMPC-HC cannot find a feasible solution. This indicates that the SRHC method has better conditioning performance compared to DMPC in the scenario where the prediction error increases. When the standard deviation of the prediction error is 15% of the predicted value, the operating cost increase rate and voltage violation rate of DMPC are 14.82% and 6.69%, while the operating cost increase rate of SRHC method is only 4.15% and voltage violation rate is only 1.52%, which are reduced by 71.99% and 77.28%, respectively. This shows that the operational voltage constraints in new energy power systems can be achieved by the SRHC method to ensure the security of power supply in the power system. Although the voltage constraint of SMPC-HC can be nearly 100% satisfied with only 0.01%~0.02% error, but it costs more operation cost.

In summary, in order to better realize the security of power supply for new energy power systems, the active distribution system stochastic rolling optimization strategy, i.e. SRHC strategy, should be selected. It can ensure the operating cost escalation rate and also effectively realize the voltage constraint of the power system to ensure the normal operation of the power system and improve the power supply security of the new energy power system.

#### **4. CONCLUSION**

This paper analyzes the optimal dispatching strategy of new energy power system from the architecture and function of new energy power system with uncertainty, and gives the modeling of power supply as well as load probability of new energy power system. In order to explore the strategy of power supply security of new energy power system considering uncertainty, an arithmetic analysis is carried out. The results show that the voltage violation constraint rate decreases from 2.87% for the DMPC strategy to 0.82% for the SRHC strategy at different uncertainty levels when the prediction error is 5%. When the prediction error is 10%, it costs 3.15% more to run SMPC-HC compared to the SRHC method. When the prediction error is 15%, the SRHC strategy has 71.99% and 77.28% lower operating cost escalation rate and voltage violation constraint rate, respectively, compared to the DMPC strategy. This shows that the SRHC strategy derived from the example in this paper can effectively promote the security of power supply of new energy power systems under uncertain loss factor levels.

## ABSTRACT

This paper firstly analyzes the structure of Chinese traditional culture and the characteristics of contemporary fashion styling, and gives a scheme to grasp the relationship between inherited tradition and fashion innovation in clothing. Secondly, the modern fashion design concept of clothing is analyzed and its trend of personalization, national culture and unification of innovation and tradition is elaborated. Finally, in order to further study the application of Chinese traditional cultural elements in fashion styling, an experimental analysis was conducted with a fashion competition of clothing design as the research object, and the results showed that in the fashion competition of clothing design, all the three judges scored more than 8 points for the new Chinese entry group, with an average score of 8.4.

## KEYWORDS

Traditional cultural elements; Fashion styling; Clothing fashion; Personalization; National culture; Innovation

## 1. INTRODUCTION

Chinese traditional culture has a long and profound history. Among the cultural systems that have been nurtured in the cradle of four ancient civilizations in the world, Chinese traditional culture is the only surviving cultural system and the only classical culture that has continued uninterruptedly without a break [1-2]. Chinese traditional culture is all-encompassing, especially the traditional Chinese plastic arts, such as the traditional Chinese folk plastic arts, the distinctive Chinese architecture, fine artifacts, silk, calligraphy, painting, etc., all of which are the source of modern clothing design [3-4]. Entering the information age, the personalized expression of clothing design relies on the perfect combination of the play of traditional Chinese culture and modern fashion design techniques [5-6]. Designers need to study Chinese traditional modeling art in depth and combine traditional modeling elements with modern clothing fashion to make the design more in line with today's aesthetic habits and lifestyles while conveying profound cultural connotations and giving new contemporary meaning to traditional modeling elements [7-8].

This paper first analyzes the structure of traditional Chinese culture and contemporary fashion styling, and points out that the relationship between inherited tradition and fashion innovation in clothing is the key issue facing Chinese fashion designers today. Then it elaborates the trend of personalization, national culture and the unification of innovation and tradition in modern fashion design concepts. Finally, the experimental analysis of fashion design based on traditional cultural elements shows that the application of Chinese traditional cultural elements in fashion styling can enhance the fashionability of modern clothing, which

in turn will lead China's fashion design industry to gradually establish its own brand in the international competitive market and spread China's excellent traditional culture to the world.

## 2. CHINESE TRADITIONAL CULTURE AND CONTEMPORARY FASHION STYLING

### 2.1. TRADITIONAL CHINESE CULTURE AND CONTEMPORARY FASHION STYLING

Chinese traditional culture is a grand classical cultural system with distinctive characteristics and stable structure, which has been passed down from generation to generation and influenced the whole social history, created by the Chinese nation as the main body and formed and developed on the land of China before the late Qing Dynasty. Figure 1 shows the structure of Chinese traditional culture. Chinese traditional culture is rich in content and has various forms of expression. The various forms of traditional culture have commonalities and are reflected in the basic spirit of traditional Chinese culture, which permeates all parts of traditional Chinese culture, mainly in the spirit of "humanism", "nature spirit" and "parity", This basic spirit permeates all parts of Chinese traditional culture, mainly in four aspects: the spirit of "humanism," the spirit of "nature," the spirit of "parity," and the spirit of "meeting."

**Figure 1.** Traditional Chinese Cultural Structure

Plastic art is an extremely broad category. Plastic art refers to the use of certain material materials, as well as shape, light, color, point, line, surface, body and other modeling means to occupy space, creating visible planes, relief or three-dimensional image, showing the objective existence of concrete things, to induce a close relationship with the visual of an art. Chinese traditional modeling art is the tangible fruit of traditional culture, intuitively presenting the history and reflecting the spiritual connotation of Chinese traditional culture, and is the visual basis for the innovation of later generations. The visual art of clothing, innovative design mainly relies on tangible cultural elements to reflect the spiritual connotation of traditional culture. Chinese traditional modeling art is rich in content, bronze, ceramics, silk, calligraphy, painting, ancient architecture, etc. are all creative sources of fashion design for clothing.

### 2.2. INHERITANCE OF TRADITION AND CLOTHING FASHION INNOVATION

How to grasp the relationship between inheritance of tradition and fashion innovation is the key issue facing Chinese fashion designers at present. First of all, it should be clear that inheritance of tradition is the premise of fashion innovation. Without understanding the traditional culture, the current design is the wood without foundation and water without source, and there is no way to talk about innovation. Although we have more than 20 years of experience in fashion design and have made certain achievements, in order to create famous brands to the world, we still need to sleep on our feet and learn traditional culture, because we have not done enough in this regard.

It is easy to find that the main reason for their success is that they have inherited their own cultural traditions and fully explored the connotations of their traditional culture. Here we might as well refer to their successful experience, the success of the French clothing industry is well known, the biggest feature of French clothing is its national character. French clothing expresses the historical tradition and spiritual connotation of the French nation, maintaining the aristocratic atmosphere of the French court and incorporating the simplicity and generosity

of modern life, French clothing reflects the combination of tradition and fashion.

Secondly, designers should learn to study traditional Chinese culture from a historical and macroscopic perspective. Chinese traditional plastic art is produced in each specific historical period, with a specific historical background and the attributes of the times. Any traditional culture has two sides, both the positive meaning of “excellent cultural heritage”, but also contains the negative meaning of backwardness, conservatism, etc., in the “ancient for the present”, we must “remove the false to preserve the truth, to remove the rough to extract the essence “, critically absorb and learn from. To create fashion culture, we must not lose the premise of national identity, dare to take the attitude of abandonment of tradition, that is, dare to deny the past. The right attitude to inherit tradition is to constantly enrich it, develop it and surpass it, and constantly push out new ideas to make tradition and modernity more integrated, so as to create fashionable clothing with individuality.

### **3. MODERN FASHION DESIGN CONCEPT OF CLOTHING**

#### **3.1. TREND OF PERSONALIZATION**

People are increasingly pursuing personalization in clothing, which is a new starting point after stylization and perfection of clothing and a sign of human spiritual civilization to higher development. The continuous improvement of human value and the continuous strengthening of the dresser’s sense of individuality have led to the development of dress image shaping and the continuous strengthening of the sense of individuality. The so-called personality is not only a single person, sometimes it may be a group of dressers, is the coordinates and symbol of the high development of human culture, and will also foreshadow the tendency of dress personalization in the future not too long period of history.

#### **3.2. ETHNIC CULTURE TREND**

Respect for regional cultural characteristics of clothing design, as expressed in its design style should reflect the differences in terroir, climate and other natural conditions of different regions, as well as heterogeneous cultural connotations and different national personalities, that is, to retain the regional cultural characteristics of clothing, fully reflect the region’s “sense of culture”. At the same time, clothing design should also be tapped into traditional culture, innovation, the incorporation of foreign culture, the transformation and development of different nationalities, regions and even the traditional culture of the East and West into a diversified, regional, personality characteristics of modern culture, which is an important feature of the concept of modern clothing design culture. In the current field of clothing design, where East and West cultures interpenetrate, many designers have made bold explorations, innovations and refinements on how to make these two cultures intermingle and blend. In this regard, Japanese fashion design, which has both national characteristics and modernity, is particularly remarkable and has achieved high achievements.

#### **3.3. THE TREND OF UNIFICATION OF INNOVATION AND TRADITION**

In the era of economic globalization and fierce competition in the garment industry, the modern garment design concept focuses on the pursuit of highlighting local traditional culture. It is also combined with modern fashion trends to realize the unity of innovation and tradition. Only by achieving the unity of innovation and tradition can we upgrade from the use of surface symbols to the performance of cultural connotation design. At present, Chinese clothing design as a whole still has a design concept is not high intention, creativity is not new, not the essence of China’s traditional culture into the design of clothing. The development trend of clothing is spiraling upward, so it means that innovation is necessary. Pay attention to theoretical research, grasp oriental culture and traditional Chinese culture at the level of cultural spirit, firmly grasp

the spiritual concept of traditional Chinese culture, and prevent symbolic and superficial combination of traditional elements, illustrative and hunting exhibition of Chinese elements. Think and feel the spiritual concept of Chinese culture.

In conclusion, the use of traditional modeling elements in modern clothing design caters to the individual distinction of modern clothing design concept, the national culture and the unification of innovation and tradition, which is the key to the success of modern design works.

#### 4. ANALYSIS OF FASHION DESIGN OF CLOTHING BASED ON TRADITIONAL CULTURAL ELEMENTS

In order to study the application of traditional Chinese cultural elements in fashion modelling, the author invited five group of clothing design professional teachers and students from the famous art school to design each group of 10 designers. Three judges were invited to score by 0-10. The design style of the five participants is France, light, dark style, American retro style and new style of Chinese style, and table 1 shows the scores of the five groups. The design style of French dress design is usually simple and optimized, and the design of light clothing usually focuses on the simplicity of the line, the dark dress design style is the smooth and smooth line of the line, the American retro style is full of the feeling of hard, wild and unruly. The Chinese style new wind combines the traditional elements, the pursuit of the rigour and the elegance.

**Table 1.** Scoring of the 5 groups of participants by the 3 judges

Competition Group	French style	Light Luxury	Dark style	American retro style	New Chinese Style
Judges 1	7.9points	7.9points	7.49points	8.0points	8.4points
Judges 2	8.2points	7.5points	7.5points	7.6points	8.5points
Judges 3	8.0points	7.8points	7.3points	7.9points	8.3points

From Table 1, we can learn that the highest rated group was the New Chinese style entry with an average score of 8.4, and the lowest rated group was the Dark Style entry with an average score of 7.4. This shows that the judges preferred the new Chinese style with contemporary traditional culture, which evolved from the traditional Chinese clothing style and contains various traditional Chinese cultural elements. Therefore, in order to meet the requirements of contemporary consumers, we need to explore and apply modern clothing design more deeply in the discovery of traditional art, and contribute a modest effort to find the fit between traditional Chinese styling elements and modern clothing design.

#### 5. CONCLUSION

This paper analyzes the structure of Chinese traditional culture and the characteristics of contemporary fashion styling in the context of the information age as the research background, and shows the importance of grasping the relationship between inherited tradition and fashion innovation in clothing. In order to be able to better analyze the fashion design of clothing based on traditional cultural elements, this paper conducts an experimental analysis using a clothing design fashion competition as the research object, and the results show that in the clothing competition, the highest rating was given to the new Chinese entry group, with an average score of 8.4. This shows that contemporary consumers prefer the new Chinese style with contemporary traditional culture, and this conclusion can lay a stable foundation and provide a strong impetus for the more diversified development of China's clothing fashion design industry.

## ABSTRACT

This paper firstly constructs a laboratory system framework based on the B/S model and designs a security management system for the laboratory system. Secondly, the RBAC model is introduced to calculate the global trust degree to obtain access control policies and then assign access rights to the users of the laboratory system. Finally, simulation tests are conducted to verify the effectiveness of the system and the ability of security access control. The results show that the maximum average response time of this system is 0.65s and 1.39s when the number of concurrent users is 1000 and 10000 respectively, which shows that the RBAC model can effectively realize the security access control of the laboratory system and ensure the security of laboratory information.

## KEYWORDS

RBAC model; Global trust degree; Laboratory system; Secure access; B/S model; Control policy

## 1. INTRODUCTION

Internet application scenarios, laboratory network links generate a large amount of data every day, which is crucial to the secure operation of the network. Since the network has to provide data access services to users without interruption, network attacks may be encountered in the process, resulting in security threats to laboratory network data, and security access control of data is thus on the agenda and has become an urgent problem in the Internet industry [1-3].

With the rapid development of laboratories and the widespread use of smart devices, privacy protection in laboratories is receiving increasing attention. When a large amount of laboratory device data is collected, processed and shared through IoT, corresponding access control mechanisms are needed to prevent unauthorized access to resources and protect sensitive private data [4-5]. The main function of access control is to prevent unauthorized user operations and restrict unauthorized users from operating specific devices [6-7]. Through the access control mechanism, users with different rights levels have their own levels of access rights, and each user can only access the private data resources under the operation corresponding rights, which can effectively secure the laboratory data [8-9]. Therefore, the access control mechanism in laboratories has become one of the important research elements for protecting data security and privacy.

## 2. LABORATORY SYSTEM FRAMEWORK AND ITS SAFETY MANAGEMENT SYSTEM DESIGN

### 2.1. FRAMEWORK OF LABORATORY SYSTEM IN B/S MODE

The network operation mode of this laboratory system adopts B/S structure, i.e., browser/server structure as shown in Figure 1, and the main transaction logic is on the server side, forming a three-layer architecture of representation layer-application layer-data layer, which is convenient for system function expansion.

**Figure 1.** Framework for a laboratory system in B/S mode

The representation layer, the client browser, is the interface through which the user interacts with the lab system. The representation layer contains the display logic of the system and is located on the client side. The user calls the applications in the system and accesses the system data through the representation layer. The application layer is the part that implements the logic of various things in the lab and is the key to the whole system architecture, located on the server side. The data processing logic of the system is contained in the data layer, located at the database server side. The task of the data layer is to accept requests from the server for data manipulation.

### 2.2. LABORATORY SYSTEM SAFETY MANAGEMENT SYSTEM DESIGN

The user security management mechanism is designed to prevent legitimate users from overstepping their rights to access laboratory system applications or data information, while satisfying the distributed anxiety among users with different roles, in order to address the issues of differentiation and definition of user roles, differentiation and granting of user rights, and user authentication involved in the representation layer. The system security prevention mechanism is designed for the security issues involved in the application layer in terms of system software and hardware and its operational reliability. It is used to help the laboratory system to face different security threats, so that it can be targeted to protect the system hardware and software information from malicious damage, changes and leakage. The database security management mechanism is designed for the data layer involving data information storage security and communication security.

## 3. RBAC MODEL-BASED LAB SYSTEM USER RIGHTS ASSIGNMENT

### 3.1. FUNDAMENTALS OF THE RBAC MODEL

RBAC is an effective privilege management model.

Direct trust is the degree of trust for users who have a direct pointing relationship  $TD_{ij}^{(0)}$ , i.e:

$$TD_{ij}^{(0)} = w(T) \prod_i^k P(x_i) \quad (1)$$

Where,  $P(x_i)$  is the joint probability of accessing the message sequence,  $w(T)$  is the time factor introduced in the laboratory system,  $i, j (i=1, 2, \dots, n; j=1, 2, \dots, m)$  is the trust factor, and  $T$  is the length of time.

The global trust degree  $T_{i,j}$  is the trust degree of the user's full access to the information resources of the laboratory system, i.e:

$$T_{i,j} = \alpha \cdot T_{D,i,j} + \beta \cdot T_{R,i,j} \quad (2)$$

Where  $\alpha > \beta > 0$ ,  $T_{R,i,j}$  is the recommended trust level and  $T_{R,i,j} = \lambda \cdot T_{D,i,j}$ . Then the access control policy is

$$T_{i,j} = (\alpha + \beta \cdot \lambda) \cdot T_{D,i,j} \quad (3)$$

where  $(\alpha + \beta \cdot \lambda)$  is the global node trust degree parameter.

### 3.2. LAB SYSTEM USER RIGHTS ASSIGNMENT BASED ON RBAC MODEL

Using the global trust degree and the set access control results, the laboratory system user rights are assigned, which are divided into autonomous and mandatory access. The formula for calculating the idea of assigning weights for autonomous type access control is

$$R = \begin{cases} r_i, \forall r_i = refuse(1 \leq i \leq n) \\ T_{ij}(r_1 + r_2 + \dots + r_n), \forall r_i \neq refuse(1 \leq i \leq n) \end{cases} \quad (4)$$

Where  $R$  is the user access result after incorporating the autonomous access control weight assignment idea, and  $r_1, r_2, \dots, r_n$  is each access permission of the user. The forced access control weight assignment idea is calculated as

$$S = \begin{cases} r_i, \forall r_i = refuse(1 \leq i \leq n) \\ \mu(r_1 + r_2 + \dots + r_n), \forall r_i \neq refuse(1 \leq i \leq n) \end{cases} \quad (5)$$

## 4. LABORATORY SYSTEM MULTI-LEVEL SECURITY ACCESS CONTROL SIMULATION EXPERIMENTS AND ANALYSIS

In order to verify the security access control performance and feasibility of the lab system built based on RBAC model and B/S mode in this paper more effectively, simulation experiments are conducted. One computer is used to run the system designed in this paper, and the other two computers are used to run the blockchain system and the trust degree system, respectively, as the control group A and control group B. Before the formal start of this simulation experiment, the relevant experimental parameters need to be set, and the setup parameters are shown in Table 1.

**Table 1.** Experimental parameter setting table

Parameters	Experimental group	Group A	Group B
Network Security Parameters	$3.85 \cdot 10^{-5}$	$3.85 \cdot 10^{-5}$	$3.85 \cdot 10^{-5}$
Total access control/TB	$4.68 \cdot 10^5$	$4.68 \cdot 10^5$	$4.68 \cdot 10^5$
Total amount of data/TB	$11.55 \cdot 10^8$	$11.55 \cdot 10^8$	$11.55 \cdot 10^8$
Estimated response time/s	1.02	1.35	1.58
Connectivity rate/%	98.37	98.26	98.15

As can be seen from Table 1, in this simulation experiment, only the expected response time is inconsistent between the experimental group and the control group, and other experimental parameters are the same, so the average response time of the network security access control system is used as the research index in this experiment. After setting the experiment-related parameters, the network security access control system of the

experimental group and the control group were controlled to run synchronously, and the number of concurrent users was set to 1000 and 10000 during the experiment, and the experimental results were obtained as shown in Figure 2.

From the comparison of the average response time of the system, it can be seen that with the increasing number of concurrent users, the average response time of the laboratory security access control system is increasing, but the response time of the designed system in this paper is much smaller than that of the two control systems. When the number of concurrent users is 1000, the maximum average response time of the system designed in this paper is only 0.65s. When the number of concurrent users is 10000, the maximum average response time of the system designed in this paper is 1.39s, which is smaller than that of the experimental control group. This shows that the laboratory system designed in this paper based on B/S model has better performance, and the security access control using RBAC model can further optimize the security of the laboratory system and protect the laboratory system data from unauthorized access.

**Figure 2.** Comparison of system response times for different numbers of concurrent users

## 5. CONCLUSION

In this paper, starting from the laboratory system framework, the basic framework of the laboratory system is constructed in B/S mode, and the security management system of the laboratory system is designed. For security access control of the lab, RBAC model is used for system user permission assignment. The system in this paper is compared with the blockchain system and the trustworthiness system in a simulation test of the average response time. The results show that when the number of concurrent users is 1000 and 10000, the average maximum response time of this system is 0.65s and 1.39s respectively, which indicates that the system built in this paper has good performance, and the RBAC model can be used to better realize the multi-level security access control of the laboratory and guarantee the security of laboratory data.

## ABSTRACT

This paper firstly analyzes the design principles and fundamental role of urban low carbon landscapes. Secondly, the ecological and environmental contribution values of landscape spatial pattern gradients are calculated by using landscape load ratio index under big data analysis. The degree of influence of ecological changes in the landscape and changes in the gradient of landscape spatial pattern is analyzed by the single factor evaluation method, and the comprehensive potential measurement model is used to calculate the comprehensive force measurement of each gradient pattern. Finally, the three methods were used to compare and analyze the scheme of innovative landscaping. The results show that the comprehensive force measurement value of this paper's method is 9.5, which is 40.74% and 72.73% higher than the other two methods, respectively.

## KEYWORDS

Urban low carbon strategy; Landscape design; Spatial pattern gradient; Landscape load ratio; Comprehensive force measurement; Ecological contribution value

## 1. INTRODUCTION

Landscaping is an important part of urban construction, it is the main place for urban residents to relax and sightsee, and it plays a pivotal role in improving urban environment, reducing pollution, reducing noise, promoting urban ecological balance, and achieving carbon sequestration [1-2]. The design of urban garden plants landscape with low-carbon concept as the core is the fundamental requirement for maximizing the efficiency of carbon sequestration in urban greening, and good design is the key to the effect of the whole gardening [3-4].

In the design of urban garden plants based on low carbon concept, designers need to strictly follow the principle of low carbon. From a practical point of view, plants themselves have the function of temperature regulation, and if the ecological environment of the city is in trouble, the application of some plants can play an effective role in reducing the environmental temperature [5-6]. This is mainly due to the low carbon emission and high carbon sink characteristics of plants, which can improve the urban living environment to a great extent.

Therefore, urban garden plant landscape design should focus on the carbon sink function of the green space system, carry out green, low-carbon and recycling urban landscape construction, and build a conservation garden, ecological garden and environment-friendly garden [7-8]. Thus, it can promote the high-quality development of urban green space and contribute to the construction of social ecological civilization and beautiful China.

## 2. PRINCIPLES AND ROLE OF URBAN LOW-CARBON STRATEGIES IN LANDSCAPE DESIGN

### 2.1. DESIGN PRINCIPLES OF URBAN LOW CARBON LANDSCAPING

Developing carbon sequestration and biological carbon sink technologies, increasing carbon absorption in terrestrial ecosystems through afforestation, actively carrying out forest fire prevention and disease control, and improving the carbon storage capacity of nature are the common technical ways to reduce emissions. As the creator of “urban green lung”, landscape is an important part of energy-saving and carbon-reducing society. Low carbon is a development model aimed at reducing greenhouse gas emissions, which can achieve low pollution, low energy consumption and low emissions. In the whole life cycle of planning, design, construction and post-maintenance of low-carbon landscape construction, carbon dioxide emissions should be minimized. The design principles of urban low-carbon landscaping are shown in Figure 1.

**Figure 1.** Design principles for low carbon urban landscaping

### 2.2. THE ROLE OF URBAN LOW-CARBON STRATEGIES IN LANDSCAPE DESIGN

In the process of urbanization, resulting in the energy crisis and environmental deterioration is very serious, not only domestic, the global are facing such contradictions, so that the security pattern of the city gradually collapse, so that people’s production and life by different degrees of interference. The effect of urban low-carbon concept in landscape design is to make the layout of urban green landscape more scientific and reasonable, which can strongly moderate the contradiction of severe environmental pollution in the process of urbanization.

The most direct effect of the urban low-carbon concept in landscape design is to improve the atmospheric environment and optimize the spatial conditions for human survival. The implementation of the low-carbon concept in the design of urban garden plants and landscapes will make the distance and distribution between green landscapes more scientific and reasonable in urban construction, which directly affects the ecological cycle in urban areas. It greatly improves the resilience of the ecosystem itself, promotes the optimization of the urban ecological pattern, and enhances the ability to resist urban atmospheric pollution. The ability of different types of plants to sequester carbon and release oxygen is shown in Table 1.

**Table 1.** Plants’ ability to sequester carbon and release oxygen

Plant type	Average whole plant carbon sequestration/(g/d)	Average whole plant oxygen release/(g/d)
Trees	429.22	313.35
Deciduous plants	404.36	296.54
Evergreen	297.67	218.72
Shrubs	168.52	124.13

## 3. GRADIENT OPTIMIZATION OF URBAN LANDSCAPE SPATIAL PATTERN BASED ON BIG DATA

The ecological environmental contribution value of the gradient of landscape pattern is

calculated by using landscape load ratio index under big data analysis, the influence degree of ecological change of landscape and gradient change of landscape spatial pattern is analyzed by single factor evaluation method, and the comprehensive measuring force of each gradient pattern is calculated by using comprehensive potential measurement model. The landscape flow of the landscape spatial pattern is calculated by the index method, and the gradient optimization of the landscape spatial pattern is completed according to the calculation results combined with the ecological environment contribution value and the comprehensive measurement force.

Let  $LCI$  represent the contribution of the spatial gradient pattern of the landscape to the ecological environment, then:

$$LCI = \log \left\{ \frac{\sum_{i=1}^m S_i \cdot W_i \cdot P_{ci}}{\sum_{j=1}^m S_j \cdot W_j \cdot P_{cj}} \right\} \quad (1)$$

Where  $S_i$  represents the area of the trigonometry of the  $i$ nd “sink” landscape in the Lorenz diagram,  $S_j$  represents the area of the trigonometry of the  $j$ th “source” landscape in the Lorenz diagram.  $W_i$  represents the weight of the  $i$ th “source” landscape in the gradient pattern, and  $W_j$  represents the weight of the  $j$ th “sink” landscape in the gradient pattern.  $P_{ci}$  represents the percentage of the  $i$ th “source” landscape in the watershed, and  $P_{cj}$  represents the percentage of the  $j$ th “sink” landscape in the watershed.

The single-factor evaluation method is used to analyze the degree of influence of ecological changes in landscape and gradient changes in landscape spatial patterns, and compare the standard and index values of each factor to obtain the degree of influence of the target by each factor, and the single-factor evaluation formula is:

$$\psi_i = \begin{cases} C_i / C_1, & 0 < C_i \leq C_1 \\ 1 + (C_i - C_1) / (C_2 - C_1), & C_1 < C_i \leq C_2 \\ \vdots & \vdots \\ 2 + (C_i - C_2) / (C_n - C_2), & C_2 < C_i \leq C_n \end{cases} \quad (2)$$

where  $\psi_i$  and  $C_i$  are the single-factor evaluation indices and measured values of the  $i$  influence factors on the spatial pattern gradient of the landscape, respectively.  $C_1, C_2, \dots, C_n$  represents the standard value of the evaluation criteria for the spatial pattern gradient of the garden landscape.

According to the evaluation index of influence shadow  $\psi_i$ , the landscape ecological potential of each gradient pattern in the landscape space is calculated using the integrated potential measurement model, and the expression of the integrated potential measurement model is:

$$Q = \sum_{i=1}^n S_i \cdot W_i / \psi_i \quad (3)$$

Where  $W_i$  represents the weight of the indicator,  $S_i$  represents the score of the indicator,  $n$  represents the total number of indicators, and the integrated power measurement  $Q$  is taken in the interval  $[1,10]$ .

Landscape flow is an important sign to reflect landscape functions and landscape processes. Patches are connected by corridors to form a network of landscape through interactions. The corridors in the spatial ecosystem of the landscape are connected by intersections to reflect the complexity of the spatial gradient pattern of the landscape. The index method is used to calculate the landscape flow of the landscape spatial pattern gradient, and the optimization of the landscape spatial pattern gradient is completed under the analysis of big data according to the calculation result of landscape flow  $Y$  combined with the ecological contribution value and comprehensive force measurement of the landscape spatial pattern, and the calculation formula of  $Y$  is

$$Y = L / L_{\max} = L / 3(g - 3) \quad (4)$$

Where  $L$  represents the number of connections in the actual landscape space,  $L_{\max}$  represents the maximum number of connections, and  $g$  represents the number of nodes in the actual landscape space.

#### 4. EMPIRICAL ANALYSIS OF LOW-CARBON URBAN LANDSCAPE PLANNING

To prove the effectiveness of the proposed planning scheme, the biodiversity index is used to evaluate the planning and design of urban low-carbon landscape, which is an important manifestation of ecological construction. The methods of this paper, the spatial landscape gradient optimization method at all levels in the context of rapid urbanization, and the land use based landscape pattern gradient optimization method are tested respectively. The spatial coordinate system of spatial gradient pattern of landscape was established, and the plant species in the gradient of spatial pattern of landscape optimized by three different methods were compared. The test results are shown in Table 2.

In Table 2, SY represents the number of iterations, Q represents the integrated force measurement of landscape spatial pattern gradient, DS represents the optimization method of landscape spatial pattern gradient under big data analysis, KS represents the optimization method of spatial landscape gradient at all levels in the context of rapid urbanization, JY represents the optimization method of landscape pattern gradient based on land use, and PJ represents the average value of integrated force measurement.

**Table 2.** Test results of three different methods

SY	Q		
	DS	KS	JY
1	10	6	6
2	9	8	6
3	10	7	5
4	9	6	5
PJ	9.5	6.75	5.5

Analyzing Table 2, we can see that the average comprehensive measurement force obtained by using the method of spatial pattern gradient optimization of landscape under big data analysis is 9.5, the average comprehensive measurement force obtained by using the method of gradient optimization of spatial landscape at all levels in the context of rapid urbanization is 6.75, and the average comprehensive measurement force obtained by using the method of gradient optimization of landscape pattern based on land use is 5.5. Comparing the average comprehensive measurement force of the three methods, we can see that the big It is clear that the gradient optimization method for landscape spatial pattern under data

analysis can effectively optimize the gradient pattern.

In summary, in the urban low-carbon garden plant landscape design, planning and design personnel should reasonably consider the geographical conditions, climatic conditions and other factors affecting plant growth in the area where the project is located, reasonably select the site and optimize the configuration of garden plants, and strengthen the integration of plants and the application of buildings such as pavilions and courtyards in the garden. And do a good job in the design of key parts such as entrances and exits, objective assessment of the garden carbon sink situation, the full implementation of the concept of low-carbon environmental protection, to enhance the social value of the garden project as well as ecological value.

## 5. CONCLUSION

This paper takes the design principles of urban low-carbon landscapes as the entry point and analyzes the role of urban low-carbon strategies in landscape design. The ecological and environmental contribution values of landscape pattern gradients are calculated by using landscape load ratio index under big data analysis, the influence degree of ecological changes in landscape and changes in landscape spatial pattern gradients are analyzed by single factor evaluation method, and the comprehensive potential measurement model is used to calculate the comprehensive measurement force of each gradient pattern. Finally, in order to verify the effectiveness of the method in this paper, a comparative experimental analysis was conducted. The results show that the integrated force measurement value of the proposed design scheme is 9.5, which is higher than the other two methods. This shows that the urban low-carbon strategy under big data technology needs to further strengthen the grasp of the spatial location of the garden landscape and promote the effective improvement of the carbon sink capacity of the garden, so that the urban low-carbon concept can be better developed.

## ABSTRACT

This paper firstly analyzes the importance of sight-reading to choral conducting in music education majors. Secondly, based on big data technology, a deep learning network is used to fuse music features and construct a music style classification model. Finally, an example analysis was conducted to verify the effectiveness of the model in teaching the integration of choral conducting and sight-reading. The results showed that the classification accuracy of the model was 88.52%, 82.34% and 72.16% for pop, electronic and classical music, respectively. This shows that using the music style classification model can help teachers better prepare music teaching contents and promote the integration teaching of choral conducting and sight-singing and ear training.

## KEYWORDS

Sight-reading; Choral conducting; Music education; Deep learning network; Musical style; Big data

## 1. INTRODUCTION

With the continuous progress of big data technology, reshaping music makes the disciplinary literacy cultivation, aesthetic perception, artistic expression and cultural understanding of music education become more supportive and creative, and exploring the application of big data technology to promote the reform and development of music teaching has a very important significance [1-3]. Based on big data technology, students are guided to learn to use scientific methods to cultivate computational thinking to create music, to appreciate music in a scientific context to cultivate students' sense of musical aesthetics, and to use scientific evaluation to enhance the efficiency of music classroom teaching [4-6]. Through these measures, school music education can be accurately carried out to differentiate teaching according to the material and highlight the characteristics of music education.

Sight-singing and choral conducting are the two basic courses required for undergraduate students in music majors in colleges and universities. Sight-singing and ear training are the foundation for music majors and guarantee students' further study of music, and choral conducting course is one of the most popular courses in colleges and universities in recent years [7-8]. The two courses are traditionally taught in a single-subject teaching mode, and the knowledge students receive in their studies is relatively independent and scattered. However, the art of music is profound and boundless, especially because there is a certain degree of integration between the courses, and there are commonalities and intersections between the courses of sight-singing and choral conducting. The learning of sight-singing and ear training

is to establish accurate pitch concept and serve for polyphonic music, while choral conducting training can be said to be an extension of polyphonic, which cannot be separated from the foundation of sight-singing and ear training [9-10]. Thus, exploring the effective strategy of integrating choral conducting and sight-singing and ear training based on big data technology can further promote the development of music majors in colleges and universities and bring out the characteristics of music students.

## 2. THE IMPORTANCE OF SIGHT-SINGING AND EAR TRAINING FOR CHORAL CONDUCTING

### 2.1. SIGHT-SINGING AND CHORAL CONDUCTING

The discipline of sight-reading and ear training, like other courses that develop musical skills, forms musical skills by digging deeper, refining and summarizing the musical elements contained in the musical material itself. The characteristics of the discipline are shown in Table 1.

**Table 1.** Sight-singing and ear-training subject features

Features	Contents
Basic	Extensive coverage, High level of coverage, Highly integrated
Practicality	The perception of music, The perception of music, Thinking about music
Independence	Rhythm and beat, Pitch and chords, Melody and Modulation
Integrated	Integration in content, Interactive in form

The importance of learning to sing and practice music cannot be overstated. In the process of teaching, it is necessary to combine the teaching of the subject with the practice of music to form a training mode that integrates the internal and external aspects. In the “internal” training, the main focus is to build up the inner “listening”, through the teaching of various musical information, to develop students’ perception of pitch and rhythm, and to form a fixed concept of pitch. In the “external” training, the main focus is on “singing”, through various forms of singing, to express the music in sound. Through various forms of singing, students can express the music with their voices. In the interplay of internal and external articulation, students’ ability of sight singing and ear training is improved.

Choral singing, as the name implies, is the process of interpreting a musical work in the form of singing by a group of people. Choral singing is a comprehensive form of music performance in all courses of music majors, mainly vocal, and incorporates the basic theoretical knowledge of various subjects, and is also a kind of training in colleges and universities to broaden students’ knowledge and increase employment opportunities. The conductor is the most critical and core character in the chorus, is the overall leader of the choir, in the whole team, whether in pitch, musical expression or rhythm control, the conductor should also be the best one deserved.

### 2.2. THE IMPORTANCE OF SIGHT-SINGING AND EAR TRAINING FOR CHORAL CONDUCTING

In choral singing, good polyphonic thinking is very important. Many pieces have monophonic and polyphonic parts, and some music will combine monophonic and polyphonic parts. Monophonic music can be done independently with one singer, while polyphonic music requires the cooperation of several people. Polyphonic music has two or more vocal parts, and collaboration is the typical form of polyphonic performance. Sight-singing training for polyphonic parts is systematic and mature in sight-singing textbooks, and such choral performances are compatible. Choral singing involves not only the pitch of the single part, but

also requires the rhythm to be strictly according to the score, as well as the harmony and tune style, etc. The influence of sight-reading on choral conducting is shown in Figure 1.

**Figure 1.** The impact of sight-reading on choral conducting

Choral singing needs to lay a good foundation through sight-singing and ear training, and choral singing cannot be done without the foundation laid by sight-singing and ear training. In the choral process, the music conductor must have the ability to identify the pitch and judge whether the harmony is harmonious, which needs to ensure the smooth progress of the chorus through the cumulative training of sight-singing and ear training.

### 3. MUSIC STYLE CLASSIFICATION MODEL BASED ON BIG DATA TECHNOLOGY

The use of big data technology to classify music styles can better help college music majors to understand music styles more intuitively when teaching the integration of choral conducting and sight-singing and ear training, and then achieve the accuracy of conducting and the precise grasp of timbre, rhythm and pitch. This chapter focuses on the construction of a music style classification model based on deep learning networks after fusing the characteristics of timbre, rhythm and pitch of music. The specific steps are as follows:

(1) The music features are input to the network, the weight matrix  $W$  of the deep learning network is initialized, and the bias  $a, b$  of the implicit and visible layers is initialized to 0.

(2) The visible layer neural units are assigned to forward transmit the input music features to obtain the activation probability corresponding to forward propagation in the deep learning network. That is:

$$p(h | v) = \prod_{j=1}^n p(h_j | v) \quad (1)$$

(3) The activation probability value  $p(h | v)$  corresponding to the neuron in the hidden layer is usually a real number, which is binarized.

(4) Back-propagating the probability value corresponding to the unit in the hidden layer in the deep learning network to obtain the reconstructed value  $v'$ . The activation probability is described by  $p(v' | h)$  as

$$p(v' | h) = \prod_{i=1}^n p(v_i | h) \quad (2)$$

(5) Calculate the backpropagation and activation probabilities in the improved deep learning network with forward propagation reconfiguration of  $v'$ .

(6) Use the above calculation results to obtain the increment corresponding to bias  $b$  in the visible layer, and also obtain the increment corresponding to bias  $a$  in the hidden layer  $h$ . The increments of the weight matrix  $W$  can be obtained by backpropagation probability and forward propagation probability calculation, thus constructing the music style classification model expressed as

$$\begin{cases} W_t = W_{t-1} + \varepsilon[v p(h|v) - v' p(h'|v')] \\ b_t = b_{t-1} + \varepsilon[p(v|h) - p(v'|h')] \\ a_t = a_{t-1} + \varepsilon[p(h|v) - p(h'|v')] \end{cases} \quad (3)$$

Where,  $\varepsilon$  represents the learning rate.

Through the above steps, the music style classification results are output.

#### 4. EMPIRICAL ANALYSIS OF THE INTEGRATION TEACHING OF CHORAL CONDUCTING AND SIGHT-SINGING AND EAR TRAINING

In order to further study the effectiveness of fusion teaching of choral conducting and sight-singing and ear training in college music education majors, this chapter carries out the fusion teaching model of choral conducting and sight-singing and ear training for teachers and 980 students of freshmen, sophomores and juniors in A city college as examples. This is to verify the effectiveness of the music classification model based on big data technology in the integration teaching of choral conducting and sight-singing and ear training.

##### 4.1. ANALYSIS OF THE CLASSIFICATION ACCURACY OF THE MUSIC STYLE CLASSIFICATION MODEL

For the music classification model constructed in this paper, this section uses the existing music style genre database on the Internet for quantitative analysis of the data, and the classification accuracy of the model for music styles is obtained as shown in Figure 2.

From the results of the classification accuracy of music styles, the classification accuracy of the music classification model constructed in this paper based on big data technology is higher for pop music, electronic music and classical music, with the accuracy rates of 88.52%, 82.34% and 72.16%, respectively. The reason for this is that pop music, electronic music and classical music are the mainstream music in the current society, which makes the process of music feature fusion more often use the rhythm and timbre of pop music, electronic music and classical music for feature extraction. This also shows that the music style classification model constructed in this paper can effectively classify music styles and provide effective teaching materials for the integration of choral conducting and sight-singing and ear training.

Figure 2. Classification accuracy of music classification models

## 4.2. STUDENTS' EVALUATION OF THE INTEGRATION OF CHORAL CONDUCTING AND SIGHT-SINGING AND EAR TRAINING TEACHING

In order to further analyze the effectiveness of teaching the integration of choral conducting and sight-reading, the evaluation data of students were collected and compiled in this section, and the results are shown in Table 2.

**Table 2.** Student assessment for integrated teaching and learning

	Very good	Good	Fair	Poor
Professional competence	429	338	198	15
Teaching Attitude	482	324	107	67
Teaching methods	327	325	225	103
Teaching effectiveness	401	209	209	161

From the students' evaluation of the integration teaching of choral conducting and sight-singing and ear training, the music style classification model constructed by using big data technology can effectively help students realize the discrimination of music genres, and then promote the coordinated development of sight-singing and choral conducting. The percentages of those who rated the teachers' professional ability, teaching attitude, teaching method and teaching effect as very good were 43.77%, 49.18%, 33.37% and 40.92%, respectively. This also shows that by using big data technology to classify music styles can better help teachers to innovate their teaching methods and contents, and improve students' mastery of music choral conducting and sight-singing and ear training skills.

## 5. CONCLUSION

This paper analyzes the influence of sight-reading on choral conducting, starting from the specific characteristics of sight-reading and choral conducting. In order to promote the integration teaching of both, a music style classification model was constructed based on big data technology using deep learning networks to fuse music features. The quantitative analysis of the data was carried out with the example of colleges and universities in city A. The results showed that the percentage of students who rated the teacher's professional ability, teaching attitude, teaching method and teaching effect as very good in the integration teaching of sight-singing and choral conducting through the music style classification model were 43.77%, 49.18%, 33.37% and 40.92%, respectively. This indicates that the classification of musical styles can strengthen the teaching effect of the integration teaching of sight-singing and choral conducting.

## ABSTRACT

This paper firstly constructs a virtual teaching and research room teaching platform for swimming professional courses by combining artificial intelligence technology, and uses median filter algorithm for data collection and pre-processing. Secondly, the advantages and framework of the application of virtual teaching and research room in swimming professional courses are analyzed. Finally, a performance test analysis was conducted to verify the effectiveness of the virtual teaching and research room teaching platform in this paper. The results show that the average incoming time delay of the virtual teaching and research room teaching platform does not exceed 1s and the data loss rate does not exceed 0.05%. This shows that the virtual teaching and research room teaching platform of swimming course combined with artificial intelligence technology can effectively enrich students' swimming learning methods and further enhance students' interest in swimming learning.

## KEYWORDS

Artificial intelligence technology; Teaching platform; Median filtering; Swimming; Virtual teaching room; Performance testing

## 1. INTRODUCTION

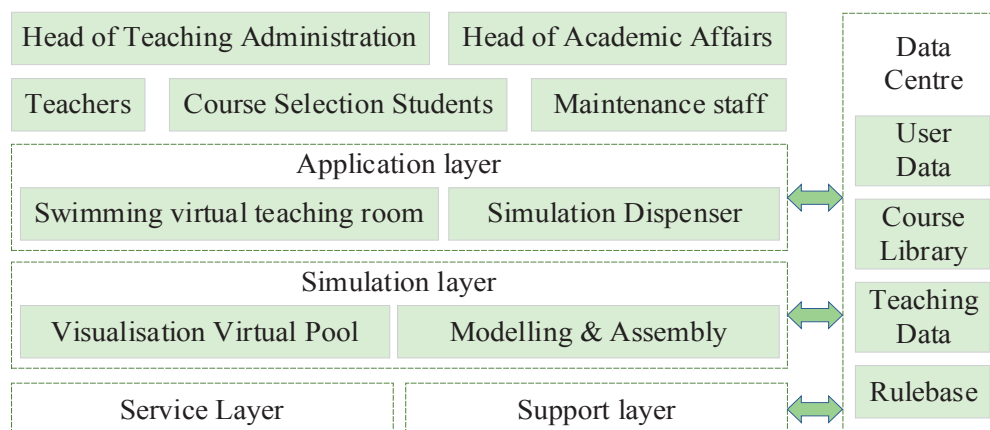

The virtual teaching and research office is a new type of teaching organization developed based on modern information technology, which can coordinate and drive the management of teaching resources in different regions, schools and disciplines, emphasizing the exploration of classification of multi-level and multi-type systems [1-2]. Compared with traditional teaching and research office, the core connotation of virtual teaching and research office is the teaching space created with the help of digital information technology or Internet platform, which breaks through the original temporal and spatial boundaries and administrative boundaries of universities [3-4]. The creation of this teaching space is concretely manifested as a new digital space form, which can spatialize or temporalize the coexisting practices at the same time with the help of information technology in the Internet [5-6].

In the era when artificial intelligence technology has been widely used in modern competitive sports, swimming, as one of the sports with high requirements for technological content, has relatively failed to keep up with the times in the teaching of swimming professional courses in China [7-8]. This paper discusses the necessity of introducing artificial intelligence technology in swimming professional courses from the current situation of combining swimming and artificial intelligence technology in China, illustrates the effectiveness of the application of virtual teaching and research room to swimming professional courses, and also

conducts a test analysis for the virtual teaching and research room platform of swimming professional courses. The results show that the virtual teaching and research room of swimming course based on artificial intelligence technology can effectively realize the innovation of swimming course and also provide a new way for the development of swimming course.

## 2. CONSTRUCTION OF VIRTUAL TEACHING AND RESEARCH ROOM FOR SWIMMING PROFESSIONAL COURSES BASED ON ARTIFICIAL INTELLIGENCE TECHNOLOGY

Artificial intelligence technology and computer numerical simulation technology are used to build a virtual reality model for swimming teaching, which includes the realization of enhanced virtual effects such as people, swimming technique movements and environment. The powerful virtual reality technology can let students experience the feeling of being in the “water” in the waterless environment, and accompanied by a strong sense of entertainment and movement. Based on computer simulation technology, multimedia technology and artificial intelligence technology, this chapter integrates physical simulation, innovative design, intelligent guidance, virtual experiment results and teaching management, and builds a virtual teaching and research platform for swimming, whose basic architecture is shown in Figure 1.

**Figure 1.** Virtual teaching platform for swimming

The overall architecture of the platform contains 4 layers and 1 data center, which are application layer, simulation layer, service layer, support layer, and data center containing user information, course library, experimental data, rule library, and standard answer library. In the application layer, students need to read the experimental requirements of the swimming course, view the experimental data, conduct experiments, and submit experimental reports. The simulation layer contains the virtual pool, swimming technique movement modeling, and dispenser. The service layer contains experimental teaching management, experimental teaching management, theoretical knowledge learning, experimental resource management, experimental intelligent guidance, and interactive communication between teachers and students. The support layer contains security management, service container, data management, domain management and other links.

In the service layer, the data pre-processing algorithm chosen in this paper is the median filter algorithm, and the median filter processing of the signal can be quickly implemented with the Scipy.Signal.Filtfilt function in the Python library function. The median filter algorithm is a nonlinear signal processing method, and the median filter with the median filter algorithm as the core is a nonlinear filter, and the median filter can effectively filter out the impulse interference in the signal.

The median filter is a sliding window with an odd number of points, where the value of the

center point of the window is replaced by the median value of the points in the window. The median filter is a one-dimensional sequence  $f_1, f_2, \dots, f_n$  with a window of length  $m$ . The median filter is a sequence of  $m$  numbers  $f_{i-v}, \dots, f_{i-1}, f_i, f_{i+1}, \dots, f_{i+v}$ , of which  $f_i$  is the center point of the window,  $v = (m-1)/2$ . The  $m$  point values are then sorted by their numerical magnitude and the number whose number is the center point is taken as the filtered output:

$$y_i = \text{Med}\{f_{i-v}, \dots, f_i, \dots, f_{i+v}\}; i \in Z, v = (m-1)/2 \quad (1)$$

The shape and size of the median filter window have a significant impact on the filtering effect, and different window shapes and sizes are often used for different types of signals and the environment in which the signals are applied. The data of students in the virtual teaching room are collected and processed using the median filtering algorithm to help teachers better understand the learning situation of students.

### **3. ADVANTAGES AND FRAMEWORK FOR THE APPLICATION OF ARTIFICIAL INTELLIGENCE TECHNOLOGY IN SWIMMING PROFESSIONAL COURSES**

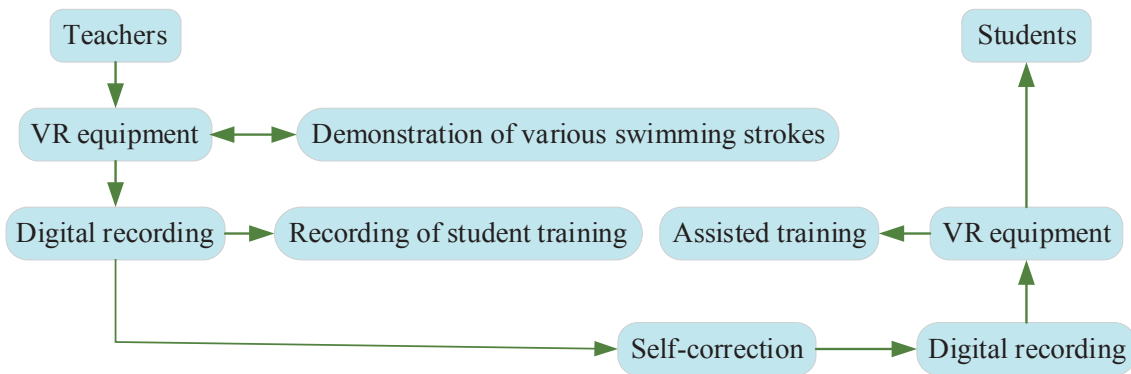

#### **3.1. ADVANTAGES OF THE APPLICATION OF VIRTUAL TEACHING AND RESEARCH ROOM IN SWIMMING COURSES**

The virtual teaching and research room combined with artificial intelligence technology provides very great support for the learning and practical ability cultivation of swimming professional courses. It not only enriches the original traditional teaching methods and practical activities, improves the current situation that students' practical ability training in real environment is not implemented, but also expands the channels of teaching practical ability training. The use of virtual teaching and research room can create a variety of forms of natural water places, live atmosphere, rescue skills training environment, can mobilize the enthusiasm of course learning and enhance learning interest.

The use of virtual teaching and research room for swimming professional course learning, is conducive to increasing the time of practice, breaking the traditional practice ability training time constraints, and greatly enhance the diversity of teaching equipment functions and equipment utilization. And can effectively avoid the dangers that exist in the real environment learning, for some relatively high risk factor and uncontrollable teaching practice, through simulation virtual practice training, so that students are familiar with the basic movements and operation process after the essentials and requirements. Then according to the teaching requirements in the virtual environment similar to the real environment to practice, so as to ensure the safety of practice and eliminate the danger.

#### **3.2. FRAMEWORK FOR THE APPLICATION OF VIRTUAL TEACHING AND RESEARCH ROOMS IN SWIMMING COURSES**

For learners who are new to swimming, the teaching methods used in traditional swimming teaching have certain limitations. In the teaching process, students have certain reaction time and understanding bias for the teacher's teaching language, and teachers mostly use the means of explanation + demonstration and multimedia + explanation to teach. Therefore, the implementation framework of the virtual teaching room is used to realize the teaching of swimming professional courses and its auxiliary teaching is shown in Figure 2.

**Figure 2.** Implementation framework for virtual faculty-assisted teaching

The virtual teaching room combined with artificial intelligence technology applied to swimming teaching can make swimming teaching get rid of the long-standing teaching dilemma in the past. The authenticity, timeliness, scalability and richness of the virtual swimming teaching room can effectively solve the problems of traditional swimming teaching such as visual obstacle in water, itchy demonstration on land, blurred positioning of wrong movements and inability to compare the body movements with self-knowledge.

#### 4. TEST ANALYSIS OF VIRTUAL TEACHING PLATFORM OF SWIMMING PROFESSIONAL COURSES

Table 1 shows five sets of test results, each including data volume, received data volume and data loss rate after sending data ten times in a loop using 5000 threads, as well as the rounded average incoming delay calculated after sampling 200 data.

**Table 1.** Data entry latency and loss rate testing Results

	1	2	3	4	5
Sending data volume	59247	62104	59917	58316	60015
Received data volume	59245	62102	59892	58312	60004
Data loss rate	0.02%	0.01%	0.05%	0.02%	0.04%
Average incoming delay	408ms	603ms	571ms	224ms	529ms

From the results of the five sets of performance tests, the average entry delay is as low as 224ms and as high as 603ms, which are not more than 1s. For a qualified virtual teaching and research room teaching platform, its data loss rate should not exceed 0.05%, and the data loss rate of the five test results in the table does not exceed 0.05%. Through the above two data show that this paper combined with artificial intelligence technology of swimming professional course virtual teaching room teaching platform has good stability and data fidelity, can make the student data can be completely shown in front of the teacher. In turn, it enables teachers to target the reform of swimming teaching course content and promotes students to improve their interest degree in learning swimming.

#### 5. CONCLUSION

Based on artificial intelligence technology and multimedia information technology, this paper constructs a virtual teaching and research room teaching platform for swimming, and analyzes the advantages and framework of the application of virtual teaching and research room in swimming professional courses. In order to further analyze the application effectiveness of the virtual teaching and research room teaching platform for swimming professional courses, performance test analysis was conducted for the platform. The results show that the average entry practice of the virtual teaching platform of the swimming professional course combined with AI technology is as low as 224ms and as high as 603ms, none of which exceeds 1s, and

the data loss rate in the five test results does not exceed 0.05%. This shows that the virtual teaching room of swimming professional course built by combining artificial intelligence technology can effectively realize the innovation of swimming professional course, and can further optimize the learning of swimming course and enhance the interest degree of students for swimming professional course.

---

## ABSTRACT

This paper first analyzes the stage characteristics of the financial sharing model, and explains the content and characteristics of audit risk for accounting firms. Secondly, the impact of big data technology on the audit model of accounting firms is discussed, and an audit risk prediction model is constructed using multiple linear regression. Finally, in order to verify the effectiveness of the application of big data technology in the audit risk of accounting firms, an example analysis is conducted. The results show that the predicted value of the audit risk prediction model based on multiple linear regression has a significant difference from the actual value with an error of only 1.264%, Sig.=0.0001. It indicates that big data technology can help accounting firms to predict the financial data of audited units to find out their possible audit risks.

## KEYWORDS

Financial sharing model; Accounting firm; Big data technology; Multiple linear regression; Audit risk; Predictive model

## 1. INTRODUCTION

With the advent of the era of big data, an inseparable relationship has been formed between the audit work of accounting firms and various data, which is the trend of the times. For accounting firms, the audit work is carried out by the data to present the results and processes, therefore, the scientific use and analysis of data can greatly help accounting firms to prevent audit risks [1-3].

The establishment of the financial sharing model has changed the organizational structure of enterprises, which relies on modern network information technology to build an integrated information system platform that is internally integrated with various enterprise information systems and externally interconnected with finance-related systems. These changes have led to significant changes in the audit targets, audit methods, audit data forms, audit techniques, and requirements for auditors in accounting firms [4-5]. As a result, data security, information system security, and the rationality of business processes under the financial sharing model more seriously affect the audit risk during the audit work of accounting firms.

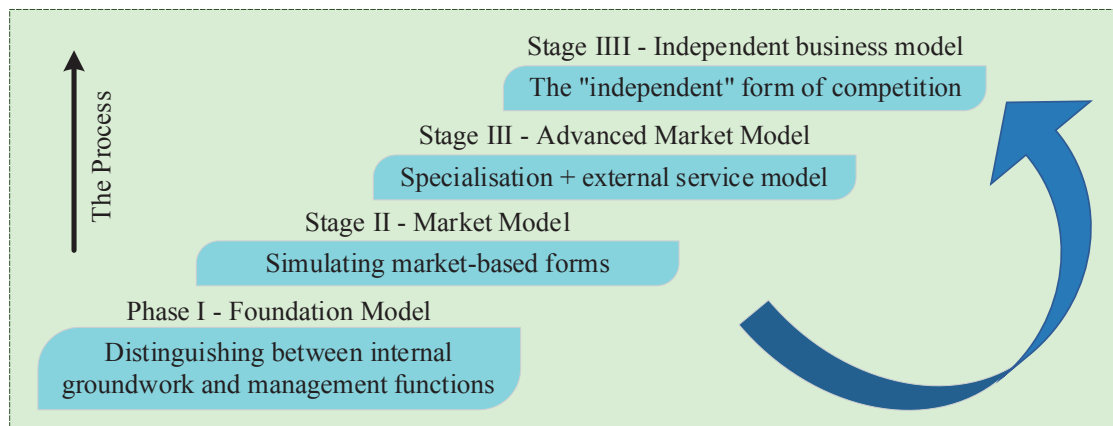

As far as the current situation is concerned, there are few accounting firms that apply big data, which in turn affects the implementation of auditing. Therefore, in the future, the application of big data CPA audit will become a trend, and it is likely to transform the audit model of accounting firms under big data application [6-8]. For this reason, this will not only bring new development opportunities to the auditing industry, but also likely to generate risks, which requires accounting firms to take effective measures to prevent such risks.

## 2. AUDIT RISKS OF ACCOUNTING FIRMS UNDER THE FINANCIAL SHARING MODEL

### 2.1. FINANCIAL SHARING MODEL

The four main factors that an enterprise should consider when choosing which model to adopt when building a financial shared service center include the development stage and management level of the enterprise, the enterprise's positioning of the financial shared service center, the objectives of financial management and services, and the corporate governance and leadership capabilities. Based on these influencing factors, the models of financial shared services can be broadly classified into basic model, market model, advanced market model and independent operation model, and their basic classification is shown in Figure 1.

**Figure 1.** Four types of financial sharing models

### 2.2. AUDIT RISK CONTENT AND CHARACTERISTICS OF ACCOUNTING FIRMS

#### (1) Content of audit risk

Audit risk consists of the probability that a CPA will render an incorrect audit opinion in the actual course of work due to various factors such as omissions and misstatements in accounting statements. Therefore, if the risk is classified according to the factors that cause it, it can be classified as inherent risk, inspection risk, control risk, etc.

Inherent risk refers to the risk arising from the audit unit's own characteristics at the time of the actual work. Inspection risk refers to the risk that the CPA does not find any hidden errors after careful examination in accordance with the inspection risk. The control risk refers to the problems caused by the operational errors or mistakes of the salesperson or accountant employed by the audited company or unit, but such problems cannot be solved by strengthening the supervision of the unit or company itself.

#### (2) Characteristics of audit risk

Audit risk occurs when the audit results do not match the actual situation due to some uncertainties in the audit process. In order to effectively avoid these risks, the first step is to understand clearly the characteristics of the financial audit risk, based on the characteristics of the necessary control measures. Accounting firms to conduct financial audits is the existence of audit risk characteristics shown in Table 1.

**Table 1.** Characteristics of audit risk

<b>Features</b>	<b>Meaning</b>
Objectivity	Financial audit risks are objective and unavoidable.
Universality	Audit risk exists in all aspects of financial auditing.
Potential	Audit risks are potential and need to be addressed in a timely manner.
Controllable	Audit risk can be avoided and controlled through effective methods.

Based on the above description of financial audit risks, it is also possible to understand the specific role of financial audit risk control for accounting firms. On the one hand, it improves the overall quality of financial auditing, and on the other hand, it can contribute to the healthy development of the auditing industry. Accounting firms focus on strengthening internal construction, through the control of financial audit risk, while strengthening the construction of the firm itself. Can promote the healthy and sustainable development of the whole industry, to ensure a more reasonable flow of social resources and promote the stable development of the entire market economy.

### **3. FRAMEWORK FOR THE APPLICATION OF BIG DATA TECHNOLOGY IN THE AUDIT RISK OF ACCOUNTING FIRMS**

#### **3.1. THE IMPACT OF BIG DATA ON THE AUDIT MODEL OF ACCOUNTING FIRMS**

##### (1) The impact on the audit sampling method

The application of big data technology by accounting firms has a greater impact on audit sampling methods, and audit sampling is gradually shifting in the direction of overall auditing. With the application of big data technology, accounting firms have increased the statistics and analysis of information data related to auditing and can better analyze the information data submitted by audited units effectively. It has increased the scope of audit work, making the results of audit work more accurate and improving the quality and effectiveness of audit work.

##### (2) Promoting the continuous development of auditing work

By applying big data technology, accounting firms can process relevant information data with modern technology in a high-quality and efficient manner. This not only saves time in auditing work, but also enables early detection of risks in auditing work and dealing with them. With the support of network technology and information technology, the auditing work of accounting firms is more informative and intelligent, which greatly improves the overall effectiveness of auditing work.

#### **3.2. AUDIT RISK PREDICTION MODEL BASED ON MULTIPLE LINEAR REGRESSION**

Multiple linear regression is a method to study the quantitative relationship between a dependent variable and multiple independent variables. When there is a linear relationship between audit risk variable  $y$  and  $n$  independent variables  $x_1, x_2, \dots, x_n$ , then the audit risk prediction model given multiple linear regression is established as

$$y = a_0 + a_1x_1 + a_2x_2 + \dots + a_nx_n + \varepsilon \quad (1)$$

Where  $y$  is the dependent variable,  $x_1, x_2, \dots, x_n$  is the independent variable,  $a_0, a_1, \dots, a_n$  is the regression coefficient, and  $\varepsilon$  is the random error.

The advent of the Big Data era and the development of technology has provided more efficient and advanced technologies and methods for the conduct of audits in accounting firms. To a certain extent, it makes it easier to conduct and implement audits and helps to improve the quality and efficiency of audits. The use of multiple linear regression models for audit risk

prediction analysis can effectively help accounting firms to identify audit risks more intuitively, and then propose targeted solutions to promote normal economic development.

#### 4. EMPIRICAL ANALYSIS OF AUDIT RISK PREDICTION OF ACCOUNTING FIRMS UNDER BIG DATA TECHNOLOGY

In order to further discuss the application of big data technology in forecasting audit risk in accounting firms, this chapter is designed to use the annual audit of Group S as a case study to see at a glance how big data technology can be applied in practice and can be strongly contrasted with the tediousness of traditional auditing.

The audit process uses regression equations to analyze and forecast data, mainly to analyze the rationalization of company expenses. For example, we have the actual data of Group S's operating costs for multiple years, and Table 2 shows the breakdown of Group S's operating costs for each year.

**Table 2.** Breakdown of operating costs by year

Project	2017	2018	2019	2020	2021
Time	1	2	3	4	5
Operating Costs	1442536.58	1684529.17	1855549.24	2033182.51	2618744.92
Operating income	1582414.42	1766483.55	1952412.61	2269547.18	3033154.79

From the table, we can see that Group S's operating costs and operating income are continuously increasing. If we want to forecast 2022 and verify the operating costs in 2021, then we can use the data from previous years to establish the regression equation as

$$Y = A + BT \tag{2}$$

where  $A, B$  is a constant,  $T$  is time, and  $Y$  is operating cost.

The specific regression results using regression analysis are shown in Table 3.

**Table 3.** Regression analysis results

	B	Error	T	Sig.
X	246427.48	11654.29	22.127	0.0001
Constants	-23541.65	65423.18	-0.153	0.3318
F			621.263	
Sig.			0.0001	

Through the above regression equation, we can roughly predict the operating cost to 2021 is 2585621.73, but the actual number of statements is 2618744.92, the error rate between the two is 1.264%, and the Sig. between the constants = 0.0001, indicating that it has a significant difference. And the error rate is around 1% proves that its prediction result is within the acceptable range, then it means that the prediction value is probable to be true, if the difference is great, then we need to find out the audit doubt. At the same time, through this regression equation we can calculate the projected value of 272342.16 in 2022, in order to achieve the forecasting effect and give the audited unit column to the reference value. The predicted data of operating cost can be used to analyze whether there is a certain degree of audit risk in Group S at present, and then provide effective data support for audit risk avoidance. This also shows that the regression analysis under the big data technology can effectively achieve the prediction of the enterprise financial data, through the data to show the possible audit risk of the audited unit, and then provide effective suggestions for the audited unit to solve, so that the audited unit can effectively avoid the audit risk and promote the normal operation of its

economy.

## 5. CONCLUSION

This paper discusses the impact of big data on the audit model of accounting firms under the financial sharing model, and constructs an audit risk prediction model using multiple linear regression model. In order to verify the effectiveness of the application of big data technology on the audit risk of accounting firms under the financial sharing model, a regression analysis of the data was conducted using Group S as an example. The results show that the error rate between the predicted and actual values of corporate financial income obtained from the regression analysis using big data technology is 1.264%, and the regression results are significantly different with Sig.=0.0001. This indicates that the use of big data technology can help accounting firms make accurate predictions of the financial data of audited units, and further determine the possible audit risks of audited units through the predicted values. The predicted values can be used to further determine the possible audit risks of the audited entity and then propose targeted solutions.

## ABSTRACT

This paper analyzes the sustainable livelihood strategies of farming households by taking the sustainable development framework of cross-county relocation farming households as an entry point. Logistic regression in the context of big data is used for model construction and variable indicator selection, and validation analysis of the examples is conducted. The results show that the inter-county relocated farmers are mainly part-time farmers, part-time farmers and non-farmers, among which the influencing factors of part-time farmers are natural and human capital, with correlation coefficients of 0.387 and 0.335. The influencing factors of part-time farmers are human, financial and social, with correlation coefficients of 0.278, 0.345 and 3.012, respectively. The correlation coefficients were 0.278, 0.345, and 3.012, respectively.

## KEYWORDS

Inter-county relocation; Livelihood transition; Livelihood strategy; Logistic regression; Part-Agricultural; Part-Agriculture

## 1. INTRODUCTION

Inter-county relocation aims at poor people in areas where “one side of the land cannot feed one side of the people” and fundamentally changes the poor people’s poor living environment by means of spatial displacement, which is one of the important ways in the strategy of precise poverty alleviation [1-3]. The spatial displacement of cross-county relocation makes the migrants move from mountainous areas to new communities with tourism development, which is not only a change of living space. It is more the change of production methods, the reconstruction of social structure and social relations, and the deconstruction of cultural psychology hidden under the material space, to which the migrants have to re-adapt [4-6].

Sustainable livelihoods are the maintenance and improvement of living conditions through the acquisition of livelihood assets, capabilities and activities by individuals or households based on long-term development goals, and residents who have relocated across counties to engage in harvesting, logging, and clear-cut farming are one of the main ways to maintain and improve their livelihood patterns [7-8]. Livelihood transition is the best option for community residents to cope with the changes in their surroundings. Numerous studies have shown that livelihood transformation can achieve ecological conservation while promoting the survival and development of local residents, and achieving mutually beneficial coexistence between

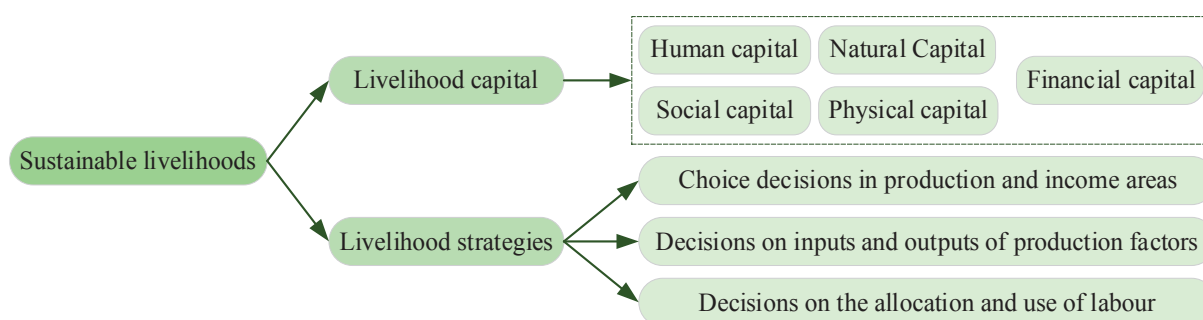

migrants and communities [9-10]. In the context of big data, more attention needs to be focused on the way of livelihood transition and the future direction of farmers relocating across counties, so that farmers can live better even when they move away from their hometowns.

## 2. SUSTAINABLE DEVELOPMENT FRAMEWORK FOR LIVELIHOOD TRANSFORMATION OF FARMERS RELOCATED ACROSS COUNTIES

### 2.1. SUSTAINABLE LIVELIHOOD STRATEGIES FOR FARM HOUSEHOLDS RELOCATED ACROSS COUNTIES

In this paper, cross-county easy-land poverty alleviation and relocation of farmers refers to the relocation of the poor population from the areas with scarce development resources, poor ecological environment, lack of public facilities, and non-availability of basic production and development conditions to the areas with better development conditions of all kinds through the government-organized and coordinated easy-land poverty alleviation and relocation project. Break through the constrained state of resources, environment and development conditions that restrict the development of the poor population to achieve poverty relief and coordinated development of poverty alleviation and development activities, as well as the relocated population generated by this activity.

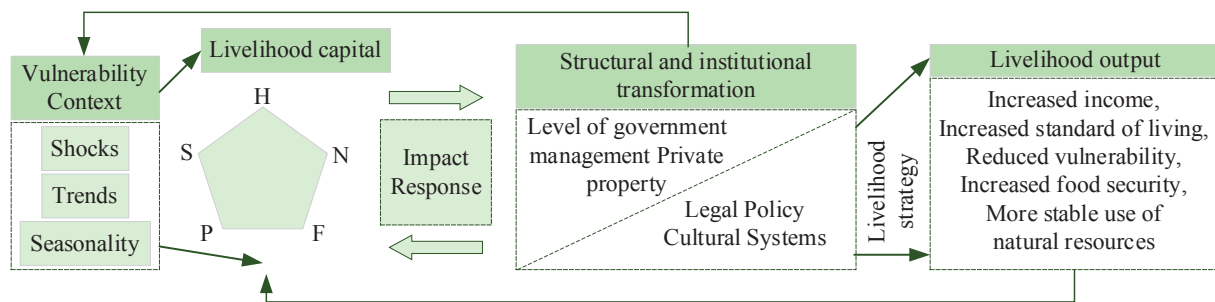

Sustainable livelihood refers to the activity of households or individuals to choose reasonable livelihood strategies to pursue positive livelihood outcomes based on the capital they possess and have access to in order to improve their long-term living conditions. Livelihood capital is the foundation and starting point of sustainable livelihoods. The livelihood capital that households or individuals possess and acquire includes five categories of human, natural, social, physical and financial capital. Livelihood strategy is a rational choice based on the status of livelihood capital, i.e., sustainable livelihood is the activity of allocating and combining various types of livelihood capital to choose the corresponding livelihood strategy and obtain positive benefits in order to maintain the long-term survival and development of a household or individual. The classification of sustainable livelihoods for farmers relocated across counties is shown in Figure 1.

**Figure 1.** Classification of sustainable livelihoods

### 2.2. FRAMEWORK FOR SUSTAINABLE LIVELIHOODS FOR FARM HOUSEHOLDS RELOCATED ACROSS COUNTIES

The sustainable livelihood framework for cross-county relocated farm households consists of five main components, namely, vulnerability context, five types of livelihood capital, structural and institutional transformation, livelihood strategies, and livelihood outputs, which are interlinked and interact with each other. The basic structure is shown in Figure 2.

**Figure 2.** A framework for sustainable livelihoods for farm households

The ultimate goal of the sustainable livelihood framework for cross-county relocation is to achieve enrichment and enhancement of livelihood capital, reduction of livelihood risks, and optimization of livelihood outcomes. Using the sustainable livelihoods framework to analyze the livelihoods of cross-county relocated farm households can help to systematically understand the possession status of various types of livelihood capital and its changes among cross-county relocated farm households. The relationship between vulnerability context and livelihood capital is used to analyze the limiting factors affecting the livelihoods of relocated farm households, so that structural and institutional shifts can be used to compensate for them and secure their livelihoods.

### 3. LOGISTIC REGRESSION MODEL TO ANALYZE FARMERS' LIVELIHOOD CAPITAL IN THE CONTEXT OF BIG DATA

#### 3.1. INDICATOR SELECTION OF FARM HOUSEHOLD LIVELIHOOD CAPITAL LOGISTIC REGRESSION VARIABLES

After reading the literature to have an in-depth understanding of previous articles on livelihood capital, the relevant independent variables were selected on the basis of previous studies combined with the actual situation of the research content of this paper, and the independent variable indicators are shown in Table 1.

**Table 1.** Livelihood Capital Logistic Regression Variable Indicators

Primary variables	Secondary variables	Coding
Natural capital (N)	Arable land area per capita	X1
	Woodland area per capita	X2
	Quality and accessibility of arable land	X3
Physical capital (P)	Area of housing	X4
	Number of durable consumer goods	X5
	Access to water for domestic use	X6
Human capital (H)	Number of labour force	X7
	Average level of education	X8
	Level of health	X9
Financial capital (F)	Annual household income per capita	X10
	Whether the household has a loan	X11
Social capital (S)	Degree of rapport with neighbors	X12
	Number of borrowers available	X13
	Number of households visited on major holidays	X14
	Whether any relatives are working in county or above	X15
	Participation in cooperative economic organisations	X16

### 3.2. FARMERS' LIVELIHOOD CAPITAL LOGISTIC REGRESSION MODEL CONSTRUCTION

First, drawing on relevant studies, the influence relationship between livelihood capital and livelihood strategies was investigated through a binary logistic regression model. Then, according to the construction principle of binary logistic regression model, a binary logistic regression model was established with the following equation:

$$\ln(P_{y1} / 1 - P_{y1}) = b_{10} + b_{11}x_1 + \dots + b_{1m}x_m \quad (1)$$

$$\ln(P_{y2} / 1 - P_{y2}) = b_{20} + b_{21}x_1 + \dots + b_{2m}x_m \quad (2)$$

$$\ln(P_{y3} / 1 - P_{y3}) = b_{30} + b_{31}x_1 + \dots + b_{3m}x_m \quad (3)$$

In equation (1) above, if the relocated farmer is part-farm, then define  $P_{y1} = 1$ , otherwise  $P_{y1} = 0$ , the explanatory variable  $x_i$  is livelihood capital, and  $b_{10}, b_{11}, \dots, b_{1m}$  is the coefficient to be estimated. In equation (2), if the relocated farmer is a part-farmer, then let  $P_{y2} = 1$ , otherwise  $P_{y2} = 0$ . In equation (3), if the relocated farmer is a non-farmer, then let  $P_{y3} = 1$ , otherwise  $P_{y3} = 0$ . Thus, a binary logistic regression model is used to analyze the influencing factors and the degree of influence on the choice of different livelihood strategies of the relocated farmer.

## 4. EMPIRICAL ANALYSIS OF SUSTAINABLE LIVELIHOOD STRATEGIES FOR INTER-COUNTY RELOCATED FARM HOUSEHOLDS

According to the previous classification of livelihood strategies, it can be seen that the livelihood strategies chosen by relocated farmers are determined by the amount of livelihood capital they possess, which means that the choice of livelihood strategies varies according to the amount of livelihood capital they possess. Therefore, a binary logistic regression model was used to analyze the influence of farmers' livelihood capital on the choice of livelihood strategies. The results of the analysis were obtained as shown in Table 2.

**Table 2.** Results of regression analysis of sustainable livelihood strategies

Category	Variables	(B)	Wald	Exp (B)
Agricultural	N	0.387***	7.561	1.468
	P	-0.296*	2.934	0.752
	H	0.335**	4.498	1.414
	F	-0.667**	4.917	0.513
	S	-4.689**	5.387	0.005
Part-Agricultural	N	-0.269**	4.827	0.759
	P	0.006	0.002	1.003
	H	0.278**	4.068	1.328
	F	0.345**	5.367	1.402
	S	3.012**	4.067	20.338
Non-agricultural	N	0.148	1.041	1.158
	P	0.188	1.989	1.206
	H	0.297**	4.435	1.346
	F	0.565***	10.373	1.758
	S	3.456**	5.315	31.758

Note: \*\* and \*\*\* are statistically significant at the 5% and 1% levels respectively.

The correlation coefficients of natural capital and human capital possessed by inter-county relocation households are 0.387 and 0.335, respectively, which means that the choice of farming and farming livelihood strategy is favored when the farmers possess high levels of these two types of capital. The correlation coefficients of human, financial, and social are 0.278, 0.345, and 3.012, respectively, which indicate that the choice of part-farm livelihood strategy is facilitated by the higher financial capital, which means the higher income of the household. At the same time they can transfer some of their excess income to other livelihood activities to further improve their quality of life. From the analysis of the influence of the choice of non-farm livelihood strategies of farm households, human, financial and social capital positively promote the choice of non-farm livelihood strategies of farm households, with correlation coefficients of 0.297, 0.565 and 3.456, respectively. This indicates that when the possession of these three types of capital in farm households is high, it will promote their choice of non-farm livelihood strategies.

In summary, for the livelihood transition strategies of farmers relocating across counties, the influence of different capital variables will make farmers choose different livelihood strategies. However, whatever the strategy is, it can be analyzed using regression models, which also provide effective data support to better promote farmers' economic income and ensure livelihood stability.

## 5. CONCLUSION

This paper analyzes the sustainable livelihood strategies of farm households from the framework of sustainable development of cross-county relocation farm households' livelihood transformation. The model construction and variable selection were also carried out using logistic regression in the context of big data, and an example analysis was conducted in order to seek the livelihood strategies of cross-county relocation farmers. The results show that the impact of livelihood capital under the three livelihood strategies of farm-cum-farm, part-farm and non-farm types are different. The correlation coefficients were 0.387, 0.335, 0.278, 0.345, and 3.012 for the part-farm type, and 0.297, 0.565, and 3.456 for the part-farm type,

respectively, with natural capital and human capital as the main choices, The correlation coefficients are 0.297, 0.565, and 3.456, respectively, which show that the transformation of inter-county relocated farmers' livelihoods requires more human, financial, and social capital inputs, thus making the livelihoods of inter-county relocated farmers more stable and prosperous.

## ABSTRACT

This paper firstly analyzes the relationship between digital finance and green innovation and discusses the mutuality between urban economic resilience and digital finance. Secondly, benchmark regression is introduced for model construction and good indicator selection of the model. Finally, in order to verify the relationship between digital finance, green innovation and urban economic resilience an empirical analysis is conducted. The results show that the Pearson correlation coefficient between variables is less than 0.5, the VIF value is less than 2, and the significant correlation coefficients obtained without and with control variables are 0.003 and 0.001, respectively. Thus indicating that digital finance and green innovation can effectively promote the improvement of urban economic resilience and accelerate the development efficiency of urban economy.

## KEYWORDS

Digital finance; Green innovation; Urban economic Resilience; Benchmark regression; VIF value; Pearson coefficient

## 1. INTRODUCTION

Innovation is the first driving force to promote high-quality economic development. Since the reform and opening up, China's economic construction has achieved remarkable results, but it has also caused pollution problems to some extent. We should actively innovate green production methods, vigorously carry out technological innovation, and promote the greening of production services [1-3]. As China enters a new stage of socialist development, improving green innovation capacity becomes an important guarantee for promoting high-quality economic development.

Green innovation is characterized by high technological content, huge capital demand and high uncertainty, which is a capital-intensive investment project, and it is usually difficult to meet the demand by the enterprise's own capital volume alone, and it must rely on a strong financial market to carry out financing activities [4-6]. Since the development of China's financial market is still imperfect, there had been long-term structural problems such as information asymmetry and imbalance between supply and demand.

Facing the current economic development environment with frequent external shocks and accumulating internal risks, enhancing the level of resilience is the key for China's economy to maintain its competitive advantage and achieve high-quality development. The natural ecological and social environment is complex, and there are always many uncertainties in the process of economic development, and the ripple effects of economic risks are often more extensive as economic ties between countries continue to strengthen [7-9]. However, with the

advent of the digital era, digital finance, which is a combination of many advanced information technologies such as big data, the Internet, artificial intelligence and traditional finance, has emerged to provide digital solutions to many problems.

## 2. INTERPLAY OF DIGITAL FINANCE, GREEN INNOVATION AND URBAN ECONOMIC RESILIENCE

### 2.1. THE RELATIONSHIP BETWEEN DIGITAL FINANCE AND GREEN INNOVATION

Digital finance is inclusive and intelligent, and can promote technological innovation of enterprises from two aspects: easing financing pressure and optimizing industrial structure. In terms of enterprise financing, digital finance development is conducive to reducing information asymmetry in the lending process, alleviating financing constraints from the supply side, and thus improving regional innovation levels. The innovation incentive effect of digital finance is stronger for SMEs and private enterprises, which can obtain more stable funds by reducing borrowing costs and adjusting loan maturity structure. In terms of industrial structure upgrading, digital finance is conducive to optimizing industrial structure, thus promoting economic growth. At the regional level, industrial structure upgrading helps promote the optimal allocation of production factors such as technology and labor, and the influence of digital finance on industrial structure optimization is not consistent in different regions. The mutuality between digital finance and green innovation is shown in Figure 1.

**Figure 1.** The mutuality of digital finance and green innovation

Both financial development scale expansion and structural adjustment have a significant contribution to green innovation efficiency, and there is regional heterogeneity in the spillover effects of digital finance on green innovation at different levels of economic development and innovation capacity.

### 2.2. THE MUTUALITY OF DIGITAL FINANCE AND URBAN ECONOMIC RESILIENCE

Cities can achieve the enhancement of urban economic resilience by encouraging green technology innovation and industrial structure upgrading. On the one hand, the upgrading of green innovation technology is inevitably accompanied by the upgrading of technology level, which promotes the formation of green innovation system, enhances desired output and reduces non-desired output, thus enhancing the economic resilience of cities. On the other hand, the enhancement of green innovation technology can promote the transformation of enterprise development, reduce resource consumption and environmental pollution, realize internal economic development and enhance the input-output efficiency of urban economic resilience through the upgrade of industrial structure supported by it.

## 3. MODEL DESIGN OF DIGITAL FINANCE, GREEN INNOVATION AND URBAN ECONOMIC RESILIENCE

### 3.1. CONSTRUCTION OF THE BASELINE REGRESSION MODEL

Based on the previous analysis of digital finance, green innovation and urban economic resilience, it is shown that digital finance can provide convenient, diverse and perfect financial services for green innovation subjects by extending the depth of use. It helps market players to widely carry out green innovation activities, effectively promotes the transformation of urban

economic growth, promotes the healthy and sustainable development of economic system, and enhances urban economic resilience. The resulting benchmark regression model covering digital finance, green innovation and urban economic resilience is constructed as

$$\ln UECT_{it} = a_0 + a_1 \ln DIFI_{it} + a_2 \ln GRIN_{it} + a_3 \ln CONT_{it} + \varepsilon_{it} \quad (1)$$

Where,  $a_0$  represents the constant term,  $a_1$  represents the regression coefficient of digital finance,  $a_2$  represents the regression coefficient of green innovation,  $a_3$  represents the regression coefficient of control variables,  $i$  represents the city, and  $t$  represents the period.  $UECT$  represents urban economic resilience,  $DIFI$  is digital finance,  $GRIN$  represents green innovation,  $CONT_{it}$  is the control variable, and  $\varepsilon_{it}$  is the residual term.

On the basis of equation (1), the interaction term between digital finance and green innovation is introduced to further construct the model as

$$\ln UECT_{it} = b_0 + b_1 \ln GRIN_{it} + b_2 (\ln DIFI_{it} \times \ln GRIN_{it}) + b_3 \ln CONT_{it} + \varepsilon_{it} \quad (2)$$

Where,  $b_0$  represents the constant term,  $b_1$  represents the regression coefficient of green innovation,  $b_2$  represents the regression coefficient of the interaction term between digital finance and green innovation, and  $b_3$  represents the regression coefficient of the control variables.

### 3.2. SELECTION OF INDICATORS FOR THE BASELINE REGRESSION MODEL

#### (1) Explanatory Variables - Urban Economic Resilience

Urban economic resilience refers to the defensive resistance of the economic system in the event of a shock, its ability to recover during the shock process, and its resilience and transformation after the shock. The measured expressions are:

$$UECT_{it} = \frac{(Y_{it} - Y_{i,t-1}) / Y_{i,t-1} - (Y_{nt} - Y_{n,t-1}) / Y_{n,t-1}}{|(Y_{nt} - Y_{n,t-1}) / Y_{n,t-1}|} \quad (3)$$

where  $t$  represents national,  $Y_{it}$  represents urban real GDP in period  $t$ , and  $Y_{nt}$  represents national real GDP in period  $t$ .

#### (2) Explanatory variables - digital finance and green innovation

Digital finance is a new type of financial service derived from the integration of digital technology and traditional financial service industry in the context of the continuous development of the Internet, relying on artificial intelligence, big data, cloud computing, blockchain and biometric technologies to provide more inclusive and accurate financial services, which can meet the needs of green economic development.

Green innovation is to achieve green technology development as the core goal, based on innovation to provide new products and services, through reducing ecological and environmental damage, reducing natural resource consumption, and improving the allocation efficiency of resources, so as to provide power support and realization path for the high-quality development of China's green economy.

In addition, urban economic resilience cannot be influenced by digital finance and green innovation alone. Thus, this paper additionally selects indicators such as urban economic density (ECD), human capital dividend (HCD), urban industrial structure (IST), and economic development level (GDP) for comprehensive variable control.

#### 4. EMPIRICAL ANALYSIS OF DIGITAL FINANCE, GREEN INNOVATION AND URBAN ECONOMIC RESILIENCE

The explanatory variables in this paper are obtained from the official website of the World Intellectual Property Organization and the patent search and analysis platform of the State Intellectual Property Office, while the core explanatory variables and the control and mediating variables are obtained from the China Urban Statistical Yearbook and the official websites of provincial (municipal) statistical bureaus. Due to the delayed nature of data disclosure, the data collection range of the explanatory variables and core explanatory variables in this paper is from 2010 to 2020, and the data collection range of the control variables is from 2010 to 2020, and the data samples of 280 prefecture-level and above cities in China can only be collected because the samples with serious missing data of single and multiple variables are excluded. The linear interpolation method and ARIMA model method were used to fill in the data gaps and anomalies.

##### 4.1. MULTICOLLINEARITY TEST

Considering the possible problem of multicollinearity between the explanatory and control variables, which would reduce the confidence of the estimation results, Pearson correlation coefficient analysis and variance inflation factor analysis were conducted for each variable. The results of the analyses were obtained as shown in Table 1.

**Table 1.** Pearson correlation coefficient and VIF analysis results

Variables	DIFI	GRIN	UECT	ECD	HCD	IST	GDP
DIFI	1.0000						
GRIN	0.3622	1.0000					
UECT	0.4134	0.2061	1.000				
ECD	0.0157	0.0204	0.0614	1.000			
HCD	-0.0133	-0.0256	-0.0103	0.1213	1.000		
IST	0.0114	0.0214	0.0802	0.1067	0.1263	1.000	
GDP	0.0252	0.0151	0.0211	0.3108	0.2451	0.1065	1.000
VIF value	1.7081	1.5645	1.4427	1.3762	1.4937	1.3325	1.3168

The results of Pearson correlation coefficient and variance inflation factor analysis show that the absolute value of Pearson correlation coefficient between most of the explanatory variables and control variables is less than 0.4, and the VIF values of all explanatory variables and control variables are significantly less than 2. This can indicate that there is no significant multicollinearity problem between all explanatory variables and control variables for the indicators selected in this model. The relationship between digital finance, green innovation and urban economic resilience can be effectively described by these indicators to ensure the validity of this paper's model.

##### 4.2. BASELINE REGRESSION ANALYSIS

Before conducting the baseline regression analysis, the optimal model was selected using the F-test and Hausman test. Based on the test results, a double fixed-effects model was selected for regression, and the results of the benchmark regression are shown in Table 2. In the table, \*\* and \*\*\* indicate significant at the 5% and 1% levels, respectively, and the numbers in parentheses indicate the *t* statistic.

**Table 2.** Baseline regression results

Variables	(1)	(2)
	No consideration of control variables	Consider control variables
$\ln DIFI$	0.3356***(9.2613)	0.4068***(11.6547)
$\ln GRIN$	0.0982**(1.7657)	0.1012***(2.1648)
$\ln DIFI \times \ln GRIN$	0.1958**(3.8701)	0.3011***(5.5078)
Constants	-1.3207***(-30.6729)	-0.9172***(-11.5917)
Hausman test	167.38**(0.0003)	383.57***(0.0001)
$R^2$	0.6324	0.6078
Sample size	6500	6500

From the results of the baseline regression analysis of the model, it can be seen that the effects of digital finance, green innovation, and the interaction term of the two on urban economic resilience are all greater than zero, and all pass the significance test at least at the 5% level. Thus, it can be seen that digital finance, green innovation, and the interaction term of both can contribute to the improvement of urban economic resilience.

## 5. CONCLUSION

This paper starts from analyzing the interaction between digital finance, green innovation and urban economic resilience, and constructs a benchmark regression model based on it. In order to verify the validity of the model, empirical analysis is conducted to prove the relationship between digital finance, green innovation and urban economic resilience. The results show that the absolute values of the Pearce correlation coefficients between the explanatory variables and the explanatory variables of the model indicators are less than 0.4, and the variance inflation factors are significantly less than 2. Moreover, the effects of digital finance, green innovation and their interaction terms on urban economic resilience are all greater than 0, and they all pass the significance test at least at the 5% level. This indicates that digital finance and green innovation can effectively promote the enhancement of urban economic resilience and provide effective support for the further development of urban economy.

## ABSTRACT

In this paper, the first innovative use of traditional art design and modern art in the context of deep learning, it is necessary to make the relevant designers to comprehensively examine and understand Chinese traditional art and fully familiar with Chinese cultural ideas. Then, on the basis of mastering the modern design concept of cultural globalization, Chinese traditional art and modern art design can be better combined with each other, in order to enrich the connotation of modern art design from a new thought perspective in the context of deep learning. While there are differences between the two, they also have more commonalities, and the organic integration of the two on the basis of their differences makes modern art and design innovation have a more special artistic charm.

## KEYWORDS

Deep learning; Traditional art; Modern art; Integration; Innovation

## 1. INTRODUCTION

With the rapid development of China's economy and the improvement of people's living standards and quality of life since China's reform and opening up, the demand for Chinese modern art design among the general public in China has been rising, and due to the development of economic globalization and cultural globalization nowadays [1-2]. Various advanced art and design ideas from abroad have continuously flowed into China, which has led to the rapid development of Chinese modern art and design, and the design level has been greatly improved [3]. However, in the new situation, with the influence of the highly informative international environment and the influx of various foreign cultural trends, there has been a huge impact on Chinese modern art and design, making Chinese modern art and design increasingly influenced by the design styles and design concepts of Europe and the United States and other countries in many aspects, making Chinese modern art and design increasingly deviate from the Chinese national style [4-5]. Moreover, with the advent and development of the era of globalization, cultural differences are increasingly affirmed and

accepted by people of all ethnic groups in the world, which makes us realize more clearly that in the new situation, we should make efforts to use traditional Chinese elements in modern art design and innovate according to the requirements of the times [6-7].

The authors of the literature [8] studied the concepts and applications of modern art design and ethnic cultural symbols and analyzed the connections and interactions between them. The study aims to promote cultural heritage and innovation by exploring the relationship between modern art design and national cultural symbols, and to provide ideas and directions for promoting cultural diversity and sustainable development. The authors of the literature [9] studied the concepts and applications of environmental art design and digital media, and analyzed the relationship and interaction between them. The study aims to improve the innovation and sustainability of environmental art design by exploring the integration of environmental art design and digital media, and to provide technical support and guarantee for promoting cultural and creative industries and sustainable development.

## **2. RESEARCH ON THE INTEGRATION OF TRADITIONAL ARTS AND CRAFTS AND MODERN ART DESIGN**

### **2.1. DIFFERENCES AND CONNECTIONS BETWEEN TRADITIONAL ARTS AND CRAFTS AND MODERN ARTS AND CRAFTS DESIGN**

#### **(1) Differences between the two**

Traditional arts and crafts are born out of people's labor and are gradually formed in the process of labor. Therefore, the expression of traditional arts and crafts shows more of the agrarian civilization and reflects the wisdom and art of people in the agrarian period. During the agrarian civilization, due to the low level of technological development, the production of many crafts relied on traditional handwork, which was relatively low in terms of production quality and efficiency. Modern art was born in the period of industrial civilization, and as we all know, during this period, the level of technology was greatly improved, thus enhancing the level of craftsmanship and production efficiency, and the expression of modern arts and crafts is not only limited to people's daily life, but also derived from many new fields, and the content is more abundant.

#### **(2) The connection between the two**

Modern art design comes more from life, but with the support of modern processing technology, the expression content and expression form have been greatly improved, so modern art crafts come from life but higher than life, and the important role of modern art is to provide services for our life, including the enjoyment of art and the enhancement of cultural value. Therefore, modern art design and the development of the times are closely related, and the development of the times will also determine the development of modern art.

### **2.2. THE INFLUENCE OF TRADITIONAL ARTS AND CRAFTS ON MODERN ART AND DESIGN EDUCATION**

At present, the economic and cultural exchanges between countries in the world are more frequent, and the trend of globalization is getting stronger, so the cultural exchanges between different nationalities in the world also let multi-ethnic cultures influence each other, in this process, Chinese art and craft design must not forget the original heart, adhere to the characteristics of its own culture, on this basis, learn the excellent culture of other nationalities, enrich the connotation of its own culture, in the international community. Improve the propaganda and promotion of the national culture, increase the cultural soft power, form a good cultural influence in the world, so as to obtain a greater sense of national identity and promote the development of modern art, the influence of traditional arts and crafts on modern art and

design education is shown in Figure 1.

#### (1) Ideology and Culture of Traditional Arts and Crafts

Traditional arts and crafts were born in China during the ancient farming period, and during the subsequent development of thousands of years, the mainstream cultural thought in China was Confucianism, so Confucian culture also had a positive impact on the development of Chinese arts and crafts. Under the influence of Confucian culture and Confucianism, the connotation value of traditional arts and crafts became richer and richer, forming the treasure of traditional Chinese national culture. In the traditional Chinese ideology, more importance is attached to the harmony with nature.

#### (2) Artistic modeling of traditional arts and crafts

Traditional artworks are essentially the crystallization of the wisdom of the ancient working people. No matter which form of expression, they reflect and express the daily life of the ancient working people, and the five thousand years of Chinese history have brought rich cultural deposits and provided rich contents for the development of modern art, and modern art products can be innovated on the basis of borrowing and inheriting traditional arts and crafts.

#### (3) Technical development of traditional arts and crafts

The development of history and the accumulation of culture have given birth to countless outstanding works of traditional Chinese arts and crafts. These outstanding works are the cultural crystallization made by the Chinese working people during their persistent labor production and creation process, and in the process of continuous honing, the concepts and techniques are constantly innovated, pushing forward the improvement of the aesthetic level of society and the progress and development of society.

**Figure 1.** The influence of traditional arts and crafts on modern art and design education

### **3. THE RELATIONSHIP BETWEEN MODERN ART DESIGN AND FOLK ART INTEGRATION**

#### **3.1. FOLK ART IS THE SOURCE OF MODERN ART DESIGN**

Folk beauty is not a common creation of the people, it is divided into two aspects of material and spiritual civilization. It is also an important source of national culture and art design at present. In terms of art forms, folk art is both a stream and a source: while in terms of art psychology, folk art is the embodiment and aesthetic basis of national psychology. Both ancient and modern art and design have such characteristics. Looking at the development of art and design around the world, due to the differences in economic and cultural levels and customs of each country, there are certain differences in the level of art and design, but art and design are rich in their own national heritage, and will absorb the essence of culture from folk art. In modern art design, China should pay attention to absorb the characteristics of its own folk art to enhance the characteristics of national style. Modern art design needs to obtain sufficient nutrients from a large number of folk art, and dig its essence, in order to get design inspiration to make art design sustainable development.

### 3.2. COMMONALITY OF CULTURAL CONNOTATION BETWEEN MODERN ART DESIGN AND FOLK ART

There are certain differences between traditional folk art and modern art design, but there is also an obvious intrinsic correlation between them, and they can achieve integration in essence.

#### (1) Commonality of humanistic spirit

However, both in terms of time and space, folk art is usually closely related to human activities. It has a high humanistic connotation and has a clear inheritance value for humanistic spirit, which is what modern art design pursues. Nowadays, art design is mostly a fusion of national characteristics and world trends, traditional culture and modern thinking, and other factors such as material basis and spiritual pursuit.

#### (2) Commonality of natural view

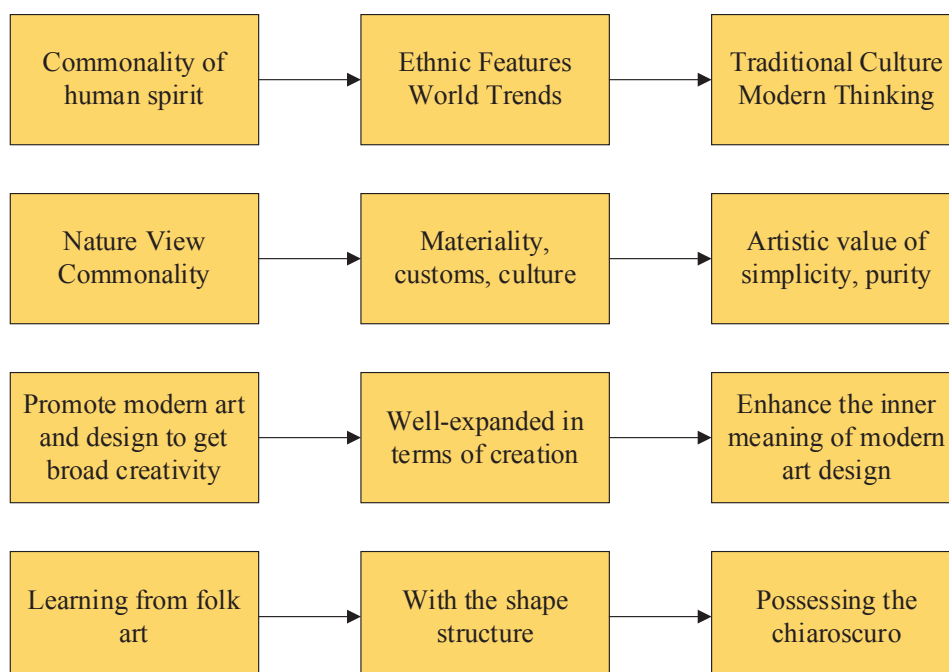

The inspiration of folk art comes from local material, customs and culture, all of which can be used as reference for modern art design and provide new inspiration for modern art design. Adopt the objects that can be found everywhere in life and give them artistry through simple processing. The main characteristic of folk art is to give full play to the morphological characteristics and material properties of raw materials.

#### (3) Folk art promotes the broad creativity of modern art and design

Folk art can inspire modern art design effectively, and the inspiration can come from many angles and levels. Folk art contains rich traditional mother culture, which is a source of creation for modern art design, and can make modern art design expand well in terms of creation.

#### (4) Learning from folk art

When adopting elements of Chinese folk art in modern art design, it is necessary to select items that are in line with modern aesthetic art so that the essence of folk art and the cultural connotation contained in it can be carried forward and reasonably applied in modern art design. The items involved in folk art can be used in modern art design mainly in two aspects: on the one hand, the shape structure of things, and on the other hand, the atmosphere of things, which usually contains and expresses the spiritual nourishment of the picture.

**Figure 2.** Modern art design and folk art cultural connotation commonality

#### **4. CONCLUSION**

In modern art design, the effective penetration of relevant elements in folk traditional art can, to a certain extent, make use of the shape and color characteristics of folk traditional art itself, while helping to shape distinctive modern art works. The essence of traditional folk art in modern art design can improve design skills, enrich design themes, deepen the connotation of works, and promote the effective inheritance and development of traditional folk culture in contemporary society. Designers should continue to borrow the essence of elements from traditional folk art and culture, actively inherit Chinese culture, and take it as the eternal pursuit of artistic creation career.

## ABSTRACT

In this paper, we first segment the cross-border e-commerce marketing market through demographics and customer needs, based on market positioning strategies, from which we can develop appropriate marketing strategies. Then, customer-centric product and service strategies, customer satisfaction-based pricing strategies, vertical sales-based distribution strategies, and the implementation of marketing strategies that take advantage of the company's unique strengths, as well as the management and control of merchants and products, are used to ensure the effective implementation of marketing strategies and improve the customer shopping experience. This study explores the need for companies to constantly change with the changing market in order to stay on top of the e-commerce market.

## KEYWORDS

Demographics; Cross-border e-commerce; Marketing market; Pricing strategy; Service quality strategy; Vertical sales strategy

## 1. INTRODUCTION

Small and medium-sized enterprises are relatively less competitive in the brick-and-mortar retail industry surviving under the impact of the epidemic is very difficult. In addition, from the industry situation, since the rise of e-commerce industry and new retailing in China, online shopping and new retailing have become important channels for consumer consumption, resulting in the development of traditional supermarket industry is cold [1-3]. Facing the new situation under the epidemic, some supermarkets have started to devote themselves to marketing programs that enhance consumers' shopping experience for supermarket stores, covering both emotional and rational factors of consumers, gradually adjusting and optimizing the marketing strategy programs of supermarket stores, using differentiation and gradually improving market competitiveness [4-5]. However, in today's rapidly changing market, it is indeed not easy for the traditional supermarket industry to avoid the vicious circle of business dilemma and enhance market competitiveness [6-7].

The authors of the literature [8] studied the concept and application of social commerce and proposed an optimized marketing channel and strategy to achieve the goal of increasing sales and revenue in social commerce. The study aims to improve the marketing effectiveness and efficiency of social commerce by designing suitable algorithms and strategies to achieve the best marketing channel and strategy selection, and provide technical support and guarantee for sustainable development. The authors of the literature [9] studied the current market situation and development trend of LED lighting products and proposed a dual-channel

integrated marketing strategy to achieve the goal of increasing the sales and market share of LED lighting products in the competitive market. The study aims to achieve the balance and coordination of dual-channel integrated marketing by designing suitable strategies and measures to improve the brand awareness and market competitiveness of LED lighting products and provide technical support and guarantee for sustainable development.

## 2. CROSS-BORDER E-COMMERCE MARKETING MARKET SEGMENTATION

### 2.1. SEGMENTATION ACCORDING TO THE CUSTOMER'S PRODUCT FOR THE DESIRED

This is the most basic market segmentation, whether for C2C, B2C or B2B, because we first need to know the products our customers want, and then we can further understand the price, brand, specifications and other special requirements of the products it needs, which is further market segmentation. Tmall has done a good job of product segmentation by dividing the products into sixteen categories, such as apparel, shoes and bags, beauty and cosmetics, jewelry and accessories, etc. For each category, there is a more detailed classification, which seems to be clear at a glance, so that customers can limit the products they need to a small area, and in this small area they can find the products they need and related products, which is very convenient, and to a large extent, also improves the customer experience to a large extent.

### 2.2. DEMOGRAPHICS

In the market segmentation, Tmall takes into full consideration the characteristics of customers and makes a detailed classification in terms of age, gender, income and purchasing behavior, etc. To develop different markets for different customers and adapt to different customer groups by providing different grades of products, the classification of online shopping user needs is shown in Table 1.

**Table 1.** Online shopping user needs classification

Gender	Age	Revenue	Mental Behavior	Internet Shopping
Male	Young single Young married with no children	Low	Special discounted, practical goods practical	Game cards, phone cards, discount products digital products
		Medium	low-end and mid-range brands, focusing on popular	brand clothing, outdoor sports, shoes and bags
		High	Personalized, high-end brand goods	High-end digital, home appliances, high- end clothing
	Young single Young married with no children	Low	Cheap, promotional, practical goods	Game point card, phone card, special price clothing
		Medium	Practical, fashion oriented, popular	Popular clothing, digital products
		High	Personalized products	Brand clothing, high-end digital products
Female	Young single Young married with no children	Low	Focus on price product style lack of brand loyalty	Low-end products, do not pay attention to the brand, buy good quality and inexpensive goods, food
		Medium	More focus on brand, product effect	Cosmetics, accessories, food, clothing, luggage, mid-range brand products
		High	High brand loyalty, focus on personalized products	Brand clothing, high-end cosmetics, digital products, shoes and bags
	Young single Young married with no children	Low	Cheap, practical products	Home accessories, discount clothing
		Medium	Practical, home products	Branded clothing, home textiles, cosmetics
		High	Personalized products	Branded clothing, jewelry, home textiles

### 2.3. ONLINE MERCHANT SEGMENTATION

Consumers should be classified, and for suppliers engaged in e-commerce sales should also be classified, which is crucial for selecting what kind of merchants to be stationed in Tmall for business, online merchants are subdivided as shown in Figure 1.

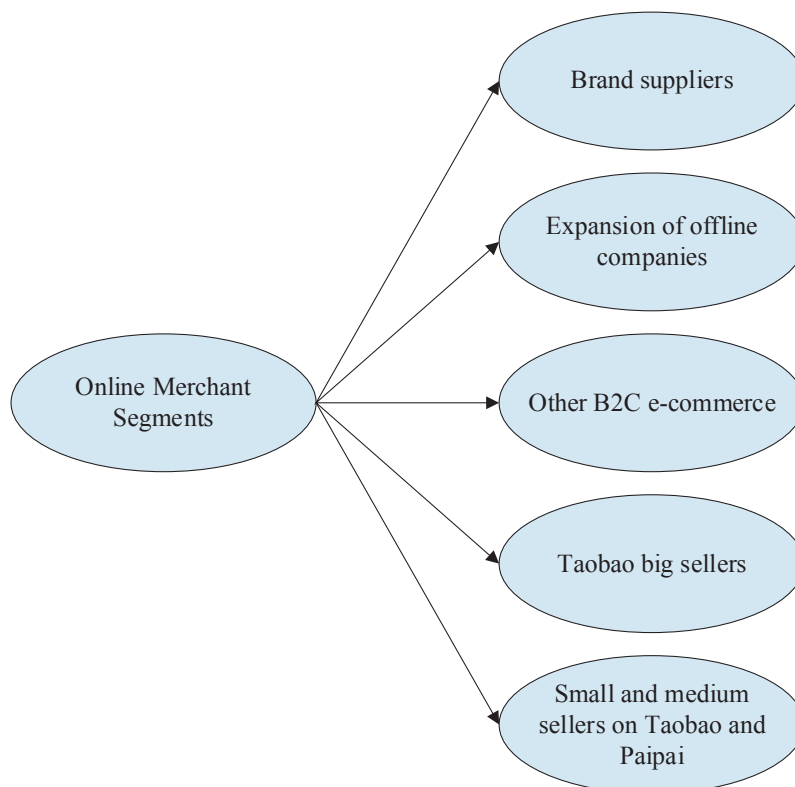

(1) Brand suppliers, manufacturers with their own brands or suppliers authorized by brands, where well-known brands have strong operational capabilities, sufficient funds, standardized services and guaranteed quality after sales.

(2) Traditional offline enterprises ready to expand e-commerce, more and more traditional offline enterprises recognize the development of e-commerce, and online shopping is the advantage, into the Internet to expand their business. Generally use two methods kind is to establish their own B2C website, one is to cooperate with other e-commerce sites online.

(3) other B2C e-commerce, there are independent domain name server of the independent operation of the B2C e-commerce, such as Jingdong Dangdang, Vancl, One Store, Yintai network, Kuba, McCallum, eXchange, Le Tao, New Egg, good buy, red child, go show net, Vipshop, etc..

(4) The original Taobao brand or Taobao big sellers, and some Taobao in the big sellers, hope to further enhance the business strength of the enterprise, hope to enter a better platform to play themselves.

(5) Taobao and pat small and medium-sized sellers. Weak strength no brand, or rely on Alibaba or Tmall distribution platform supply, or offline wholesale market. Low profits, store operations and services are not formal, many counterfeit products are mostly sold by these stores.

**Figure 1.** Online Merchant Segmentation

### **3. THE DEVELOPMENT OF CROSS-BORDER E-COMMERCE MARKETING STRATEGY**

#### **3.1. SERVICE QUALITY STRATEGY**

Consumers put their own ideas and product requirements through the Internet to communicate with enterprises interactive enterprises understand the needs and desires of consumers to provide products and services, the Internet era to make this personalized customization is possible. At the same time, customers do not only buy books, cosmetics and other small goods on the Internet, but also want to buy more goods, while hoping to buy goods quality assurance to eliminate fake goods, network payment means more secure and fast, after-sales service is more in place, logistics and transport safety and fast.

#### **3.2. PRICING STRATEGY**

Price is a very important factor for customers' purchasing decisions. Customers want to buy the best quality, best service and lowest price through selection and comparison. In network marketing, the price strategy generally has the following kinds:

(1) Cost-of-ownership pricing method. This method is based on the cost of production to increase a certain profit margin and in the network era such profit margins continue to reduce, the use of such methods of pricing companies are gradually reduced.

(2) Competition-based pricing method. This method is also often used by e-commerce enterprises, like Taobao B2C price comparison network has emerged, intensifying price competition. Therefore, e-commerce companies should have enough flexibility in formulating pricing strategies to adapt to market competition, but also to ensure that the company has the right profit in the fierce market competition.

(3) Customer-led pricing method. The so-called customer-led pricing, is to meet customer demand, customers through full market information to choose to buy or customize the production of their own satisfaction with the product or service, while obtaining these products or services at minimal cost, is to maximize the value of the customer, the customer at a minimum cost to obtain maximum benefit.

(4) Free price strategy. Free price strategy is a common marketing strategy in marketing, it is mainly used for promotion and promotion of products, this strategy is generally short-term and temporary. But in network marketing, free price is not only a promotional strategy, it is also a very effective pricing strategy for products and services.

#### **Vertical sales strategy**

The traditional marketing channel consists of independent producers, wholesalers and retailers. Each member acts as an independent business entity to maximize its own profits, and no one channel member has total or sufficient control over the others. A vertical marketing system, in contrast, is a unified consortium of producers, wholesalers, and retailers. A channel member owns the property rights of other members, or a special agency relationship, or a channel member has considerable strength, the other members are willing to cooperate, vertical marketing system is conducive to control the channel, eliminate the conflict caused by the pursuit of their own interests and the benefits of the channel members.

### **4. CONCLUSION**

E-commerce marketing strategy is also constantly adjusted with the fierce market competition, but the center is the same, that is, everything is customer-centric and adjusted to allow customers to have a better customer experience. Develop a suitable marketing strategy, which is customer-centric products and services strategy, customer satisfaction as the

standard pricing strategy, vertical sales as a platform for distribution strategy, communication as the core of the promotion strategy. So far it is still in a relatively successful. Of course, with the development of time, the market continues to change, corporate marketing strategy will continue to adjust the changes.

## ABSTRACT

In this paper, in the Internet era, various industries are highly integrated with the Internet, and education is forming new forms of teaching and learning, and schools at all levels are actively reforming. It first examines piano teaching based on interactive theory in the Internet+ era and discusses the new changes brought about by the Internet+ era to piano teaching. Then the characteristics and use of online piano teaching mode and offline piano teaching mode and teaching interaction analysis are studied, and the choice of interactive mode to interactive teaching can be used to cultivate music literacy for students with the help of piano learning. This study is based on the Internet + era based on interactive theory of piano teaching to prompt students to learn piano better and to lay a solid foundation for students' subsequent piano learning and even music learning.

## KEYWORDS

Internet; Piano teaching; Interactive; Online and offline; Interactive analysis

## 1. 1 INTRODUCTION

With the socio-political, economic, cultural, and educational developments in China in the 21st century, music education has received the attention of the educational community and even the whole society [1-2]. Instrumental music education, especially piano education, is widely chosen by parents and students, and the piano has become an important tool for most students to learn music [3]. Piano education for students is an integral part of music education, which is important for the development of students' personality, the development of intelligence and ability, the improvement of musical aesthetic ability, as well as the cultivation of sentiment and the perfection of personality [4-5].

The authors of the literature [6] studied the concept and application of piano education and mental health education, and analyzed the connections and interactions between them. The study aimed to promote the development of children's mental health and improve the quality and effectiveness of piano teaching by infusing mental health education into children's piano teaching. The authors of the literature [7] studied the concept and application of artificial intelligence and proposed an exploration and innovative approach to the development direction of piano performance teaching based on artificial intelligence in order to achieve the goal of improving the quality and effectiveness of piano performance teaching in higher education.

The study aims to explore and innovate the development direction of piano performance teaching through the use of artificial intelligence technology to improve the teaching effectiveness and teaching quality of piano performance teaching, and provide technical support and guarantee for sustainable development. The authors of the literature [8] studied the concept and application of complex networks and multimedia technologies, and proposed a method for the penetration of multimedia technologies based on complex networks in piano teaching and performance to achieve the goal of improving learning effectiveness and performance quality in piano teaching and performance. The study aims to achieve the penetration and application of multimedia technology in piano teaching and performance by designing suitable algorithms and strategies.

## **2. PIANO TEACHING BASED ON INTERACTIVE THEORY IN THE INTERNET+ ERA**

### **2.1. INTERACTIVE TEACHING**

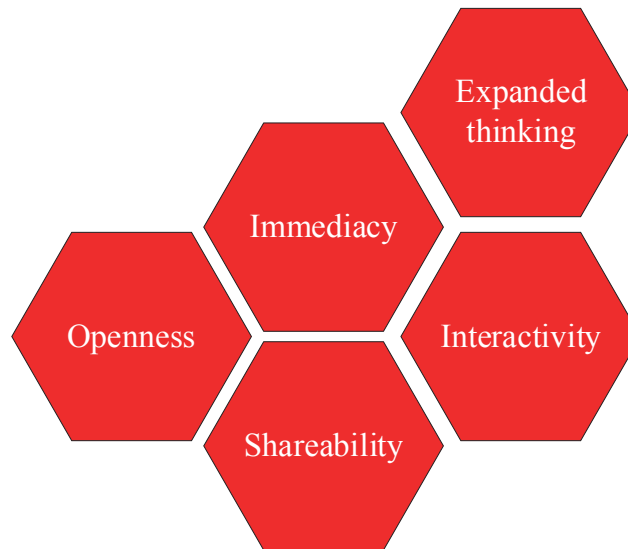

Interactive teaching method refers to a two-way, multi-directional and equal communication and interaction between teachers and students, and between students around a topic or content. In the teaching process, the teacher needs to put the students as the protagonists and needs to adopt appropriate teaching strategies according to the learners' cultural background and knowledge level to make the learners generate endogenous power, stimulate their enthusiasm and promote the understanding, digestion and application of new knowledge. With the principle of fostering students' intrinsic motivation, students are the main actors and teachers are the leading actors, and through teaching strategies, learners are encouraged to complete the construction of knowledge and self-construction.

### **2.2. INTERACTIVE OFFLINE PIANO TEACHING**

The interactive teaching concept can be used not only in online teaching mode, but also in offline piano teaching, where it is more fully used, more active and adjustable. Offline teaching is a face-to-face interaction. Interactive teaching emphasizes the student as the main character, and the student and the teacher are equally important. In the Internet+ era of offline teaching, teachers' teaching ideas have also changed. In the offline teaching process, teachers often let students go to understand the background of the work before class and preview the problems they think are difficult in the work, or the areas they do not understand. In the class, the teacher will let students be the little teacher to sort out the background of a work and discuss with them the problems that arise, reflecting the characteristics of interactive teaching as the main body and equal communication. When solving difficult problems, the teacher will let students discuss in small groups, think about how to solve problems, and improve problem-solving skills.

### **2.3. ONLINE INTERACTIVE PIANO TEACHING**

The integration of "Internet+" with piano teaching has brought a new model of online teaching, which is richer and more diversified, and the teaching results can be data-driven. From the use of online teaching, it is becoming more and more acceptable to students and parents, which has a great relationship with its own advantages. The advantages of online teaching are summarized in Figure 1 after the survey and data review. Students can have the APP play one voice part and play one voice part by themselves to enhance their familiarity and memory of the melody of each voice part and to clarify the relationship between each voice part. The smart APP also has a beautiful, animated interface that can mobilize students' interest in learning, stabilize their persistence of interest in learning, and increase internal motivation.

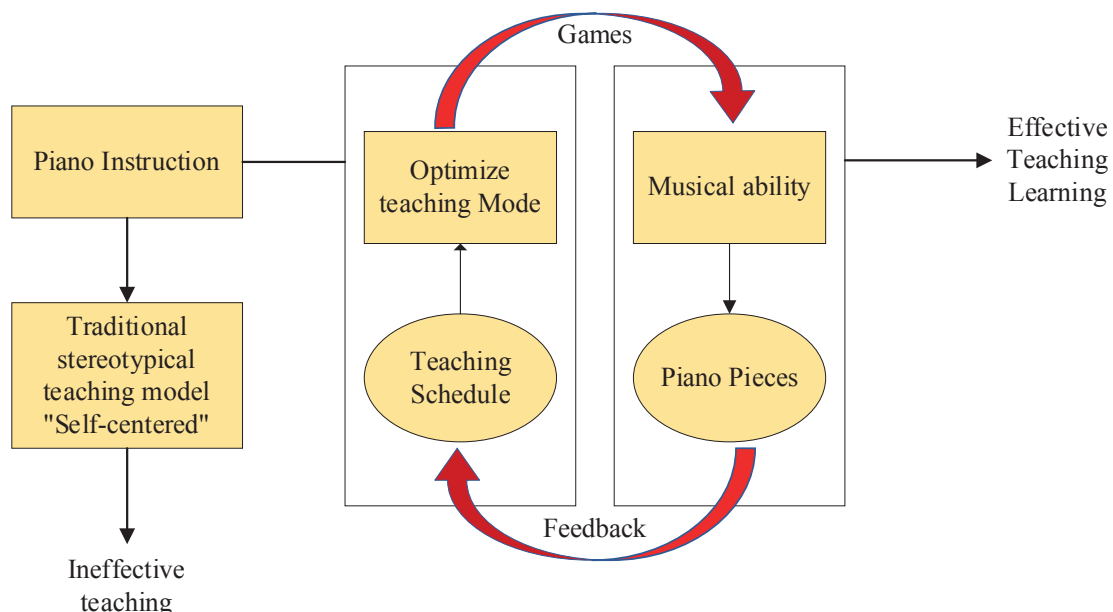

**Figure 1.** Advantages of online teaching

### 3. INTERNET+ ERA ONLINE AND OFFLINE COMBINATION OF INTERACTIVE PIANO TEACHING MODE

#### 3.1. INTERACTIVE ANALYSIS OF INTERACTIVE PIANO TEACHING

In piano teaching, if teachers consistently uphold the traditional stereotypical educational approach, teaching will tend to be ineffective development such as piano teaching, both sides are self-centered, teachers never innovate teaching methods, just be a reciter or exporter of musical knowledge, and insensitive to students' poor reflections, when there is negative feedback, teachers do not respond sensitively to interactive piano teaching interaction. The analysis is shown in Figure 2. The effective way of teaching is that the teacher himself has a certain musical literacy, and is taught in a way that is acceptable to the child when the basic knowledge and basic skills are well mastered by the child, which is a teaching process. And the knowledge and skills mastered by the school children gradually form part of their own music literacy, and the performance of the school children's music literacy in the classroom is simultaneously analyzed and considered by the teacher, optimizing the teaching mode, creating new teaching materials, and improving the teacher's own musicianship, which is a feedback process.

**Figure 2.** Interactive analysis of interactive piano teaching

### 3.2. INTERACTIVE TEACHING OF INTELLIGENT PIANO GROUP LESSONS

Smart Piano is a product of Internet + technology, which integrates the concept of online and offline teaching. The advantages of interactive teaching of smart piano are shown in Figure 3. In the teaching process according to the principle of two-way nature of interactive teaching, the teacher can set up pre-tutorial assignments through the interactive teaching module before class, and students can also find background information of the works through the smart piano. Students can upload their homework through their cell phones, and the teacher can automatically correct and analyze the homework through the system and cloud data. During the lesson the teacher can play a video of the demonstration piece or play it himself so that the students can see the teacher's playing posture, fingering, etc. When students are noisy, the teacher can control the students' instruments to be in mute state. When students practice, they can put on their own headphones without disturbing each other, which improves the efficiency of practicing. Students can also record their own performance and send it to the teacher for review. The system also comes with its own accompaniment, so students can interact with each other and play along with the accompaniment to increase the fun of playing the piano.

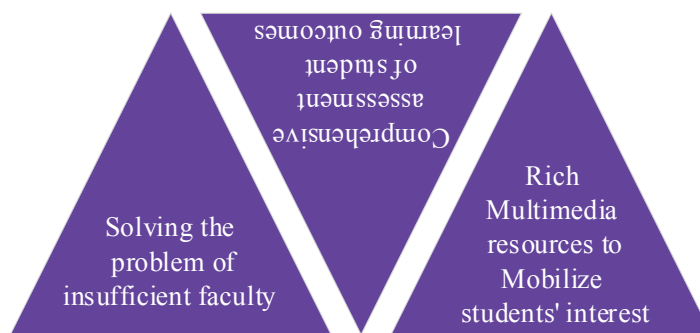

Figure 3. Smart Piano Interactive Teaching Benefits

### 4. CONCLUSION

The exploration of interactive teaching plays a positive role in piano learning. On the one hand, in terms of teaching effectiveness, the effect of practice can be found that instead of increasing students' piano lesson time, it is better to improve students' learning efficiency, and students in the international class clearly outperformed the regular class in the final repertoire. On the other hand, according to social interaction theory, the interaction between the subject's cognitive factors and the environment determines the shaping of learning behavior. The most frequent interaction in piano classroom teaching is teacher-student interaction, and the interaction between them provides students with a real environment to communicate with music, so that students not only learn music knowledge itself, but also learn to use music to express their emotions. By analyzing the implementation of interactive teaching theory in piano teaching, especially in the Internet+ era when both online and offline teaching have their own advantages and shortcomings, it is concluded that online teaching is suitable for teaching theory and offline teaching is suitable for teaching technical skills.

---

## ABSTRACT

In the context of comprehensively promoting the rural revitalization strategy, this paper firstly proposes that the Party Central Committee should attach great importance to the construction of rural grass-roots party organizations in ethnic areas, so as to provide a strong leadership core for the realization of rural revitalization in ethnic areas. Then, with the general requirements of rural revitalization strategy as the guide, unique and successful practices are explored through various channels and according to local conditions, such as Party building leading ethnic regions to develop special industries, Party building leading ethnic regions to protect ecological environment, Party building leading ethnic regions to make villagers' life rich, etc. The development results achieved in tourism promote ethnic regions to preserve special culture, protect special architecture, cultivate special industries, narrow the urban-rural development gap, and is the main position for implementing rural revitalization. In the process of comprehensively promoting rural revitalization in ethnic areas, it is necessary to give full play to the leading role of grass-roots party building in rural revitalization in ethnic areas, so as to effectively promote rural revitalization in ethnic areas.

## KEYWORDS

Internet; Grassroots party building; Ethnic areas; Tourism; Rural revitalization

## 1. INTRODUCTION

With the completion of the poverty eradication campaign as scheduled, China has solved the historical problem of absolute poverty, and the aspirations of the masses of farmers of all ethnic groups for a better life are getting stronger day by day. Moreover, with the deepening of comprehensive reform, the agricultural and rural development in ethnic areas has entered a period of transition, and the revitalization of rural areas in ethnic areas is facing many troubling factors, which poses a contemporary challenge to the Party building at the grassroots level in ethnic areas [1-3]. The Party Central Committee has proposed that “the key to doing a good job in rural areas and achieving rural revitalization lies in the Party” [4]. The grass-roots Party organizations in ethnic areas are the strong bastions of rural revitalization in ethnic areas, leading the revitalization of rural areas in ethnic areas [5].

The authors of the literature [6] studied the concept and application of big data technology and cloud computing technology, and proposed an approach based on big data-driven co-management mechanism for rural revitalization and its implementation using cloud computing technology to achieve the goal of improving rural economic and social development in rural revitalization. The authors of the literature [7] studied the concept and significance of

environmentally friendly land use and rural revitalization, and proposed a coupling analysis-based approach to explore the relationship between them in order to achieve the goal of promoting environmentally sustainable development in rural revitalization. This study aims to explore the relationship between environmentally friendly land use and rural revitalization through an empirical study in Hainan Province, and provide some theoretical and empirical basis for the formulation of sustainable development strategies and policies. The authors of the literature [8] examined the concept and meaning of rural revitalization and proposed an integrated research approach that encompasses theoretical, technical, and managerial aspects to achieve the goal of promoting rural economic and social development in rural revitalization. The study aims to investigate in depth the intrinsic mechanism and reality of rural revitalization by studying the theoretical, technical and managerial aspects of rural revitalization and development in China, and to provide some theoretical and empirical basis for formulating rural revitalization strategies and policies.

## **2. LEADING RURAL REVITALIZATION IN ETHNIC AREAS WITH GRASSROOTS PARTY BUILDING IN THE INTERNET ERA**

### **2.1. PRACTICAL EXPLORATION OF LEADING RURAL REVITALIZATION IN ETHNIC AREAS BY GRASSROOTS PARTY BUILDING IN THE INTERNET ERA**

The general requirements of the rural revitalization strategy were put forward in the report of the 19th Party Congress: prosperous industry, pleasant ecology, civilized countryside, effective governance, and rich living. In recent years, grass-roots party organizations in ethnic areas have respected the local natural laws, drawn up a development blueprint with unique regional characteristics, and conducted useful practical exploration under the leadership of grass-roots party building in the region.

#### **(1) Party building leads ethnic regions to develop special industries**

Since the reform and opening up, ethnic regions have been developed and developed rapidly, especially since the 18th CPC National Congress, ethnic regions, under the leadership of grass-roots party organizations, have made full use of the unique natural endowments of ethnic regions and the unique folk customs and ethnic culture of ethnic regions to vigorously develop the characteristic industries of ethnic regions. First of all, we develop special agriculture, animal husbandry and fishery, etc., and enlarge the related industrial chain.

#### **(2) Party building leads ethnic regions to protect ecological environment**

China's vast ethnic areas, especially those in the northwest and southwest, are densely distributed with grasslands, mountains, forests and rivers, which are not only rich in natural resources, but also the water source areas of China's great rivers, ecological barrier areas and areas prone to natural disasters, so not only is the ecological environment in these areas quite fragile and the level of ecological environmental protection still needs to be improved, which requires the grassroots Party building in ethnic areas to Leading the construction of ecological civilization.

#### **(3) Party building leads the construction of civilized countryside in ethnic areas**

Culture is the root and soul of a nation, and in order to realize rural revitalization in ethnic areas, it is significant for grass-roots party building to lead the construction of civilized countryside. General Secretary Xi Jinping pointed out that "attention should be paid to the protection and inheritance of minority cultures." The villages and hamlets of ethnic minorities in China are different and have their own characteristics. The village architecture and living environment of ethnic minorities reflect their spiritual pursuit and inheritance of history and culture, and the grass-roots party organizations in ethnic areas strengthen the construction of

rural style “soul casting” project through various forms.

(4) Party building leads rural good governance in ethnic areas

Rural governance is an important part of national governance, and a harmonious and stable rural social environment is essential to promote rural revitalization in ethnic areas in the Internet era. Therefore, grass-roots party building must lead ethnic areas to realize rural good governance.

(5) Party building leads villagers in ethnic areas to live a rich life

Although China has completed the battle against poverty in 2020, based on the harsh natural environment and the thin development base in ethnic areas of China, our Party should lead the majority of farmers in ethnic areas to do a good job in preventing poverty return and make an effective connection between poverty eradication and rural revitalization.

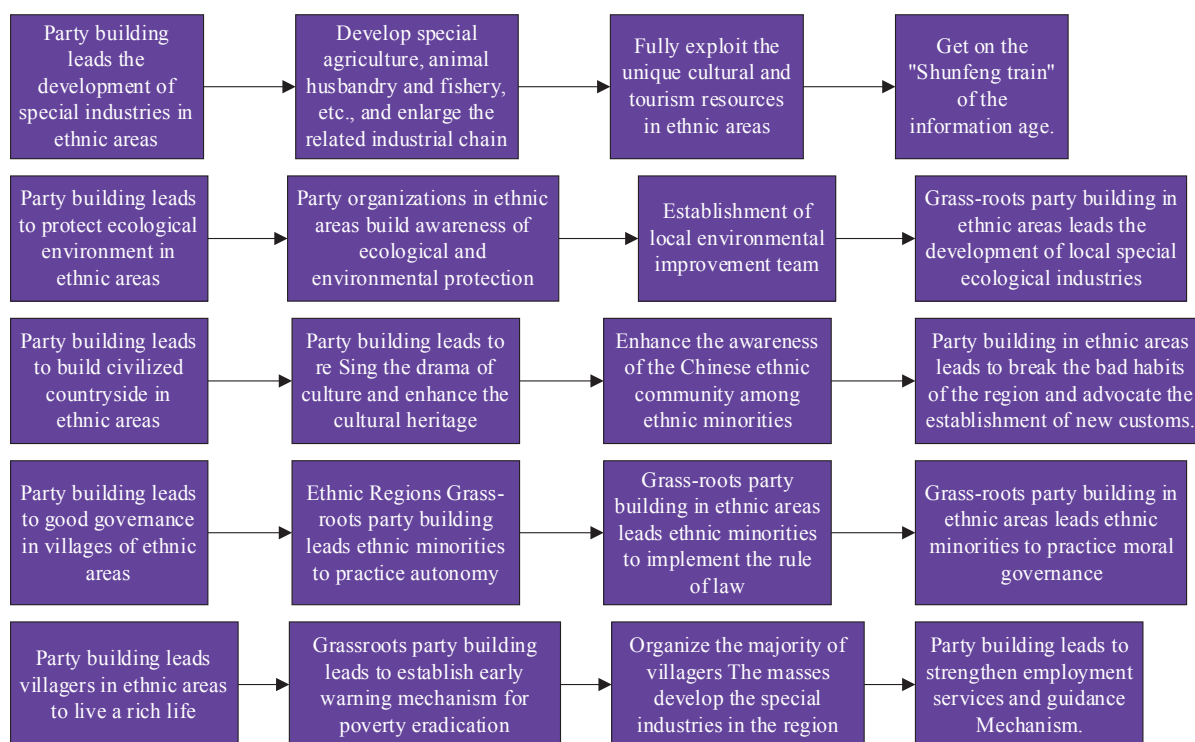

Figure 1. Practical Exploration of Rural Revitalization in Ethnic Areas

**2.2. GIVE FULL PLAY TO THE LEADING ROLE OF PARTY BUILDING IN RURAL REVITALIZATION IN ETHNIC AREAS**

“To revive the nation, the countryside must be revitalized”, and the revitalization of the countryside plays an extremely important role in the great rejuvenation of the Chinese nation as shown in Figure 2. To lead rural revitalization in ethnic areas with grass-roots party building, the key lies in the party and the key lies in people, so it is necessary to strengthen the construction of grass-roots party organizations in ethnic areas and optimize the grass-roots party cadres to provide guarantee for rural revitalization in ethnic areas. In order to play a long-term role, the service-oriented grass-roots party organizations in rural ethnic areas must improve the institutional mechanism and rely on this guarantee function to better play and maintain the function and role of service-oriented grass-roots party organizations.

**Figure 2.** The role of rural revitalization in the great rejuvenation of the Chinese nation is reflected

### 3. RESEARCH ON THE PATH OF HIGH-QUALITY DEVELOPMENT OF TOURISM IN RURAL REVITALIZATION

#### 3.1. POSITIONING OF HIGH-QUALITY TOURISM DEVELOPMENT IN ETHNIC AREAS

##### (1) Strategic positioning

Relying on the unique natural and humanistic environment of ethnic areas, the strategic positioning of high-quality development is to make tourism the focus of development in ethnic areas, upgrade and develop tourism through ethnic villages, let the development of tourism in ethnic villages pull the economic growth of ethnic areas, promote tourism to alleviate poverty, and become an important breakthrough to realize tourism to enrich the people. Through tourism to drive the integration and development of related industries to achieve industrial revitalization. To achieve ecological revitalization by improving the living environment of villages and protecting the tourism environment. Through the training of villagers and the introduction of talents, it realizes the revitalization of village talents, improves the management system of villages and implements a reasonable management system of tourism to improve the participation of villagers and realize the revitalization of organization.

##### (2) Market positioning

From the current situation and future trend of tourism development in ethnic areas, the main market is still from the province and the surrounding cities, and the existing market needs to be maintained: while the out-of-province source market, which is a secondary market, needs to be further expanded to form a pattern where the in-province market and the out-of-province market go hand in hand. Given the unique ethnic culture of ethnic areas and the tradition of spontaneous governance of villages, it is advantageous to carry out study tours outside of the province or abroad, and to actively expand the scope of the tourism audience market.

##### (3) Product positioning

Ethnic area tourism is still stuck in the low level of sightseeing tours, such as watching shows, visiting villages, taking pictures and other single forms. In response to the lack of tourism products and single form of the status quo, to clarify the positioning of ethnic areas product, the formation of core products - special tourism products - extended products three levels of product standards.

#### (4) Image positioning

Ethnic regions form an environment native, people simple and less commercialized according to their original ecological characteristics, and shape a distinctive market image. The natural geographical features, history and culture, and folk culture here are different from other Miao villages, which can realize differentiated tourism image positioning. The audience of tourists in this region are mainly group outings, family and parent-child tours, and study tours.

### **3.2. ETHNIC TOURISM HIGH-QUALITY DEVELOPMENT PATH OPTIONS**

(1) Implementation of industrial cultivation projects to promote the revitalization of the tourism industry in ethnic villages

The core goal of high-quality development of ethnic village tourism is to achieve industrial and product upgrading, the current lack of tourism product development in ethnic villages, the number of tourism projects is not enough, the integration of the tourism industry and the lack of driving force is to achieve industrial upgrading to overcome the difficulties, but also the inevitable requirements of the implementation of industrial cultivation project. As far as possible, local resources into products, the formation of brands, and strive to achieve a unique “one village, one product”, reduce the similarity with other ethnic villages, the formation of advantages and create a competitive brand to achieve the development of cultural industries, agriculture, manufacturing industry in ethnic areas.

(2) Implementation of organizational optimization project to realize the revitalization of ethnic village tourism organization

To achieve high-quality development of ethnic village tourism in the context of rural revitalization, the organization optimization project must be implemented. The organization optimization project of ethnic villages can be started from the following points: 1) the government strengthens industry management and carries out rule of law propaganda, 2) various organizations innovate business methods and coordinate benefit distribution, and 3) realize village autonomy and moral governance projects.

(3) Implementing cultural protection and innovation projects to ensure the revitalization of tourism culture in ethnic villages

The culture of ethnic villages is an advantageous resource that drives the development of tourism industry, enhances economic benefits and shows the charm of the villages. The spiritual civilization of ethnic villages is concentrated in the traditional culture, customs and habits of the villages, and the culture of ethnic villages can be revitalized only through the integration and interaction between rural revitalization and traditional culture.

(4) Implementing talent-driven project to guarantee the revitalization of tourism talents in ethnic villages

Talent is the key to the development of ethnic village tourism, and is the booster to promote the rapid development of village tourism. The quality and quantity of talent determines whether the development of tourism industry can achieve horizontal extension and vertical depth. The current development of tourism is in a talent-poor situation, the high-quality development of ethnic village tourism must be based on the long-term, the implementation of a planned, purposeful and focused talent training mechanism, so as to respond to the various tourism needs of tourists.

## **4. CONCLUSION**

The grass-roots Party organizations in rural ethnic areas are the strong bastions of rural revitalization in ethnic areas, leading the revitalization of rural areas in ethnic areas. Party

members and cadres at the grassroots level in rural ethnic areas should realize that “iron needs to be hardened by itself” and seriously learn about economic development and rural revitalization so that they can have a deep theoretical foundation to comprehensively promote rural revitalization and enhance their self-confidence so that they will not be frightened when things go wrong. Party members and cadres at large should also actively study the latest science and technology, apply new technologies flexibly to rural revitalization, use modern information technology platforms to solve the problems in rural revitalization and accelerate the pace of rural revitalization. Therefore, by enhancing the capacity of grass-roots party organizations in ethnic areas, we can empower and increase the effectiveness of rural revitalization in ethnic areas.

## ABSTRACT

Firstly, under the popularization of the concept of national learning and lifelong learning and the inculcation of learning society, the continuing education of college administrators has become more and more important, and how to transform the continuing education of college administrators to meet the educational objectives in the context of deep learning is an important issue in the field of education reform in China at this stage. Then, in view of the fact that the field of continuing education for college administrators still encounters multiple layers of difficulties to meet the new requirements put forward in the context of deep learning, it is necessary to realize the transformation of continuing education for college administrators in the context of deep learning from various aspects such as institutional mechanism, regulations and systems, lifelong education, information technology, evaluation and monitoring and external communication.

## KEYWORDS

Deep learning; Universities; Managers; Continuing education; Transformation

## 1. INTRODUCTION

With the continuous popularization of higher education from elite education and increasingly into mass education, improving the quality of talent cultivation is the focus of attention from all walks of life [1-2]. As the frontline of talent cultivation, college administrators play an important role in promoting the construction and development of colleges and universities [3]. Driven by such a background demand as well as the learning boom, the continuing education of college managers has received unprecedented attention [4]. Therefore, it is of great practical significance to continuously research and explore the problems and strategies of continuing education for college managers to comprehensively promote the professional development of college managers and the connotation construction of higher education institutions [5-6].

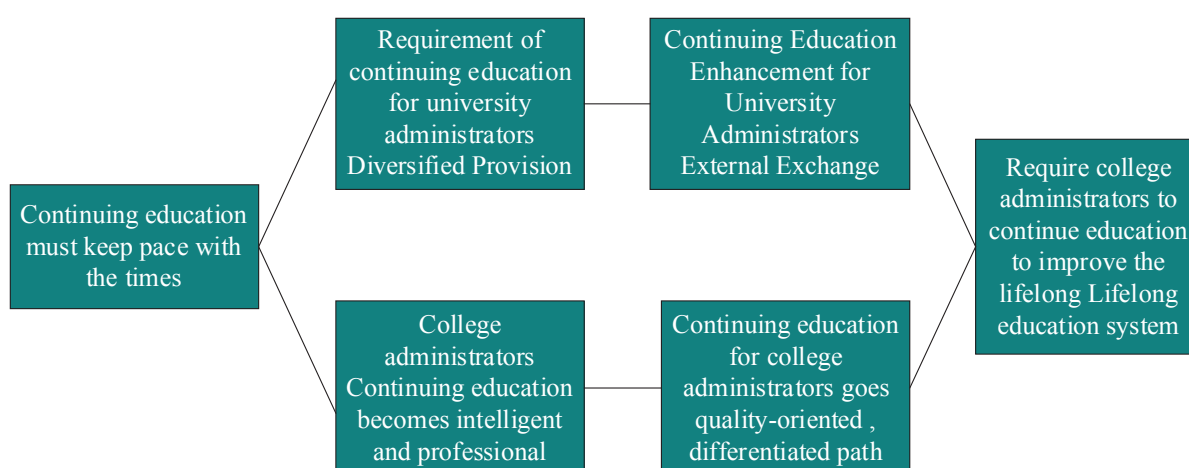

The authors of the literature [7] studied the importance of continuing nursing education programs and proposed a method of quality indicators applied to high complexity university hospitals to assess the effectiveness and quality of the program. The focus of this paper is on assessing attendance indicators to analyze the attendance of participants in nursing continuing education programs in order to provide a basis for improving the effectiveness and quality of the program. The study aims to assess the effectiveness and quality of the continuing nursing education program by applying a quality indicator approach and to provide support and assurance for improving the sustainability of the continuing nursing education program. The authors of the literature [8] studied the importance of forestry continuing education programs and compared forestry continuing education degree programs for different schools in order to

understand their differences and characteristics. The focus of this paper is to compare the differences in curriculum, teaching methods, tuition fees, and other aspects of forestry continuing education degree programs in different schools and to analyze their advantages and disadvantages. The literature [9] analyzes the impact of sustainability learning and interdisciplinarity in higher education on the development of competencies needed for students to solve complex problems, as well as the development and assessment of these competencies, through an interdisciplinary research study. The study aims to provide a basis for improving educational methods and assessment systems in the field of higher education through investigation and analysis in order to promote sustainable development of higher education and improve the overall quality of students.

## 2. NEW REQUIREMENTS AND DILEMMAS OF CONTINUING EDUCATION FOR UNIVERSITY ADMINISTRATORS IN THE CONTEXT OF DEEP LEARNING

### 2.1. NEW REQUIREMENTS FOR THE CONTINUING EDUCATION OF COLLEGE ADMINISTRATORS IN THE CONTEXT OF DEEP LEARNING

In the context of deep learning, “consumer demand pattern”, “import and export pattern”, “production factors”, “production capacity and industrial organization mode” and “market competition pattern” have changed. The changes of “consumption demand pattern”, “import and export pattern”, “production factors”, “production capacity and industrial organization mode” and “market competition pattern” have put forward new requirements for the continuing education of college administrators as shown in Figure 1. The change of consumption demand mode requires diversified supply of continuing education for college managers. Under the background of new deep learning, the stage of imitative consumption has basically ended, and personalized and diversified consumption has gradually become mainstream. To increase external communication and improve the overall level of college teaching management team, it is inevitable to require college teaching managers to continuously improve their own quality and ability, and establish and improve the lifelong education system to meet the reform and development requirements of the times. It is necessary to gradually pay attention to the market-oriented attributes of continuing education, and realize the breakthrough innovation of continuing education by introducing market competition mechanism and by taking the quality-oriented and differentiated path.

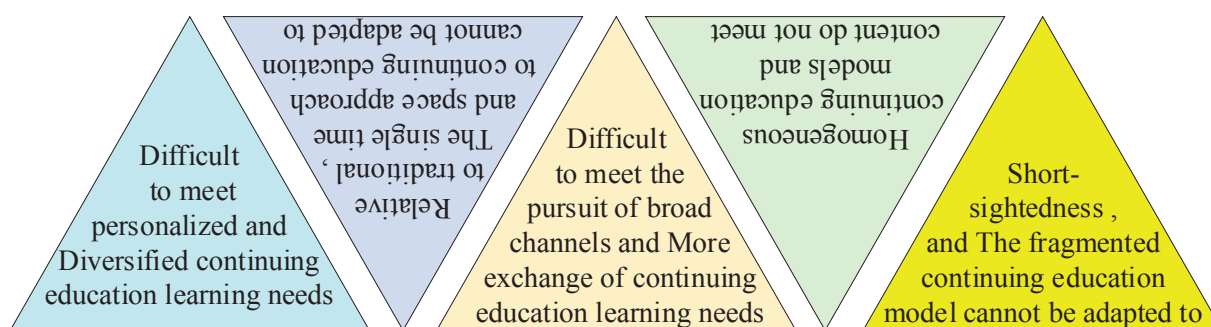

**Figure 1.** Continuing education requirements in the context of deep learning

### 2.2. THE DILEMMA OF CONTINUING EDUCATION FOR COLLEGE ADMINISTRATORS IN THE CONTEXT OF DEEP LEARNING

However, looking at the development of continuing education for college administrators in recent years, although some progress has been made in continuing education, and there are

improvements in the degree of attention and actual operation, the field of continuing education for college administrators still encounters multiple layers of difficulties as shown in Figure 2, and it is difficult to meet the new requirements put forward in the context of new deep learning, which has been due to the difference in the nature of work, compared with the research and teaching-oriented college teachers, the academic level of college teaching administrators is relatively lower. Due to the difference of work nature, the academic level of university teaching managers is relatively lower and the structure of academic level is more complicated than that of research and teaching teachers. Under this circumstance, the continuing education of teaching managers in colleges and universities has been in a relatively closed internal circulation mode for a long time, and there is a lack of learning and communication with external society and colleges and universities. For a long time, the continuing education based on academic compensation is more for direct and temporary goals such as title evaluation and promotion assessment, which makes the content and mode of continuing education short-sighted and fragmented, and has not yet created the learning atmosphere of lifelong education.

**Figure 2.** The dilemma of continuing education for college administrators

### **3. TRANSFORMATION STRATEGIES OF CONTINUING EDUCATION FOR COLLEGE ADMINISTRATORS IN THE CONTEXT OF DEEP LEARNING**

#### **3.1. STRENGTHEN THE IMPORTANCE OF EFFORTS**

“Teachers are the decisive factor of teaching quality in colleges and universities, and college managers are the core force of college management level. All levels should change their concepts and realize the importance and necessity of continuing education for managers in colleges and universities. From the state, society, universities and individuals, we should pay more attention to it in order to form a perfect system from top to bottom. College management personnel are the backbone of college management and the important support of comprehensive strength of college. Only with a high level management team, the education level of colleges and universities can have a major breakthrough. Therefore, it is important to strengthen the attention to the continuing education of college managers and give special financial, technical and personnel support back.

#### **3.2. ESTABLISHING REGULATIONS AND LAWS AND REGULATIONS**

In order to ensure the correct and orderly promotion of continuing education for college managers, it is necessary to establish scientific and sound rules and regulations and relevant laws and regulations, so that the promotion of continuing education for college managers can be followed by rules and laws, and the rights and obligations of college managers to participate in continuing education can be guaranteed. The establishment of the system should not only ensure that the issue of continuing education for college managers is not neglected, but also ensure that the normal management of the school is not affected. It is necessary to provide opportunities for college managers to improve their own quality, and to include the improvement of school management in the overall planning.

### **3.3. BUILDING A LIFELONG EDUCATION SYSTEM**

It is a good way to combine the continuing education of college teaching managers with the development strategy of colleges and universities, the management innovation of colleges and universities and the cultural construction of colleges and universities, to build a lifelong education system for college teaching managers, to effectively play the basic role of continuing education in the lifelong learning of college teaching managers, and to fully realize the integration of high-quality education and teaching resources from all walks of life.

### **3.4. USE MODERN INFORMATION TECHNOLOGY TO BROADEN LEARNING TIME AND SPACE**

Modern information technology represented by the Internet undoubtedly provides an important education and teaching platform for continuing education. The continuing education of college teaching managers should conform to the new form of next-generation Internet and location service to realize a new type of continuing education with diversified terminals, personalized services, precise marketing and networked payment. In order to realize the new requirements of continuing education that everyone, everywhere and all the time can learn.

### **3.5. CONDUCTING EVALUATION AND MONITORING**

Successful continuing education for university teaching managers cannot be separated from scientific evaluation and monitoring. With the proposition of lifelong learning and lifelong education, we should grasp the stage effect of continuing education by formulating a reasonable evaluation and monitoring system, and control the progress degree of individual lifelong education at any time to ensure that continuing education does not deviate from the main line and completes the stage and overall goal in due time.

## **4. CONCLUSION**

Continuing education of college management personnel is a significant, time-critical and extensive research topic and task, which is an inevitable requirement for the development of college librarians under the environment of network era. In a word, in today's rapidly changing network, in order to serve the teaching and research of teachers and students with high efficiency, high level and high quality, universities should pay attention to the continuing education of university management personnel, formulate scientific system and comprehensive continuing education plan and incentive mechanism, so that they can master modern library management technology, operation means and service skills, and provide the latest, fastest and most complete for teaching and research. The most up-to-date, fastest and comprehensive documentary information service for teaching and research.

## **ABSTRACT**

Leisure agriculture is a novel rural industrial form in line with modern society. This paper analyzes the development history of Guanxiang cultivation and processing, and proposes a development strategy for Guanxiang cultivation and processing under the vision of leisure agriculture. Combining Steam VR technology, Unity UI interaction technology and VR technology of collision detection, a Guanxiang cultivation and processing experience system based on VR technology is constructed, using and improving the handle detection technology to realize the interaction function of VR handle with virtual objects and UI. Through the VR technology-based Guanxiang cultivation and processing experience system from the perspective of leisure agriculture, we can experience the process of Guanxiang cultivation and processing and understand the culture of Guanxiang cultivation and processing in the virtual reality environment.

## **KEYWORDS**

Leisure agriculture; Guanxiang cultivation and processing; Guanxiang culture; Handle detection technology; VR technology

## **1. INTRODUCTION**

Intangible cultural heritage is an indispensable and important part of the excellent Chinese traditional culture with a history of more than 5,000 years, and is an inseparable national cultural gene [1-2]. With the development of national economy, people's material living standard has gradually improved, and the demand for spiritual aspects such as inheritance and development of excellent Chinese traditional culture has become increasingly strong, and the intangible cultural heritage industry has gradually taken root and grown with the development and growth of the tertiary industry [3-4]. People are the most decisive factor in the process of industrialization of NRM. The mastery and transmission of the essence of ancient folk cultural knowledge and skills by NRM bearers gives a realistic and reliable carrier for the inheritance,

continuation and industrialization of NRM, and is an important driving force for the industrialization of NRM [5]. Leisure agriculture is a novel rural industrial form in line with modern society and a new way to promote rural revitalization [6]. The resource base of leisure agriculture is based on the “three rural areas”, the business content is integrated with the “three industries”, and the service purpose is located in the “three lives”. As intangible cultural heritage, Guanxiang production techniques are closely related to people’s production and life, and are an indispensable part of traditional culture [7]. In people’s daily production life, the cultural attributes and skills value of Guanxiang production techniques are mainly reflected through the production process. This paper explores the heritage of Guanxiang culture by combining leisure agriculture and VR technology.

## **2. CULTIVATION AND PROCESSING OF GUANXIANG FROM THE PERSPECTIVE OF LEISURE AGRICULTURE**

### **2.1. DEVELOPMENT HISTORY OF GUANXIANG CULTIVATION AND PROCESSING**

Guanxiang is the most famous product in Dongguan, and it is produced from the Guanxiang tree, which is a Grade II protected plant in China. From transplanting, breaking branches, breaking roots, opening incense doors, cultivating incense to picking incense, managing incense, picking incense, making incense and combining incense, there are as many as 30 procedures, all of which follow the production techniques of the Song Dynasty, and the whole process spans more than ten years or even decades, and many processes are inherited from ancient methods. At the beginning of the 20th century, Dongguan redirected its attention to the Guanxiang industry, vigorously explored the historical and cultural connotations of Guanxiang and cultivated Guanxiang saplings in order to revive the excavation and research of local Guanxiang techniques. In 2012, Dongguan Intangible Cultural Heritage Protection Center and other relevant protection units successfully declared the Guanxiang production techniques to be included in the list of recommended projects of the fourth batch of provincial intangible cultural heritage, and in 2014, promoted the Guanxiang

production techniques to be included in the list of representative projects of national intangible cultural heritage, so that it has a solid guarantee mechanism on the road of inheritance and development.

## 2.2. LEISURE AGRICULTURE

The resource base of leisure agriculture is based on the “three rural areas”, the business content of leisure agriculture is integrated with the “three industries”, and the service purpose of leisure agriculture is located in the “three lives”. The definition of leisure agriculture is shown in Table 1. Leisure agriculture is a new form of rural industrial development that integrates rural natural resources and agricultural production conditions with technology and art to create tourism, leisure and travel. The development of leisure agriculture can deeply develop the potential of agricultural resources and bring consumers the pleasure of sightseeing, fruit picking, vacationing, accommodation and experiencing local culture based on regional characteristics.

**Table 1.** Definition of leisure agriculture

<p>“Three rural” is the foundation of leisure agriculture development</p>	<p>(1) In terms of agriculture, the development of leisure agriculture has implanted leisure functions in the countryside and stretched the agricultural industry chain</p> <p>(2) In terms of farmers, the development of leisure agriculture has fully absorbed the surplus rural labor force</p> <p>(3) In rural areas, the development of leisure agriculture drives local economic development</p>
<p>The integration of “three industries” is a new form to develop leisure agriculture</p>	<p>(1) Taking into account the development of traditional agriculture, but also combined with the integration of different types of modern industrial development of new forms of industry</p> <p>(2) Leisure agriculture takes leisure as the development orientation and “agriculture” as the development basis to create a new form of rural industry with the integrated development of “three industries”</p> <p>(3) New forms of rural development in which “three industries” complement each other and promote each other</p>
<p>Leisure agriculture takes the integrated development of “three life” as the integration point</p>	<p>(1) The integrated development of leisure agriculture in production, life and ecology meets the popular consumption demand</p> <p>(2) Consumers in the leisure park can experience the combination of traditional production of agricultural products with modern technology and other projects</p> <p>(3) Revitalize natural and agricultural resources in rural areas High-quality development of leisure agriculture to promote agricultural efficiency, drive farmers to increase capital and add rural green.</p>

### **2.3. DEVELOPMENT STRATEGY OF GUANXIANG CULTIVATION AND PROCESSING FROM THE PERSPECTIVE OF LEISURE AGRICULTURE**

(1) Standardize seedling production, strengthen the awareness of good seeds and improve the quality of seedlings

Good seed and strong seedlings is the key and foundation of the healthy development of Guanxiang planting industry, cities and counties should effectively strengthen the awareness of good seed. First, strengthen seedling law enforcement, standardize nursery management, eliminate inferior seeds, from the source of the gatekeeper, improve the rate of good seeds. Second, increase investment in science and technology, accelerate research on seedling breeding techniques, strengthen the selection of good seeds, and improve the quality of seedlings.

(2) Strengthen technical research, service industry development, one is to strengthen the camping and planting technology and pest control technology research, to solve the problem of Guanxiang canopy year after year by pests and diseases, to improve the quality of forest stands. Second, to strengthen the research and application of artificial incense technology, to improve the incense rate, the amount of incense and the quality of white wood incense. Third, the construction of artificial incense technology model base, the promotion of advanced artificial incense technology.

(3) Combined with the actual situation, according to local conditions, scientific development of Guanxiang planting industry Guanxiang development of white wood incense planting industry, should follow the principle of local conditions, suitable for the land and trees, on the basis of full respect for the wishes of investors, to guide their scientific and rational development of planting. First, encourage enterprises and planting households to play their own advantages to carry out large-scale planting, professional management and industrial operation. The second is to promote the right tree for the right place, to create mixed forests. Third, make full use of forest land, plant Guanxiang in secondary forest land, sparse forest land and residual forest land, first easy and then difficult, and gradually promote, so that Guanxiang planting industry can

be effectively developed. Fourth, to build demonstration bases in the main production areas in the province to demonstrate and promote planting.

### 3. VR RELATED TECHNOLOGY

The Steam VR Unity Plugin, developed by Valve, is a bridge between the HTC Vive headset and the Unity development engine. The VR Camera provided in Steam VR converts the normal camera that comes with Unity into a VR camera, and the visuals are converted to Vive imaging, while the Steam VR library also provides features such as grabbing and teleportation, and users can customize button and motion bindings through the Steam VR Input System to provide a richer interaction. The Steam VR library is compatible with the library platform between HMDs and encapsulates functionality into a prefabricated body that developers can use directly.

Unity has a complete GUI system built in, which provides users with a set of GUI layout design solutions. Unity officially provides UGUI components and integrates them into the compiler, which are more flexible and easier to operate than the previous GUI. UGUI components include canvas, image, text, button and other controls, which basically meet the development needs of developers. Table 2 shows the common components in GUI.

**Table 2.** Common components in the GUI

Control name	Control function
Canvas	The basic unit of rendering, all UI components are child objects
Image	Map display control, usually used to display non-interactive images
Tex	Text display controls provide labels, titles, and descriptions other GUI controls
Button	Respond to event components by clicking to initiate or confirm user actions
Scroll View	Scroll display component, you can scroll in horizontal, vertical display content

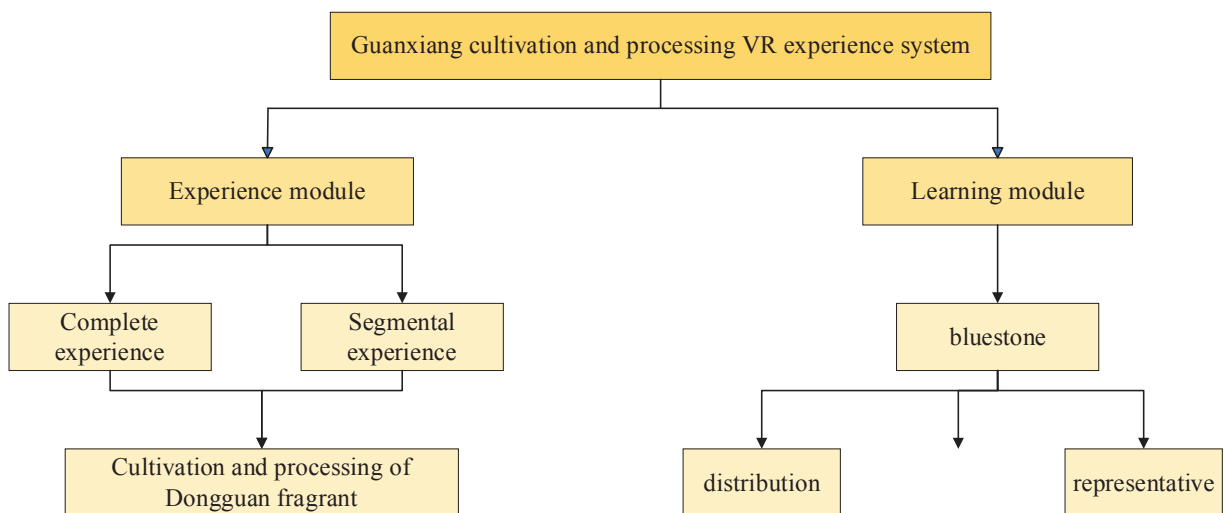

Within the virtual reality environment, collision detection can be used to determine whether two or more objects occupy the same area at the same time, and if they occupy the same area then a reasonable event response is required, otherwise penetration will occur and reduce user immersion. Collision detection is an important part of virtual reality project development.

## 4. VR TECHNOLOGY-BASED GUANXIANG CULTIVATION AND PROCESSING EXPERIENCE SYSTEM

### 4.1. OVERALL SYSTEM ARCHITECTURE DESIGN

According to the demand for practicality, application and immersion of Guanxiang cultivation and processing VR experience system, the architecture of Guanxiang cultivation and processing experience system is shown in Figure 1. The system is divided into an experience module and a learning module. The experience module is divided into a complete experience and a sub-section experience for the tea-making process, and the learning module mainly introduces the knowledge of Guanxiang. In the Guanxiang cultivation and processing VR experience system, users use HTC Vive virtual reality game equipment to experience the Guanxiang cultivation and processing process and understand the culture of Guanxiang in the virtual reality scene.

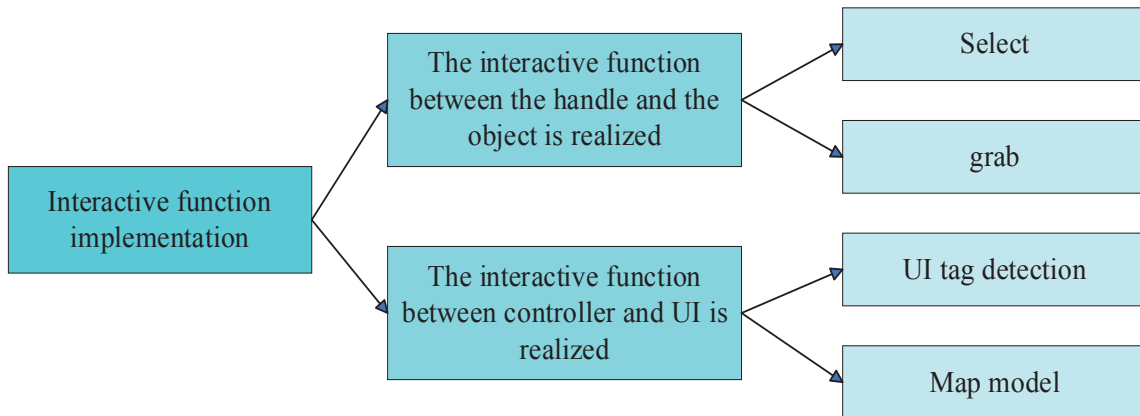

**Figure 1.** Structure of Dongguan fragrant cultivation and processing experience system

### 4.2. INTERACTION FUNCTION IMPLEMENTATION

Figure 2 shows the implementation of the interaction function. The process of interaction between the handle and the object mainly includes the selection and grasping of the object by the handle. The Guanxiang culture science is the main content of the learning module in this paper, and the user uses the handle to interact with the UI interface. The learning module mainly uses the map model to visually

display the place of origin of Guanxiang and introduce its detailed information through graphics and text. When you enter the learning module, you can learn about the representatives of Guanxiang planted in different regions and their detailed information by clicking on the UI of the provinces in the map.

**Figure 2.** Implementation of the interaction function

## 5. CONCLUSION

Leisure agriculture is the future trend of agricultural development. By analyzing the development history and strategies of Guanxiang cultivation and processing from the perspective of leisure agriculture, this paper combines VR technology to build a system of Guanxiang cultivation and processing based on VR technology and realize the interactive function. The system is mainly divided into two parts: the first part is an experience module about the Guanxiang cultivation and processing process, and the second part is a learning module to understand the cultural knowledge of Guanxiang cultivation and processing. Through these two modules, users can experience the process of Guanxiang cultivation and processing and understand the culture of Guanxiang cultivation and processing in the virtual reality environment.

## ABSTRACT

At present, there is a problem of deviation from the goal in the educational work related to ideology and politics in schools. In order to solve this problem, this paper clarifies the theoretical mechanism of this education based on big data, clarifies its educational concept, innovates teaching and develops excellent resources. The theoretical mechanism is verified through practice, the theory-based educational integration assessment and evaluation system is explored, and the significance of educational theory and the value of practice are studied. Educators are cautioned to be good at analyzing and mining data rationally, maintaining correct values and positive curriculum concepts, working scientifically and rationally, and applying educational theories positively.

## KEYWORDS

College political education; Theoretical mechanism; Assessment and evaluation system; Resources for political education

## 1. INTRODUCTION

National ideological and politically relevant education is an important channel for the dissemination of the dominant ideology and has an important modern value in shaping the mindset and behavior of citizens [1-2]. To resist various erroneous views and trends, it is necessary to secure the main channel and main position of the national ideology [3-4]. With the wide application of higher technologies and the significant progress of precision thinking in national governance and other aspects, more and more universities have started to explore new models of innovation [5-6]. Precision thinking, as an important part of national governance thinking, has an important guiding role in dealing with problems in various fields of our society and is an important way to govern the country under the new situation [7]. Precision thinking

is the application of educational content related to ideology and politics in the field of education, and under the leadership of precision thinking, an educational model that collects, processes, and analyzes information about students' learning needs and behavioral changes through highly intelligent technologies to help students solve various specific problems [8-9]. This paper explores the theory and practice of college ideological education based on big data.

## **2. THEORETICAL MECHANISM OF COLLEGE CIVIC EDUCATION BASED ON BIG DATA**

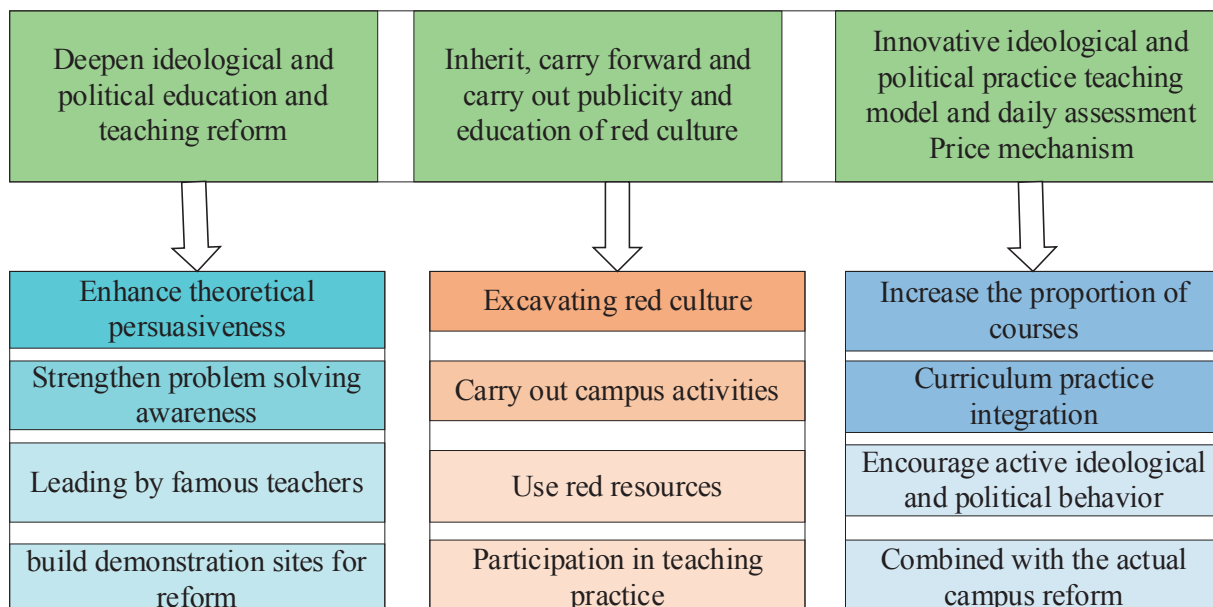

Higher education in the period of big data will certainly carry the historical mission of washing the ideological and political soul of college students. The educational work of education needs to follow the basic laws of belief generation mechanism, main thought needs and ideological and political work of college students through the Chineseized and practical Marxist position, viewpoint and method, and comprehensively construct the practical innovation mechanism to enhance the contemporary view, mission and effectiveness of ideological and political education work.

### **2.1. ESTABLISHING THE GOAL SYSTEM OF MARXIST IDEAL BELIEF EDUCATION IN COLLEGES AND UNIVERSITIES**

In order to strengthen ideological leadership, cultivate college students' firm scientific beliefs and internalize Marxist theory education into college students' thoughts, beliefs and action guidelines, universities in the new era should clearly grasp the target level and orientation of ideal and belief education. First, based on the goal of establishing moral education, we should see that the multipolarity of the world and cultural pluralism inevitably depend on the reality of different social beliefs, ideologies and cultural trends, and solve the problem of "for whom to train people". Secondly, the education work should get out of the standardized and unified mode and misunderstanding, and solve the problem of "how to cultivate people". Thirdly, based on the goal of establishing moral education, the education work should be based on the construction of "all-round integrated" training mode, and closely connected with the goal of personal struggle and the realization of social value, so as to solve the problem of "what kind of people to cultivate".

### **2.2. REFORM AND INNOVATE THE LARGE SYSTEM OF TEACHING CIVIC THEORY CLASS IN COLLEGES AND UNIVERSITIES**

Figure 1 shows the big system of teaching ideological and political theory class based on big data. What colleges and universities need to do now is to build an internal and external system of ideological education that can carry out the ideals and beliefs of college students into specific programs and realistic scenes, and finally transform them into "unity of learning, thinking and application, knowledge, faith and action".

**Figure 1.** University ideological and political theory teaching system

### 2.3. DEVELOP MULTI-POLAR RESOURCES OF EDUCATION NETWORK IN COLLEGES AND UNIVERSITIES

With the rapid development of big data technology, the amount of information provided by electronic products and network media for students is much larger than the amount of educational information in classroom disposable time, therefore, the time and way to carry out ideological education for college students should keep pace with the times, make full use of and give full play to network educational resources, and explore the new path and large space of “Internet+Education”. Therefore, the time and way to carry out college students’ ideological education should be improved, make full use of the network education resources, and explore the new path and space of “Internet+education”. Firstly, colleges and universities should promote the implementation of the action plan of “Internet+student ideological and political education” and “Internet+cultivation of ideological talents”, through “touching the Internet, using the Internet and borrowing the Internet” to research and judge the students’ ideological dynamics, and make use of the professional advantages to carry out the “Internet+education”. By “touching the Internet, using the Internet and borrowing the Internet”, we can judge the ideological dynamics of students, play our professional advantages to explain and solve the problems, guide students to participate in positive network interaction, and build a new mode of college ideological education and a new mechanism of education in the Internet era. Secondly, colleges and universities should overcome the new technical barriers of network big data research and network behavior data analysis, pay attention to the data analysis of political tendency, ideological condition, psychological health and behavior hotspots of college students at fixed points, and establish a dynamic research database of college students’ ideological and political conditions. Thirdly, universities should build “resources+teaching+learning+practice” integrated online education and teaching platform of Civic Science course and red ideology propaganda campus cloud media.

## 3. PRACTICE BASED ASSESSMENT AND EVALUATION SYSTEM OF COLLEGE CIVIC EDUCATION

### 3.1. BIG DATA-BASED ASSESSMENT AND EVALUATION OF EDUCATIONAL INTEGRATION

Table 1 shows the connotation of assessment and evaluation of ideological education in colleges and universities based on big data.

**Table 1.** Connotation of ideological and political education evaluation in colleges and universities

Examination and evaluation	Specific content
The main body	(1) The subject of assessment and evaluation can be divided into management subject and education subject (2) The main body of management is the evaluation of the education department and the evaluation of education and teaching in colleges and universities (3) The subject of education is the implementer of the curriculum, the organizer of the activity and the object of education
The object	(1) Students' learning situation, cognitive level, emotional state and ideological and moral quality (2) The establishment of educational ideas, the establishment of educational systems and the exploration of educational methods
The method	(1) Data collection and statistics (2) Reliability detection of data (3) Establish data model (4) Result analysis and strategy formulation

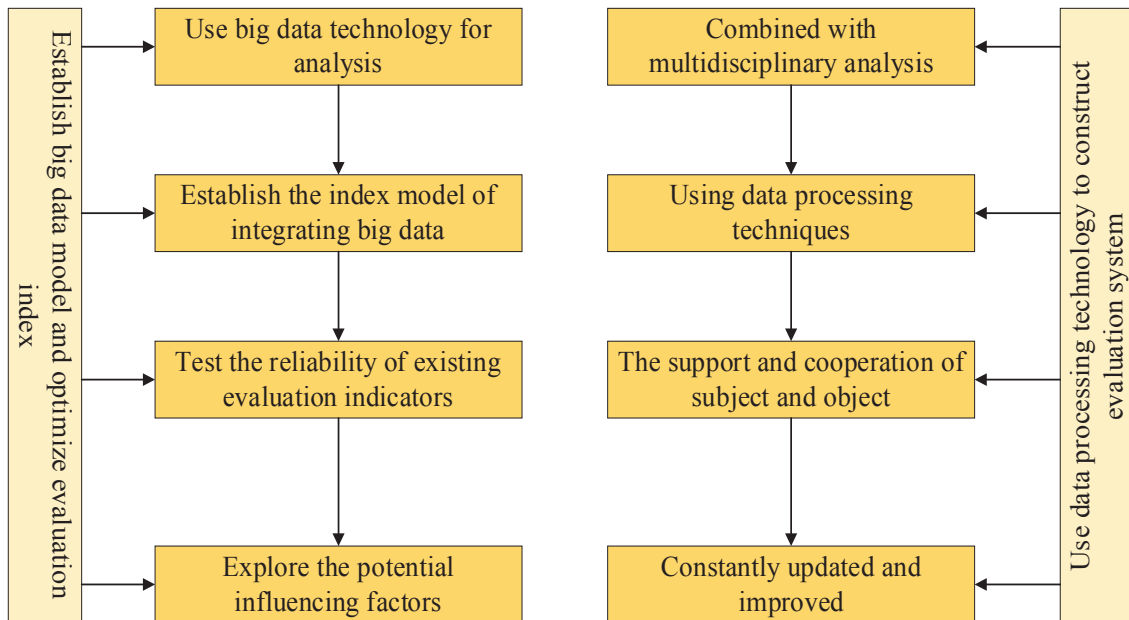

### **3.2. THE DILEMMA OF CONSTRUCTING THE ASSESSMENT AND EVALUATION OF THE INTEGRATION OF CIVIC AND POLITICAL EDUCATION IN UNIVERSITIES BASED ON BIG DATA**

In recent years, the construction and development of the integration assessment and evaluation system has achieved remarkable results, but still faces difficulties. On the one hand, many problems only remain on the surface phenomenon, lacking systematic summary and reflection, reflecting the immaturity of the construction of the evaluation system, and on the other hand, the lack of sufficient attention makes its overall construction process lag behind the development of the current Civic Education practice and does not really play the role of cultivating and practicing The role of socialist core values. There are problems in terms of single objective, single structure and poor relevance.

### **3.3. THE METHOD OF ASSESSMENT AND EVALUATION OF THE INTEGRATION OF CIVIC AND POLITICAL EDUCATION IN UNIVERSITIES BASED ON BIG DATA**

Figure 2 shows the methodological innovation of the assessment and evaluation of the integration of Civic and Political Education with Big Data. What comes along with the era of big data is not only new technology, but also new values and methodology, which will trigger a change in people's thinking. Deeply understanding the important role of big data, carefully collecting and storing all kinds of data information, and using the results of data analysis to improve the effectiveness of education integration assessment and evaluation is an urgent practical problem that practice has put forward to us.

**Figure 2.** Evaluation methods of ideological and political education integration in universities

#### 4. THEORETICAL SIGNIFICANCE AND PRACTICAL VALUE

By making full use of big data to extract, summarize and sort out the laws of education in the massive information, it can effectively anticipate the future. Through the application of big data, educators can understand the ideological dynamics of students more clearly, so as to carry out education in a targeted manner. Currently in the era of information explosion, students receive all kinds of information in the network from time to time. Educators should be good at analyzing and mining data rationally, maintaining correct values and positive curriculum concepts, and working scientifically and rationally.

#### 5. CONCLUSION

Civic education is a process of continuous development and change, this process should be closely combined with the development of society students' ideological situation and changes in political consciousness, only in the ideological constantly improve their consciousness, in order to better put theory into practice in action. Only in the continuous strengthening of students' own worldview, outlook on life and values transformation can they effectively improve their political theory and work ability. This paper explores the education assessment and evaluation system based on practice and analyzes the significance of education theory and the value of practice based on big data. It is conducive to expanding the research field of ideological education, enriching the content of college education, strengthening the "three-dimensional" and "systematic" understanding of all aspects of education, and improving and perfecting the education methods.

# EFFECTIVE APPLICATION OF BIG DATA INFORMATION TECHNOLOGY IN ARCHIVES MANAGEMENT

---

Shouzhong Wang\*

Archives of Henan University, Kaifeng, Henan, 475001, China

[wsz@henu.edu.cn](mailto:wsz@henu.edu.cn)

## ABSTRACT

This paper analyzes the connotation and basic characteristics of big data, concludes that big data information technology consists of data analysis technology, data processing technology, and data storage technology, and explores its effective application in archives management. At the same time, the problems and considerations in the application of big data information technology in archives are analyzed, and solutions are made to deepen the effective application of big data information technology in archives management. Through multi-dimensional analysis and perspective, the needs related to archival data and information are presented to relevant managers in an all-round way, which effectively improves the accuracy of archival management and promotes the reform of archival management in the era of big data.

## KEYWORDS

Data analysis; Data processing; Data storage; Archival management; Big data information technology

## 1. INTRODUCTION

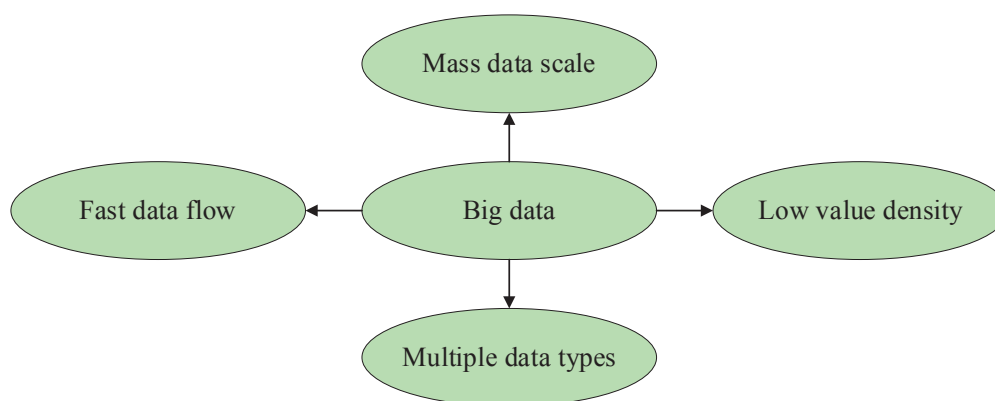

With the rapid development of social economy, the level of development of Internet information technology is also increasing, and at the same time, big data is also developing rapidly, but at the present stage of the actual development of various industries, archives management work also occupies a more important position in the process [1-2]. Archival management has undergone a series of changes, and archival information resources have been developed in depth, and the service role played by archival management for society is more obvious [3-4]. Big data information technology can effectively promote the optimization of the archival management process and realize the purpose of centralized management of archives, and at the same time, it can deeply explore archival data and provide the people with services that meet their needs [5-6]. However, according to the relevant survey data, most of the current archive management work often has some unreasonable problems in the case of using big data information technology, in which case, it is necessary for the relevant departments and staff to increase their attention to it [7]. And to analyze and study the problems that exist in it, take scientific and reasonable control measures to ensure that big data information technology can give full play to its own role and value, so as to guarantee that the level of archives management work can be further strengthened [8].

## 2. APPLICATION OF BIG DATA INFORMATION TECHNOLOGY IN FILE MANAGEMENT

### 2.1. BIG DATA

Big data is a kind of aggregate with massive data information, which encompasses a very large amount of data and cannot be collected, stored and analyzed with the help of traditional database software tools. The characteristics of big data are reflected in four aspects, and the basic features of big data are shown in Figure 1. The application of big data does not focus on acquiring and storing huge amount of information, but its core is to effectively process, process

and mine the data, so that the data becomes valuable for utilization. Big data technology requires a combination of many assistive technology tools, databases and systems to better process and extract valuable data information.

**Figure 1.** Basic characteristics of big data

## 2.2. BIG DATA INFORMATION TECHNOLOGY

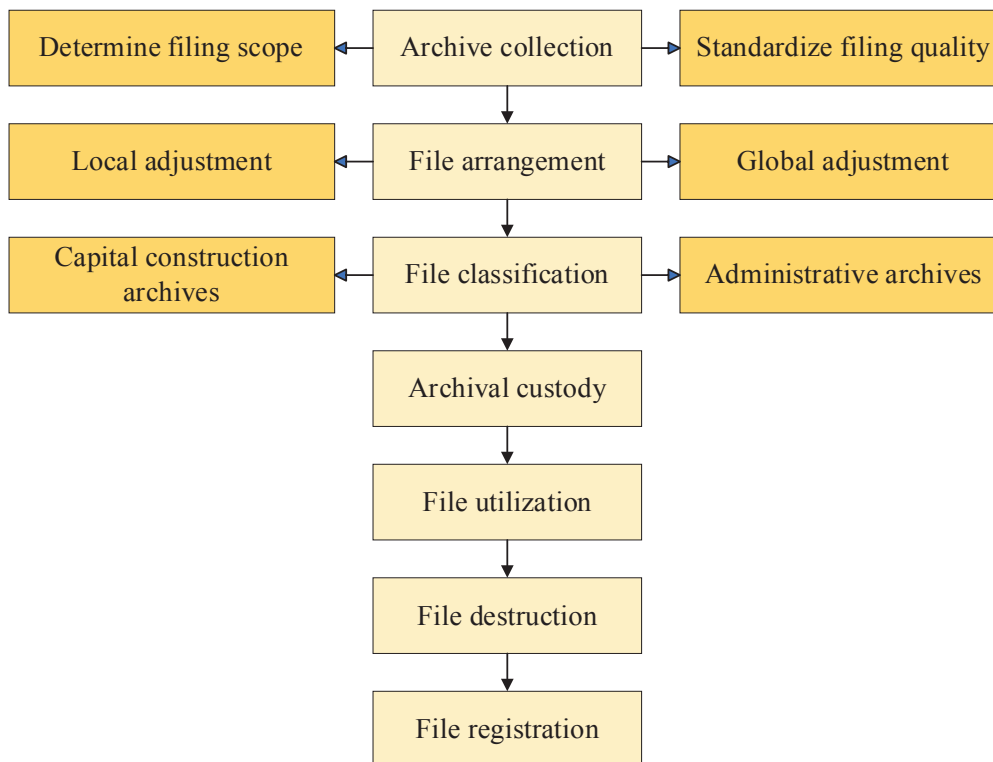

Big data information technology consists of data analysis technology, data processing technology, and data storage technology. In the application of big data information technology, all three technologies can be applied in the file management. In the specific implementation process, large-scale application and processing database, data mining technology, distributed database, cloud computing platform, Internet technology, and combined with distributed file system, scalable storage system, etc. are required. The collection of massive data and data transmission work are carried out, and then data mining analysis is carried out to achieve the purpose of efficient processing of data information.

## 2.3. THE EFFECTIVE APPLICATION OF BIG DATA INFORMATION TECHNOLOGY IN THE MANAGEMENT OF CONTEMPORARY RECORDS

Figure 2 shows the general process of file management, and big data information technology can help file managers to standardize the format of files for centralized file management, such as the conversion of paper files into electronic files after scanning technology for data format, so as to facilitate the unified and centralized file management, and the effective application of big data information technology in file management is as follows:

(1) strengthen the integrity of archival information data, archival management work itself has the characteristics of complexity, but the traditional period in the process of archival management work, will continue to have data, but the data storage capacity has a limit, which requires the deletion of relevant data, in such a case, it will lead to the problem and phenomenon of data loss. But in the current stage of big data archive management work, it can control the relevant problems, not only can store a large amount of data, but also can backup the relevant data, thus ensuring that the integrity of archival data information can be strengthened.

(2) In the process of traditional archives management, paper archives are generally adopted, which will lead to inconvenience in the process of searching, and if a little loss occurs, it will consume a lot of time and increase the workload of the staff themselves. But in the process of archives management in the big data environment, it is possible to control the relevant problems, but also to facilitate the search of relevant data, to avoid the problem and phenomenon of data loss, so as to ensure that the needs and standards of all aspects can be met.

**Figure 2.** General flow of file management

### **3. BIG DATA INFORMATION TECHNOLOGY IN ARCHIVES MANAGEMENT STATUS AND CONSIDERATIONS**

#### **3.1. PROBLEMS WITH THE APPLICATION**

(1) Lack of professional talents, most units still adopt traditional management methods in the process of actually carrying out archive management work, which will lead to the inability to process and analyze the relevant data, and the lack of professional processing personnel.

(2) Uniform backup of data is not possible. At present, each unit in each region manages its own records in its own way and is not able to manage records uniformly throughout the country, which affects the level and efficiency of records management and leads to frequent problems of information security.

(3) There are security problems in file management. The current security system of file management is poor, and the traditional form of file management is adopted, which will not only increase the difficulty of file management, but also lead to the problem and phenomenon of information loss, thus leading to the data not being able to give full play to its own role and value.

#### **3.2. PRECAUTIONS FOR APPLICATION**

(1) When archives managers use big data information technology for archives management, they should use a dynamic eye view of big data information technology, and at the same time, they should selectively apply big data information technology according to their actual work situation. At the same time, after the introduction of big data information technology and its application in archives management, the relevant units should increase the support for archives management, and also do a good job of promoting the knowledge of big data information technology among archives managers, actively cultivating professional talents of big data information technology, introducing more advanced equipment related to big data information technology, and improving the application level of big data information technology in the units.

(2) The staff of relevant units should systematically apply big data information technology as a whole when they carry out archive management work, so that the greatest advantages of big data information technology can be brought into play. At the same time, each unit should do a good job of the corresponding training, and also analyze the relationship between the various elements of the file management work, so as to achieve a systematic macroscopic file management. In addition, the archives management department should also strengthen the connection with other departments, do a good job in the management of various information resources, and also improve the quality of archives services.

#### **4. DEEPEN THE EFFECTIVE APPLICATION OF BIG DATA INFORMATION TECHNOLOGY IN ARCHIVE MANAGEMENT**

##### **4.1. IMPROVING THE APPLICATION OF BIG DATA INFORMATION TECHNOLOGY IN ARCHIVE MANAGEMENT**

The use of big data information technology in archives management can solve the drawbacks of traditional archives management itself, so it is necessary to apply big data information technology to archives management and improve the application of big data information technology in archives management. Table 1 shows the measures to improve the application of big data information technology in archives management. It is necessary to have a large enough space to store a large amount of data information as well as various archives, and to analyze the stored information systematically so that the value behind the big data information can be discovered. Big data information technology is used to systematically classify information and then manage it in a unified and centralized manner, while users can search through the unified database with big data information technology and find the information they need.

**Table 1.** Measures to improve big data information technology in archives management

Build cloud storage	1.Improve the level of information sharing platform construction 2.Promote the construction of digital archives
Improve data analysis skills	1.Improve traditional ideas 2.We will increase the use of advanced technologies
Strengthen data retrieval capabilities	Improve the management system

##### **4.2. DEEP MINING OF ARCHIVAL DATA**

The multidimensional analysis and perspective can present the needs of archival data and information to the relevant managers in a comprehensive manner. It can effectively improve the accuracy of archival management, prevent the omission of various key data information, and effectively promote the reform of archival management in the era of big data. When big data information technology is applied to archives management, it mainly includes the flexible use of semantic search engine to analyze and predict the changing trend of people's needs when deep mining of archival data information is carried out.

#### **5. CONCLUSION**

The current rapid development of science and technology has promoted the rapid development of big data, which has also been widely promoted and used in various industries, but at this stage, some departments are still using the traditional file management methods and concepts in the process of carrying out file management. With the rapid development of big data information technology, it is necessary to pay attention to the application of big data information technology in archives management. The article explores the effective application of big data information technology in archives management, and analyzes the current situation of big data technology in archives management as well as precautions, and proposes

measures to deepen the application.

# THE POSITIVE IMPACT OF THE DEVELOPMENT OF TEACHING EVALUATION SYSTEM OF COLLEGE CIVICS CLASS ON STUDENTS' BEHAVIOR IN THE ERA OF BIG DATA

---

Zhuqing Wang\*

Guangzhou Health Science College, Guangzhou, Guangdong, 510450, China

[zhuoer80@126.com](mailto:zhuoer80@126.com)

---

## ABSTRACT

In the era of big data, the teaching evaluation of college Civics class integrating big data is important to comply with the changes of Civics class teaching. Based on the basic principles of teaching evaluation index system construction, this paper constructs the basic framework of teaching evaluation system of Civics and Political Science class, and analyzes the shortcomings of teaching evaluation system of Civics and Political Science in colleges and universities in the era of big data, puts forward corresponding strategies, and explores the influence on students' behavior. The results show that the concentration of students' classroom attention behavior has increased by 0.2, the participation of classroom participation behavior has increased by 0.21, the interaction of classroom interaction behavior has increased by 0.18, and the learning of classroom learning behavior has increased by 0.21, and there is a positive impact.

## KEYWORDS

Big data; Civics teaching evaluation; Evaluation principles; Student behavior; Classroom behavior

## 1. INTRODUCTION

The ideological and political theory course is the key course to implement the fundamental task of establishing moral education, and is the soul course to strengthen and improve the thinking and government work in colleges and universities, and has been highly valued by the Party and the State [1-2]. In this context, theory courses can effectively arm the minds of young college students and build a firm ideological foundation [3-4]. It can be seen that it is significant and honorable to promote teaching reform and improve teaching quality, university courses integrating modern information technology present new characteristics of teaching [5]. Traditional teaching evaluation methods have clearly failed to adapt to education under the changing times, and it is only by conforming to the changes in teaching and deepening curriculum reform that we can promote the modernization of education [6]. A correct understanding of the opportunities and challenges brought by the development of technology in the new period on the evaluation of teaching and learning of college and university Civics courses is necessary to propose a more scientific and effective strategy for proposing relevant courses [7-8].

## 2. THE BASIC FRAMEWORK OF CIVICS TEACHING EVALUATION SYSTEM

### 2.1. BASIC PRINCIPLES FOR THE CONSTRUCTION OF TEACHING EVALUATION INDEX SYSTEM

The basic principles of the five aspects can ensure that the evaluation index system can play its guiding and evaluating role objectively and fairly, help schools achieve their teaching purposes, and establish an advanced evaluation system for teachers of theory courses. First, the principle of politics, the purpose of teaching college Civics class is to train students to become people with correct political beliefs, the establishment of a practical evaluation system for teaching Civics class in colleges and universities should clearly reflect the value orientation of socialism with Chinese characteristics. Second is the principle of systemic, education evaluation itself is a system, in practice, should be the process evaluation and result evaluation, qualitative evaluation and quantitative evaluation organic combination, so as to fully ensure the objectivity and fairness of the evaluation results. Third is the principle of scientificity, evaluation is a value judgment activity based on objective facts, reflecting the real situation of education, and can correctly handle and reflect the relationship between all aspects of education. Fourth is the principle of feasibility. Feasibility is an important principle for judging whether an indicator system is perfect. The indicator system should be simple and easy to implement. In the design of the indicator system, the progressiveness of students' growth and the ambiguity of thinking levels must be taken into account, and some indicator systems should be fuzzy and quantitative. Fifth is the principle of dynamism, the purpose of strengthening the construction of the Civics course is not only to enable students to obtain certain basic theoretical knowledge, and more importantly, starting from theoretical education, using theory to guide the shaping of students' values and specific behavior, which is a long-term process.

### 2.2. BASIC FRAMEWORK OF THE EVALUATION SYSTEM

Table 1 shows the basic framework of the evaluation system of Civics and Political Science teaching.

**Table 1.** Basic framework of ideological and political teaching evaluation system

Primary index	Secondary index
Evaluation of teaching objectives	Value goal
	Operational target
	Comprehensive objective
Evaluation of teaching activities	Syllabus index
	Teaching progress indicator
	Lesson plan index
	Teaching classroom index
Teaching ability evaluation	Teaching attitude index
	Teaching method index
	Teaching organization index
Teaching feedback evaluation	Teacher feedback indicator
	Student feedback index

(1) Teaching objectives are pioneering and decisive, and the fundamental purpose of the construction of teaching evaluation index system of college Civics class is to achieve specific teaching objectives. Therefore, the reasonable choice of teaching objectives evaluation indexes is in the first place in the construction of the basic framework of teaching evaluation index system of Civics and Political Science class.

(2) Teaching activity is the main object of teaching evaluation and the core of the evaluation system, around the syllabus, syllabus progress, teacher syllabus, classroom lectures, syllabus evaluation and other key links to select teaching activity evaluation indexes, targeted comprehensive evaluation of Civics and Political Science class teaching activities and their effects.

(3) Teaching ability evaluation Teaching ability plays a fundamental role in the improvement of teaching quality of Civics and Political Science class. Teaching ability is a comprehensive concept, and should focus on the comprehensive evaluation of the teaching attitude, teaching methods and teaching organization of Civics and Political Science teachers.

(4) Civics teaching is a subtle process. The real teaching effectiveness of the Civics class is never represented by the examination results of several courses, and sometimes the examination results can cover up the problems in the teaching of Civics class. Teaching feedback can effectively find the implicit deficiencies in the teaching of Civics and Political Science class, which is an important part of the organization and implementation of Civics and Political Science class.

### **3. THE DEVELOPMENT OF THE EVALUATION SYSTEM N THE ERA OF BIG DATA**

#### **3.1. INADEQUACY OF THE EVALUATION SYSTEM**

(1) The evaluation system of college Civics teaching is unreasonable. In the past, most of the evaluation work of college Civics teaching was to evaluate teachers' teaching effect and students' learning outcomes. When evaluating teachers' teaching, some schools mainly look at whether teachers have carried out Civics teaching to students, because it is difficult to evaluate students quantitatively due to the influence of the number of hours, so they mostly evaluate students qualitatively, that is, teachers evaluate students according to their Civics reports. Under this kind of Civics teaching evaluation system, its whole evaluation method is very lagging behind, and it is difficult to effectively play a positive role in evaluation.

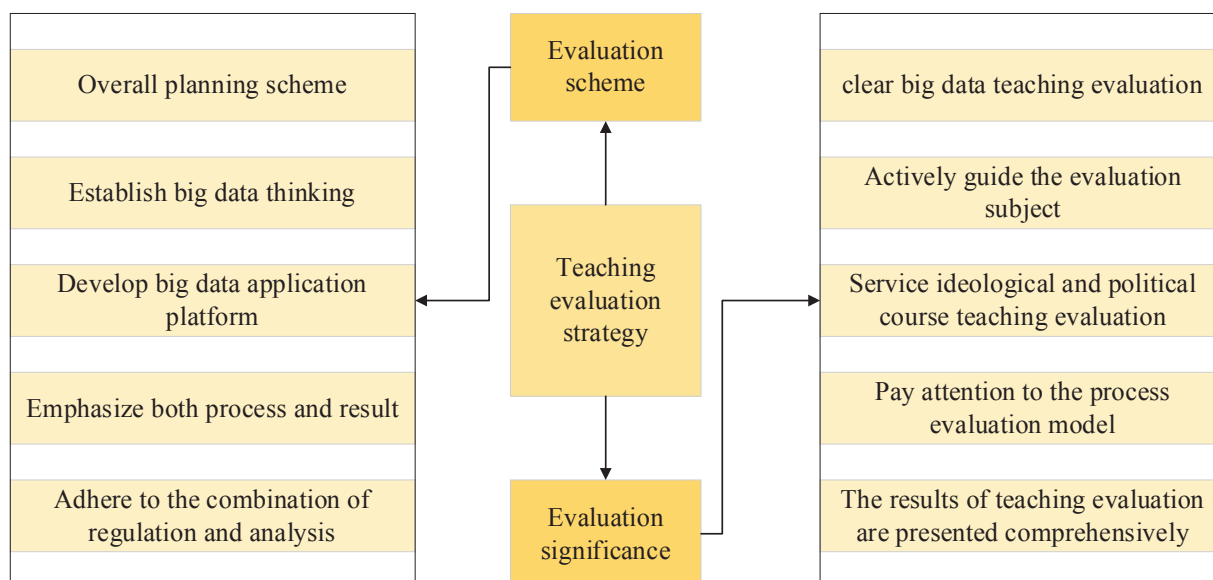

(2) The content of the evaluation of college Civics teaching is one-sided. In today's evaluation of college Civics teaching, most of the evaluation contents are focused on the textual materials submitted by students, but ignore the performance and actual effect of students' Civics practice, and the evaluation of students' innovation consciousness, practical ability, ideal beliefs and other aspects is obviously insufficient. Under this one-sided situation of the evaluation content of college Civic and Political Science teaching, it is especially important to make a good reform of college Civic and Political Science teaching evaluation.

(3) The evaluation mechanism of college Civics teaching needs to be improved. In the process of college Civics education and teaching, teaching evaluation can be considered a very important link. With regard to the actual situation of teaching evaluation of college Civics class, that is, the teaching evaluation mechanism is not standardized enough, lacking a perfect and scientific evaluation system, and there is no corresponding evaluation standard in the specific evaluation, or even no corresponding evaluation standard is formulated, while some schools have formulated but not strictly enforced, and the whole teaching evaluation mechanism is not operable, which leads to the teaching evaluation is superficial.

#### **3.2. STRATEGIES FOR TEACHING EVALUATION**

The more difficult part of the implementation of formative assessment in Civics is the evaluation criteria. Civics courses focus on students' ideological and moral cultivation and political literacy, and these requirements are difficult to distinguish obviously between good and bad students' assignments, and students' roughly equal levels, which can cause the problem of subjectivity and ambiguity in formative evaluation. Figure 1 shows the strategy of

teaching evaluation of college Civics course in the era of big data. In the era of big data, facing all the challenges of applying big data to carry out teaching evaluation of college Civics class, colleges and universities need to seize the opportunity to improve the scientific and comprehensive teaching evaluation of Civics class, and need to take a macro view and plan the scheme of applying big data to teaching evaluation of Civics class as a whole.

**Figure 1.** Teaching evaluation strategies of ideological and political courses in colleges

#### 4. THE POSITIVE IMPACT OF THE DEVELOPMENT OF THE EVALUATION SYSTEM ON STUDENT BEHAVIOR

Examining students' learning attitudes and study habits. The traditional assessment mode for students' learning attitudes and habits is limited to attendance, classroom speech and homework completion, which cannot fully mobilize students' enthusiasm, and the passive learning attitude cannot help students form good learning habits.

**Figure 2.** Behavioral changes of students in the development of the evaluation system

Figure 2 shows the changes in students' behaviors in the development of the teaching evaluation system of a classroom Civics class. The concentration level of students' classroom attention behavior increased from 0.69 to 0.89, an increase of 0.2, and the participation level of students' classroom participation behavior increased from 0.71 to 0.92, an increase of 0.21. The interaction level of students' classroom interaction behavior increased from 0.73 to 0.91, an increase of 0.18, and the learning level of students' classroom learning behavior increased

from 0.72 to 0.93, an increase of 0.21. The positive classroom behaviors of students have increased by 18%-21%, therefore, the development of evaluation system can promote students' positive classroom behaviors, that is, the development of evaluation system of college Civics class teaching in the era of big data has an impact on students' behaviors.

## 5. CONCLUSION

This paper explores the basic framework of the evaluation index system of Civics teaching, analyzes the development of the evaluation system of Civics teaching in colleges and universities in the era of big data, and explores the influence of the development of the evaluation system on students' behaviors in the era of big data. The concentration degree of students' classroom attention behavior increased from 0.69 to 0.89, the participation degree of classroom participation behavior increased from 0.71 to 0.92, the interaction degree of classroom interaction behavior increased from 0.73 to 0.91, and the learning degree of classroom learning behavior increased from 0.72 to 0.93. Therefore, the development of the evaluation system of college Civics teaching in the era of big data has a positive influence, and big data can promote the teaching of Civics.

# THE TURN AND IMPACT OF POSTMODERNIST VISUAL COMMUNICATION DESIGN IN THE CONTEXT OF BIG DATA

---

Haitao Huang\*

Sichuan University, Chengdu, Sichuan, 610065, China

[18115282007@163.com](mailto:18115282007@163.com)

---

## ABSTRACT

This paper analyzes postmodernism and visual communication, and explores the development trend and development path of postmodernist visual design in the context of big data through the dilemma faced by the turn of postmodernist visual design in the context of big data. It realizes the design turn of postmodernist visual communication design from elitism to popular culture, the gender category turn from patriarchy to feminism, and the design concept turn from functional rationality to acceptance aesthetics in the context of big data. The new postmodern realist visual communication design is more adaptable to people's demand for material and spiritual culture, and plays a role in promoting social development.

## KEYWORDS

Postmodernism; Visual communication design; Big data; Design turn; Design influence

## 1. INTRODUCTION

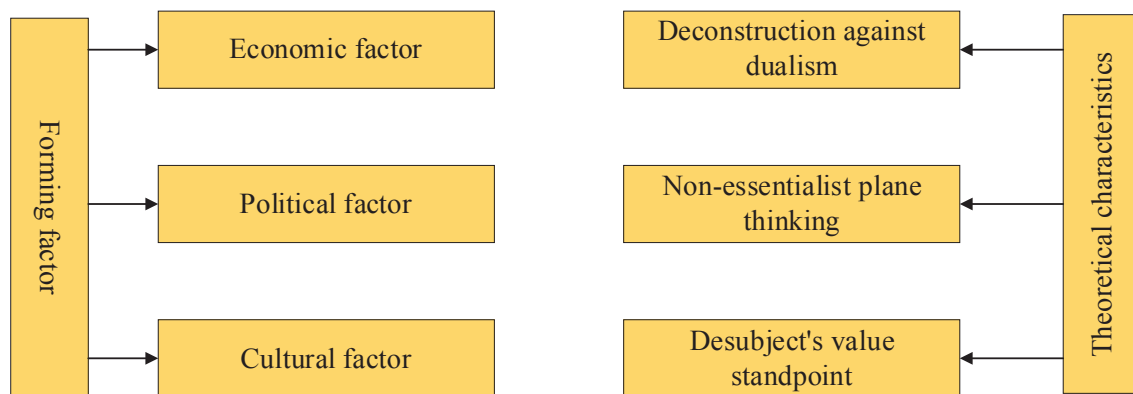

With the rise of popular culture in the mid-twentieth century, consumerism and popular aesthetics prevailed among the vast emerging middle class, and visual communication design logically replaced architecture in the postmodernist stage as the role of laying the foundation and guidelines for design [1-2]. The essence of visual communication design is to process and disseminate information effectively, but as the standard of living and quality of life in Western societies continue to improve, visual symbols that satisfy the basic communication function can no longer meet people's growing emotional needs and individual differences [3-4]. As a result, based on the inner interpretation and self-reinforcement of certain modernist ideas, visual communication design has turned to the postmodernist stage to find answers [5]. Focusing on the "irrational" value and emotional expression of design, exploring the relationship between design and culture, forming a dialogical and interventional aesthetic form of daily life, etc., these changes also became the driving force of postmodernism and the future development of visual communication design [6]. At this time, visual communication design tries to meet new needs while creating new desires, developing a more diversified, elegant and humanistic design paradigm, making up for past absences while forming a variety of critical synthesis, trying to break free from the shackles of function and rationality, and seeking a new life after breaking [7]. In this paper, the turn and impact of postmodernist visual communication design in the context of big data.

## 2. POSTMODERNISM AND VISUAL COMMUNICATION

### 2.1. POSTMODERNISM

Postmodernism is a design ideology that emerged after modernism, in the late 1960s and

early 1970s, as a product of the post-industrial and information society. Postmodernism is a design movement that first emerged from architecture and gradually developed into other fields. In academic circles, it is generally regarded as “a design style that makes extensive use of historical decorative motives for eclectic decoration based on modernist design. The ideological foundation of post-modernist design is based on the anti-modernist design form, which strongly opposes the design principle of “less is more” and emphasizes the design viewpoint of “less is more”, proposing that design should not only meet the function, but also need to show different colorful visual presentation in its form. It is proposed that the design should not only satisfy the function, but also show different colorful visual presentation effects, and meet the aesthetic requirements of different consumers. The formation factors and characteristics of postmodernism are shown in Figure 1. Postmodernism design advocates the theory of “urban history fusion revival”, emphasizing that the new era design needs to use new materials and technologies to overcome the unique technical characteristics of history and tradition, to show the continuity of historical culture, to explore new forms of creation without the limitations and constraints of traditional logical thinking, and to reflect the individuality and unique design style of designers in the era. The post-modern design in the design practice to achieve the Postmodern design has realized complex and diverse characteristics in design practice, and different types, styles and schools of design have emerged.

**Figure 1.** Formation factors and characteristics of postmodernism

## 2.2. VISUAL COMMUNICATION DESIGN

Visual Communication Design is a direct translation of Visual Communication Design, which was first used in the 1920s and formally developed in the 1960s. Visual communication design includes the two basic concepts of “visual symbols” and “communication”, and refers to the design that uses visual symbols to communicate information. “Visual symbols” refers to symbols that can be seen with the eyes and express certain properties of things, such as words, pictures, colors, commercials, TV shows, movies, landscapes, etc. The so-called “communication” refers to the process of using symbols to convey information from the sender to the receiver. In short, visual communication design is “the design that shows and informs”, and its main purpose is to convey information. The components and contents of visual communication design are shown in Table 1.

**Table 1.** Components and contents of visual communication design

Constituent elements and contents	Concrete performance
Text	Text is the most commonly used visual symbolic element
graph	Graphic design includes illustrations and graphic logos
arrange	According to the main idea conveyed, various visual elements are scientifically arranged and organized
hue	Colors often have their own associations and symbolic meanings
content	Newspapers and books design, packaging design, advertising design, logo design, corporate image design, software interface and web design, visual oriented design, display design, film and television design, etc. Graphic design includes newspaper and book design, packaging design, advertising design, logo design, corporate image design

### **3. THE TURN OF POSTMODERNIST VISUAL COMMUNICATION DESIGN IN THE CONTEXT OF BIG DATA**

#### **3.1. THE DILEMMA FACED**

With the advent of the big data era, visual communication design has entered a new stage of development, and the demand for composite talents is increasing. Educational practice should focus on cultivating students' practical innovation ability and strengthening the cultivation of data analysis and digital content creation, so as to meet the needs of modern design disciplines. The traditional thinking and mode of visual communication education has been unable to adapt to the demand for applied talents in the era of big data. Influenced by the work experience in various aspects, the traditional visual communication design education mainly suffers from such shortcomings as the teaching concept and teaching mode are too old, not combined with modern information network technology, not fully connected with the market, and insufficient innovation and competition consciousness. Secondly, the lack of industry standards for talents is also a pressing issue, which makes many media publish disorganized content, many media videos are chaotic, and the produced content lacks creativity or even proliferates, which also indirectly affects the development of the industry.

#### **3.2. DEVELOPMENT TREND AND DEVELOPMENT PATH**

Post-modernist visual communication design in the context of big data has a history of more than thirty years of development and has gradually formed a perfect system. The initial visual communication design was decoration design, which gradually developed into graphic design and digital media design. The development path of post-modern visual communication design innovation in the background of big data is shown in Table 2. In the teaching of visual communication art discipline, it is necessary to follow the law of natural development, align with the times, seek diversified development paths, adopt the mode of integration and development of multiple disciplines, expand new teaching resources, on the one hand, aggregate new teaching basic resources, on the other hand, expand new teaching auxiliary resources.

**Table 2.** Innovative development path of post-modern visual communication design

Innovation in virtual and interactive technologies	With the rapid development of virtual interaction technology, visual communication design forms will be more abundant
Achieve cross-border form innovation	The use of new digital media holographic technology in visual communication design
Leading concept innovation	Comprehensive innovation in all interactive areas of visual communication

### **3.3. STEERING IN THE CONTEXT OF BIG DATA**

#### **(1) The design turn from elitism to popular culture**

Postmodernist visual communication design effectively produces a connection with the living world, highlighting the uniqueness of the individual. Designers try to establish an aesthetic connection between elegance and vulgarity, break the old dichotomy between good and bad, pursue the complete liberation and freedom of human nature, and emphasize the integration of elite culture and popular culture. At the same time, design achieves the extension and crossing between multiple fields and becomes a systematic way that can gather social influence.

#### **(2) The shift of gender category from patriarchy to feminism**

After the 1960s, the post-modernist visual communication design trend with clear attitudes and the pursuit of equal liberation gradually diluted the rational design model, and female culture re-emerged to influence design. This has led to a trend of diversification in the field of visual communication design, which no longer relies on the reference to the one-way aesthetic model of men to define the status of women's identity.

#### **(3) From functional rationality to the design concept of aesthetic acceptance**

After the satisfaction of material life, the consciousness of human subjects gradually awakened, and the design approach lacking emotion and interest was criticized. Postmodernist visual communication design criticized the pre-determined model of modernism and the closedness and self-sufficiency of aesthetics, and turned the living world into a stage full of "theatricality", in which everyone is a participant who does not care about the performance of others, and promoted the multi-dimensional development of visual communication design after postmodernism.

### **4. THE INFLUENCE OF POSTMODERNISM VISUAL COMMUNICATION DESIGN IN THE CONTEXT OF BIG DATA**

The impact of big data era on postmodernist visual communication design is shown in Table 3. Due to the innovative progress of technology, big data gradually became the main tool of graphic design. Postmodernist designers began to devote themselves to exploring the potential of big data and developing the design language embedded in the new media, so that the postmodernist tendency in graphic design finally evolved into a trend of the times. The use of big data has brought a new change to type design. New typefaces have been developed like never before, and many commercial and non-commercial research institutions specializing in typeface innovation have emerged in the West. In terms of font application, with the unprecedented power of big data, post-modern designers can adjust the shape, size, thickness, position, and color of text at will, and control the density of text coverage. As a result, fonts have risen from being information carriers in the traditional sense to being the constituent elements of graphic design. Although this has somewhat weakened the recognition of text, it has created an extremely powerful visual impact. These post-modernist designs reflect the spiritual essence of post-modernism, where what people need is both physical and spiritual content, rather than the purely physical content emphasized by internationalism.

**Table 3.** Influences of big data era on visual communication design

<b>influence</b>	<b>Challenge</b>	<b>Development direction</b>
Big data promotes multi-dimensional visual communication design in postmodern realism	Postmodern visual communication design needs to be more diverse	Adopt digital design scheme
Big data promotes the heterogeneity of post-modern realism visual communication design	The content of postmodern visual communication design needs to be continuously enriched	Promote the integrated development of multiple media
Big data virtualizes post-modern realist visual communication design	The screening ability of post-modernism visual communication design needs to be improved	Constantly innovating forms of artistic expression

## **5. CONCLUSION**

This paper analyzes the development of postmodernist visual design in the context of big data, analyzes postmodernism and visual communication design, and explores the turn and influence of postmodern visual communication design in the context of big data. In the context of big data postmodernism visual communication design turns from elitism to mass culture design, from patriarchy to feminism gender category turn, from functional rationality to acceptance aesthetics design concept turn. Under the influence of big data, postmodern realist visual communication design has been newly developed, and the new postmodern realist visual communication design is more adaptable to people's needs for material and spiritual culture, and has played a role in promoting social development.

## ABSTRACT

By classifying the forms of image dissemination in the era of self-media, this paper elaborates on the WeChat public website, short video platform and live streaming platform. The process of growth, proliferation and degradation of traditional village images in the process of dissemination on the self media platform is constructed. The significance and value of traditional village image dissemination in the era of self-media is summarized, and the importance of the protection and inheritance of traditional village culture is emphasized. The discussion in this paper helps to better understand the current situation and future development trend of traditional village image dissemination in the age of self-media, and provides new ideas and new methods for traditional culture preservation and innovation.

## KEYWORDS

Self-media; Image dissemination; Short video platform; Traditional villages; Degradation process; Traditional culture

## 1. INTRODUCTION

With the popularity of Internet technology and the ease of information dissemination, self-media has become an important way of information dissemination, which has produced new influences and changes on the image dissemination of traditional villages [1-2]. In this paper, we will study the following two aspects: first, the current situation and characteristics of traditional village image dissemination in the era of self-media [3]. The second is to explore the significance and impact of self-media on traditional village image dissemination [4]. The current situation and characteristics of traditional village image dissemination in the era of self-media have become a hot spot for research [5-6]. In recent years, relevant scholars have conducted a series of studies and researches on this issue. Some scholars have analyzed the current situation and challenges of traditional village image dissemination in the age of self-media and proposed that the platform construction and content innovation of village image dissemination should be strengthened [7-8]. To sum up, traditional village image dissemination has become

an important research area in the era of self-media.

## **2. IMAGE COMMUNICATION OF TRADITIONAL VILLAGES IN THE AGE OF SELF-MEDIA**

### **2.1. THE FORM OF IMAGE COMMUNICATION IN THE AGE OF SELF-MEDIA**

#### **2.1.1. WECHAT PUBLIC**

WeChat is one of the most popular forms of image dissemination in the age of self-media. Through WeChat public numbers, images of traditional villages can be quickly disseminated to a wider audience. For example, the beauty of a traditional village can be photographed by a photographer and then released through WeChat public number. In this way, more people can browse these images through their cell phones or computers and learn about the beauty and charm of traditional villages, which in turn will stimulate their interest in tourism.

#### **2.1.2. SHORT VIDEO PLATFORM**

Short video platforms have now also become one of the important forms of image dissemination in the age of self-media. For example, short videos can be uploaded on platforms such as Jitterbug and Crypto to show the beauty and culture of traditional villages. These videos can be quickly spread to a wider audience, attracting more people to pay attention to traditional villages and thus promoting the tourism development of traditional villages.

#### **2.1.3. LIVE STREAMING PLATFORM**

Live streaming platform is also one of the important forms of image dissemination in the era of self-media. For example, some travel bloggers can show the beautiful scenery and culture of traditional villages to viewers in real time through the live streaming platform, so that viewers can understand the charm of traditional villages more intuitively. The interactive nature of the live streaming platform also allows viewers to interact with the bloggers, ask questions or share their opinions, further promoting the spread and development of traditional villages.

### **2.2. THE SIGNIFICANCE OF COMMUNICATION OF CULTURAL VALUES OF TRADITIONAL VILLAGES**

The dissemination of cultural values of traditional villages is not only an inheritance and promotion of traditional culture, but also an inspiration and education for contemporary society. Traditional villages represent the essence of Chinese traditional culture, and the dissemination of their cultural values can promote people's awareness and understanding of traditional culture and enhance cultural self-confidence. At the same time, traditional villages are also an important resource for contemporary society, and their unique cultural values can provide inspiration and reference for contemporary society. Through the dissemination of the cultural values of traditional villages, we can promote the inheritance and innovation of traditional culture, and promote the development and prosperity of Chinese culture.

## **3. THE PROCESS OF SPREADING THE IMAGES OF TRADITIONAL VILLAGES ON THE SELF-MEDIA PLATFORM**

Taking Rongjiang Pingxiang Miao Village in Guizhou as an example, we analyze the dissemination process of a video material. First, the characteristics of the short video spreading within the self-media platform are comprehensively considered, and a GDC spreading model containing growth, diffusion and degradation processes is established. Secondly, for the dissemination process of the short video of the traditional village Pingxiang Miaozhai, we consider the independence of the dissemination of a short video, take the dissemination within the Jitterbug platform as an example, use the web crawler technology to collect relevant data,

and carry out simulation according to the GDC model. Its propagation process is simulated by MATLAB software, and its growth process is analyzed using a logistic model.

### 3.1. THE GROWTH PROCESS OF SHORT VIDEOS SPREADING IN SELF MEDIA PLATFORMS

The diffusion process of the short video of Pingxiang Miao village in the network can be referred to Fick's second law, which is defined as a non-stationary diffusion process in which the rate of change of concentration with time at a distance  $x$  is equal to the negative of the rate of change of diffusion flux with distance at that location. Let  $C$  be the volume concentration (atomic number/m<sup>3</sup>) of the diffusing substance (group element),  $t$  be the diffusion time (in s), and  $x$  be the distance (in m).

Let  $I(x, t)$  be the number of affected nodes with distance  $x$  from the information source  $S$  at time  $t$ .  $r$  is the growth rate of affected users, which reflects the information dissemination speed in the growth process.  $K$  is the carrying capacity and  $\partial$  is the bias sign. The mathematical model of the growth process of propagation is

$$\frac{\partial I(x, t)}{\partial t} = rI(x, t) \left( 1 - \frac{I(x, t)}{K} \right) \quad (1)$$

Integrating equation (1) yields

$$I(t) = \frac{K}{1 + e^{\sigma - rt}} \quad (2)$$

where  $\sigma$  is a parameter.

It is assumed that the growth rate remains constant throughout the process. Different values of  $r$  are taken, and MATLAB is used to visualize the change process, and the model simulation results are shown in Figure 1.

**Figure 1.** Growth Model Curve with Fixed  $r$

It can be seen that the growth rate  $r$  reflects the steepness of the curve, and the higher the value of  $r$ , the faster the growth process reaches the end state.  $K$  has an influence on the value of the end state reached, and the maximum value that  $I(x, t)$  can reach is positively related to the value of  $K$ . In practice, however, the growth rate is not constant, but follows the same trend as the classical population growth model, i.e., the growth rate tends to decrease as  $I(x, t)$  increases, and it is not possible to have a growth process that reaches the maximum

carrying capacity.

### 3.2. THE DIFFUSION PROCESS OF SHORT VIDEOS IN THE SELF MEDIA PLATFORM

Let  $d$  be the diffusion coefficient, which reflects the speed of information propagation in the diffusion process. The mathematical model of the diffusion process is

$$\frac{\partial I(x,t)}{\partial t} = d \frac{\partial^2 I(x,t)}{\partial x^2} \quad (3)$$

The main consideration in the diffusion process is the parameter  $x$ . According to the established model, the diffusion curves under different  $d$  values can be made as shown in Figure 2.

Figure 2. Diffusion model curve

It can be seen that the diffusion curves corresponding to different diffusion coefficients are somewhat different, showing that the larger the  $d$  is in the beginning time, the larger the diffusion density is. However, as the diffusion process proceeds, the increasing trend of the nodes involved is very obvious because the diffusion distance becomes larger, which will lead to a gradual decrease of the diffusion density, and there may be a situation where the diffusion coefficient  $d$  is smaller and the diffusion density is larger.

### 3.3. THE DEGRADATION PROCESS OF SHORT VIDEOS SPREADING IN SELF MEDIA PLATFORMS

In the propagation network, the propagation time has an effect on the propagation of short videos. Let  $\omega$  be the intrinsic degradation factor,  $\varepsilon$  be the degradation growth factor, and  $\rho$  be the initial growth rate. The degradation probability function of the disseminator is

$$\alpha(t) = \frac{\omega}{1 + e^{\rho - \varepsilon t}} \quad (0 < \omega \leq 1, \quad \rho > 0, \quad \varepsilon > 0) \quad (4)$$

Obviously, the larger  $\rho$  is, the smaller  $\alpha(t)$  is. When  $\rho = 0$ ,  $\varepsilon = 0$ ,  $\alpha(t) = \frac{\omega}{2}$  degenerates to a fixed degeneracy probability as shown in Figure 3.

**Figure 3.** Degradation probability curve

It can be seen that the degradation probability  $\alpha(t)$  increases with the increase of the propagation time  $t$ . The degradation probability increases gradually with time, which reflects that the message will gradually lose its propagation ability in the process of propagation, which is consistent with the realistic message propagation law.

#### 4. CONCLUSION

In this paper, the following conclusions can be drawn from the discussion of traditional village image dissemination in the age of self-media:

In the era of self-media, the dissemination of traditional village images has shown a diversified and rapid development trend. Self-media platforms such as WeChat public number, short video platform, and live streaming platform have provided new channels and means for the dissemination of traditional village images, and also accelerated the inheritance and protection of traditional village culture.

However, in the process of on dissemination, traditional village images also face some problems, such as the degradation process of short videos spreading in the self-media platforms, which need to be addressed in a targeted manner. Therefore, the dissemination of traditional village images needs to focus on quality and effect, as well as on platform construction and content innovation. Through the reasonable use of self media platforms, the dissemination of traditional village images can be better developed and promoted, thus promoting the inheritance and innovation of traditional culture.

## ABSTRACT

In this paper, we extract information related to the rock classification from the pictures of the surrounding rock palm faces of highway tunnels by using a deep learning model. Combining deep learning technology and edge detection method, the number and spacing of the surrounding rock joints are counted to describe the structural surface integrity, and then the rock hardness is described by using the color space model to determine the rock type. Finally, the discriminative factors of perimeter rock grading are converted into BQ values for grading, and the final results of perimeter rock grading are obtained. The results show that by loading the accuracy of the tunnel surrounding rock grading system based on the deep learning model, 88.2%, 83.7% and 85.9%, respectively, the deep learning model is applicable to the tunnel to identify different morphological characteristics of surrounding rock for grading.

## KEYWORDS

Deep learning model; Tunnel envelope classification; Edge detection; Color space; BQ value

## 1. INTRODUCTION

Tunnel envelope classification is a very important issue in tunnel engineering, which is related to the safety and efficiency of tunnel construction [1-2]. Traditional tunnel envelope grading methods are mainly based on manual experience and intuition, which have the problems of high subjectivity and uncertainty [3]. Therefore, it is of great practical significance and scientific value to study the tunnel envelope classification method based on deep learning model [4-5]. At present, many scholars have conducted in-depth research and exploration in this field [6]. For example, many scholars have achieved certain results by applying convolutional neural network (CNN) method to classify and identify tunnel surrounding rocks [7]. In addition, some scholars have also discussed the problems and challenges in the practical application of tunnel envelope grading methods based on deep learning models, such as insufficient amount of data and insufficient model robustness [8-9]. Taken together, the problem of tunnel envelope classification based on deep learning models is an area worthy of in-depth research, and this research will effectively improve the efficiency and safety of tunnel construction.

## 2. DEEP LEARNING MODEL EXTRACTION OF GEOTECHNICAL BOUNDARIES AND TYPES

There are many types of rocks, and it is difficult to identify them only by images. This paper proposes to take the typical rocks in the region as the main category, such as the tunnel project on which this paper is based is located in the area of County H. The surrounding rocks in the region are basically limestone (sedimentary rocks). Due to the differences in lime

content there will be different types of limestone: dolomitic limestone, ordinary limestone, clay limestone, etc. The two most important features for geotechnical identification are color and texture, and because of the strong variability of texture, color is the main breakthrough point to identify the surrounding rock types using deep learning boundary extraction technology.

## 2.1. DEEP LEARNING MODEL FOR EDGE DETECTION

In image processing, the convolution of an image with a convolution kernel is actually a filtering process:

$$f(x, y) * w(x, y) = \sum_s \sum_t w(s, t) f(x - s, y - t) \quad (1)$$

where  $f(x, y)$  is the gray value of point  $(x, y)$  on the image, and  $w(x, y)$  is the convolution kernel, also called the filter.

The convolution operation provides a weight template that slides over the image and aligns the center with each pixel in the image in turn. All pixels covered by this template are then weighted, and the result is used as the response of this convolution kernel at that point on the image. Convolution operations can be used to do edge detection, sharpening, blurring, etc. on an image.

Single convolution kernel detection often exhibits high noise and unclear boundaries, while the process of deep learning is the superposition of multiple convolution layers, and the convolution of multiple layers will gradually remove the noise and highlight the boundaries of different objects. We can obtain rock edges to count the joints and determine more parameters in the rock by deep learning model based on convolution.

## 2.2. PRIMARY COLORS AND HIS COLOR SPACE

Both RGB and HIS values are basic vectors describing color characteristics, and HIS color space has the advantage of low correlation of color covariates compared with RGB color space. Especially between the covariates I and H and S, there are more inert features to the external environment. Therefore, we only need to analyze H and S to cut down the influence of lighting and other external factors on the sampled images. The RGB values of the image are obtained, and the H, S and I values are obtained after conversion as

$$H = \begin{cases} \theta & G \geq B \\ \theta + \pi & G < B \end{cases} \quad \text{where } \theta = \frac{\pi}{2} - \tan^{-1} \left( \frac{2R - G - B}{\sqrt{3}(G - B)} \right)$$

$$S = \frac{2}{\sqrt{6}} \times \sqrt{(R - G)^2 + (R - B)(G - B)} \quad (2)$$

$$I = \frac{R + G + B}{\sqrt{3}}$$

After conversion, it was possible to classify four types of geotechnical soils. The specific classification and characteristics of limestone are: dolomitic concentration of 20% to 50% in dolomitic limestone(gray-white), ordinary limestone(light-gray), clay minerals concentration of 10% to 30% in low clay limestone(dark-gray), clay minerals concentration of 30% to 50% in high clay limestone(gray-black). Generally, limestone has a high-density crystal structure. Lime bulk density is about 2.7g/cm<sup>3</sup>, Moh's hardness is 3.0 to 5.0, and compressive strength is 10 to 100MPa. The amount of limestone mixed with dolomite or clay will affect rock properties. Therefore, we can further obtain the basic physical and mechanical properties through rock type.

### 3. DEEP LEARNING MODEL BASED ON TUNNEL ROCK CLASSIFICATION

The method used in this paper needs to go through several major steps of surrounding rock feature identification, geotechnical identification to derive the saturated uniaxial compressive strength  $R_c$ , rock integrity factor  $K_v$ , groundwater condition correction factor  $K_1$ , and structural surface yield influence correction factor  $K_2$ , respectively.

(1) Pre-process tunnel palm faces images and obtain the basic parameters of the surrounding rock classification, including depicting the main types of structural surfaces, whether water surges occur, whether joints and fissures exist, and whether the composition is single.

(2) Using color processing technique obtain the HIS value of the surrounding rock image, used to identify the kind. The hardness of the kind of rock is derived against the universal hardness coefficient table, and infer the saturated uniaxial compressive strength  $R_c$  of rocks by hardness.

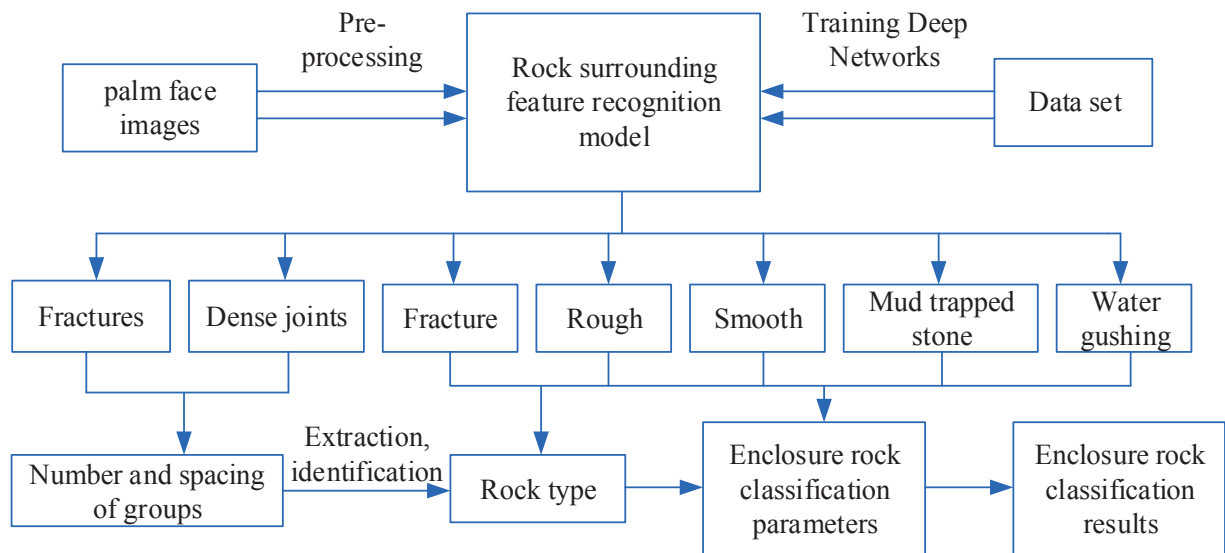

(3) Using deep learning technology to extract the boundary between the rock and soil and using fracture feature extraction technique and morphological parameter analysis method to calculate the number of groups and spacing of joints and obtain the degree of structural surface development. Therefore, the value of rock integrity factor  $K_v$  and structural surface yield influence correction factor  $K_2$  of the surrounding rock can obtained.

(4) step (1) has been judged in the state of whether the emergence of gushing water, because this paper selected the enclosing rock grading lot is located in the area of county H, the area is rich in groundwater, rarely dry environment. Therefore, the groundwater state can be divided into three states: moist, gushing water and obvious gushing water, the  $K_1$  value is determined by this. Due to the shallow depth of tunnel burial, temporarily disregard the impact of the initial stress, therefore the  $K_3$  value is zero.

(5) The median-taking method is designed to quantify the qualitative envelope classification parameters to deal with them. The disadvantage of the treatment is that there will be errors in the values, but there is not much change in the final envelope grade determination. The calculation of BQ value and [BQ] value is as

$$\begin{aligned} BQ &= 100 + 3R_c + 250K_v \\ [BQ] &= BQ - 100(K_1 + K_2 + K_3) \end{aligned} \quad (3)$$

The harder rock is taken 50 MPa as  $R_c$  value and 0.6 as  $R_v$  value, and the calculated BQ value is 400, while the median value method corresponds to a BQ value of 397.5, resulting in the uncorrected surrounding rock grading results are all Class III. Referring to the engineering rock grading standard, the final grading of the surrounding rock is finally obtained as shown in Figure 1.

**Figure 1.** Flow chart of deep learning of surrounding rock mass classification

According to the principle and steps of this surrounding rock grading, the author established an automatic surrounding rock grading system with python as the platform, loaded a total of 306 pictures of three tunnels in excavation in H County A, B and C for testing, and compared the recognition results with the BQ grading of the parameters obtained by traditional methods to verify its accuracy, Table 1 shows the grading results of some examples. It can be found that by loading the accuracy of the tunnel envelope grading system based on the deep learning model, it reaches 88.2%, 83.7% and 85.9%, respectively. Overall, the method can better meet the requirements of surrounding rock classification in this region.

**Table 1.** Results of tunnel envelope classification for tunnels in County H

Location	Grading Method	R <sub>c</sub>	K <sub>v</sub>	BQ value	K <sub>1</sub>	K <sub>2</sub>	[BQ] value	Corrected grading
A-825	Deep learning	46	0.653	401.25	0.2	0.5	331.25	Class IV
	Traditional	49	0.705	423.25	0.3	0.5	343.25	Class IV
B-173	Deep learning	51	0.252	316.00	0.5	0.3	236.00	Class V
	Traditional	23	0.457	283.25	0.4	0.4	203.25	Class V
C-515	Deep learning	60	0.651	442.75	0.3	0.1	402.75	Class III
	Traditional	58	0.575	417.75	0.2	0.1	387.75	Class III

#### 4. CONCLUSION

In this paper, we use the deep learning model for tunnel envelope feature recognition. By loading the accuracy of tunnel envelope rock grading system based on deep learning model, it reaches 88.2%, 83.7% and 85.9% respectively, which indicates that the deep learning model is suitable for tunnel identification of different morphological characteristics of envelope rock for grading. In the research process, we found that the tunnel envelope classification method based on the deep learning model has high recognition accuracy and classification precision, which can effectively improve the efficiency and safety of tunnel construction. At the same time, we also found that the method still has some problems and challenges, such as insufficient amount of data and insufficient model robustness. The study shows that the tunnel envelope classification method based on deep learning model is an effective research method with broad prospect and application value in practical application, and also needs further in-depth research and exploration.

## ABSTRACT

In the section of landscape culture communication methods and public art forms, this paper classifies the landscape culture communication methods and discusses the evolution and significance of public art forms. The AHP hierarchical analysis method is used to construct a method for determining the combination weights. Finally, the historical evolution and creative concepts of public art forms were analyzed. The results show that public art has gradually transformed from the initial monumental and decorative art to a carrier that carries social information and spreads the cultural values of the landscape. The results of this study are important for promoting the development of landscape culture communication and public art.

## KEYWORDS

Landscape culture; Public art; Hierarchical analysis; Portfolio weights; Historical evolution; Cultural value

## 1. INTRODUCTION

With the acceleration of urbanization, the design of urban environment and public space is becoming more and more important [1-2]. As an important part of urban culture, landscape culture communication and public art play a vital role in the inheritance and development of urban culture [3-4]. In order to better promote the development of landscape cultural communication and public art, it needs to be studied and explored in depth [5]. The application of hierarchical analysis is a popular decision analysis method, which can compare and evaluate different options and provide theoretical support for the development of landscape culture communication and public art [6-7]. In terms of landscape culture communication, research in recent years has focused on the connotation of landscape culture, the ways of landscape culture communication and landscape culture innovation [8]. As for the research on the evolution of public art forms, it mainly focuses on the historical evolution, creative concepts and media forms of public art [9]. In addition, some scholars have combined landscape culture dissemination and public art to promote the development of urban culture by comparing and discussing the two.

## 2. LANDSCAPE CULTURE DISSEMINATION METHODS AND PUBLIC ART FORMS

### 2.1. CLASSIFICATION OF LANDSCAPE CULTURE COMMUNICATION METHODS

Landscape culture communication methods can be classified according to the aspects of communication media, communication forms and communication purposes. Among them, according to the different communication media, landscape culture communication methods

can be divided into the following three categories:

(1) Written communication, written communication refers to the dissemination of landscape culture through written forms such as text and diagrams. For example, landscape designers can convey the concept and ideas of landscape design through design manuscripts, technical drawings and other written forms.

(2) Oral communication, oral communication refers to the dissemination of landscape culture through oral forms. For example, landscape designers can convey the ideas and concepts of landscape design through speeches, lectures and other forms.

(3) Visual communication, visual communication refers to the dissemination of landscape culture through visual forms. For example, landscape designers can show the results and ideas of landscape design through design exhibitions, videos and other forms.

According to the different forms of communication, landscape culture communication methods can be divided into the following three categories:

(1) Educational communication, educational communication refers to the dissemination of landscape culture through educational institutions and educational activities. For example, landscape designers can deliver the concept and ideas of landscape design by offering courses, lectures and other forms.

(2) Media communication, media communication refers to the dissemination of landscape culture through news media, network media and other channels. For example, landscape designers can deliver the concept and ideas of landscape design by publishing articles, displaying design works and other forms.

(3) Community communication, community communication refers to the dissemination of landscape culture through community organizations, community activities and other forms. For example, landscape designers can participate in community activities, organize community design competitions and other forms to convey the concept and ideas of landscape design.

## **2.2. PUBLIC ART FORMS**

Public art forms are artworks that are displayed in public places; they are not only artworks, but also a medium for interaction with the public. There are various types of works in public art forms, including sculptures, murals, and installations. Artists of public art forms need to consider the visibility, readability, and acceptability of their works in order to achieve the purpose of interacting between art and the public and conveying artistic messages.

### **2.2.1. EVOLUTION OF PUBLIC ART FORMS**

The evolution of public art forms has undergone a transformation from traditional to modern. Traditional public art forms are mainly sculptures, murals, etc., and their expression forms are relatively single, mostly for political propaganda and historical commemoration purposes. Modern public art forms, on the other hand, are more diversified, not only in terms of single art forms, but also in terms of the interaction between art and the public and the communication of art messages, such as installation art and digital art. At the same time, modern public art forms are also more concerned with social issues and environmental protection, conveying social messages and values through artworks.

### **2.2.2. THE SIGNIFICANCE OF PUBLIC ART FORMS**

Public art forms play an important role in the urban landscape, not only beautifying the city, but also providing a platform for the public to enjoy culture, art and communication. Public art forms can become landmarks and attractions in cities, attracting tourists and foreign

populations and promoting the economic development of cities. At the same time, public art forms can also convey social messages and values, guide the public to pay attention to and think about social issues, and promote social progress and development.

### 3. HIERARCHICAL ANALYSIS OF LANDSCAPE CULTURE COMMUNICATION

#### 3.1. AHP HIERARCHICAL ANALYSIS

Landscape culture communication refers to the transmission of cultural information in the landscape to the audience through various media means. In landscape cultural communication, different levels assume different roles and meanings. In this paper, we will analyze landscape cultural communication from three levels. Assuming that the landscape culture communication judgment matrix  $A = (a_{ij})_{n \times n}$ , non-zero vector  $\omega$  is the eigenvector of matrix A about eigenroot  $\lambda$ , the weight calculation steps of this judgment matrix are:

(1) Calculate the maximum eigenroot value of judgment matrix A:

$$\lambda_{\max} = \frac{1}{n} \sum_{i=1}^n \frac{(Aw)_i}{w_i} \quad (1)$$

(2) Calculate the consistency index CI as:

$$CI = \frac{\lambda_{\max} - n}{n - 1} \quad (2)$$

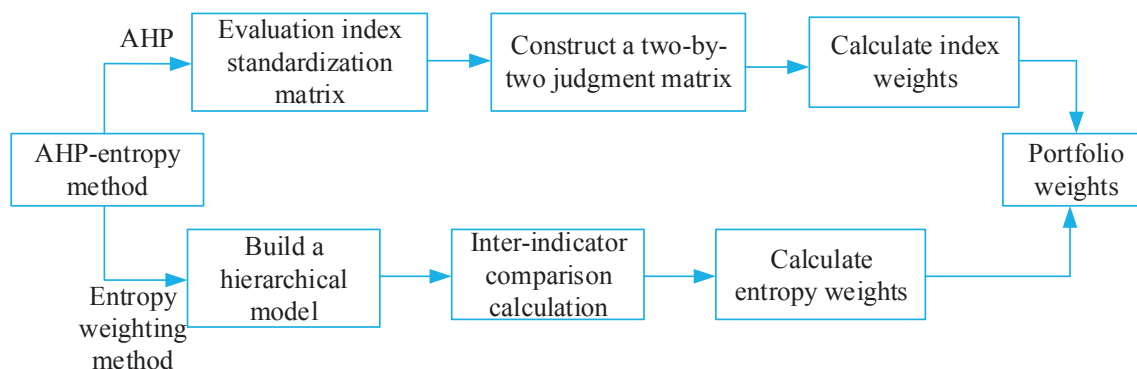

(3) Calculate the consistency ratio CR, as

$$CR = \frac{CI}{RI} \quad (3)$$

When  $CR < 0.1$ , the judgment matrix is considered to be consistent and acceptable. Otherwise, it is adjusted appropriately until the value of CR is less than 0.1. According to the judgment matrix A, the hierarchical single ranking is calculated first, and the results of the hierarchical single ranking are synthesized to obtain the ranking weight  $\omega_{ahp}$  of each layer element to the total target.

#### 3.2. DETERMINATION OF PORTFOLIO WEIGHTS

Hierarchical analysis is a direct comparison method that combines experts' experience with quantitative analysis, and is also a commonly used method for calculating index weights. AHP-entropy method is an objective assignment method based on the principle of information entropy to determine the weights based on sample data, and the combined assignment of AHP-entropy method can avoid the difference of experts' experience and the phenomenon that the objective assignment results do not match the actual one.

**Figure 1.** The technical route of AHP-entropy weighting method combination

The smaller the sum of squared deviations between the combined weights and the AHP weights and entropy weights respectively is used as the objective to establish the function, the more reasonable the calculation result is. Suppose  $\omega'_j$  is the weight of the  $j$ th index of the combination of hierarchical analysis and entropy weight method, and the objective function is established as

$$\text{Min } O = \sum_{j=1}^n \left[ (\omega'_j - \omega_{ahp})^2 + (\omega'_j - \omega_j)^2 \right] \quad (4)$$

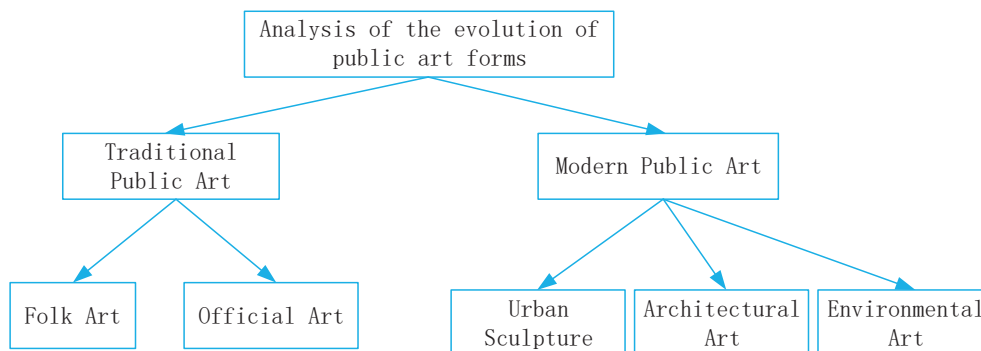

Finding the first order derivative and making it 0, and calculating  $\alpha = 0.5$ , yields

$$\omega = 0.5\omega_{ahp} + 0.5\omega_j \quad (5)$$

It is calculated that the coefficients of the optimal combination weights are 50% each of the weights of the hierarchical analysis method and the weights of the entropy method, respectively, under the convention that the deviation sum is minimal, and the resulting combination weight is  $\omega = [\omega_1, \omega_2, \omega_3, \dots, \omega_n]^T$ .

#### 4. ANALYSIS OF THE EVOLUTION OF PUBLIC ART FORMS

Public art refers to an art form that expresses public interests and social values through art forms. The evolution of public art forms is closely related to the development and changes of society. The evolution of public art forms is shown in Figure 2, and this paper will analyze the evolution of public art forms from 2 aspects: traditional and modern.

**Figure 2.** Evolution of traditional and modern public art forms

##### (1) Functional evolution of public art forms

Public art has gradually changed from the initial monumental and decorative art to a carrier that carries social information and conveys cultural values. In contemporary society, public art is not only for beautifying the urban environment, but also as a way to meet people's spiritual and cultural needs.

##### (2) Media evolution of public art forms

The medium of public art forms is also constantly changing. From urban sculpture and urban landscapes in the beginning to digital art, virtual art and other forms of media, public art is constantly expanding its forms of expression.

##### (3) Evolution of the creative concept of public art forms

The creation concept of public art is also constantly changing and innovating. From the initial commissioning by the government or institutions, to the current community participation

and private creation, the creation concept of public art is also increasingly focused on the participation and sharing of the people.

## 5. CONCLUSION

This paper explores the relationship between landscape culture transmission methods and the evolution of public art forms and their impact on urban culture by applying the hierarchical analysis method. The analysis leads to the following conclusions:

(1) The evolution of both landscape culture dissemination and public art forms are inseparable from the urbanization process. With the acceleration of urbanization, the importance of landscape culture communication and public art has been highlighted.

(2) The evolution of both landscape culture communication methods and public art forms are closely related to social development and change. Landscape culture communication methods are constantly being updated, and public art forms are constantly innovating and changing.

(3) The application of hierarchical analysis is an effective decision-making analysis method that can provide theoretical support and practical guidance for the development of landscape culture communication and public art.

## ABSTRACT

In this paper, the three-dimensional value management evaluation system of financial accounting is combined with the three-dimensional matrix evaluation model to build an enterprise accounting management system that adapts to the modern market demand. In the simulation evaluation model of three-dimensional value of financial accounting, the methods of index value calculation and data pre-processing, and determination of index weights are used. In the matrix evaluation model of three-dimensional value of financial accounting, the evaluation and management of three-dimensional value of financial accounting through matrix evaluation model is discussed. The results show that this paper combines the three-dimensional matrix model to complete the evaluation of three-dimensional value of financial accounting, which further improves the accounting management of enterprises and has important practical significance and promotion value.

## KEYWORDS

Financial accounting; Management evaluation system; Three-dimensional matrix model; Data pre-processing; Indicator weights

## 1. INTRODUCTION

With the change of business environment, the accounting management system also faces many challenges [1]. The traditional accounting management system can no longer meet the needs of enterprise development, so it is necessary to establish an accounting management system that meets the requirements of modern enterprise management [2-3]. To this end, this paper proposes a method for building an enterprise accounting management system that combines a three-dimensional matrix model [4]. A number of scholars have already conducted research on the construction of enterprise accounting management system. Among them, some scholars have proposed various different construction methods and models from the theoretical level [5]. Some scholars, on the other hand, have proposed an accounting information management model [6]. Some other scholars have proposed some accounting management system construction methods with practical significance by investigating and analyzing the actual situation of enterprises from the practical point of view [7-8]. These research results provide an important theoretical and practical basis for the study of this paper, and provide useful reference and inspiration for the construction of enterprise accounting management system.

## 2. FINANCIAL ACCOUNTING THREE-DIMENSIONAL VALUE MANAGEMENT EVALUATION SYSTEM

Enterprise is a community of values, interests and relationships. It needs to provide valuable

goods and services through continuous input of resources to achieve value conversion, value addition and value redistribution. The value creation of an enterprise is not isolated and static but a dynamic process of spiral change, which requires not only the support of capital, technology, human and material resources but also the collaboration of shareholders, customers, suppliers, government and other stakeholders.

## 2.1. FINANCIAL 3D VALUE SIMULATION EVALUATION MODEL

Financial 3D value evaluation uses computer simulation technology to collect data from the consolidated balance sheet, consolidated income statement and consolidated cash flow statement by industry according to the evaluation index system constructed in 3 dimensions. After entering the raw data into the computer, the index value calculation, index pre-processing and index weighting calculation are carried out, and the target value is derived from the evaluation model, and then the evaluation ranking and matrix analysis are performed.

Let there be  $n$  enterprise within the enterprise, i.e., domain  $U = \{u_1, u_2, \dots, u_n\}$ , the vector set of financial 3D value evaluation indicators is  $X = \{X_1, X_2, X_3\}$ , the indicator vector is  $X_i = \{x_{i1}, x_{i2}, \dots, x_{iS_i}\}$ , and the weight vector is  $W_i = \{w_{i1}, w_{i2}, \dots, w_{ij}\}$ . Then the financial accounting 3D value simulation evaluation model is

$$u_{ki} = \sum_{j=1}^{S_i} x_{ij} w'_{ij} \quad (1)$$

The integrated simulation evaluation model is:

$$u_k = \sum_{i=1}^3 \sum_{j=1}^{S_i} x_{ij} w_{ij} \quad (2)$$

Where,  $S_i$  is the number of indicators in 3 dimensions,  $i = 1, 2, 3$  denotes dimensions.  $k = 1, 2, \dots, n$  denotes the  $k$ th firm in the industry.  $u_{ki}$  denotes the evaluation value of the  $i$ th dimension of the  $k$ th firm in the industry.  $u_k$  denotes the composite evaluation value of the  $k$ th firm in the industry.

## 2.2. CALCULATION OF INDICATOR VALUES AND DATA PRE-PROCESSING

After obtaining the raw data from the consolidated balance sheet, consolidated income statement and consolidated cash flow statement of the enterprise. The calculation is performed by the computer according to formula (1) to obtain the calculated values of the indicators. Due to the influence of the scale and the large differences in the calculated values of the indicators, the calculated values of the indicators must be normalized and standardized. The calculated values of the indexes of the enterprises in the industry are transformed by the computer to the extreme difference, and the standardized index values are limited to the range of  $x_{ij} \in [0, 1]$ .

Let  $v_{ij}$  be the  $j$ th original indicator of the  $i$ th subsystem, the corresponding pre-processed indicator  $x_{ij}$ , and  $v_{j\max}$  be the industry maximum or sample maximum of the  $j$ th indicator.  $v_{j\min}$  be the industry minimum or sample minimum of the  $j$ th indicator. Then the preprocessing model of indicators is as follows:

For the positive indicator dimensionless processing model is as follows:

$$x_{ij} = (v_{ij} - v_{j\min}) / (v_{j\max} - v_{j\min}) \quad (3)$$

For the inverse indicator dimensionless treatment model is:

$$x_{ij} = (v_{j\max} - v_{ij}) / (v_{j\max} - v_{j\min}) \quad (4)$$

### 2.3. DETERMINATION OF INDICATOR WEIGHTS

In order to eliminate the influence of subjective factors on the evaluation of the three-dimensional value of the enterprise objective assignment method is used. The main methods of objective assignment are entropy weighting method, standard deviation method and CRITIC method. Since the CRITIC assignment method not only considers the influence of the size of indicator variation on the indicator weights, but also takes into account the conflicting nature among indicators. Therefore, the CRITIC method is used, and the CRITIC method is based on the comparative strength and conflict of indicators, and the comparative strength indicates the size of the difference between the values of each evaluation scheme of the same indicator in the form of standard deviation. The conflict between indicators is reflected by the correlation coefficient between indicators, if 2 indicators have a strong positive correlation between them, it means that the conflict between 2 indicators is low.

The amount of information contained in the  $j$ th evaluation indicator of the  $i$ -th dimension is:

$$C_{ij} = \sigma_{ij} \sum_{l=1, m=1}^{s_i} (1 - r_{ij(lm)}) \quad (5)$$

where the standard deviation is:

$$\sigma_{ij} = \sqrt{\frac{1}{n} \sum_{k=1}^n (x_{ij(k)} - \bar{x}_{ij})^2} \quad (6)$$

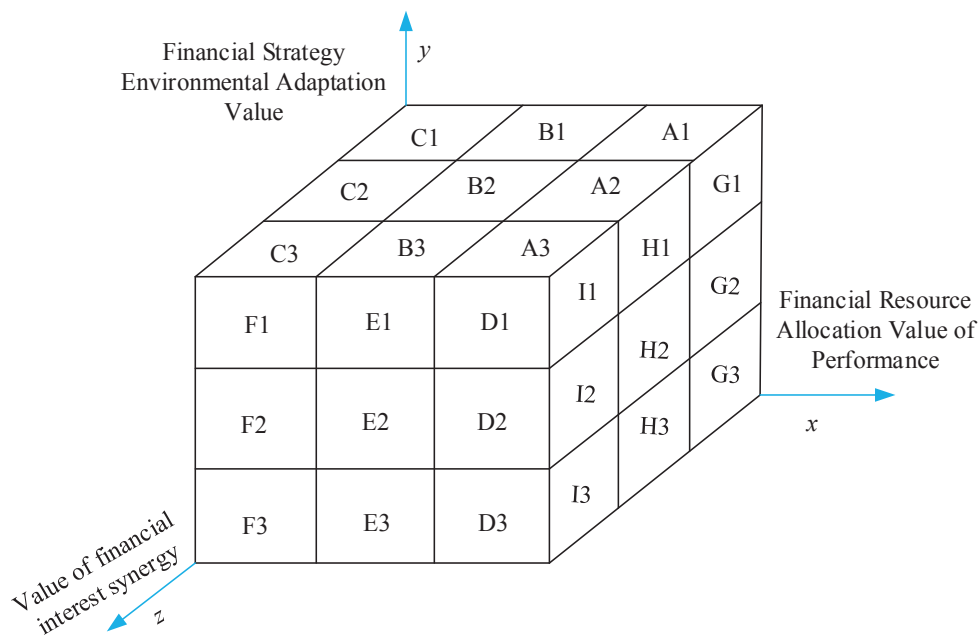

Then the objective indicator weights of the  $j$ th evaluation indicator of the  $i$ -th dimension are

$$W_{ij} = \frac{C_{ij}}{\sum_{i=1}^3 \sum_{j=1}^{s_i} C_{ij}} \quad (7)$$

where  $i, l = 1, 2, 3$  in Eq.  $j, m = 1, 2, 3, \dots, S_i$ .

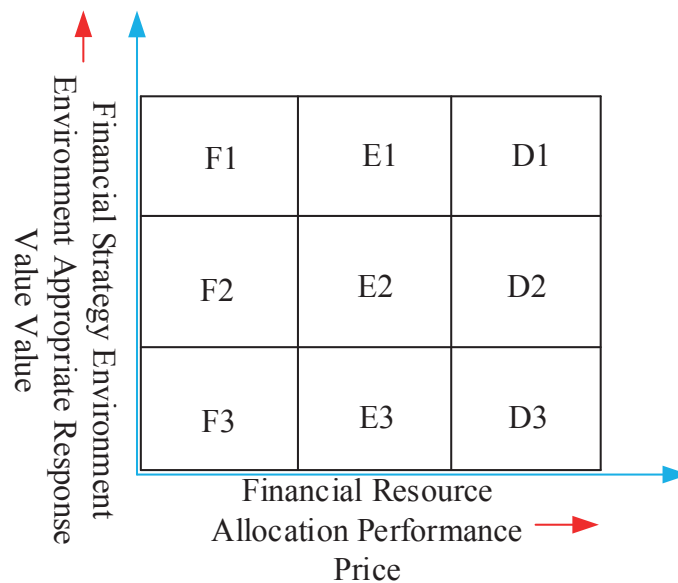

### 3. MATRIX EVALUATION MODEL OF THE THREE-DIMENSIONAL VALUE OF FINANCIAL ACCOUNTING

The three-dimensional value of financial accounting is the reflection of enterprise value in the spatial dimension, which has obvious inherent parallelism and spatial boundaries. In terms of structure, it constitutes a spatial distribution according to the dimensional hierarchy of "high, medium and low", and can be divided into high adaptive value, medium adaptive value and low adaptive value. High performance value, medium performance value, and low performance value. High relationship value, medium relationship value and low relationship value. Spatially, the financial three-dimensional value can be divided into 27 levels, and each square represents a different level of financial value as shown in Figure 1.

**Figure 1.** Spatial distribution structure of the three-dimensional financial value of the enterprise

In order to visually analyze and evaluate the three-dimensional value of financial accounting, the spatial distribution structure of enterprise value is decomposed into a two-dimensional matrix evaluation model according to the value of financial interest synergy relationship as shown in Figure 2. The model includes high synergistic relationship value evaluation matrix, medium synergistic relationship value evaluation matrix and low synergistic relationship value evaluation matrix, with financial resource allocation performance value and financial strategic environment adaptation value as the horizontal and vertical axes, respectively. And the matrix is divided into 27 squares with A1-G3 indicating different evaluation levels respectively according to the evaluation calculation data of each enterprise in the industry, which can visually reflect the evaluation results in the evaluation matrix.

**Figure 2.** Two-dimensional matrix evaluation model of financial 3D value

#### 4. CONCLUSION

In this paper, two aspects of the three-dimensional value management evaluation system

of financial accounting and matrix evaluation model are studied, and a new method of constructing an enterprise accounting management system is proposed. The following conclusions are drawn after the study:

(1) The three-dimensional value management evaluation system of financial accounting constructed in this paper has certain applicability and practicality, and can make a comprehensive assessment and analysis of the financial situation of the enterprise.

(2) The matrix evaluation model of three-dimensional value of financial accounting proposed in this paper can transform the financial accounting information into a three-dimensional matrix to visualize and evaluate the financial status of enterprises.

(3) The research results of this paper provide new ideas and methods for the construction of enterprise accounting management system, which can help enterprises to better adapt to market demand, improve accounting management level and achieve sustainable development.

## ABSTRACT

This paper firstly constructs the campus network security emergency management system in the era of big data, mainly focuses on campus network security strategy, campus network security protection design, campus network security detection design, campus network exit security design on the construction of the security emergency management system, and then tests the campus network security management system, and tests whether the system modules achieve the expected functions by writing detailed test cases. This paper further improves the emergency management system of general colleges and universities, enriches the relevant research on emergency management of colleges and universities from the theoretical point of view, and provides certain reference reference for the improvement of emergency management system of colleges and universities and the improvement of emergency management capability from the practical point of view.

## KEYWORDS

Campus network; Security emergency; Management system; Design; Testing

## 1. INTRODUCTION

In the era of big data, the role of information technology for maintaining the normal operation of society is highlighted, and with the development of human society, scholars from various countries have been studying emergency management more and more deeply, and various countries and regions are paying more and more attention to emergency management [1-3]. Establishing a set of scientific and reasonable, continuous and effective information security operation trace management mechanism and regular self-inspection to retain operation records while forming positive feedback on the development of good operation habits, and relying on the operation trace management mechanism to determine the current status of information system security, extract security requirements, find weak links, and make targeted rectification and improvement [4-5].

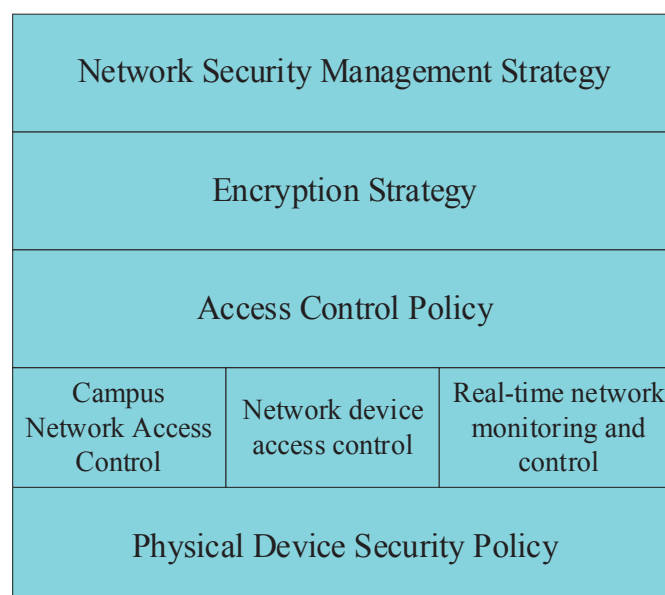

The literature [6] studied the establishment of an energy management system for an intelligent multi-energy microgrid in the Savona campus. The system aims to optimize energy production and consumption and to reduce energy waste and emissions. The article studies

the design, implementation and operation of the system and details its main functions and features. The system is based on intelligent control and data analysis technologies that allow real-time monitoring and management of the production and consumption of a wide range of energy sources, including solar, gas, and steam. The literature [7] investigates an IM/DD system for campus and data center network applications that can achieve transmission rates of more than 200 Gbit/s. The system is based on direct modulation/direct detection technology and uses high-speed electronic and optical components to achieve high-speed data transmission and processing. The article investigates in detail the design, implementation and performance testing of the system and compares it with other transmission systems. The literature [8] presents an instructional model for teaching the development of educational materials for computer networks and systems management. The model aims to help instructors and course designers to better design and develop educational materials to enhance student learning and interest. The article examines the design and implementation process of the model and details its main features and advantages. The model designs different teaching contents and materials based on three aspects: basic knowledge, applied skills and practical experience, including theoretical knowledge lectures, case studies and experimental operations. In addition, the model adopts multimedia and interactive teaching tools to improve teaching effectiveness and student participation. The article finally also investigates the practical application effects of the model and looks forward to its development and application prospects in the future.

## 2. THE CONSTRUCTION OF CAMPUS NETWORK SECURITY EMERGENCY MANAGEMENT SYSTEM IN THE ERA OF BIG DATA

### 2.1. CAMPUS NETWORK SECURITY POLICY DESIGN

The security policy of a school campus network is designed in detail in order to ensure the security and stability of the campus network. The security policy of the campus network is required to effectively prevent and defend against attacks from inside and outside the campus network and ensure the security of data information of the whole network. Based on the analysis of the current security situation in the previous Chapter 3 and the assessment results, the campus network security policy should be developed with different relevance. There are five different levels of network security policy, and the detailed design of network security policy is shown in Figure 1. The security strategy of physical devices is used to ensure that all the hardware and other basic devices in the internal network of a school in Neijiang will not be damaged by malicious attacks, which will have a relatively large impact on the existing network.

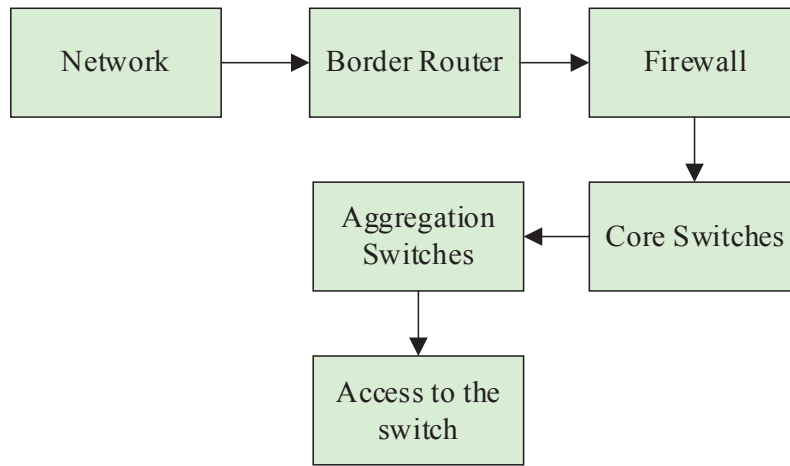

**Figure 1.** Detailed design of network security policy

### 2.2. CAMPUS NETWORK SECURITY PROTECTION DESIGN

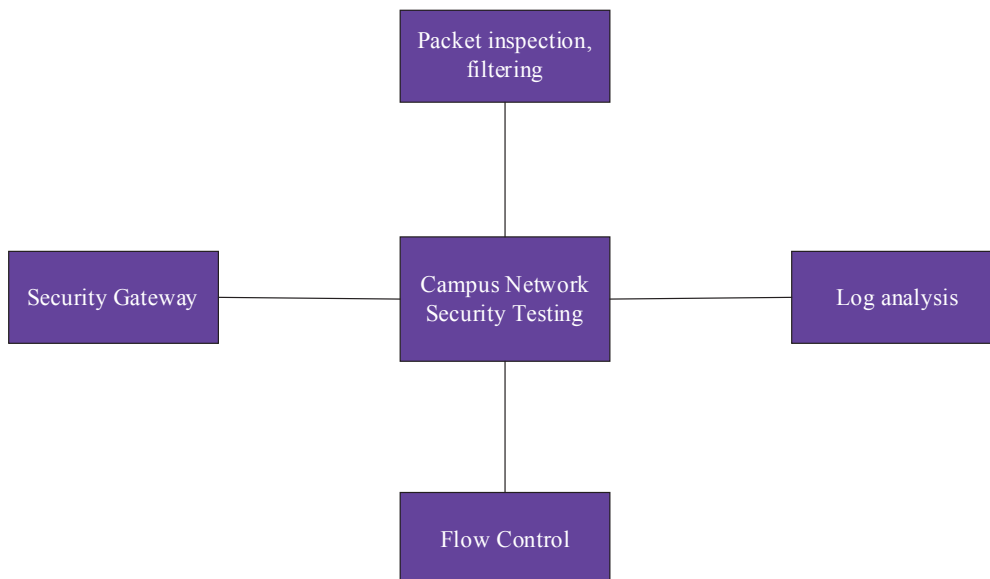

The network security protection design of a school campus network is based on the developed network security policy to open security protection for each key node of the campus network. The network security protection structure is shown in Figure 2.

**Figure 2.** Network security protection structure

### 2.3. CAMPUS NETWORK SECURITY DETECTION DESIGN

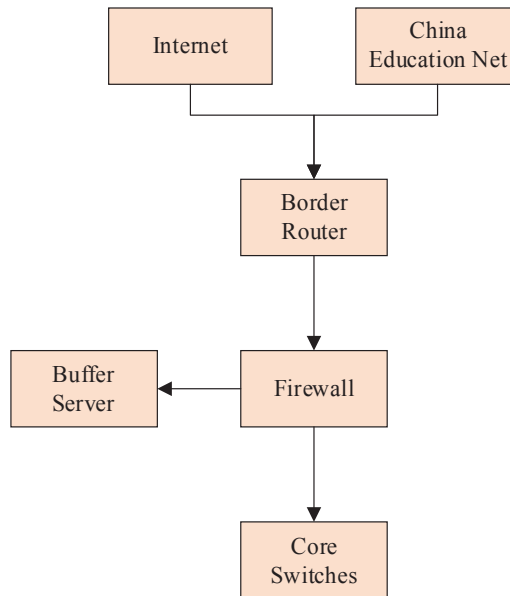

The school campus network security detection design is shown in Figure 3. The campus network security detection design includes four parts of content, which are security gateway, traffic control, log record analysis, packet detection and filtering.

**Figure 3.** School campus network security testing design

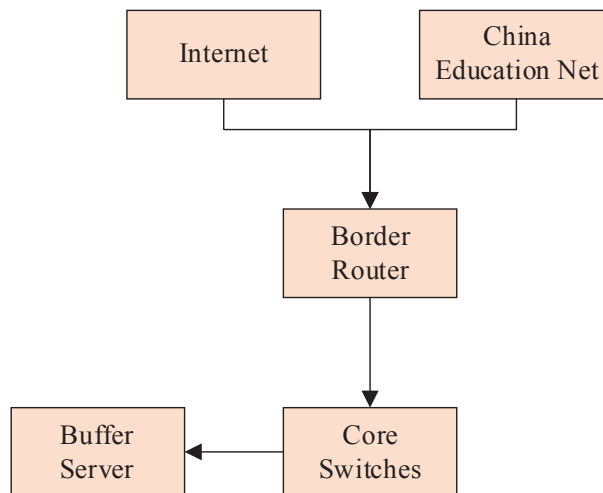

### 2.4. CAMPUS NETWORK EXIT SECURITY DESIGN

In order to have an effective and timely plan to respond in case of network security events, we designed the corresponding security response mechanism needed for the campus network to solve the current problems faced and to provide timely feedback of the processing results to the information management personnel to facilitate the understanding of the whole network operation. In the network egress security design, the egress security is ensured through the setting of devices, and the campus network egress structure is shown in Figure 4.

**Figure 4.** Campus Network Outlet Structure

The router used at the boundary of the school campus network is Digital China's DCRS-7608E, which has 4 Gigabit ports for connecting to the firewall, China Mobile and China Education Network respectively. The real content server is protected through a reverse proxy server, and the reverse proxy structure is shown in Figure 5:

**Figure 5.** Campus Network Outlet Structure

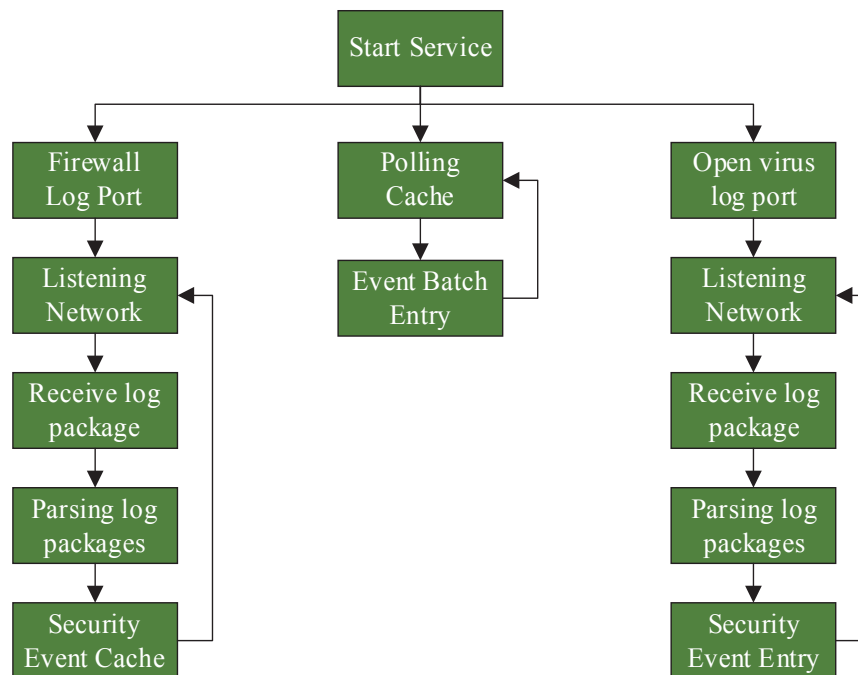

The VPN server is deployed at the boundary of the campus network to facilitate faculty and staff to access the campus network resources through the external network. At the same time, different applications are authorized, and users need to access and use the corresponding applications only when they are authorized and have open privileges. The deployment of VPN server is shown in Figure 6.

**Figure 6.** Deploy VPN server

Two levels of general agents and sub-agents are used to collect security events in this module, monitoring the overall and local operation of the network from different levels, which also makes it more comprehensive. The security event collection process is shown in Figure

7. In the campus network, the monitored computer is listed as the collection end. In order to prevent users from disconnecting from monitoring, the relevant program runs in the background, and the program is set not to be found in the task manager so that users cannot find it easily, preventing the risk caused by users deleting the program.

**Figure 7.** Security Event Collection Process

### 3. REVIEW OF CAMPUS NETWORK SECURITY EMERGENCY MANAGEMENT SYSTEM

#### 3.1. SYSTEM TEST ENVIRONMENT

The testing environment of the campus network security risk assessment system designed in this paper is:

The server is selected from DELL server with i5 processor, 12GB memory and 1TB hard disk.

The workstation is a HPZ series workstation with i7 processor, 12GB memory and 1TB hard disk.

#### 3.2. SYSTEM TESTING

According to the prior requirement analysis, test cases are written for the campus network security management system, and the steps of testing are planned in detail, and the test results of each step are recorded. In the testing process of this paper, the black-box testing method, which is the functional testing method in the test method theory, is mainly used.

The objectives of the campus network security management system testing can be summarized as follows:

(1) To discover problems and defects of the campus network security management system in time before it goes online, and to develop solutions to avoid finding similar problems after the system goes online.

(2) To test the performance of the campus network security management system designed in this paper, and to test whether the designed campus network security management system meets the predefined design performance requirements.

#### 4. CONCLUSION

In today's society, China attaches more and more importance to education, and the social influence of colleges and universities is also increasing, so when emergencies occur in colleges and universities, they often receive wide attention from all walks of life and cause greater impact. When dealing with emergencies, colleges and universities are different from other public places because of their specific properties, so it is necessary to analyze the emergency management of colleges and universities. Nowadays, many colleges and universities have their own emergency management process, but they have not formed a unified and efficient emergency management system. This paper further improves the emergency management system of ordinary colleges and universities based on relevant theories, and provides some reference for ordinary colleges and universities to improve their emergency management ability.

# EXPLORING THE IMPACT OF FINANCIAL DIGITAL MANAGEMENT MODEL ON BUSINESS PERFORMANCE

---

Yuchan Chen\*

Hainan Technology and Business College, Haikou, Hainan, 570203, China

[ltmjoam@163.com](mailto:ltmjoam@163.com)

---

## ABSTRACT

The digital economy has now become the most important economic form in the world, and the digital management model of finance is also the future development direction. Then, from the value perspective, the indicators of financial digital management model are determined from five dimensions of value discovery, value creation, value transfer, value realization and digitalization respectively, and the digitalization dimension of financial digital management model is measured from the quantitative perspective with the help of text analysis method, and the corresponding financial indicators are selected to measure the value creation dimension, value transfer dimension and value realization dimension, and then the factor analysis method is used to Then, all the indicators of the financial digital management model were downscaled by factor analysis. Finally, descriptive statistical analysis and regression analysis in the empirical analysis are used to investigate whether there is a linear relationship between the financial digital management model and the performance of retail enterprises.

## KEYWORDS

Financial digitalization; Management model; Business performance; Regression analysis; Indicators

## 1. INTRODUCTION

The current digital technologies such as artificial intelligence, blockchain, cloud computing, and big data drive the rise of digital economy, which profoundly affects the industrial structure and economic growth pattern and is a new blue ocean for economic quality and efficiency [1-3]. Digital industrialization and industrial digitization have accelerated expansion and become new economic growth points [4]. Under the current general trend of industrial digitization, there are still many enterprises in the process of digital transformation, and whether improving enterprise digitization and conducting business model innovation can effectively improve enterprise performance is one of their concerns, and in this context, it is of great practical significance to study the impact of digitization and business model innovation on enterprise performance [5-6].

The literature [7] investigates the relationship between digital banking, customer experience and financial performance of banks, focusing on the perceptions of UK customers. The authors examine the importance of digital banking and customer experience to the banking industry and explore the impact of digital banking and customer experience on financial performance in the banking industry by examining the perceptions of UK customers. The focus of the article is to analyze the impact of digital banking and customer experience on the financial performance of the banking industry by investigating the perceptions of UK customers about

digital banking and customer experience and to explore how the financial performance of banks can be improved by enhancing digital banking and customer experience. The authors of the literature [8] examine the importance of digital transformation and discuss how SMEs can address the challenges and opportunities in the process of digital transformation. The focus of the article is to analyze the impact and implications of digital transformation for SMEs, explore the process and strategies of digital transformation, and how to facilitate digital transformation of SMEs. The authors of the literature [9] examine the background and importance of the development of DeFi and discuss the applications and challenges of DeFi in the financial sector. The focus of the article is on analyzing the concepts and principles of DeFi, as well as the applications and advantages of DeFi in the financial sector. Also, the article explores the challenges and risks of DeFi, such as security issues and regulatory issues. The study aims to provide the financial community and regulators with a deeper understanding of DeFi and help them better understand and address the changes and challenges that DeFi brings.

## **2. STUDY SAMPLE AND INDEX SELECTION**

### **2.1. STUDY SAMPLE**

In this paper, the financial list of listed retail companies in the revised 2022 CSRC industry classification standard is selected as the basis and the financial list of companies listed in Shanghai and Shenzhen is screened according to the following principles:

(1) Companies should have complete annual financial data for the past three years (2019~2022).

(2) Considering the stability of the study and the reliability of the paper, companies with the \*ST symbol, i.e., with the risk of delisting, and companies with the ST symbol that are "specially treated" are removed.

(3) Excluding companies with missing important data.

From the data browser of Chioce Financial Terminal, there are 98 listed companies in the retail industry in Shanghai and Shenzhen exchanges, among which 88 listed companies in Shanghai and Shenzhen with complete financial data from 2019-2022. Screening according to the three principles described above, the remaining 72 listed retail companies among these 88 retail companies meet the requirements.

### **2.2. SELECTION OF INDICATORS**

The impact of the financial digital management model on corporate performance, which is the main study of this paper, is described in terms of the explanatory and explanatory variables as follows:

(1) Explanatory variables

In the study of this paper, the measures of retail firm performance are return on net assets (ROE) and Tobin's Q value. Among them, ROE reflects the efficiency of the company's use of its own capital, which can reflect the financial performance of the company in the short term.

(2) Explanatory variables

The explanatory variables in this paper mainly include the three dimensions of the financial digital management model and the degree of digitalization. Among them, the degree of digitization is measured by the data obtained from text analysis.

Among the above indicators, the indicators related to the degree of digitalization are calculated from the results of text analysis, and the rest of financial indicators are obtained

from Choice Financial Terminal and CSMAR database, and the summary of the above indicators is shown in Table 1.

**Table 1.** Summary of indicators

Dimensionality		Indicators	Symbols
Financial Digital Management Model	Value Creation Value Transfer Value Realization	Net sales margin	A1
		Cash Ratio	A2
		Cost Margin	A3
	Degree of Digitalization Long-term Performance	Current Asset Turnover Ratio	B1
		Total Assets Turnover Ratio	B2
	Short-term Performance Value Creation Value Transfer	Operating income growth rate	C1
		Operating profit growth rate	C2
		Operating Cost Growth Rate	C3
	Value Realization Degree of Digitalization Long-term Performance	Digitization of value creation	D1
		Digitization of value delivery	D2
		Enterprise Digital Foundation	D3
	Corporate Performance	Short-term Performance	Tobin's Q value
Value Creation		Return on Net Assets (ROE)	E2

### 3. EMPIRICAL ANALYSIS OF FINANCIAL DIGITAL MANAGEMENT MODEL ON CORPORATE PERFORMANCE

#### 3.1. DESCRIPTIVE STATISTICAL ANALYSIS

The next descriptive statistical analysis is performed on the indicators of financial digital management model and corporate performance of listed companies in the retail industry. Table 2 shows the descriptive statistical analysis of financial digital management model indicators and corporate performance after factor analysis. Since the factor analysis process of financial digital management model is standardized, the standard deviations in the descriptive statistics are all close to 1.0, which is not informative, and descriptive statistics are needed for the data before the standardization process.

**Table 2.** Descriptive statistical analysis after standardization

Variable Name	N	Min	Max	AVG	SD
Value Creation Factor	72	-1.171	7.555	.000000135	1
Value Realization Factor	72	-1.252	7.923	.000000822	1
Value Transfer Factor	72	-1.251	6.841	.000000683	1
Digitalization Factor	72	-1.056	4.952	.000000411	1
Net Asset Yield	72	-60.167	22.918	6.785	1
Tobin's Q	72	.726	6.085	1.7958	1

Table 3 shows the results of the unstandardized descriptive statistical analysis, from the table, we can see that the standard deviation of the three indicators of operating profit growth rate, operating cost growth rate and operating income growth rate is relatively large, which indicates that there is a great difference in the development ability of each retail enterprise, and these three indicators are all indicators of the value realization dimension of the financial digital management model, which also indicates that the value realization ability of these enterprises There is a big difference, and the value realization dimension of the financial digital management model of retail enterprises includes revenue sources and cost structure, and the

big difference in the value realization ability of each retail enterprise indicates that there is a difference in the revenue sources He cost structure chosen by the retail enterprises, which leads to a big standard deviation of the indicators of the value realization dimension among different retail enterprises. Among the three measures of the value creation dimension, the standard deviation of the cash ratio is relatively small at 0.93, which indicates that the solvency of retail enterprises is relatively close, and the standard deviation of the net sales margin and cost margin is large, which indicates that the profitability of retail enterprises varies greatly. The components of the value creation dimension include partnership, key business, and core resource capabilities. There is a gap in the value created by retail enterprises building partnership networks around value propositions and using the core resources and core capabilities owned by the enterprises to start this series of production and operation activities of the enterprises. The standard deviation of current asset turnover among the indicators of value transfer dimension is large, which indicates that there is a big gap in the fixed asset operation capability of retail enterprises. The standard deviation of both indicators of digitalization degree is small, around 0.01, because the process of data pre-processing is consistent, but this does not indicate that the digitalization degree of each enterprise is close, and further in-depth analysis is needed for the digitalization degree.

**Table 3.** Unstandardized descriptive statistical analysis

Variable Name	N	Min	Max	AVG	SD
Net sales margin	72	-22.534	133.344	5.597	16.411
Cost margin	72	-19.375	120.312	5.972	15.245
Cash Ratio	72	.077	6.887	.662	.931
Current Asset Turnover Ratio	72	.614	835.734	24.441	99.307
Total Assets Turnover Ratio	72	.053	2.562	1.086	.513
Operating cost growth rate	72	-66.586	366.237	8.352	46.413
Operating income growth rate	72	-66.232	390.943	8.502	49.167
Operating profit growth rate	72	-1281.572	3283.638	28.956	440.751
Digital Value Creation	72	.000992	.068	0.134	.011
Digital value transfer	72	.001638	.071	.0135	.0128
Return on Net Assets	72	-60.167	22.917	6.786	11.654
Tobin's Q	72	.72776	6.085	1.794	1.036

### 3.2. REGRESSION ANALYSIS

The purpose of regression analysis is to understand whether two or more variables are correlated and the direction and strength of this correlation, and to develop a mathematical model for looking at specific variables to predict the variables of interest to the researcher. Regression analysis can help one understand the amount of change in the dependent variable when a single variable changes. In this paper, we first establish the linear regression equation of financial digital management model indicators and performance indicators, and the regression parameter values and significance tests are shown in Table 4. VIF is the inverse of tolerance, which is mainly used to determine whether there is co-linearity, and the regression results in this paper have VIF=1, which indicates that there is no multiple co-linearity between variables. Both value realization factor and value creation factor passed the significance test. The t-test statistic of value realization factor was 2.056, and its probability p-value was 0.044, which was less than the significance level of 0.05, so the test was significant; the t-test statistic of value creation factor was 2.316, and its p-test value was 0.024, which was less than the significance level of 0.05, so the test was also significant. The coefficients of value creation

factor and value realization factor are 2.707 and 3.049 respectively, which are positive and further indicate that corporate performance is positively related to the value creation dimension and value realization dimension of the financial digital management model.

**Table 4.** Regression parameter values and significance tests

Models	Unstandardized factor		Standardization factor	t	Saliience	Covariance statistics	
	B	SD	Beta			tolerances	VIF
(Constant)	6.77	1.307		5.18	.000		
Value Creation Factor	2.71	1.316	.232	2.04	.043	1	1
Value Realization Factor	3.03	1.316	.262	2.32	.023	1	1
Value Transfer Factor	.975	1.316	.084	.73	.462	1	1
Digitalization factor	-.62	1.316	-.054	-.47	.633	1	1

a. Dependent variable: return on net assets ROE

#### 4. CONCLUSION

This paper defines the definition, components and basic structure of digital business model, establishes the evaluation index system of digital business model and retail enterprise performance, and investigates the impact of each dimension of digital business model on short-term performance and long-term performance, and the related findings can provide reference for retail enterprise finance to develop digital transformation measures in the rapidly developing digital environment.

## ABSTRACT

The progress and breakthrough of artificial intelligence technology is of great significance to the improvement of the intelligence of home appliances. Firstly, we start from the connotation of intelligent home appliances, sort out the intelligent needs of home appliance development, and combine the characteristics and applicability of various artificial intelligence technologies. Then the role of artificial intelligence technology in intelligent appliance automation control is analyzed, and the key technologies in modern artificial intelligence technology and their application in intelligent appliance automation control are focused on to improve the judgment and troubleshooting efficiency of enterprise system for intelligent appliance equipment, so as to better assist in realizing high-speed, safe, fast and smooth operation of enterprise appliance equipment and further enhance company benefits, aiming to provide reference for researchers in related industries.

## KEYWORDS

Artificial intelligence technology; Smart home appliances; Equipment failure; Electrical equipment; Applicability analysis

## 1. INTRODUCTION

The mature application of artificial intelligence technology in intelligent home appliance systems and intelligent production management equipment can enhance the industrial production and intelligent manufacturing management of electrical systems [1]. With the emergence of a large number of artificial intelligence technology research results, its technical achievements have been widely developed and applied in China's intelligent appliance technology and production automation and other related appliance industries, which play a positive role and have a significant impact on further promoting the development of China's modern intelligent appliance industry [2-3]. The use of artificial intelligence technology to design intelligent control systems for home appliances can not only reasonably improve the intelligent capability of home appliances and enhance their efficiency in the process of complex use, but also the relevant research results can provide more scientific and reasonable, practical and innovative technology development directions and financial guarantees for the development of science and technology development planning and national economic medium and long-term planning in the field of intelligent automation and home appliance industry intelligence in China [4-5].

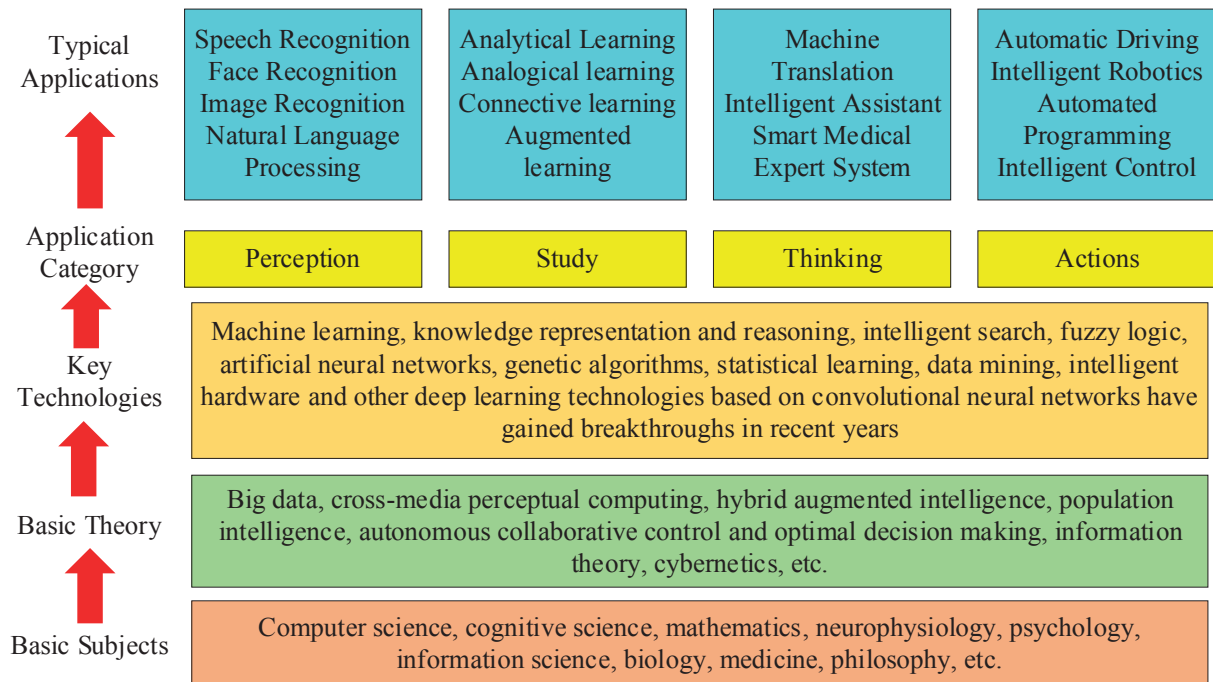

The literature [6] investigates the concept and development of smart homes and explores demand-side management techniques in smart homes and how they can be applied to improve

the efficiency of residential home appliances. The focus of the article is to analyze the demand-side management techniques in smart homes and how to achieve effective scheduling of appliances in smart homes to save energy and reduce energy costs. The study aims to provide guidance for research and practice in the field of smart homes, help people better understand the applications and advantages of demand-side management technologies, and improve the energy efficiency and user experience of smart homes. The literature [7] investigates the current development and importance of smart homes and explores the application of real-time pricing strategies based on multiple time periods in smart homes. The focus of the article is to analyze the power fluctuation problem caused by the continuity of smart home appliance operation and propose a real-time pricing strategy based on multiple time periods to achieve effective scheduling and energy saving for smart home appliances. The literature [8] investigates the design of an electrical energy scheduling system in smart homes, using multi-objective ant-lion optimization algorithms and evidence-based reasoning techniques to achieve electrical energy scheduling. The difficulties and challenges of electric power scheduling in smart home are analyzed, and a power scheduling system based on multi-objective antlion optimization algorithm and evidence inference technique is proposed to improve the energy utilization efficiency and user experience in smart home. The study aims to provide guidance for research and practice in the field of smart home, help people better understand the applications and advantages of multi-objective antlion optimization algorithm and evidence inference techniques, and promote the development and diffusion of smart home technologies.

## **2. ARTIFICIAL INTELLIGENCE TECHNOLOGY IN THE APPLICATION OF INTELLIGENT HOME APPLIANCES IDEAS**

### **2.1. ANALYSIS OF ARTIFICIAL INTELLIGENCE TECHNOLOGY AND ITS APPLICABILITY**

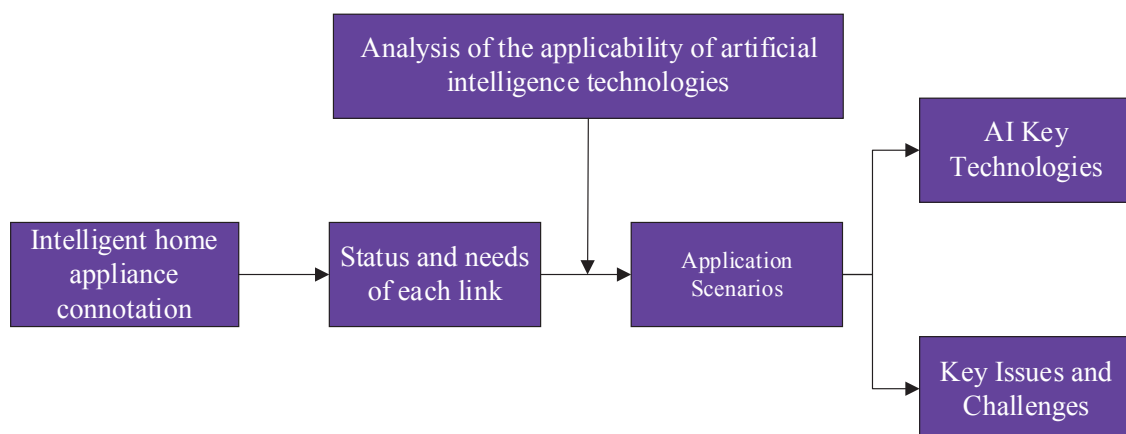

As a theoretical, methodological, technical and applied science to study the simulation, extension and expansion of human intelligence, AI has formed three mainstream research schools during its long-term development: (1) structural simulation approach (also known as connectionism), which is represented by “black box”-type technologies such as neural networks. (2) Functional simulation approach (also known as symbolism), which is represented by expert systems, intelligent search, machine games, etc. (3) Behavioral simulation methods, which are represented by intelligent robots, etc. Although the development of AI has encountered several downturns, the connectionist deep learning methods, represented by deep confidence networks and convolutional neural networks, have made breakthroughs in machine vision, speech recognition, natural language processing and other fields first since 2016, driving a new round of AI research worldwide. ai has become a multidisciplinary cross-technology field with its own complex intrinsic system and a wide range of application AI has become a multidisciplinary interdisciplinary technology field with its own complex inner system and wide range of applications. Figure 1 shows the overview of AI technology, which compares the main AI technologies from the perspective of basic disciplines, fundamental theories, key technologies, and classification applications.

**Figure 1.** Overview of Artificial Intelligence Technologies

## 2.2. INTELLIGENT HOME APPLIANCES BASED ON ARTIFICIAL INTELLIGENCE TECHNOLOGY

Early applications of AI technology in electric power mainly focus on fault diagnosis, load prediction and part of the intelligent control field has a fundamental role in the subsequent in-depth research. In the context of today’s extensive research and development of smart home appliances and even the global energy Internet construction on the agenda, the application of AI technology needs to start from the connotation of “strong and reliable, economic and efficient, clean and environmentally friendly, transparent and open and friendly interaction” of smart home appliances, sort out the current situation and needs of smart home appliances development, combine the characteristics and applicability of AI The overall application idea is shown in Figure 2. The general application idea is shown in Figure 2. It can be expected that not all smart home appliance applications need to add AI technology, but the application of AI technology may greatly improve the level of intelligence of home appliances. For this reason, an in-depth analysis of various suitable application scenarios, the characteristics and applicable environment of various AI technologies, and the possible problems and challenges faced is needed.

**Figure 2.** Intelligent home appliance ideas based on artificial intelligence technology

### **3. ANALYSIS OF THE SPECIFIC APPLICATION OF ARTIFICIAL INTELLIGENCE TECHNOLOGY IN INTELLIGENT HOME APPLIANCES**

#### **3.1. APPLICATION IN THE DESIGN OF SMART HOME APPLIANCES**

Electrical product design involves motor control technology, mechanical circuits, electronics technology and other electronic professional basic theoretical knowledge. In the traditional design of industrial electrical product development, in order to ensure design quality, it is necessary to increase the theoretical knowledge and experience reserves of relevant designers and improve their comprehensive technical capabilities.

Reasonable application of artificial intelligence technology can improve the comprehensive utilization of resources and reduce the probability of cost increase caused by human factors. The application of artificial intelligence technology, through scientific technical planning and design analysis and practical operation, can realize the design optimization of electrical products, avoiding the waste of large-scale research and development resources due to the lack of ability of designers or lack of practical experience, as well as the huge research costs and waste of investment.

#### **3.2. APPLICATION IN ELECTRICAL CONTROL**

Analysis of recent experience in the design and development of intelligent control systems for enterprise electrical automation reveals that the application of artificial intelligence technology to develop electrical automation control systems is an effective way to improve the efficiency of electrical equipment automation control systems can provide security for the overall safety and stability of the operation and use of various electrical appliances, and can also improve the overall production efficiency and quality of various electrical products and systems, thus promoting the intelligent development of electrical control.

#### **3.3. APPLICATION IN ELECTRICAL EQUIPMENT FAULT DIAGNOSIS**

Various minor faults may occur during the actual production, operation or maintenance of electrical equipment products. Generally, electrical equipment products will show some signs of failure a few days before the occurrence of minor faults. Therefore, in the process of management and maintenance, attention should be paid to regular monitoring of the whole system and the detailed conditions of each equipment to ensure that scientific and reasonable detection and control can be carried out when new fault phenomena occur suddenly in the process of maintenance and management, so as to improve the efficiency of the dynamic monitoring and control of the whole system and ensure that each electrical equipment can work reasonably and efficiently.

### **4. CONCLUSION**

In various electrical automation devices and their control, the application of artificial intelligence technology has always been an important reflection of today's scientific and technological development. The full promotion and application of AI technology in modern electrical equipment and its intelligent automation control system in China can help improve the intelligence and automation level of industrial electrical systems and enhance the energy efficiency level and the quality of automation operations. Therefore, it is necessary to comprehensively analyze and understand the various characteristics and various key application functions of artificial intelligence technology in electrical automation control. Through the application of electrical artificial intelligence technology and integrated platform system, it can truly achieve technological innovation, reduce the labor cost of manufacturing equipment, and promote the sustainable and coordinated stable development of the manufacturing informatization process in the domestic electrical industry.

## ABSTRACT

This paper firstly studies the planning and design of modern ecological gardens and landscapes, the connotation of which has been gradually expanded, both in terms of spatial and temporal span, rich variety of items and environmental protection, as well as in pursuit of their large neutral richness, and traditional gardening techniques have been difficult to meet the needs of modern ecological garden development. Secondly, the use of modern digital-aided design methods in ecological garden planning and design is studied, bringing new aesthetic features to the planning and design of ecological gardens. Then it summarizes the splitting and reconfiguration, conjoint analysis, and two topologic ecological garden design methods, and designs the corresponding procedural flow to build a basic framework for topologic ecological garden design methods. This paper solves the long-standing problem of ecological design lacking a systematic and comprehensive analysis method, and promotes the development of digital-aided design methods for ecological gardens.

## KEYWORDS

Ecological garden; Digital-aided design; Conjoint analysis; Splitting; Reconfiguration

## 1. INTRODUCTION

Urban ecological gardening construction helps to make up for the shortcomings of environmental improvement, helps to build ecological civilization, and helps to enhance people's well-being [1]. China's supply-side structure has not been completely improved, the situation of environmental pollution is severe, and ecological degradation is still serious. Nowadays, people's living standards have obviously improved, and they pay more and more attention to the requirements of living environment quality, and the construction of new urbanization is still continuing, so it is very necessary to transform traditional gardens and strengthen the construction of ecological gardens in towns [2-4]. The construction of ecological gardens in towns and cities does not only stay on the surface of the landscape, but also takes into account the concept of ecological economy and environmental protection, which is an important initiative to build a beautiful China [5].

Literature [6] introduced a landscape design system based on 3D virtual reality and image processing technology. The system can simulate real scenes by using virtual reality technology and analyze and process the scenes by combining image processing technology to make the

landscape design more detailed and intuitive. The researchers proposed the design and implementation method of the system, and verified the feasibility and effectiveness of the system for landscape design through experiments. The literature [7] investigated the effects of campus landscape attributes on bird species richness and diversity and explored the implications of these results for eco-friendly urban planning. It was found that the diversity of campus landscapes was closely related to the richness and diversity of bird species. The article further suggests some suggestions for eco-friendly urban planning to promote diversity of campus landscapes and conservation of bird species. The authors of the literature [8] emphasized the importance of the need to consider the balance of ecosystems and how to reduce carbon emissions in the urban development process. The article suggests some practical approaches to help urban planners and designers to design urban landscapes with low carbon in mind.

## **2. DIGITAL-AIDED DESIGN METHODS FOR URBAN ECOLOGICAL GARDENS**

### **2.1. TOWN ECOLOGICAL GARDEN**

Urban gardens have both natural and cultural attributes that counteract urban environmental degradation and are an important means of solving environmental problems. However, with the development of ecology, scholars have found that not all landscaping is conducive to ecological construction. Effective ecological construction requires systematic and detailed consideration from macro to micro levels, which means that garden construction has new requirements, namely the construction of “ecological gardens”, which require reflecting the beauty of nature and society and following the laws of ecology. Based on ecology, ecological gardens integrate landscape science, landscape ecology, plant ecology and theories about urban ecosystems to study the relationship between ecosystems within the range that landscape gardens and urban green spaces may affect. Its purpose is to resolve the contradiction between the growing human demand and the limited supply capacity of nature, and to restore the virtuous cycle of the ecosystem.

### **2.2. DIGITAL-AIDED DESIGN CONCEPTS AND METHODS FOR ECOLOGICAL GARDENS**

Early ecological design focused only on natural factors, but as ecological design developed, it was found that the absence of human factors also failed to solve ecological problems. So ecological planning and design is now developing toward an overall humanistic ecosystem, i.e. a planning concept that considers both nature and humanity together. In addition, ecological gardening currently has the problem of limitations, and the expertise in various fields is not well integrated. Furthermore, theoretical research is dominated by principle results and lacks systematic theories and methodological systems. The development of computer software and remote sensing detection and other technologies, powerful data analysis capabilities and information graphical techniques bring designers a clear and explicit design basis, and gradually form ecological garden design methods based on various technologies. However, ecological issues are a huge system full of contradictions and connections, and it is difficult for any single discipline or technology to achieve ecological balance, and the problem of disciplinary integration still exists.

## **3. TOPOLOGICALLY BASED APPROACH TO ECOLOGICAL GARDEN DESIGN IN DIGITAL ASSISTANCE**

### **3.1. THE CONSTRUCTION OF TOPOLOGY ECOLOGICAL GARDEN DESIGN METHOD SYSTEM**

With primitives as the most basic logical cells, topologists perform logical transformations

by expanding the principles of conjugation, dynamics, conduction and transformation, and guide thinking through patterns such as rhombic thinking, inverse thinking, conjugate thinking and conduction thinking. The study of ecology requires systematic thinking, symbiotic thinking, and evolutionary thinking. We use the systematic, correlative, flexible, and changeable characteristics of topology, as well as the ability to break through contradictory problems, to build our own methodological system.

### 3.2. DIVERGENCE AND RECONSTRUCTION METHODS

This method is roughly divided into three steps: splitting (i.e., divergence), and transforming and reconstructing. The first step of splitting, according to the composition principle of primitives to split things according to different characteristics and properties: the second step of transformation, through replacement, increase, deletion, expansion, reduction, decomposition, replication, inverse thing element, non-thing element, inverse thing element, inverse transformation, inverse implication, conduction and other transformation methods. The third step of reconstruction, through the combination of chain, superiority evaluation and other methods to complete. In addition to establishing thinking paths to assist designers in thinking, the topologically formal model can be used as a programming language to establish artificial intelligence to allow computer-aided designers to generate design strategies. The process design is shown in Figure 1. In this way, as soon as a design vocabulary is input, the computer immediately presents the relevant connotation and the corresponding system, and then identifies the contradictory links through contradiction determination, and then transforms until the contradiction disappears, and the solutions to make the contradiction disappear are usually various, and the optimal solution needs to be screened by superiority evaluation.

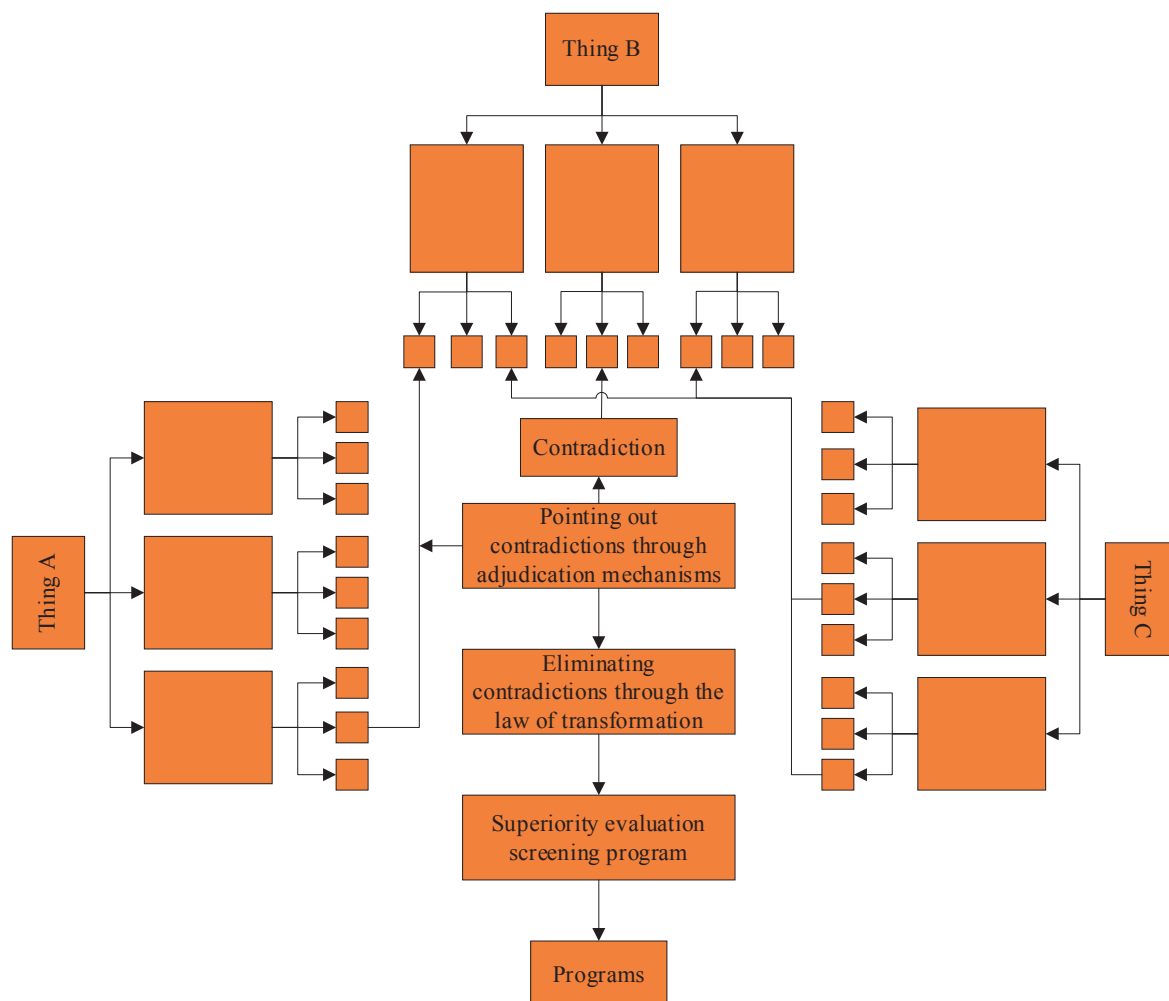

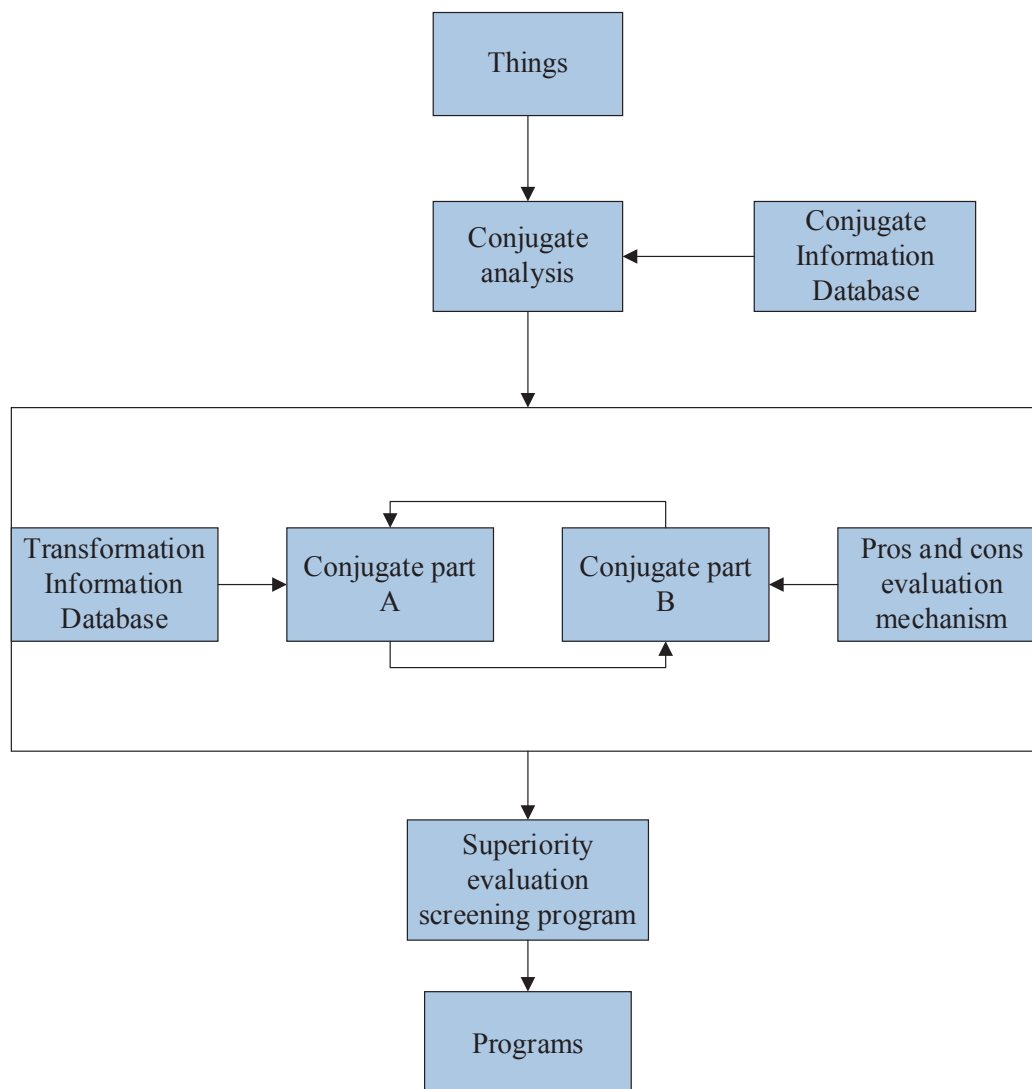

Figure 1. Sub-refactoring program flow

### 3.3. CONJUGATE ANALYSIS

Conjugate analysis is often used to describe the composition of things, which can reveal the nature of development and change, and under certain conditions, the corresponding conjugate parts can be transformed into each other, which can be used to explore the strategy to avoid harm. For example, a building consists of a real part “wall” and an imaginary part “space”, and the wall and space are interdependent. The design of the covariance analysis process is shown in Figure 2. Topology is a discipline that addresses contradictory problems by solving them in a variable and associative way. These features are very valuable to be utilized for ecological garden design.

**Figure 2.** Conjugate analysis process design

### 3.4. INTEGRATED USE

The dispersion and reconstruction method can systematically analyze the content of things and discover the potential for development and change. The most outstanding value of the total choke analysis method is to reflect the structure of things and to consider both sides of the problem. The fact of analysis method is a synthesis, which can include several levels of splitting and reorganization analysis and rich co-Choke pairs. A variety of analytical methods are combined with each other to finally conduct systematic and correlated analysis, solving the long-standing problem of ecological design lacking systematic and integrated analytical methods.

#### 4. CONCLUSION

In short, technological innovation plays an important role in modern ecological landscape planning and design, enabling us not only to reproduce natural beauty more freely, but even to create supernatural wonders on earth. Chinese gardens still have a strong vitality, in the construction of modern parks and scenic areas to get a new complement and development. We can believe that a new landscape design science rich in traditional Chinese cultural characteristics will be gradually enriched, perfected and matured in the development of modern socialist landscape construction.

#### FUNDING

This research was supported by Optimization and Evaluation of Rural Landscape Layout in Nanping City under the Background of Rural Revitalization (H21010).

## ABSTRACT

This paper firstly combines the electronic schoolbag with the flipped classroom teaching mode, which not only solves the problem that the flipped classroom teaching mode lacks the corresponding learning scaffold, thus also greatly exerts the application value of the electronic schoolbag in school education. Then the effectiveness and feasibility of the flipped classroom teaching mode in early education are verified through teaching experiments, which provides new ideas for the teaching reform of early education, improves the training quality of preschool education students, provides reference for the teaching reform of other similar courses, and promotes the application of the flipped classroom teaching mode in vocational education.

## KEYWORDS

E-book package; Flipped classroom; Teaching model; early education; Application research

## 1. INTRODUCTION

With the continuous integration of information technology, network technology and education, the traditional teaching model can no longer meet the learning needs of learners [1]. As a result, educational experts at home and abroad have devoted themselves to studying an efficient and innovative teaching model that can meet the learning needs of learners and the progress of social development [2]. Until the emergence of the flipped classroom teaching model, which innovates through the reverse order of the teaching process, people who are currently in the anxious state of curriculum and teaching reform have seen a new prospect and a “flipped classroom fever” has rapidly started in China [3-4]. The electronic schoolbag as a teaching aid undoubtedly adds wings to the flipped classroom teaching mode, and the proper combination of the two can provide learners with rich learning resources and help learners' independent inquiry, while teachers can also give learners timely answers and inspiration to achieve better learning results [5-6].

The literature [7] describes a web-based information technology application for English education in the flipped classroom. The researchers proposed the design and implementation method of the application and verified the feasibility and effectiveness of the method for English education through experiments. The method reverses the traditional classroom teaching model, i.e., students first learn relevant course content in a home environment, and then discuss and communicate in the classroom in order to improve students' learning and participation. The literature [8] investigated the practice of applying the flipped classroom to computer-assisted landscape design teaching. The researcher proposed a flipped classroom design method

based on the “Rain Classroom” platform and verified the effectiveness of the method in landscape design teaching through experiments. The method can stimulate students’ learning interest and motivation, and improve their learning effectiveness and participation. At the same time, the method can provide more learning resources and interactive opportunities for students, promote communication and cooperation between teachers and students, and thus improve teaching quality and students’ overall quality.

## **2. FLIPPED CLASSROOM BASED ON E-BOOK PACKAGE**

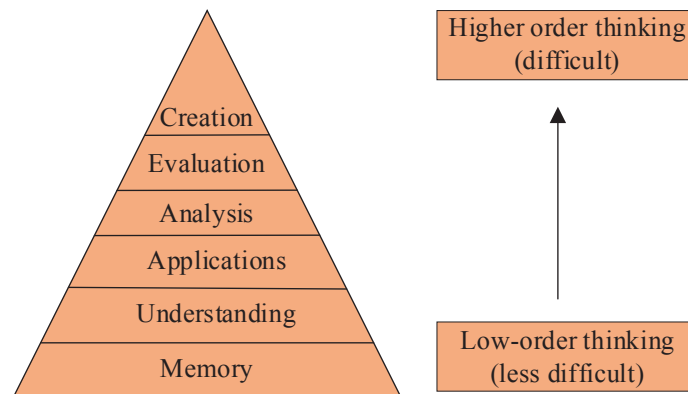

The e-book package plays the role of a learning scaffold in the flipped classroom teaching model. A learning scaffold is a temporary scaffolding framework provided to learners according to their learning needs, with the aim of helping students to traverse the nearest developmental zone and gain further development and independent learning ability. The learning scaffolds currently used in the flipped classroom teaching model implemented in schools are guided learning plans prepared by teachers before class. Such learning scaffolds are task-based learning scaffolds with clear purposes, which are relatively simple for learners to operate and understand. However, it often restricts learners’ thinking space and is not conducive to learners’ deep learning. Thus, the organic combination of e-bookbag and flipped classroom model has a strong practical significance.

### **2.1. E-BOOK PACKAGE**

Electronic schoolbag is a portable terminal that uses information technology equipment for teaching and learning. From its name, it is easy to understand that the electronic schoolbag is a network-based, mobile educational support product that can accommodate a large amount of resources. In China, the electronic schoolbag system is a learning environment that integrates education cloud services and personal terminal application platform to provide teaching support services for learners in the way of “cloud + end”. This “cloud + end” form of e-schoolbag learning system mainly includes two parts: the user side and the education cloud platform. The user side mainly provides some resources for learners, including teaching videos, error books, homework system, examination system and classroom interactive system and other functional modules. The education cloud platform mainly includes four parts: basic teaching functions, learning management system, teaching dashboard system and electronic file system. The electronic schoolbag terminal based on Education Cloud can better support the development of flipped classroom teaching mode, and learners can customize the learning mode, which is more conducive to the development of personalized learning.

### **2.2. UNDERLYING LOGIC OF FLIPPED CLASSROOM**

The first stage of the traditional teaching model is in the classroom and the second stage is in the classroom, as shown in Figure 1. In the flipped classroom model, the first stage is brought forward to before class, and knowledge is presented and delivered through various vehicles, so that students’ confusion in the second stage can be solved more efficiently during and after class, changing from “knowledge-based” to “behavior-based”.

**Figure 1.** A modified model of Bloom's cognitive domain goal model

### 2.3. DIFFERENCES BETWEEN FLIPPED CLASSROOM AND TRADITIONAL CLASSROOM

At a conference on flipped classrooms held at a university in 2021, participants identified the flipped classroom as a teaching model that promotes student-teacher interaction and transforms teachers into student facilitators. Unlike traditional teaching models, flipped classroom teaching resources can be kept for a long time, making it easy for students to preview, study or review. According to domestic scholars, Zhang Jinlei and others, flipped classroom can also be called “inverted classroom”, which is a new teaching model that changes the roles of teachers and students in traditional teaching by reversing the arrangement of knowledge transfer and knowledge internalization, and re-planning the use of classroom time. The flipped classroom integrates constructivist learning theory, mastery learning theory, learning style theory and cooperative learning theory, and has a relatively deep theoretical foundation and important practical value purpose. The differences between the flipped classroom and the traditional classroom are shown in Table 1.

**Table 1.** Differences between flipped classroom and traditional classroom

Type	Traditional Classroom	Flipped Classroom
Teacher Roles	Indoctrinators and Dominators	Leaders and facilitators
Student Role	Passive recipient	Active inquirer
Teaching Model	Lecture in class, homework in class	Learning before class, exploring during class, summarizing after class
Classroom Assignment	Teacher lecture-based	Teacher-student inquiry-based
Teaching Tools	Visual presentation	Self-directed learning Collaborative exploration, question and answer
Teaching Evaluation	Offline paper tests	Multi-dimensional assessment

### 3. THE APPLICATION OF THE FLIPPED CLASSROOM TEACHING MODEL BASED ON E-BOOKBAG IN EARLY EDUCATION

In order to understand the achievement of the learning objectives of the flipped classroom teaching mode of “before, during and after” in the teaching of early education, the experimental class and the control class of this experiment were selected among 22 classes (51 students), 22 classes (54 students) and 22 classes (49 students) by combining the results of the final examination and the pre-test questionnaire of the last semester. The experimental class and the control class were selected. The experimental study was conducted for 6 weeks with the experimental content of “Early Children’s Thinking” in the early psychology course, to test the effectiveness of the e-schoolbag-based flipped classroom teaching model in the early classroom from the perspectives of cognitive goals, ability goals and emotional goals.

### 3.1. ANALYSIS OF THE FRONT-SIDE QUESTIONNAIRE

After collecting the pretest questionnaires, a one-way ANOVA was conducted on them using SPSS tools: the mean scores of the students in the three classes, Class 22, School 1 and Class 22, School 3, were 78.13 and 77.46, respectively, which were much higher than the mean score of Class 22, School 2, which was 65.36, and the standard deviations of these two classes were much lower than those of Class 22, School 2, indicating that the students in Class 22, School 1 and Class 22, School 3 had basically the same level of awareness. Thus, the experimental class of this experiment was determined to be Class 22 School 1 and the control class was Class 22 School 3, and the return of the pre-test questionnaire is shown in Table 2.

Table 2. Pre-test questionnaire return

Classes	Quantity	Issuance	Recycling volume	Recovery rate (%)
Class 1 of 22	51	51	47	92.16
Class 2 of 22	54	54	54	100
Class 3 of 22	49	49	48	97.95

### 3.2. POST-TEST PAPER ANALYSIS

At the later stage of the experiment, the unit test of the experimental content was administered to the experimental class and the control class respectively, and both classes participated fully. The recovery rate of the test papers was 100%, and the recovery of the post-test questionnaire is shown in Table 3, from which it can be seen that the experimental class had an excellent rate of 54%, and no one failed. In contrast, the excellent rate of the control class reached 43%, and the number of failures reached 8%. Looking at the average scores of the two classes, the average score of the experimental class was 83, while the average score of the control class was only 74, the effect was obvious.

Table 3. Post-test questionnaire return

Classes	Score	Quantity	Percentage (%)	AVG
Class 1 of 22	90-100	9	17.65	83
	80-89	18	35.29	
	70-79	12	23.53	
	60-69	9	17.65	
	Less than 60	3	5.88	
Class 3 of 22	90-100	5	10.20	74
	80-89	16	32.65	
	70-79	13	26.53	
	60-69	11	22.45	
	Less than 60	3	8.16	

### 3.3. ANALYSIS OF STUDENTS' RECOGNITION OF FLIPPED CLASSROOM

The survey results of the experimental class showed that 41% of the students liked the flipped classroom teaching mode very much, 53% of the students liked the flipped classroom teaching mode, 6% of the students had indifferent attitude, and 3% did not like it, which indicated that most of the students liked the flipped classroom teaching mode. In contrast, the results of the control class showed that more than 59% of the students expressed less satisfaction with the traditional classroom.

### 3.4. ANALYSIS OF STUDENTS' INDEPENDENT LEARNING

Statistical analysis of the experimental class on completing homework before class and participating in group discussion and teacher-student communication in class showed that 37% of the students could easily complete the homework assigned by the teacher before class, 44% could basically complete the homework, and 14% felt that it was difficult to complete the homework. 50% of the students had been participating in classroom interaction and behaved actively. 31% of the students often participated in group cooperation and were more active, which showed that more than 81% of the students were able to complete the tasks given by the teacher and actively participate in classroom interactions. In contrast, less than 11% of the students in the control class interacted actively on a regular basis, and nearly 72% of the students were in a passive waiting mode. In today's rapidly changing online learning platform, the flipped classroom teaching model will be better applied in the field of early education, helping to strengthen the learning quality cultivation and professionalism of kindergarten teacher students.

### 4. CONCLUSION

The e-schoolbag-based flipped classroom teaching model is in the stage of practical verification, and further research is still needed for the emergence of problems and shortcomings. The effectiveness and feasibility of the e-schoolbag-based flipped classroom teaching model in early education are verified through practical data and students' feedback. It has both cultivated students' habits of independent learning and improved their learning performance. The flipped classroom based on e-schoolbag effectively frees teachers from the podium and makes students really become the main subject of the classroom, which provides new ideas for the teaching reform of early education majors and has certain reference significance for other courses, and promotes the application of the new concept of flipped classroom based on e-schoolbag in vocational education.

### FUNDING

This research was supported by the Project of the 14th Five Year Plan for Education Science in Hunan Province: Research on the Training Model of Early Education Teachers in Hunan Province under the Background of Early Childhood Education (Project Number: ND229202, Project Approval Number: XJK22CJ004).

## ABSTRACT

In this paper, the overall framework of wisdom tourism management and the construction of wisdom tourism management platform are proposed in the scenic area wisdom tourism management scheme design. The construction of wisdom tourism management platform includes the integration of network resources and hardware facilities, the establishment of Internet of Things and video monitoring system and the construction of big data platform to unify standards. An evolutionary game analysis of the regional wisdom tourism cooperative management model is also conducted. The results show that the long-term evolutionary equilibrium of the wisdom tourism management model, at this time the expected return of inland and coastal wisdom tourism cooperative management is 2.5. This paper analyzes the construction strategy of the wisdom tourism management model in the context of big data, which has certain reference significance for tourism enterprises.

## KEYWORDS

Intelligent tourism management; Internet of things; Video monitoring system; Big data platform; Evolutionary game

## 1. INTRODUCTION

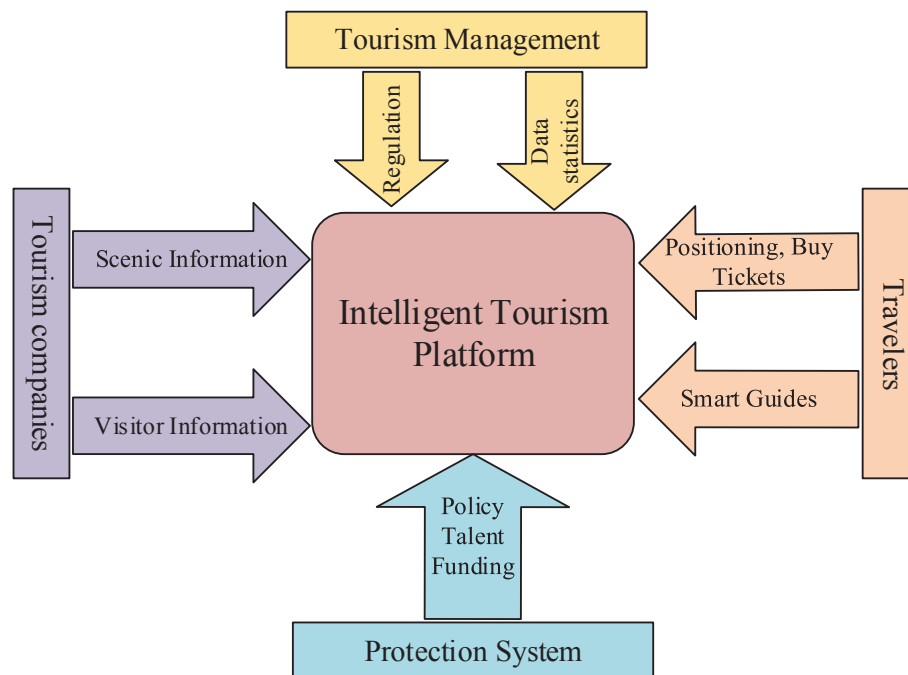

With the development of information technology, the application of big data has gradually become a hot topic in various industries [1-2]. Smart tourism, as an emerging industry in tourism, also needs to be intelligently managed with the help of big data technology [3]. The construction of smart tourism management mode not only helps to improve the operational efficiency and service quality of tourism enterprises, but also provides tourists with more convenient and personalized tourism experience [4-5]. Therefore, it is of great theoretical and practical significance to explore the construction of smart tourism management model in the context of big data [6]. Existing studies have concluded that big data technology plays an important role in promoting the construction of smart tourism management model [7]. Big data technology can collect, integrate and analyze various types of data in the tourism industry, thus providing tourism enterprises with more accurate market forecasts and customer demand analysis [8].

## 2. SCENIC INTELLIGENT TOURISM MANAGEMENT MODEL PROGRAM DESIGN

### 2.1. GENERAL FRAMEWORK OF INTELLIGENT TOURISM MANAGEMENT

The overall management framework of wisdom tourism is shown in Figure 1, in which the whole ecological system of wisdom tourism is built with the wisdom tourism platform as the

center, including the five parts of wisdom tourism platform, tourism management department, tourism enterprises, tourists and protection system. The parts form an organic whole with each other. The tourism management department, as the regulator of the tourism industry, supervises the smart tourism platform while relying on the information related to tourism enterprises collected by the platform. Tourism enterprises, as market players, obtain all kinds of effective information through the smart tourism platform, so as to provide tourists with personalized tourism services and commodity recommendations. Travelers as consumers, through the smart tourism platform, so as to easily access the information and services provided by tourism enterprises. The protection system is to ensure the establishment and subsequent safe and stable operation of the intelligent tourism system in terms of policies, funds, talents and mechanisms.

**Figure 1.** General framework of intelligent tourism

## 2.2. INTELLIGENT TOURISM MANAGEMENT PLATFORM CONSTRUCTION

### 2.2.1. INTEGRATION OF NETWORK RESOURCES AND HARDWARE FACILITIES

Intelligent tourism platform construction needs to open up the network between the scenic spots and systems to achieve data interoperability and provide a channel for the data center to collect data. On the other hand, tourism enterprises, which have always been asset-light operation mode, re-invest a lot of money to build basic networks and hardware facilities is not very realistic for tourism companies. Therefore, it is necessary to transform and integrate the existing resources to make full use of them, avoid duplication of investment and save capital expenditure.

#### (1) Integration of existing network resources

For the Internet of each scenic spot, the available ones are maintained and reused, and new business nodes should be added to the unconnected ends. At the same time, according to the peak number of tourists and peak business volume of scenic spots, the network bandwidth should be expanded to ensure timely and smooth data transmission.

#### (2) Rational use of server room resources

Each scenic area in the process of information technology is bound to establish their own server room, the construction of intelligent tourism platform more need for standardized server

room support.

### (3) Hardware equipment reuse

Intelligent tourism big data platform and the construction of each application system is bound to take up a lot of computing and storage resources. Although the old server resources computing capacity, storage space can not be compared with the new server, but the use of idle resources bearing relatively small subsystems or feasible.

## **2.2.2. ESTABLISHMENT OF INTERNET OF THINGS AND VIDEO SURVEILLANCE SYSTEM**

The popularity of mobile Internet, Wi-Fi networks and smart mobile terminals has made it possible to collect tourist search information, location information and consumption information, which can be docked with third parties through the smart tourism platform to achieve user information sharing. However, these data alone are not enough to support the application, and need to enrich their own data collection channels to provide more information to the data center. IOT and video surveillance system can just help the company to complete the collection of more information of scenic spots.

### (1) Internet of things system construction

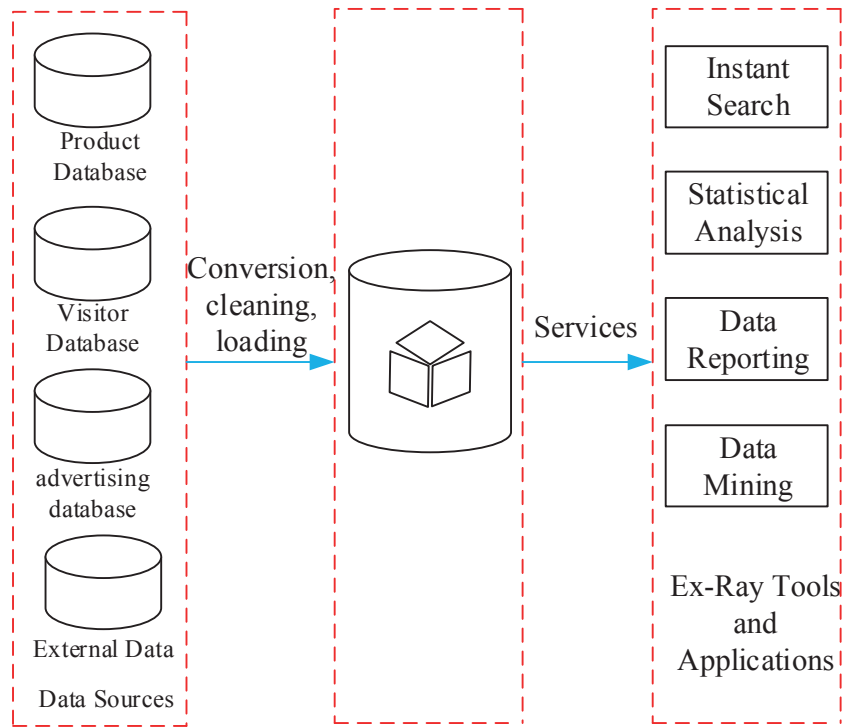

Internet of things is the nerve endings of the wisdom tourism system, is the perception organ of wisdom tourism, it is through the application of two-dimensional code, radio frequency identification (RFID), wireless sensors and other technologies to connect all kinds of items and the Internet, real-time collection of tourism activities in the basic information of each tourism activity object, and upload to the wisdom tourism platform.

### (2) Video monitoring system

Video information is the most intuitive data information. The video monitoring system is built in the tourist distribution center of the scenic spot, major traffic routes, entrances and exits of the scenic spot, key protection areas, accident-prone areas, parking lots, etc.

## **2.2.3. BUILDING A UNIFIED STANDARD FOR BIG DATA PLATFORM**

The data center layer with the big data platform as the core is the most important part of the smart tourism platform. The big data platform uses various technologies such as cloud computing and fuzzy identification to classify and store massive data and information through data collection layer and data information provided by third parties. By establishing a data warehouse, integrating all kinds of information resources, serving all kinds of intelligent applications and providing the basis for intelligent decision-making of enterprises, the framework of the big data management platform of intelligent tourism is shown in Figure 2. By integrating information data to build data sources, the existing data scattered in various scenic spots, systems and industries are integrated according to the object-centered principle to form business databases such as products, tourists and advertisements. The original scattered data of each database is extracted and cleaned up on the basis of system processing, aggregation and collation, unification and synthesis after entering the data warehouse. The virtual data view can extract subsets of information from different dimensions such as time and space, so as to build a richer application.

**Figure 2.** Wisdom tourism big data platform framework

### 3. GAME ANALYSIS OF THE EVOLUTION OF REGIONAL INTELLIGENT TOURISM COOPERATION MANAGEMENT MODEL

The main criteria for the division of regional wisdom tourism cooperation management mode are the way of cooperation of regional subjects and the degree of cooperation. From the cooperation mode of the cooperation subject, the regional cooperation can be divided into point an axis development mode, single core radiation mode, core edge mode, core edge mode and network mode. However, in terms of the degree of cooperation, these modes are shown as deep cooperation.

Through the analysis, we get the stable state and evolution law of regional smart tourism cooperative management system, which provides a theoretical basis for guiding regional smart tourism cooperative management. In this paper, we use MATLAB simulation to simulate the evolution process of regional wisdom tourism cooperative management system and verify the conclusion of regional wisdom cooperative management evolution game model. The set of ordinary differential equations describing the state of regional intelligent tourism cooperative management system is

$$F_{(X)} = \frac{dX}{dt} = X \left[ X(\Delta U_L Y + U_L + G - C_L - W_L) - (1 - X)(H_L Y + U_L) \right] \quad (1)$$

$$G_{(Y)} = \frac{dY}{dt} = Y \left[ Y(\Delta U_S X + U_S + G - C_S - W_S) - (1 - Y)(H_S X + U_S) \right] \quad (2)$$

Regional wisdom tourism cooperation subject is divided into inland and coastal regions, there are 2 regional wisdom tourism cooperation strategies to choose from, the initial strategy ratio is 0.5 respectively. Various cases, according to the needs of the actual situation, the benefit matrix uses different values.

According to the results of the theoretical analysis given for the above different cases, the number of various regional smart tourism cooperation strategies accounted for under different gains is simulated. Since coastal regions get excess returns through cooperation than inland

regions, it may be assumed here that  $U_L < U_S$  for simple cooperation its returns  $U_L = 3$ ,  $U_S = 5$ .

If  $\Delta U_L - H_L < W_L + C_L - G$ ,  $\Delta U_S - H_S > W_S + C_S - G$ .

Then the gain parameters are:

$$\begin{cases} \Delta U_L = 10, & H_L = 2, & W_L = 7, & C_L = 5, & G = 2 \\ \Delta U_S = 8, & H_S = 4, & W_S = 1, & C_S = 5, & G = 2 \end{cases} \quad (3)$$

When  $\Delta U_L - H_L < W_L + C_L - G$ ,  $\Delta U_S - H_S > W_S + C_S - G$ , (0,0) is the evolutionary stable equilibrium strategy, which means that both inland regional tourism and coastal regional tourism in the cluster adopt the simple cooperative strategy to get the stable solution. After long-term game learning, both inland region and coastal region take simple cooperation strategy and get long-term evolutionary equilibrium, at this time, the expected return of inland and coastal wisdom tourism cooperation management is 2.5.

#### 4. CONCLUSION

Big data background through the intelligent tourism management mode can improve the efficiency and competitiveness of the tourism industry, and to provide tourists with a more efficient, convenient and personalized travel experience. Scenic wisdom tourism management model program design, wisdom tourism management platform construction its important components, the construction of wisdom tourism management platform needs to integrate network resources and hardware facilities, the establishment of the Internet of things and video monitoring system and the construction of big data platform unified standards. In addition, this paper also analyzes the evolutionary game of regional wisdom tourism cooperation management mode, which can provide reference and reference for the cooperation between different scenic spots and improve the overall competitive strength of regional tourism.

## ABSTRACT

This paper proposes a specific approach to the development of young children's self-regulation ability by innovating in the target curriculum for the development of self-regulation ability in young children, based on the theory of learning self-regulation. The weights of indicators for the evaluation of young children's self-regulation ability are determined through hierarchical analysis, and the EYFS curriculum is designed to promote the development of young children's self-regulation ability. Finally, after determining the weights of the indicators, the requirements of the rating levels used for actual measurement were also calculated and determined in order to obtain the final evaluation criteria for the self-regulation ability of young children in learning. Through this study, the path of connecting kindergarten and primary school curriculum is innovated, and new ideas and methods are provided for the development of children's self-regulation ability.

## KEYWORDS

Self-regulatory skills; Learning self-regulation theory; Hierarchical analysis; EYFS program ; Rating levels

## 1. INTRODUCTION

In the Internet era, young children are faced with an unprecedented multimedia information and network environment [1]. Although the Internet has brought many conveniences and opportunities for young children, it has also brought a series of challenges, one of which is the issue of developing self-regulatory skills in young children [2-3]. Self-regulation is a key element of young children's development and is important for their learning, life, and future growth [4]. However, the infinite lure of the Internet and young children's own cognitive characteristics make them more susceptible to interruptions and distractions and lack the ability to self-control and plan [5]. Therefore, it is imperative to explore a feasible EYFS curriculum innovation to develop young children's self-regulation skills [6]. There have been many studies on young children's self-regulatory skills in early education research, mainly focusing on self-control and planning behaviors in traditional educational settings [7-8]. Therefore, it is very necessary to study children's self-regulation ability under the background of Internet.

## 2. CURRICULUM INNOVATION FOR EARLY CHILDHOOD CAPACITY BUILDING GOALS

Training objectives, that is, the expected training standards and requirements for the educated at all levels and in all types of schools. In terms of stages, preschool childhood and primary school belong to the most basic education, and its training objectives reflect the essence of basic education and the functions it should perform.

Although there are some differences in the performance of early children's self-discipline ability in kindergarten and primary school, it is essentially the reflection of children's inner psychological ability in different environments. Educational policies in different countries have different impacts on children's learning environment and learning tasks, but children, as subjects of learning, have the ability to identify and self-regulate the environment. Educators should help children identify their environment and strengthen self-regulation and control in different environments. Especially in the Internet environment, children's cognition and decision-making on the Internet will largely determine the development of their self-control ability on the Internet.

### 2.1. LEARNING SELF-REGULATION THEORY

Learning is divided into four stages: planning, behavioral, volitional control, and self-reflection, in which self-regulated learners have to continuously monitor and regulate their cognition and emotions, as well as create or use material or resources in the environment that are conducive to learning and regulate their learning behavior with the help of learning strategies.

The process is divided into four stages such as planning-self-monitoring-control-response, and the four major domains of cognition, motivation, behavior, and environment are included in each of the four stages. The theoretical model of learning self-regulation is shown in Figure 1, in which the self-regulated learner is in a cycle of interaction between the individual, behavior, and environment, containing four stages. To accurately assess learners' level of self-regulation, one can look at the elements that influence the learning process, and in conjunction with the reality of this study using kindergarten students as research subjects and the aforementioned basis, the cognitive, motivational, behavioral, and environmental dimensions can be included in the initial proposed index system.

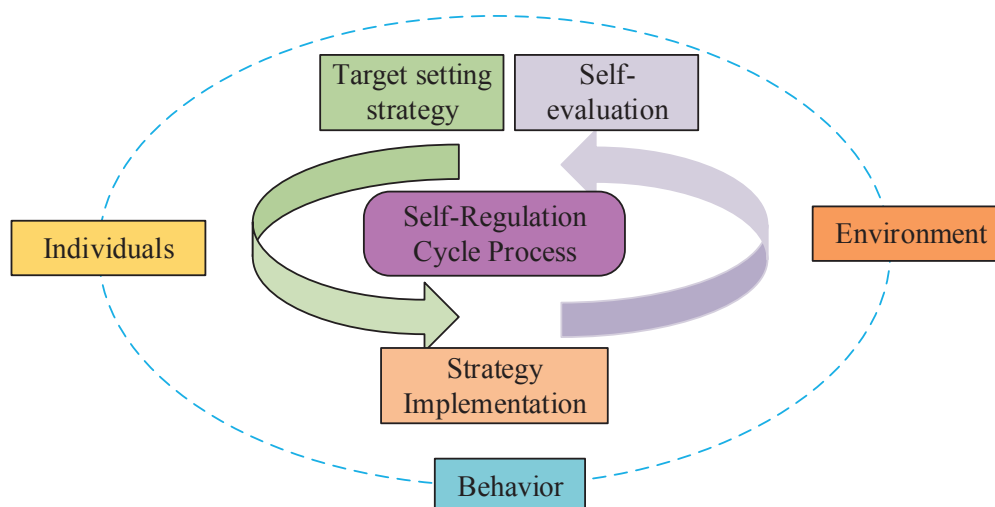

Figure 1. Theoretical model of learning self-regulation

### 2.2. DEVELOPMENT OF SELF-DISCIPLINE IN YOUNG CHILDREN

The development of self-discipline is an important skill for young children entering

elementary school. Self-regulation comes first from children's perceptions of their environment. From an ecological point of view, in today's Internet context, self-regulation is influenced by the child's own and environmental factors. From the child's point of view, the main factor is the child's perception of the environment and self-control. From kindergarten to elementary school, the environment changes and so does the way of learning. The transition from playful learning to text-based learning requires strong self-discipline in learning.

The characteristics of young children's self-discipline are mainly manifested in the following areas:

(1) Self-awareness

Children are aware of their behaviors and emotions and are able to self-evaluate and self-regulate them.

(2) Self-control

Children are able to control their own behavior and emotions, follow rules and conventions, and are not easily disturbed by the outside world.

(3) Self-management

Children are able to manage their time and behavior, make plans and goals, and act according to them.

(4) Self-regulation

Children are able to adjust their behavior and emotions to new situations and requirements in response to changes in their environment and situations.

### 3. ASSESSMENT OF YOUNG CHILDREN'S SELF-REGULATORY SKILLS AND DESIGN OF EARLY CHILDHOOD AND PRIMARY SCHOOL CURRICULUM

#### 3.1. DETERMINATION OF INDICATOR WEIGHTS

This paper uses hierarchical analysis applied to the problem of determining weights in the field of education evaluation to calculate the weights of first-level indicators, which first compares each first-level indicator between two, and then constructs a judgment matrix accordingly, and finally calculates the weights of the indicators using relevant formulas. The specific process is as follows:

(1) The first-level indicators resource management, self-regulation strategy and motivation to learn self-regulation are compared two by two, and the judgment matrix is built accordingly as shown in Table 1.

**Table 1.** Judgment matrix of self-regulation evaluation indicators for young children

	Resource Management C1	Learning Strategies C2	Learning Motivation C3
Resource Management C1	1	3	1/3
Learning Strategies C2	5	1	1/5
Learning Motivation C3	3	1/3	1

(2) Each column element in the judgment matrix is normalized, and the general term of each element is

$$a'_{ij} = \frac{a_{ij}}{\sum_{i=1}^n a_{ij}}, (i, j = 1, 2, \dots, n) \tag{1}$$

where  $a_{ij}$  is the original data.

(3) Normalize the vector  $\bar{W} = (\bar{w}_1, \bar{w}_2, \dots, \bar{w}_n)^T$ :

$$W_i = \frac{\bar{w}_i}{\sum_{j=1}^n \bar{w}_j}, (i = 1, 2, \dots, n) \quad (2)$$

The requested feature vector  $W_i$  is obtained.

(4) In order to make the judgments of relative importance of each index compatible and satisfy the characteristics of consistency, the weights of the evaluation indexes of learning self-regulation of children can be tested by calculating the following steps:

$$\lambda_{\max} = \sum_{i=1}^n \frac{(AW)_i}{nw_i} \quad (3)$$

### 3.2. DESIGN OF THE CURRICULUM BASED ON EYFS PROGRAM

After determining the weights of each index, the rating level requirements for actual measurement also need to be determined to obtain the final evaluation criteria for young children's learning self-regulation ability. In this paper, the design of the EYFS program refers to a program that is offered between kindergarten and elementary school to help children better adapt to elementary school learning life. The EYFS aims to provide children with a holistic system of continuous development and learning, so that they can have more and better opportunities in life, so that every child can become a healthy, secure, successful and happy person in the future. It has Four principles: A unique child, Positive Relationships, Enabling Environments, enabling environments, Learning and development. The EYFS program needs to help children recognize the change in their environment and the change in their learning style from their perspective, so that they can improve their self-regulation skills. The program aims to help young children gradually adapt to the learning environment and learning style of elementary school, develop their independent learning and self-management skills, and improve their interest in learning and learning effectiveness. The EYFS program has the following characteristics:

(1) Comprehensive in that the EYFS program covers several subject areas, such as language, mathematics, and science, and is designed to provide children with comprehensive subject knowledge and skills. Therefore, in terms of curriculum design, under the background of the Internet, kindergartens and primary schools need to integrate their curriculum objectives and curriculum content based on the network environment and network technology, Achieve incremental rather than leapfrog changes in your learning style, help children adapt to the learning environment.

(2) Progressiveness is the gradual increase in content and difficulty of the EYFS program to accommodate children's cognitive and developmental levels and to help children make a smooth transition to elementary school. In the context of the Internet, kindergartens and primary schools should gradually use network technology to help children perceive and learn relevant content, so as to form an interest in learning itself rather than an interest in irrelevant network stimulation, and gradually increase the learning of network knowledge, so that children have more network identification ability.

(3) Guidance is the ability of the EYFS program to develop children's self-discipline in

learning and life by guiding them to learn and manage themselves, and to improve their ability to adapt to elementary school life. Help children identify the learning environment under the background of the Internet, understand the instrumental significance of the Internet in learning, and enhance children's self-monitoring and self-management in the network environment.

(4) Transformation is the focus of the EYFS program on developing children's overall quality and creative ability, transforming their knowledge and skills into practical application skills, and laying a solid foundation for their future learning and life. Help children's online environment to take action, make corresponding self-disciplined behavior and self-evaluation.

To sum up, based on the EYFS project concept, the design of preschool and primary school bridging curriculum should focus on the characteristics of the transitional stage of learning between kindergarten and primary school. Attention should be paid to the characteristics of the transitional phase of learning between kindergarten and primary school. Based on the changes of the Internet environment, the course starts from the internal formation mechanism of children's self-regulation ability, adjusts from the aspects of environment, self and behavior, stimulate children's learning motivation, enhance their own learning strategies, and strengthen children's management of learning resources., helps children to Self-awareness, Self-control, self-manage and Self-regulation, so as to enhance their self-discipline ability, help young children better adapt to elementary school learning life.

#### **4. CONCLUSION**

This study explores the innovation of the design of preschool and primary school bridging curriculum based on the EYFS program concept for young children's self-discipline ability in the context of the Internet, aiming to provide new ideas and methods for the cultivation of young children's self-discipline ability. In the study, by studying the theory of self-regulation and the development of young children's self-regulatory ability, the index weights of the evaluation of young children's self-regulatory ability were determined, and the curriculum was designed to effectively promote the development of young children's self-regulatory ability. Specifically, the results of the study showed that by strengthening the development of self-control, normative behavior and self-evaluation, the level of children's self-regulation ability can be effectively improved. Also, in the design of the curriculum, we emphasized the cooperation between families and educational institutions to better promote the development of young children's self-regulatory skills. Therefore, it is believed that curriculum innovation for young children's self-discipline is necessary and effective, and can provide important references and lessons for the development of young children's self-discipline.

## ABSTRACT

This study firstly discusses the composition of higher vocational English teaching evaluation and the design of teaching activities in the part of the construction of a blended teaching model of higher vocational English speaking. Secondly, the process of data set acquisition and feature processing, including data extraction and pre-processing, is elaborated through the application of data mining in higher vocational English teaching. Finally, the training method of the college English assessment model is constructed based on the logistic regression model. The results show that the model is very suitable for the teaching characteristics of spoken English in higher education and the teaching effect is good. This study provides a preliminary exploration for the reform of English teaching in higher education based on big data technology and provides a reference basis for future teaching reform and practice.

## KEYWORDS

Higher-level English; Blended teaching; Data mining; Logistic regression; Big data technology

## 1. INTRODUCTION

With the rapid development of information technology, the application of big data is becoming more and more extensive. In the field of education, big data has also become an important support for teaching reform [1]. English teaching in higher education has been widely concerned, and how to promote the reform of higher education English teaching and improve the teaching effect through big data technology has become a hot issue of related research [2-3]. In recent years, many scholars have conducted research on the application of big data in higher vocational English teaching [4]. Some scholars believe that the teaching mode of higher vocational English courses based on big data technology can improve the teaching effect and enhance students' learning interest [5-6]. In addition, the current situation and problems of English teaching in higher education point out that there are some difficulties and shortcomings in technical support, teaching methods and teaching resources [7]. In order to overcome these difficulties, the researcher suggested that teachers should strengthen the application of big data technology, change the traditional teaching mode, and promote the renewal of teaching contents and forms [8].

## 2. THE CONSTRUCTION OF BLENDED TEACHING MODE OF ENGLISH IN HIGHER EDUCATION

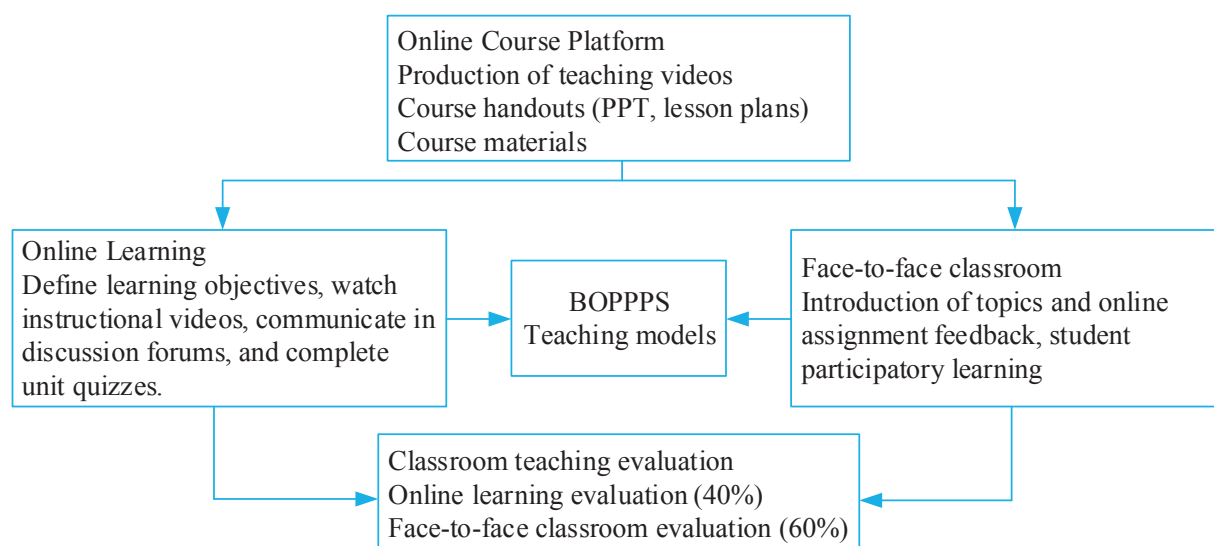

### 2.1. COMPOSITION OF ENGLISH TEACHING EVALUATION IN HIGHER EDUCATION

Under the blended teaching model based on the BOPPPS model, the teacher's learning evaluation of students includes formative and summative evaluations throughout the learning process, fully reflecting the students' input and classroom performance in the online learning process. Among them, 40% comes from students' participation in the online learning session and 60% comes from their performance in the face-to-face classroom, and the specific proportion of each component is shown in Table 1.

**Table 1.** Evaluation components of English teaching in higher education

Composition of classroom teaching evaluation						
Online learning (40%)				Face to Face Classroom (60%)		
Video viewing duration and notes	task	Unit quizzes	Discussion forum posting	Group activity performance	Classroom outcomes	Final oral exam
15%	10%	5%	10%	20%	30%	10%

After the overall planning and design of each part of the blended teaching process, the blended teaching model based on the BOPPPS model was finally constructed as shown in Figure 1.

**Figure 1.** English blended teaching model based on the BOPPPS model

### 2.2. DESIGN OF TEACHING ACTIVITIES

In the design of teaching activities, the six links of BOPPPS are used to effectively connect the learning content of the online course with the classroom teaching activities. The specific process is as follows:

(1) Let students personalize their time outside of class to study the online instructional videos and complete the corresponding learning task objectives.

(2) Through online assignments and student-teacher communication in the discussion forum, students can test the effectiveness of the online learning pre-test and prepare for the oral presentation activities in the face-to-face classroom.

(3) In the face-to-face classroom, the instructor provides feedback on students' online learning to introduce the topic. The focus is on participatory learning through group discussions, role plays, debates and other speaking activities. Students are given more opportunities to

communicate and demonstrate their speaking skills, and the teacher is able to get a true picture of how well students are learning online.

(4) The teacher summarizes the important and difficult sentence patterns taught in class and asks students to complete the unit quizzes of the online course after class to further consolidate the learning effect. Although the online learning and the face-to-face classroom are separated in terms of learning time, the activities are closely linked and organically integrated.

### **3. APPLICATION OF DATA MINING IN HIGHER EDUCATION ENGLISH TEACHING**

#### **3.1. DATASET AND FEATURE PROCESSING**

##### **3.1.1. DATA EXTRACTION**

Students use the University English Teaching and Assessment System to carry out training to predict whether or not to pass the exam, in which the data for the study are obtained from the teaching data within the system and involve the following information about the big drop.

###### **(1) Student user profile**

Student user profile refers to the basic information data of each student, such as basic personal information, answering behavior, etc.

###### **(2) English training questions data**

English training questions data refers to the basic information of all questions and the data when students do the questions. The specific data mainly includes the question type, difficulty and question weight of the test paper.

###### **(3) Students' environment during English training**

The data on the environment in which the students are working during the English training includes the total answer time of the students, the information on the equipment used to answer the questions, and the form of Internet access.

##### **3.1.2. DATA PRE-PROCESSING**

There are many problems in the data obtained in data extraction, such as inconsistent data in the same latitude, and some noise may exist in the data, which is also called dirty data. In performing model prediction, if the quality of the data cannot be guaranteed, it will have some influence on the prediction results. Therefore, corresponding measures need to be taken to eliminate the dirty data.

###### **(1) Data cleaning**

In the collected data, there may be some fields missing. For this situation, we can start from the following three ways: filling in manually, filling in by using feature average and predicting the missing values by machine learning model algorithm.

###### **(2) Data integration**

In the process of exporting raw data, several tables are generated, and data integration is the process of combining the data from these tables into a total data store.

###### **(3) Feature processing**

In feature processing, data mining is performed by using machine learning models, and feature processing is completed, and the main methods include normalization, discretization, feature dimensionality reduction, and feature selection.

## 3.2. DATA MINING BASED ASSESSMENT MODEL FOR COLLEGE ENGLISH

### 3.2.1. LOGISTIC REGRESSION MODEL

The logistic regression model is an evolution of optimization based on the linear regression concept, in which a linear regression is fitted to a given data point by using 1 straight line, and the process of fitting is linear regression. In linear regression, all sample characteristics in the combined training sample set are multiplied with the parameters separately, and then the resulting results are summed and the model takes the form of

$$h(x) = w_0x_0 + w_1x_1 + w_2x_2 + \dots + w_nx_n \quad (1)$$

The vector equation, as

$$h(x) = W^T X \quad (2)$$

### 3.2.2. COLLEGE ENGLISH ASSESSMENT MODEL TRAINING

The posterior probability of each sample as:

$$p(y | x, w) = p(y_i = 1 | x_i) y^i (1 - p(y_i = 1 | x_i))^{1-y_i} \quad (3)$$

The maximum likelihood function in the sample is the result of multiplying the posterior probabilities of each sample as:

$$L(W) = \prod_{i=1}^m p(y_i = 1 | x_i) y^i (1 - p(y_i = 1 | x_i))^{1-y_i} \quad (4)$$

For the contingent likelihood function, as:

$$L(W) = \sum_{i=1}^m \log p(y_i = 1 | x_i) y^i (1 - p(y_i = 1 | x_i))^{1-y_i} \quad (5)$$

Solving for it and deriving it for w yields:

$$w' = \frac{\partial L(w)}{\partial w} \sum_{i=1}^m (y_i - g(z)) x_i \quad (6)$$

When the derivative is 0, it is not possible to derive w. Therefore, it is necessary to find w by means of algorithmic optimization. During the training process, a penalty term about w can be added to the loss function (W).

## 4. CONCLUSION

This study makes a preliminary exploration on the reform of higher vocational English teaching in the context of big data, and proposes the construction of a blended teaching model of higher vocational English speaking and the application of data mining in higher vocational English teaching. Through the practice and analysis of this study, the following conclusions are drawn:

(1) We clarified the components of the evaluation of higher vocational English teaching and designed teaching activities suitable for blended teaching. The construction of this model enables students to complement each other in traditional classroom teaching and online learning, and improves their oral expression ability and comprehensive language use ability.

(2) We built a data mining-based assessment model for college English to assess and improve students' language skills. This data mining-based assessment model can more accurately identify students' language proficiency and provide targeted instructional coaching.

## ABSTRACT

This paper firstly analyzes the production mode and function of behind-the-scenes documentaries, and discusses the specific values carried by behind-the-scenes documentaries. Secondly, the K-means cluster analysis algorithm in big data technology is used to analyze the development constraints of behind-the-scenes documentaries with the existing evaluation of the Internet. The results show that the user evaluations of single value pursuit, rough production, lack of artistry, lack of industry, and lack of platform account for 40.75%, 30.06%, 33.46%, 20.26%, and 30.98%, respectively. Finally, some feasible strategies for the development of behind-the-scenes film documentaries are proposed, i.e., starting from the theme of the story to trigger the emotional resonance of the audience. And a professional team needs to be utilized to further balance business and art to promote the innovative development of behind-the-scenes film documentaries.

## KEYWORDS

Film; Big data technology; K-means algorithm; Cluster analysis; Behind-the-scenes documentary; Development strategy

## 1. INTRODUCTION

From the birth of documentary films at the beginning of the century to the present, the content of documentary films tends to be diversified and the subjects are all-embracing, forming different documentary genres such as humanities and social documentaries, natural science and technology documentaries, and documentary films, which have greatly enriched people's cognitive world [1-2]. Since the beginning of the new century, under the influence of the creative thinking of other countries in the world, Chinese documentaries have undergone significant changes in the concept of creation, and the areas of concern have gradually expanded, resulting in a number of new documentary genres. Among them, the emergence of documentaries that focus on the filmmaking process as the main recording content has created a brand new kind of documentary - behind-the-scenes film documentaries [3-4].

A behind-the-scenes documentary is both a faithful record of the film-making process and a new creative act done by the writer-director. Unlike the fictional creation of feature films, behind-the-scenes documentaries can be regarded as the documentary creation of the writer-director, which generally consists of two steps. The first step is to selectively collect the original material in the process of film creation, and then creatively refine the material to form an audiovisual text with an artistic form, which conveys the emotional experience and value judgment of the creative subject to the audience and realizes the emotional communication

and spiritual communication with the audience [5-6]. Therefore, in behind-the-scenes documentary creation, the camera is not only a machine to record behind-the-scenes facts, but also an ideographic tool controlled by the creator. In addition, the commercial orientation and utilitarian demands of behind-the-scenes documentaries have led to the development of their documentary from aesthetic principles to instrumental styles, placing more emphasis on discovering stories from behind-the-scenes material, enhancing the episodic nature of the documentary, and promoting the marketing and dissemination of the film through storytelling expressions [7-8].

## 2. THE PRODUCTION MODE AND FUNCTION OF BEHIND-THE-SCENES DOCUMENTARY FILM

### 2.1. THE PRODUCTION MODEL OF BEHIND-THE-SCENES FILM DOCUMENTARIES

A behind-the-scenes film documentary is a filming of a specific film production process that involves both films in terms of content. Therefore, in this paper, the feature films that are the focus of behind-the-scenes documentaries are referred to as original films, and behind-the-scenes documentaries are referred to as film documentaries or behind-the-scenes documentaries. The creation of behind-the-scenes film documentaries absorbs the traditional modes of documentary filmmaking, and Nichols classifies documentaries into six modes, as shown in Figure 1.

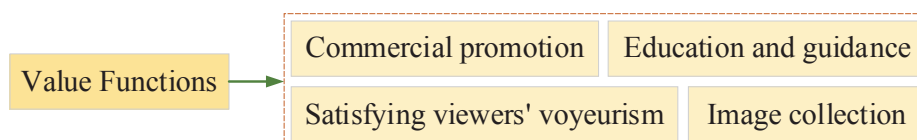

**Figure 1.** Behind the scenes of a film documentary production model

Narrative mode is an approach that combines clips of past occurrences to form a structure that better suits the needs of the filmmaker. The poetic mode is a way to correlate temporal rhythm and spatial arrangement, often manifested in behind-the-scenes documentaries as montage clips with background music to show the passage of real time. Narrative mode focuses on highlighting experiences and memories, showing a social subjectivity from the universal to the particular, from the individual to the collective, etc.

### 2.2. THE VALUE FUNCTION OF BEHIND-THE-SCENES FILM DOCUMENTARIES

Although the behind-the-scenes documentary has only been around for a decade, it has gradually revealed its own value and function as the number of works increases. The behind-the-scenes documentary is originally from the film body and therefore has the function of serving the film, while the behind-the-scenes documentary as an independent film and television text has its own theme, which all constitute the unique mark of the behind-the-scenes documentary. The value and function of behind-the-scenes documentaries are shown in Figure 2.

**Figure 2.** The value function of behind-the-scenes film documentaries

The reason for the rapid development of behind-the-scenes documentary film at this stage is that it serves the propaganda function of the film body. The film is a figurative expression of the art of video, which originates from life but is higher than life, and people peep into the lives of all kinds of people through the images shown on the screen. The behind-the-scenes

documentary is a record of the director's filmmaking process, and it is full of the director's control of the main body of the film and in-depth thinking, which has great educational value and also has a guiding meaning in the same industry. The behind-the-scenes documentary is a documentary film, and compared with the timeliness of its own publicity function, its documentary effect is more long-lasting and more meaningful. At the same time, in order to ensure the objectivity and integrity of the material, the scene usually uses "direct" filming, synchronization of material, and from the details of the plot and story, so that the audience can see the real story of the film behind the scenes.

### 3. K-MEANS-BASED ANALYSIS OF CONSTRAINTS ON THE DEVELOPMENT OF BEHIND-THE-SCENES FILM DOCUMENTARIES

The K-means algorithm is an iterative cluster analysis algorithm that divides the data into  $k$  group in advance and randomly selects  $k$  objects as the initial clustering centers. By calculating the distance between each object and each cluster center, the data object is divided into the nearest cluster centers, and the cluster centers are recalculated after each sample is assigned, repeating until the termination condition is satisfied. The algorithm can gather samples with higher similarity in the same class. Considering the requirement of algorithm complexity for the analysis of the constraints of the development type of behind-the-scenes film documentaries, the Euclidean distance with less algorithm complexity is usually used in calculating the distance between samples.

Assuming that dataset  $D$  has  $n$  sample objects and the feature dimension of each data sample is  $m$ -dimensional, the  $i$ th data object can be represented as  $X_i = (x_{1i}, x_{2i}, \dots, x_{mi})$ , where  $x_{mi}$  is the  $m$ th dimensional feature of data object  $X_i$ . If  $k$  data are randomly selected as the initial clustering center, the  $j$ th clustering center can be expressed as  $C_j = (c_{1j}, c_{2j}, \dots, c_{mj})$ , where  $c_{mj}$  is the  $m$ th dimensional feature of the clustering center  $C_j$ . Then the Euclidean distance  $d(i,j)$  between two data objects  $X_i$  and  $C_j$  is specifically calculated by the expression

$$d(i,j) = \sqrt{(x_{1i} - c_{1j})^2 + (x_{2i} - c_{2j})^2 + \dots + (x_{mi} - c_{mj})^2} \quad (1)$$

The criterion function of the K-means algorithm usually uses the error sum-of-squares function, and let  $C_i$  be the clustering cluster,  $Y$  be the data object in the clustering space, and  $m_i$  be the center of  $C_i$ . The mean square error  $E$  is expressed as

$$E = \sum_{j=1}^k \sum_{Y \in C_j} |Y - m_j|^2 \quad (2)$$

This allowed for the collection of user ratings of behind-the-scenes documentaries of films that existed on the Internet from 2017-2021 and the quantitative analysis of the data using the K-means algorithm, and yielded the results shown in Figure 3.

From the results of the Internet cluster analysis on the development constraints of behind-the-scenes film documentaries, from 2017 to 2020, single value pursuit, rough production, lack of artistry, lack of industry and lack of platform become the main factors hindering the development of behind-the-scenes film documentaries, with user ratings of 40.75%, 30.06%, 33.46%, 20.26%, and 30.98%. This shows that the current competition in the Chinese film market has made behind-the-scenes documentaries a commercial propaganda tool, which has gradually lost its other functions such as education. And the production of behind-the-scenes

documentaries in an eye-catching way makes them untechnical and unpopular with users. It is necessary to propose effective development strategies to avoid the misunderstanding of Chinese behind-the-scenes documentaries, so that Chinese behind-the-scenes documentaries can better perform their functions and gain the recognition of audiences.

**Figure 3.** Constraints to the development of behind-the-scenes film documentaries

#### 4. THE DEVELOPMENT STRATEGY OF BEHIND-THE-SCENES DOCUMENTARY FILM IN THE CONTEXT OF BIG DATA

In the context of big data, film as a kind of image text has both contemporary and historical communication value. The explosive development of Chinese cinema in recent years is the brilliant result of the continuous construction of China's film industry chain, the continuous improvement of the film industry system, and the continuous gathering of film viewers' desire to watch movies, among other factors. As a behind-the-scenes documentary that visually records the process of film production and related thematic events, it is of great significance to the industry in terms of innovation and promotion of industry development. In the face of the behind-the-scenes documentary at this stage of the emergence of quick success and near profit reduced to the pursuit of a single value of film and television publicity film asked the uneven quality of the lack of a professional team and so on. There is an urgent need for corresponding measures to make the behind-the-scenes documentary industry really get attention to achieve a healthy long-term development.

(1) Balancing commerce and art, behind-the-scenes film documentaries should accomplish the purpose of propaganda while also adhering to the artistic principles of documentaries. Through objective observation and recording, creative processing of the material, and proper handling of the relationship between propaganda and artistry, in order to play the role of film set documentaries to strengthen the theme of the film and stimulate the audience's interest in watching the film.

(2) Focusing on storytelling to dig deeper into the theme, behind-the-scenes film documentaries are documentaries that instill humanistic care by looking at people in film production or related background themes. It is an artistic medium used by humans to communicate, exchange and understand, and needs to further focus on emotional expression and character portrayal to win the audience's empathy.

(3) Team specialization to achieve industrialization, no market-oriented mode of operation can not form a relatively complete industrial pattern will seriously limit the development of the

film behind the scenes documentary. It is necessary to further cultivate professional talents, establish multiple distribution channels and innovative marketing to create an industrialized platform for behind-the-scenes documentaries and promote the innovative development of Chinese behind-the-scenes documentaries.

## 5. CONCLUSION

This paper takes the production mode and functional value of behind-the-scenes documentaries as the starting point, and analyzes the types and values of behind-the-scenes documentaries in detail. The analysis of the constraints on the development of behind-the-scenes documentaries by using K-means cluster analysis algorithm with big data technology shows that: the single pursuit of value, rough production, lack of artistry, lack of industry and lack of platform are the main factors that hinder the development of behind-the-scenes documentaries, and the percentage of user ratings are 40.75%, 30.06%, 33.46%, 20.26% The percentages of user ratings are 40.75%, 30.06%, 33.46%, 20.26%, and 30.98% respectively. This gives the development strategy of Chinese behind-the-scenes documentaries in the context of big data, i.e. the need to further dig deeper into the story theme, focus on the balance of commercialization and artistry and build a professional team to promote the development of behind-the-scenes documentaries.

## ABSTRACT

Under the background of big data, the article analyzes that the main stressors faced by college students are learning pressure, independent and independent pressure, family and economic pressure and future pressure, and the stressors of college students have certain differences in gender, grade, major, self-assessed academic performance, family origin, whether they are only children, family structure, parents' marital status and family income level. Combining the relevant knowledge of psychology and the actual management of college students, we combine qualitative and quantitative analysis to construct an early warning mechanism for college students' psychological crisis, so as to provide reference for the prevention of college students' psychological crisis and thus promote the free and comprehensive development of college students.

## KEYWORDS

College students; Stressors; Psychological crisis; Early warning mechanism

## 1. INTRODUCTION

Along with the development of big data and media convergence, China has entered the all-media era. In the era of full media, information is everywhere, everywhere, and no one uses it, which leads to profound changes in the ecology, media pattern and communication mode [1-2]. As a result, contemporary college students have a new identity "Internet generation", and the changes in their growth environment naturally cause changes in their psychological conditions, and the psychological problems of contemporary college students are mostly reflected in the reshaping of interpersonal communication ability, the reconstruction of self-cognition, the guidance of values and the relief of media dependency symptoms, etc., which are accompanied by interpersonal communication disorders, the prevalence of Internet violence, virtual personalities and the lack of communication, The changes of these psychological factors are all related to the "media ecological environment" [3-5]. Therefore, it is particularly important to construct an early warning mechanism for college students' psychological crisis in the era of full media. In the face of the profound changes that are taking place in the ecology, media pattern, and communication mode of the Austrian debate, the psychological situation of college students is waiting for the opportunity to move, which means that the early warning mechanism for college students' psychological crisis needs to be adjusted urgently [6-7].

## 2. STUDENT PSYCHOLOGICAL STRESS SURVEY STATISTICS

### 2.1. RESEARCH SUBJECTS

The population of this study was college students nationwide, but due to the limited time and the resources available, this survey used an overall stratified sampling method, and a total of 800 undergraduates from freshman to senior years were selected from four universities in Guangzhou as respondents, and 791 were collected, including 171 freshmen, 229 sophomores, 197 juniors, and 194 seniors. There were 327 male students and 464 female students. There were 361 people in arts, 311 people in science and technology, and 119 people in arts and sports. The questionnaires were distributed and collected by mail, and the statistical tool of the questionnaire was SPSS17.0.

### 2.2. GENERAL CHARACTERISTICS OF COLLEGE STUDENTS' STRESSORS

The mean values and standard deviations of the scores of each factor of college students' stressors are shown in Table 1, and it can be seen that the mean scores of each factor of college students' stressors are, in descending order, study stress, autonomy and independence stress, family and economic stress, future stress, social and interpersonal stress, opposite-sex relationship stress, and major and sudden stress.

**Table 1.** Means and standard deviations of college students' stressor scores for each factor

Stressors	Average value	Standard deviation
Learning Stress	14.94	7.72
Autonomy and independence stress	13.64	8.85
Family and financial pressures	9.29	9.43
Career stress	8.92	5.38
Social and interpersonal stress	8.39	8.13
Heterosexual Stress	8.21	8.56
Critical and sudden stress	4.52	4.98

### 2.3. COMPARISON OF THE DIFFERENCES OF COLLEGE STUDENTS' STRESSORS ON THE ONLY CHILD

The results of the independent sample t-test on each factor and total stress score of stressors for college students with only child and non-only child are shown in Table 2. It can be seen that only-child college students have higher scores than non-only-child college students on the five stressors: major and sudden stress, academic stress, social and interpersonal stress, opposite-sex stress, and autonomy and independence stress, as well as on the total stress score. The scores of the two stressors, major and sudden stress and heterosexual stress, were significantly higher than those of the non-one-child college students, while the scores of the five stressors, family and financial stress, future stress, study stress, social and interpersonal stress, and autonomy and independence stress, did not differ significantly between the one-child college students and the non-one-child college students.

**Table 2.** Comparative results of differences in college students' stressors on only child

Pressure source	one child	Quantity	AVG	SD	Significance
Major and sudden stress	Yes	328	5.136	5.48724	P=0.04
	No	463	4.068	4.54061	
Family and Economic Stress	Yes	328	9.2085	9.75417	P=0.823

	No	463	8.8527	9.19469	
Mileage pressure	Yes	328	7.9266	5.03311	P=0.716
	No	463	8.9913	7.92205	
Study Stress	Yes	328	14.9815	5.63312	P=0.924
	No	463	9.0185	8.26146	
Social and interpersonal stress	Yes	328	9.3925	7.34751	P=0.065
	No	463	7.3492	8.37025	
Opposite sex relationship stress	Yes	328	9.3925	9.30272	P=0.001
	No	463	7.3492	7.92205	
Autonomy and Independence Stress	Yes	328	13.1723	8.50894	P=0.066
	No	463	71.1226	47.3302	
Total stress score	Yes	328	14.3191	8.87984	P=0.104
	No	463	65.8232	41.8742	

## 2.4. COMPARISON OF COLLEGE STUDENTS' STRESSORS IN TERMS OF GENDER DIFFERENCES

The results of the independent sample test on the mean scores of the factors and the mean scores of the total stress scores of the stressors of college students of different genders are shown in Table 3. It can be seen that the mean scores of each factor and total stress scores of female college students are higher than those of male college students. In addition, the differences between male and female college students in the scores of four stressors, namely, major and sudden stress, family and economic stress, heterosexual relationship stress, and social and interpersonal stress, as well as the total stress scores, were significant, and the scores of female college students were significantly higher than those of male college students. There was no significant difference in the scores of male and female college students on the three stressors: career stress, study stress, and autonomy and independence stress.

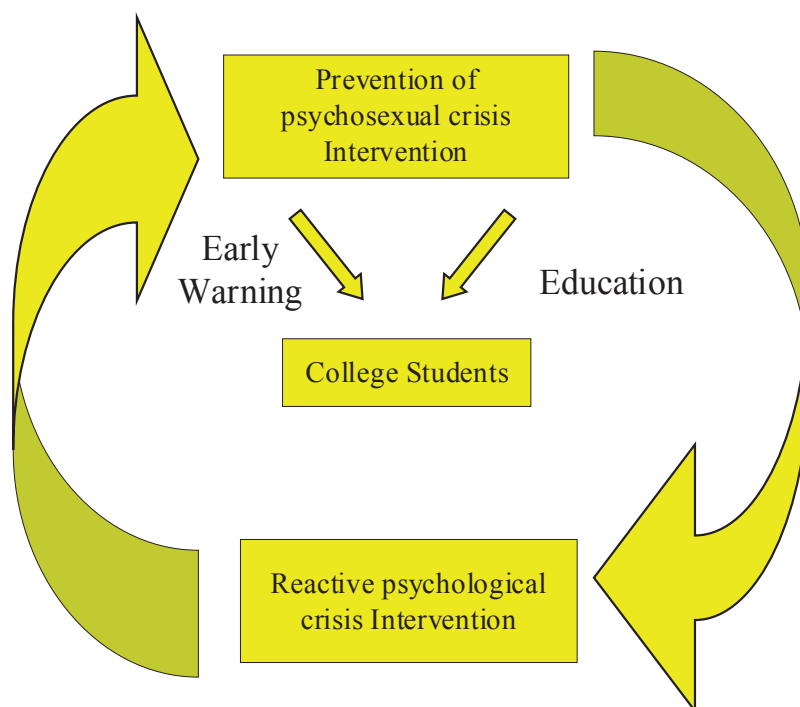

**Table 3.** Comparison of gender differences in stressors among college students

Pressure source	one child	Quantity	AVG	SD	Significance
Major and sudden stress	Male	330	5.0487	4.60793	P=0.01
	Female	461	4.1256	5.19525	
Family and Economic Stress	Male	330	10.3842	9.43828	P=0.006
	Female	461	8.9047	5.30212	
Mileage pressure	Male	330	8.5282	9.34736	P=0.855
	Female	461	8.9755	5.52111	
Study Stress	Male	330	15.4452	8.52787	P=0.142
	Female	461	14.5973	7.10306	
Social and interpersonal stress	Male	330	9.0914	8.22304	P=0.037
	Female	461	7.8702	8.04492	
Opposite sex relationship stress	Male	330	9.7072	8.73601	P=0.000
	Female	461	64.5802	43.5261	
Autonomy and Independence Stress	Male	330	7.1168	8.29756	P=0.188
	Female	461	14.1279	8.72841	
Total stress score	Male	330	13.3031	8.63297	P=0.01
	Female	461	72.5802	44.8658	

### 3. THE CONSTRUCTION OF EARLY WARNING MECHANISM OF COLLEGE STUDENTS' PSYCHOLOGICAL CRISIS BASED ON BIG DATA

#### 3.1. PREVENTIVE PSYCHOLOGICAL CRISIS INTERVENTION FOR COLLEGE STUDENTS

In the practice of psychological crisis intervention, reactive crisis intervention is indispensable, but it has limitations such as passivity and lagging. Therefore, in the practice of psychological crisis among college students, we should follow the "big intervention concept of combining preventive psychological crisis intervention and reactive psychological crisis intervention" and establish the concept of preventive psychological crisis intervention for college students as shown in Figure 1. Preventive psychological crisis intervention for college students means that colleges and universities aim to prevent the occurrence of college students' psychological crisis by planning certain programs and activities in advance, or try to prevent the development of more serious problems by designing certain strategies to intervene in college psychological crisis at an early stage, so as to control the development of college students' psychological crisis. Preventive psychological crisis intervention for college students attaches importance to prior prevention and focuses on education and early warning. Its short-term goal is to contain the possible psychological crises of college students in the bud and prevent them from occurring in the first place, and its long-term goal is to promote the comprehensive and free development of college students' body and mind. The current psychological crisis intervention work for college students should adopt the intervention mode of mainly preventive psychological crisis intervention, supplemented by reactive psychological crisis intervention, so that the pre-prevention and post-intervention can be coordinated, echoed and unified.

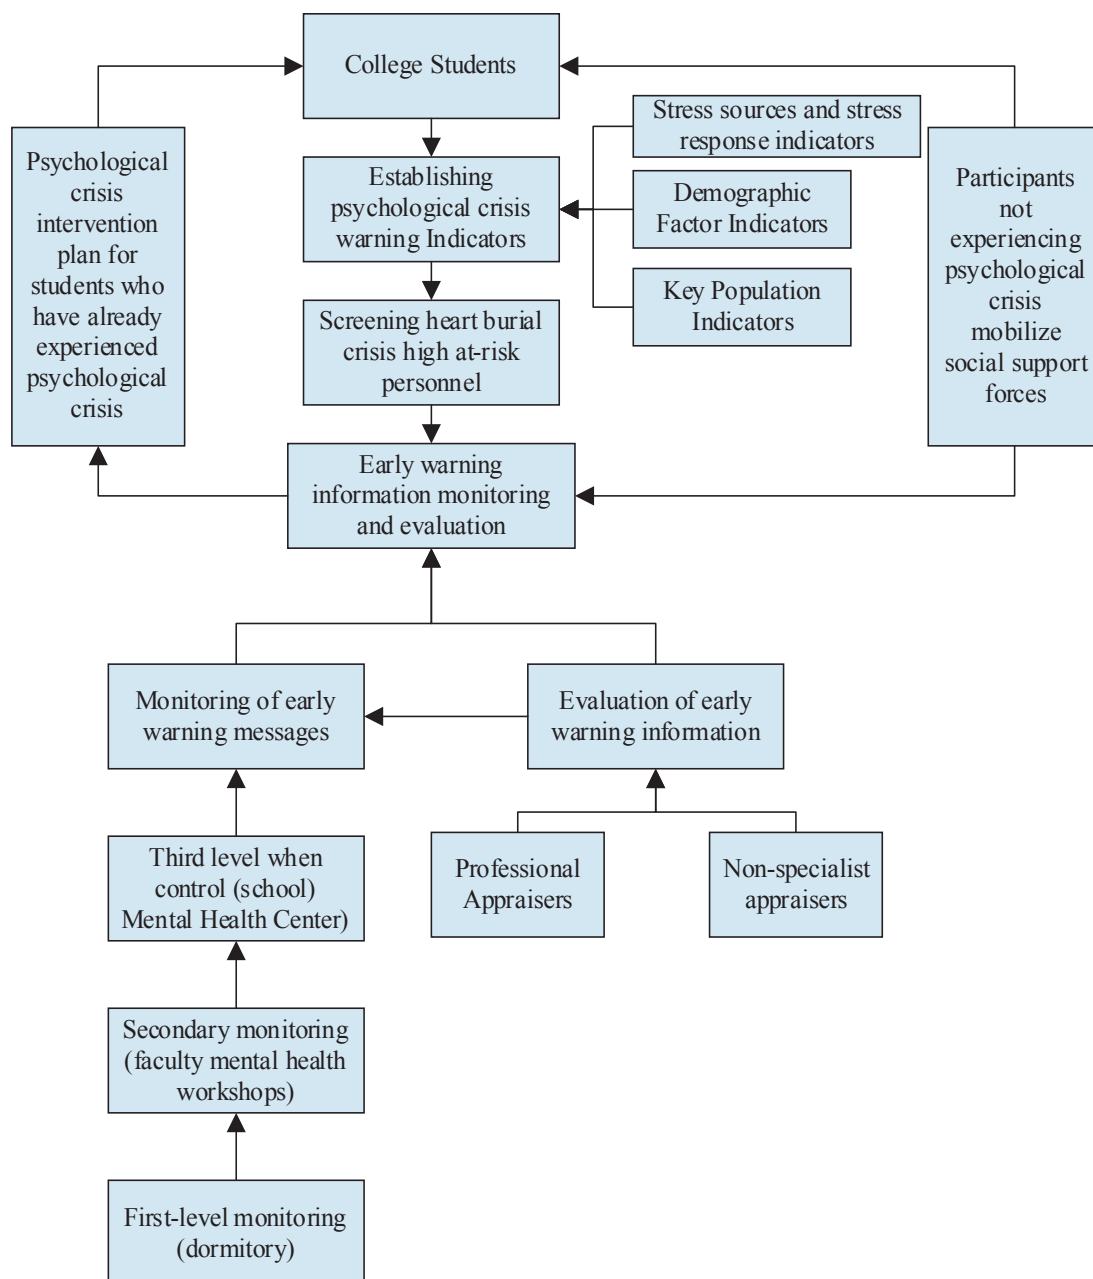

**Figure 1.** Concept of preventive psychological crisis intervention for college students

#### 3.2. EARLY WARNING MECHANISM FOR COLLEGE STUDENTS' PSYCHOLOGICAL CRISIS

The construction of the psychological crisis early warning mechanism for college students is a systematic project. It is important to analyze the main links of the psychological crisis early warning mechanism for college students and grasp the relationship between each link and

each link and the whole, so as to ensure that the constructed mechanism can run effectively. The construction of early warning mechanism for psychological crisis of college students. According to the main stress sources encountered by public security college students and their stress reaction status, combined with the demographic factors of college students and the actual police management, establish the psychological crisis early warning index, and accordingly screen the high-risk personnel (faculty psychological professionals), monitor and evaluate the high-risk personnel (faculty psychological professionals) with daily performance (district team and dormitory collection), and if it is found that they may be suspected of psychological crisis, then Need to quickly mobilize their social support forces (faculty) to prevent the occurrence of psychological crisis. The department will upload the appropriate information to the school's mental health center. If the person is in psychological crisis, the school mental health center will start the psychological crisis intervention plan to help the person get rid of the psychological crisis as soon as possible, the specific early warning mechanism is shown in Figure 2.

**Figure 2.** Early warning mechanism for college students' psychological crisis

#### 4. CONCLUSION

Under the background of big data, it is necessary to establish a three-level psychological crisis early warning and monitoring network in school, college and dormitory in order to timely and accurately record the abnormal psychological and behavioral performance of early warning subjects and update the changes of their psychological status into the early warning information database through the early warning network. On the basis of improving the three-level early warning and monitoring network, we use network technology to establish a “flat” psychological crisis early warning and monitoring network to realize direct communication between students and school mental health education center, students and college, college and school mental health education center and other channels, which can greatly improve the timeliness and effectiveness of handling psychological crisis emergencies. and effectiveness.

## **ABSTRACT**

This paper firstly discusses the cultural essence of folk music and gives measures for the development of folk music industrialization. Secondly, in order to screen out better folk music, the calculation of folk music feature thresholds and feature weights is carried out using big data technology to achieve feature selection. Finally, quantitative data analysis was conducted using Internet data as an example. The results showed that 82.17% thought that the industrialization of folk music could make the music appreciation ability of college music education students improved, and 73.26% thought that the industrialization of folk music could promote the reform and innovation of college music education mode.

## **KEYWORDS**

Folk music; Industrialization; Feature selection; Music education; Big data technology; Feature weights

## **1. INTRODUCTION**

The 5,000-year history and civilization of the Chinese nation has nurtured countless cultural essences, of which ethnic music culture is one of the most colorful. Ethnic music culture is a source of progress and development of human society, as it is the cultural essence of all ethnic groups, shoulders a strong cultural mission, and carries profound national spirituality, ideals and beliefs, and cultural heritage [1-3]. China has a long history and many ethnic groups, and one side of the land nurtures one side of the people, and one side of the land nurtures one side of the culture, and each ethnic group has formed a music culture with strong characteristics.

Ethnic music, as an important branch of the music industry, has an important significance both in terms of economic effects and in the inheritance and preservation of traditional Chinese culture, and ethnic music has injected fresh blood and new forms of expression into the development of modern music [4-5]. Many scholars and experts have conducted in-depth analysis and research on folk music, but due to the subjectivity and focus of research, a complete system has not yet been formed for the study of the heritage of folk music and some of its effects on modern music, and there is a lack of a systematic and integrated industrial

development concept.

In the context of global multicultural development, we should not only absorb the excellent foreign culture and use it for the Chinese, but also inherit and innovate our national culture, carry forward the excellent national spirit of the Chinese nation, and use the ancient for the present [6-7]. Music education in colleges and universities is an important way to realize the inheritance and dissemination of Chinese traditional culture, and national music culture must be deeply integrated into college music education to continuously improve the real influence of national music culture and enhance college students' awareness of national music culture [8-9].

## 2. CULTURAL ESSENCE OF FOLK MUSIC AND INDUSTRIALIZATION DEVELOPMENT MEASURES

### 2.1. THE CULTURAL ESSENCE OF FOLK MUSIC

Ethnic music culture is a musical style gradually formed by ethnic minority people in their life, production and activities, and is the main embodiment of traditional history and culture. Analyzed from the perspective of the essence of ethnic music, the music of ethnic minorities is also the embodiment of the character and aesthetics of ethnic minorities, showing the cognitive understanding of life, life and nature of ethnic minority people. Personal thoughts and emotional consciousness are expressed through the rhythm of the tunes and are sung according to the differences in the actual meaning conveyed by the words and songs to match different occasions. The life and development of ethnic minorities are closely related to music culture, for example, there are many prayer songs for social activities such as ritual meetings and festival celebrations, which also show the social performance of ethnic minority music culture.

### 2.2. DEVELOPMENT MEASURES FOR THE INDUSTRIALIZATION OF FOLK MUSIC

Folk music has a very prominent position in China's bright culture, and has unique cultural connotation and artistic value in terms of expression, national culture and national spirit it conveys. Folk music is a kind of art precipitated by the baptism of time and the rendering of regional culture in the long history with strong national colors and unique expressions. After hundreds of years of development and precipitation, folk music has its own industry chain, and it has greatly influenced the development of music education in colleges and universities. The specific development measures of ethnic music specialization are shown in Figure 1.

**Figure 1.** Development measures for the industrialisation of folk music

## 3. DATA CLASSIFICATION FOR FEATURE SELECTION OF ETHNIC MUSIC IN THE CONTEXT OF BIG DATA

At present, China has countless folk music works, and among these huge number of music works, there are great differences in their artistic level, expressive content and quality. For this reason, we should select folk works with specific conditions, reasonably screen folk music, and choose the best part of it. We should fully purify and screen the folk music with rich humanistic sentiment and artistic characteristics, so as to promote the long-term development of folk music. This chapter uses big data to selectively screen the characteristics of folk music, so that the

best folk music can be discovered.

Big data is characterized by speed, immediacy, and the sum of personalization and socialization. The speed is manifested in three aspects, which are fast data generation, large scale of massive data expansion, and fast data disappearance. Digitization brings the mobility of life, therefore, it is necessary to enhance the immediacy of information processing. Compared with traditional methods of screening for ethnic music, big data usually has a special relationship with users' immediate actions. Big data has a strong connection with people and social activities, and data can no longer be distributed according to physical structures, but needs to be reorganized in combination with personal and social relationships. The same is true for the industrial development of folk music, which can only be sustainable if structured content is added.

Usually the data are classified and the metadata are directly treated as features, but for a sample, different data represent different weights, i.e., for different metadata to distinguish the degree of inconsistency. In this paper, based on the above big data characteristics, certain improvements are made to feature selection, and the improved expressions are:

$$tf_{ik} = f_{ik} / \sum_{j=1}^t f_{ij} \quad (1)$$

Where,  $tf_{ik}$  denotes the  $k$  rd metadata frequency of sample  $X_i$ ,  $f_{ik}$  denotes the number of metadata occurrences, and  $j$  denotes the sample capacity. Then the threshold value of sample feature selection is:

$$f_k = \lg(N / n_k) \quad (2)$$

Where,  $N$  denotes the number of sample points and  $n_k$  is the number of samples in which the metadata has appeared, the final sample feature weight expression is

$$w_{ik} = ((\lg(f_{ik}) + 1) \cdot f_k) / \sqrt{\sum_{k=1}^t [(\lg(f_{ik}) + 1) \cdot \lg(N / n_k)]} \quad (3)$$

In the equation, the addition of 1 to the metadata is to ensure the presence of non-zero weights for metadata whose frequency is 1. The sample features are selected according to the weight size. Based on the feature selection of the ethnomusicology data samples, the classification of the ethnomusicology data is performed.

#### 4. THE IMPACT OF INDUSTRIALIZATION OF FOLK MUSIC ON MUSIC EDUCATION MAJORS IN COLLEGES AND UNIVERSITIES

Based on the previous discussion on the industrialization of ethnic music and the data classification of ethnic music feature selection through big data technology, this chapter focuses on the quantitative analysis of data based on the currently available data on the trend of ethnic music industrialization on college music education majors on the Internet, as a way to explore the specific impact of ethnic music industrialization on college music education majors. The impact of ethnic music industrialization on college music education majors within the period of 2017 to 2021 the results of the impact of industrialization on music education majors in colleges and universities are shown in Figure 2.

From the evaluation results on the Internet about the influence of the industrialization of ethnic music on music education in colleges and universities, 82.17% of people think that the industrialization of ethnic music can make the music appreciation ability of students majoring in music education in colleges and universities improved. This indicates that the development

of music industrialization can have a positive impact on the education and teaching of music majors in higher education institutions, and students can use modern music production software to experience the charm of music in a deeper level. In addition, students' job search and employment are no longer limited to their professional ability, and they can use their hobbies as the basis for development to enhance their music appreciation and composition ability. 73.26% believe that the industrialization of folk music can promote the reform and innovation of music education mode in colleges and universities, which indicates that the development of music industrialization can transform the traditional education concept within institutions and has a profound impact on promoting the reform of music curriculum in higher education institutions. It further increases the practical teaching of students, who can personally participate in art performance-type activities and summarize their music learning experience and improve their music skills in practice. The percentage of those who think that the industrialization of ethnic music can help music education majors achieve the integration and development of traditional and emerging music is 63.59%, which indicates that the development of music industrialization has stimulated the development of music e-commerce, music peripheral products, and high-end music equipment. Colleges and universities can use multimedia and other advanced technologies to use music images and acoustic materials as the main teaching content of music classes, so that traditional music expressions can be fully integrated with modern technical means. This optimizes the audiovisual experience of students and maximizes their ability to perceive the beauty of music.

**Figure 2.** The impact of the industrialisation of folk music

The educational philosophy of today's higher education institutions is gradually changing from one based on professional education to one based on aesthetic education, where students can truly achieve all-round development. Despite this shift in educational philosophy, aesthetic education has always been a more superficial development, and the failure of both students and teachers to raise the importance of music education has become a key issue limiting the development of music in higher education. As the key to talent training in higher education institutions, the real implementation of the concept of music professional education is crucial. Only by raising the importance of music education among students in institutions can we improve the environment for the development of the music industry and thus enhance the economic benefits of China.

## 5. CONCLUSION

This paper analyzes the development measures of folk music industrialization from the

cultural essence of folk music. In order to better screen out representative folk music culture for industrialization, the feature threshold and feature weights of folk music are selected using big data technology. A data analysis was conducted on the impact of the industrialization of folk music on the existing Internet on the music education majors in colleges and universities. The results showed that the percentages of helping students improve their music appreciation ability, promoting music curriculum reform, and prompting the integration of traditional and emerging music were 82.17%, 73.26%, and 63.59%, respectively. This indicates that the industrialization of ethnic music in the context of big data can effectively realize the improvement of learning ability and music appreciation ability of college music education students, and also further innovate the development of music education curriculum.

## ABSTRACT

In the context of information technology, all higher education institutions are actively exploring online and offline hybrid English teaching models suitable for students' learning characteristics. The hybrid teaching model was explored, and the effectiveness in English writing skills training was evaluated in terms of performance and analyzed quantitatively and qualitatively by SPSS data statistical method on the English writing scores of 80 college students, and 40 hybrid writing learning test questions were designed. The results showed that the participants' mean scores in English writing showed significant differences in the pre-test and post-test experiments. In the English writing proficiency assessment, students' English writing scores showed significant differences ( $\alpha \leq 0.05$ ), which verified the advantages of implementing a blended English teaching model in English writing instruction.

## KEYWORDS

Information background; College English; Online and offline hybrid; Teaching mode

## 1. INTRODUCTION

At this stage, China's economy is running smoothly, and the development of information technology in China has entered a brand new stage, and intelligent technology has been applied in various fields in China, and the external education in schools is naturally no exception [1-3]. English is the common language in the world nowadays, and with the accelerating globalization, the importance of English is becoming more and more significant [4-5]. In addition, since English is more practical, students need not only to master some theoretical knowledge in the process of learning English, but also to be able to apply the knowledge learned in practical life [6-7]. Thus, in the current context of information technology, it is very necessary to innovate English teaching in colleges and universities [8-9].

## **2. RESEARCH ON THE ONLINE AND OFFLINE HYBRID ENGLISH TEACHING MODE IN THE CONTEXT OF INFORMATION TECHNOLOGY**

### **2.1. “ONLINE” AND “OFFLINE” HYBRID TEACHING MODE**

In the era of rapid development of information, the full use of various network information to contemporary English teaching, so that students can use the network platform for learning and communication to achieve “online” and “offline” mixed learning. This not only greatly enriches teaching resources, but also expands students’ learning horizons and makes their learning more convenient and faster.

The “online” and “offline” blended teaching makes good use of information technology as a platform for students to learn online anytime and anywhere, and also highlights the “student-centered” learning mode. It facilitates the communication between students and teachers, and improves students’ interest in English learning and their ability to learn English independently. Therefore, the “online and offline” blended teaching mode is very much in line with the current requirements of China’s teaching reform, and it is also very important for the research and exploration of education and teaching.

### **2.2 Build “online and offline” hybrid English teaching mode**

Classroom learning and off-class learning are integrated with each other. In the process of English teaching, to improve classroom efficiency and enhance communication and exchange between teachers and students, teachers should pay attention to students’ learning characteristics and establish a relaxed and pleasant classroom atmosphere to achieve the best English learning effect by making learning plans and learning goals according to students’ situations in a targeted way. In the context of information technology, try to create a good online learning environment for students, which can improve students’ interest in learning English by showing pictures, playing music and other effects. After class, teachers can use online platforms or establish online second classes such as WeChat and QQ groups, where teachers can share their elaborate English courseware, some good learning materials, etc. to these groups. Teachers can also assign English learning tasks or interesting English learning activities to students in online platforms or groups, encourage students to participate, and give them appropriate rewards through various ways. This strengthens the online communication between students and teachers and also effectively expands students’ learning styles and learning spaces. Thus, it can be seen that classroom teaching and off-class learning can be better combined through information network technology, so that the quality of English teaching can be effectively improved. The continuous updating and change of English teaching mode not only improves the quality of English teaching well, but also promotes the improvement of English teachers’ teaching and research level. With online teaching, teachers can make the teaching process visual and vivid through easy-to-use course modules. Students can also learn anytime and anywhere, and teaching managers can grasp the teaching dynamics and provide support for teaching reform through the analysis of big data.

## **3. ANALYSIS OF THE APPLICATION OF ONLINE AND OFFLINE HYBRID ENGLISH TEACHING MODE**

### **3.1. RESEARCH QUESTIONS**

This paper investigates the practice of online and offline blending in college English writing in the context of college English and composition question types and writing teaching, with a view to evaluating the performance of implementing a blended intelligent learning model in English writing teaching through an empirical study. In response to the current teaching situation, the study poses the following two questions:

1. Is there any difference in the level of writing skill performance between the students in the experimental group (blended mode learning) and the students in the control group (traditional way learning) in the post-test?

2. Is there a difference in writing skill achievement levels between students in the experimental group on the pre and post tests?

### 3.2. STUDY DESIGN

An experimental research method was used for the study. A total of 100 students located in two equal level classes in the sophomore year were randomly selected and divided into two groups; the experimental group consisted of 50 students, while the control group was also 50 students. Two variables were designed: The first variable was mixed-mode learning and the second variable was writing skills. Therefore, the study focused on assessing the independent variable “mixed mode” and the dependent variable “writing skills”, with the experimental group learning to write through a mixed mode and the control group using traditional teaching methods.

### 3.3. RESEARCH TOOLS

The study used writing achievement test questions, including pre-test, post-test, and mixed mode instruction. The test questions were used to measure students’ writing performance as a pre-test and post-test of the experimental study, aiming to measure the effects of the blended model on the subjects’ English writing skills, mainly the accurate use of English language forms, the effective expansion of paragraph writing, and the rational application of coherence and articulation techniques. The content of writing instruction was analyzed based on Bloom’s cognitive taxonomy and normative scale. The objectives of each level and the percentage weights of each observed dimension were designed. To check the reliability and validity of the test questions, the time required for the test subjects, and the difficulty and discrimination coefficients of the test questions the test was first administered to 15 students at random. The following formula was applied in the pilot study to calculate the test time spent by students/number of students. The duration of the test was (60) minutes. The clarity of the test questions was checked by pretesting and modified for misleading related questions, and the correlation between the test questions and the total score is shown in Figure 1.

Figure 1. Correlation between test questions and total score

### 3.4. ANALYSIS OF STUDY RESULTS

The purpose of this study was to investigate the effectiveness of a blended model in developing English writing skills among college students. The first research question, “Is there a difference between the experimental and control groups in the level of writing skill performance on the post-test?” was analyzed and explained by using the statistical data software SPSS to collect data from the online and offline blended instruction. In order to answer

this research question, the null hypothesis was formulated: the experimental and control groups did not show statistically significant differences in writing performance levels on the posttest ( $\alpha \leq 0.05$ ). To test this hypothesis, the study counted the means and standard deviations of the two groups in the post-test and applied independent samples t-test to measure their significant differences as shown in Table 1. There was a significant difference in the overall mean scores of the experimental and control groups in the post-test ( $\alpha \leq 0.01$ ). The mean of the experimental group reached 29.9 while the mean of the control group was 23.60. This result indicates that the hybrid teaching model is more advantageous than the traditional teaching method in improving students' writing skills.

**Table 1.** Independent samples t-test in post-test for experimental and control groups

Sample	quorum	AVG	SD	T Check	Significance
Experimental group	50	29.89	4.398	3.82	0.01
Control group	50	23.61	5.923	7.9	

In order to observe whether there were differences in writing skill performance levels between students in the experimental group in the pre- and post-tests, this paper tested the second research question and formulated the null hypothesis: in the pre- and post-tests, students in the experimental group did not show statistically significant differences in their writing skill levels ( $\alpha \leq 0.05$ ), and a paired-samples t-test was statistically investigated as shown in Table 2. In the total mean score of the post-test, students in the experimental group showed significant variability, with the mean of the post-test reaching 29.89, while the mean of the pre-test was 13.36. This implies a statistically significant difference in the pre- and post-tests, proving that the rational application of the hybrid teaching model is very effective in improving college students' writing skills and is important for creating an efficient classroom.

**Table 2.** Test results for differences in mean scores in pre-test and post-test

Sample	quorum	AVG	SD	T Check	Significance
Post-test	50	29.89	4.398	11.2	0.01
Pre-test	50	13.36	5.868	5.7	

#### 4. CONCLUSION

With the development of modern information technology, the "online" and "offline" hybrid English teaching mode combines traditional teaching with students' online learning. This mode of teaching not only brings students freedom in time and space, but also brings a positive effect of mutual attention among students, which reflects the "student-centered" teaching mode, making students the main object of teaching and maximizing their individual learning needs. Teachers should vigorously implement the "online and offline" hybrid teaching model, strive to update their own teaching philosophy and teaching methods, make their own teaching model to keep up with the development of the new era, and constantly improve students' English learning level to do their part to cultivate more high-quality talents to adapt to the development of society.

## ABSTRACT

This paper firstly studied the data fusion model, explored its automatic merit seeking and the way to obtain the best fusion. Then the intelligent system of mental health education for college students was constructed based on the data fusion model, the framework of the system was established, the way of evaluating the effect of psychological education was established, and the operation process of the intelligent system was analyzed. Finally, the effect of mental health education was evaluated using indicators such as education satisfaction, self-efficacy and life satisfaction. The results showed that the self-efficacy of students increased by 3.53 and the life satisfaction of students increased by 3.08 after the mental health education in school, indicating that the education system constructed in this paper is effective. This study lays a theoretical foundation for the reform of psychological education in colleges and universities, which is important for the development of mental health education in universities.

## KEYWORDS

Data fusion model; Automatic merit seeking; Mental health education; Intelligent system; Self-efficacy; Life satisfaction

## 1. INTRODUCTION

Mental health education in higher education has always been in a crucial position in the development of modern education, especially today, when the traditional education model has developed into quality education [1]. Mental health education in higher education is not education for the treatment of mental diseases in a narrow sense, but education for psychological quality, which is precisely a fundamental component of social and cultural quality [2-3]. Mental health education in higher education occupies a leading role in the development of human potential [4]. Developing human potential is one of the important goals of quality education, and reaching this goal requires mental health education to assist in promoting the formation of a sound personality in students [5]. The role of mental health education is to promote the development of students' potential and thus their overall development [6]. Leporatti, L. et al. used hospital treatment records to investigate the effect of psychoeducation

on symptoms of depression and anxiety and its impact on physical health, and the results showed that mental health education was able to reduce the likelihood of mental disorders in patients [7]. Liu, X. explored the changes and effects of the level of mental health of students with negative psychological symptoms and applied machine learning methods to model and analyze the susceptibility factors [8].

## 2. DATA FUSION MODEL

The data fusion model finds the corresponding optimal weighting values for each sensor with the help of adaptive finding and satisfies the minimum total mean square error in order to obtain the optimal fusion results. Figure 1 shows the adaptive data fusion algorithm model.

**Figure 1.** Adaptive data fusion algorithm model

Let the monitored values of  $n$  sensors be  $X_1, X_2, \dots, X_n, X$  for the true value to be estimated, variance in order  $\sigma_1^2, \sigma_2^2, \dots, \sigma_n^2$ . Independent of each other and  $x$  is estimated unbiasedly. The fused  $x$  and the weighting factor satisfy the following equation:

$$\hat{X} = \sum_{i=1}^n \omega_i X_j \quad \sum_{i=1}^n \omega_i = 1 \quad (1)$$

where the total mean square error is:

$$\Delta^2 = E \left[ \sum_{j=l}^n \omega_i^2 (X - X_i)^2 + \sum_{i=l, j=l, i \neq j}^n \omega_i \omega_j (X - X_i)(X - X_j) \right] \quad (2)$$

By treating the estimated true value  $X$  as a constant, the estimation is based on the mean value of the historical data of each sensor. Then the mean value of the  $k$  measurements is

$$x_i(k) = \frac{1}{k} \sum_{j=1}^k x_i(j) \quad (3)$$

The estimated value is:

$$\bar{X} = \sum_{i=1}^n \omega_i x_i(k) \quad (4)$$

The total mean square error is:

$$\Delta^2 = E \left[ \sum_{i=l}^n \omega_i^2 (X - x_i(k))^2 + 2 \sum_{i=l, j=l}^n (X - \bar{x}_j(k))(X - \bar{x}_j(k)) \right] \quad (5)$$

## 3. CONSTRUCTION OF INTELLIGENT SYSTEM OF MENTAL HEALTH EDUCATION FOR COLLEGE STUDENTS

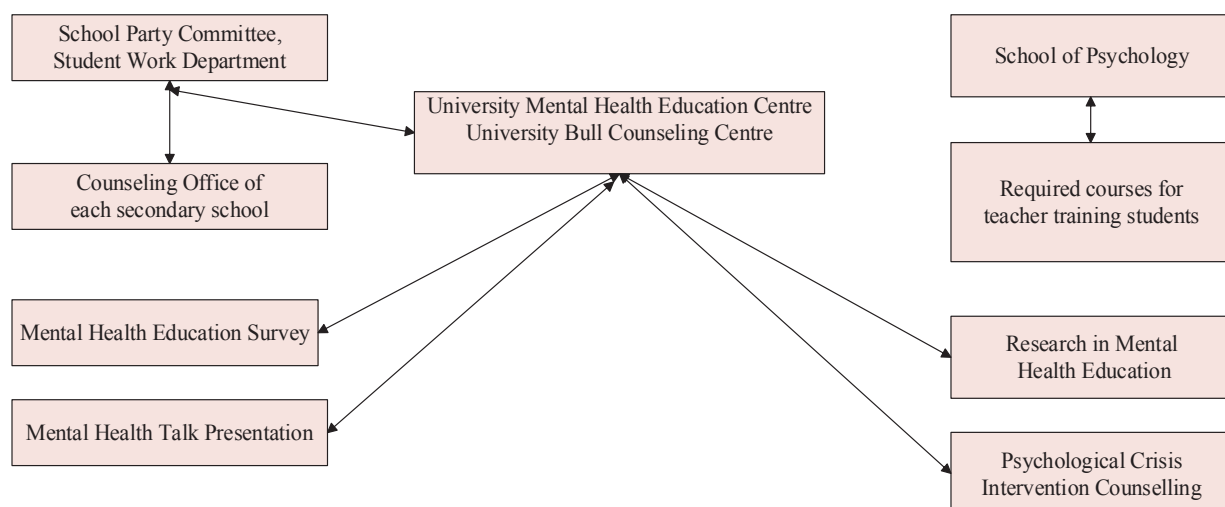

The data fusion model achieves more accurate and personalized educational support by integrating data from multiple sources, mining laws and patterns, and optimizing decision making and evaluation to support the construction of an intelligent system for mental health education of college students. This paper uses data fusion model to build an intelligent system for college students' mental health education, and the following is the main content.

### 3.1. FRAMEWORK COMPOSITION OF MENTAL HEALTH EDUCATION INTELLIGENT SYSTEM

Mental health education management system is two operating institutions, the Mental Health Education Center for college students under the leadership of the Party Committee of the university with the Department of Student Work as the guide, and the Counseling Center for college students with the School of Psychology of the second-level colleges as the leader. The Ministry of Student Work carries out mental health education activities for all students through the Mental Health Education Center and the student work departments of the second-level colleges. In accordance with the curriculum requirements arranged by the academic affairs department of the university, the School of Psychology offers compulsory courses on mental health education for all teacher-training students, as well as some elective courses on mental health education for all students.

The Mental Health Education Center, as a college student mental health education department established in accordance with national, provincial and municipal documents, is responsible for carrying out the school's mental health work and accepting inspection and supervision from higher authorities. Meanwhile, with the help of a team of peer counselors, it conducts general mental health tests and carries out special activities of mental health education for the entering freshmen every year.

The Counseling Center exists as an educational and teaching practice base for applied psychology in the School of Psychology, providing educational services to students and faculty. It is mainly responsible for, for students who are willing to seek help to use psychological expertise or skills to provide effective counseling and intervention: Familiar with the school's emergency plan for handling crisis events, and guide the docking secondary colleges to develop relevant plans. In response to the special needs of different colleges, they are guided to conduct thematic salons, psychological lectures and psychological workshops that meet the requirements of the colleges. Figure 2 shows the university mental health intelligence system.

**Figure 2.** University mental health education system

### 3.2. THE OPERATION PROCESS OF MENTAL HEALTH EDUCATION INTELLIGENT SYSTEM

The operation mode of the mental health education management system is that the two centers co-exist, and their work has independence and overlap. For the development of on-campus mental health activities and mental health survey, the Mental Health Education Center is responsible for them in cooperation with the counseling office of each second-level college and the graduate students of applied psychology. For individual psychological crisis intervention of college students on campus, the teachers of the School of Psychology in the Counseling Center are responsible. The creation of mental health education curriculum is designed by the Academic Affairs Office of the university and implemented by the School of Psychology. Figure 3 shows the operation model of mental health education.

Mental health general test, the establishment of all students' personality psychological profile, is the university for mastering the psychological situation of students, through standardized scales and annual analysis of the calculated norm, the basic screening of each year's entry of new students, targeted intervention to prevent the guarantee.

Psychological education activities refer to a series of psychological health education activities carried out by the Center for College Student Mental Health Education under the direct leadership of the Department of Student Work, in cooperation with graduate counselors, among all students in school. It includes a series of activities of the Student Mental Health Festival, special psychological salons, psychological reports for specific groups, OB group training with novel design, leaderless group discussion, box court sand tray game, relaxation training and other mental health knowledge and self-adjustment skills. We also make use of the Internet, WeChat platform, school and college radio, student magazines and other media to widely publicize and create an atmosphere.

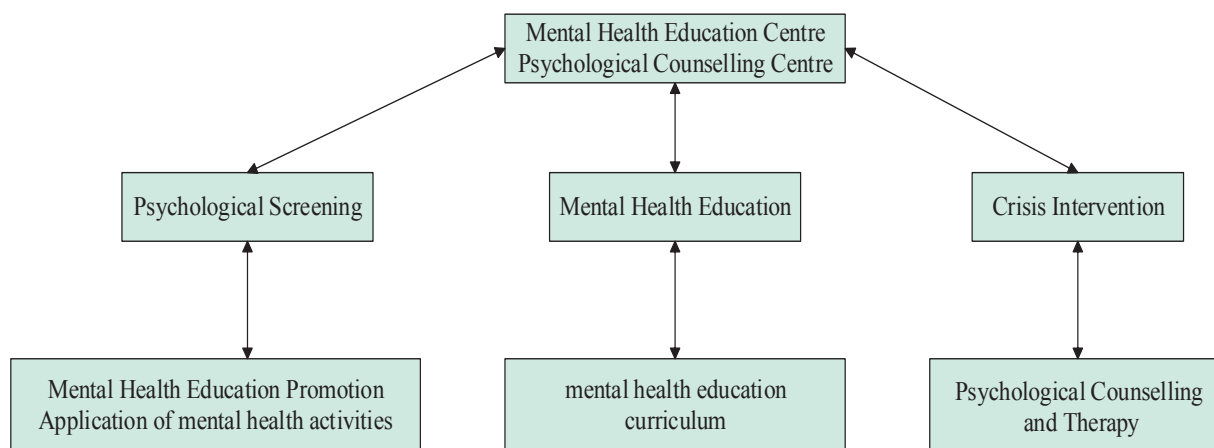

Figure 3. Mental health education operational model

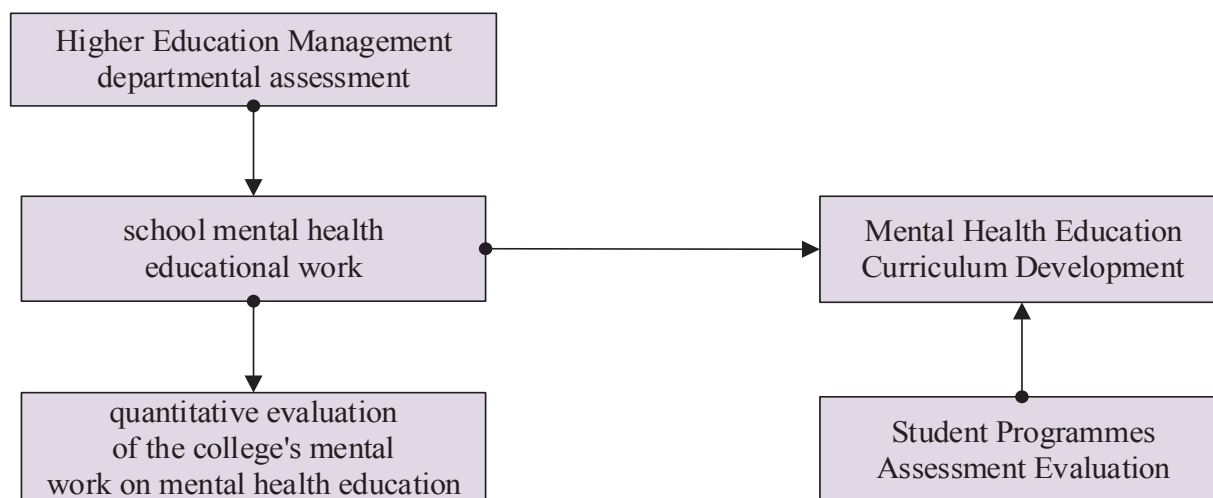

### 3.3. EVALUATION OF MENTAL HEALTH EDUCATION MANAGEMENT SYSTEM FOR COLLEGE STUDENTS

Figure 4 shows the university mental health education assessment and evaluation system. The assessment and evaluation system mainly includes the following aspects. One is the assessment of the university's hardware and supporting facilities, activity design and function creation required by the provincial and municipal higher authorities. Second, the university's target management assessment and evaluation of the development of mental health education work at each level, with emphasis on the assessment of the development of mental health work at each basic unit. Third, the students' evaluative assessment of course delivery within the academic affairs system.

The assessment points of the provincial and municipal higher authorities require sound institutional mechanisms at the school level to guarantee the basic conditions for the development of mental health work in schools. A well-developed curriculum and teaching system with a systematic knowledge structure. Content-rich activities to carry out, multi-channel expansion of educational support forms.

The school's target management assessment and evaluation observation points, including the sound organization of the second-level colleges, with dedicated personnel to regularly organize and carry out mental health education activities actively participate in the school's mental health education activities for college students.

Student evaluation observation points, student evaluation refers to course teaching evaluation and practical application effect evaluation, course teaching evaluation includes classroom knowledge teaching, case teaching, experiential activities and other content.

**Figure 4.** University mental health education assessment and evaluation system

#### 4. EVALUATION OF THE EFFECT OF MENTAL HEALTH EDUCATION FOR COLLEGE STUDENTS

In order to have a clearer picture of the impact of mental health education on students' mental health and the degree of improvement, we distributed questionnaires to 150 people in University D. 122 valid questionnaires were returned. A pre- and post-experimental group measurement design was used, and the study adopted a combination of objective measurements and subjective ratings.

Table 1 shows the difference tests before and after the members' experiment. The pre-test of students' self-efficacy was 32.66, and after the school's mental health education self-efficacy was 36.09, an increase of 3.53. The pre-test of students' life satisfaction was 15.39, and after the school's mental health education life satisfaction was 19.46, an increase of 3.08. The significant differences between the pre-test and post-test measures of self-efficacy and life satisfaction indicate that the school's mental health The difference between the pre and post measures of self-efficacy and life satisfaction was significant, indicating that the school's mental health education program had a positive effect on students' self-efficacy and life satisfaction.

**Table 1.** Tests for differences before and after member trials

	Pre-test	Post-test	t
Self-efficacy	32.66±6.56	36.09±8.98	-4.135*
Life satisfaction	15.39±4.45	19.46±9.46	-4.635**

Note: \*P<0.05, \*\*P<0.01

In the survey on “the part of mental health education that you benefit most”, 65% said that mental health education helps me a lot in terms of the number of new friends and my psychological state. 80% said that mental health education classroom teaching helps a lot and they learn a lot of psychological knowledge. 60% said that classroom group activities help a lot and they experience a sense of cohesion and belonging. Seventy percent thought that the practical assignments and reading exercises after the psychological classroom were very helpful. 65% thought that participating in various psychological education clubs was very rewarding in line with their personal interests. 68% thought that the social practice of mental health education was very helpful to them. Table 2 shows the positive feedback of psychological education. All in all, basically 70% of them think that the school’s mental health education is very helpful to their psychological construction. In terms of satisfaction with teaching, more than 70% of them said they were more satisfied. Figure 5 shows the satisfaction of teaching.

**Table 2.** Positive feedback on psychoeducation

Meet new friends	65%
Classroom group activities	60%
Mental Health Education Classroom Teaching	80%
Practical assignments and reading exercises after psychology classes	70%
Participation in various psycho-educational clubs in line with personal interests	65%
Mental health education social practice	68%

**Figure 5.** Teaching satisfaction

## 5. CONCLUSION

This paper constructs an intelligent system of mental health education for college students based on data fusion model, and analyzes the effect of mental health education in terms of teaching satisfaction, self-efficacy and life satisfaction. It is concluded that students’ self-efficacy increased by 3.53 and students’ life satisfaction increased by 3.08 after the school’s mental health education, and 70% of them thought that the school’s mental health education was helpful to their psychological construction. In terms of teaching satisfaction, more than 70% of them said they were more satisfied. It indicates that the mental health education of college

students based on the data fusion model is effective.

## ABSTRACT

This paper first analyzes the main problems of mental health education in colleges and universities, and discusses the specific significance of information-based teaching to mental health education teaching. Secondly, the four-dimensional integrated mental health education teaching model is constructed by using the idea of new discipline construction and informatization teaching theory, and the teaching design is carried out by group intelligence algorithm. Finally, a case study was conducted to verify the effectiveness of the four-dimensional integrated mental health education informatization teaching model. The results showed that more than 55% of the students agreed that the model could improve attention, learning resources utilization and sharing, and other effects. This shows that the four-dimensional integrated information-based teaching model can promote the development of information-based mental health education.

## 1. INTRODUCTION

With the development of educational philosophy, we have a deep understanding of education and teaching, based on the background of social development, it is crucial to promote the development of teaching to keep up with the times. Mental health education is a very broad concept, simply speaking, it is based on the ideological, psychological and behavioral characteristics of college students in different grades. Through different ways and methods of targeted phased education, in order to promote the improvement of college students' mental health and thus reduce the occurrence of psychological crisis events [1-2]. Mental health education in colleges and universities is carried out to promote the development of students' mental health, which has a very significant role in the improvement of students' competence and literacy awareness, so it is crucial to continuously strengthen the quality level of mental health education [3-5].

Students live and study in an information-based environment, with a strong sense of self and a large space for personality development and creative thinking. Students are more information conscious, their understanding of the Internet is gradually rationalized, they are better at using network software for information exchange, and they are more familiar with using the Internet to find resources, and most of them have a very strong sense of network participation [6-7].

In the context of the information era, a large number of information technologies have been introduced in production and life, which have a great impact on our production and life patterns. Therefore, based on the background of the information era, analyzing the development mode of mental health education can significantly promote the development and optimization of the current development mode, so that the future development mode of mental health education can be targeted and focused, and the positive significance is very far-reaching [8-9].

## 2. THE SIGNIFICANCE OF INFORMATION-BASED TEACHING OF MENTAL HEALTH EDUCATION IN COLLEGES AND UNIVERSITIES

### 2.1. THE MAIN PROBLEMS OF MENTAL HEALTH EDUCATION IN COLLEGES AND UNIVERSITIES

College students are important human resources, builders and successors of socialist modernization, which are related to the development of the country and the prosperity of the nation. Cultivating qualified builders and successors with good health quality for the country is an important function of all higher education institutions and an unshirkable responsibility of higher education providers. With the development of the times and the increasing prominence of mental health problems of college students, health education as an important part of school education has received more and more attention and focus. Through the research on the current situation of mental health education courses carried out in many colleges and universities, it is found that the main problems still exist in mental health education in colleges and universities are shown in Figure 1.

**Figure 1.** Problems of mental health education in higher education

Mental health education course for college students is a public course that integrates knowledge transfer, psychological experience and behavioral training. The uniqueness of this course determines that its teaching methods and organization should be different from other general disciplines, i.e., it requires both flexible and diverse teaching methods and forms, as well as behavioral training and interactive experience in order to achieve its teaching objectives. Due to the limitations of class time, teaching content and teachers' level, the teaching process of mental health education courses in colleges and universities. The teaching method is still mainly traditional lecture method, which is single and the students' participation is low, and it is difficult to penetrate the learned knowledge and methods into the students' actual study and life, which leads to superficial teaching effect.

### 2.2. THE SIGNIFICANCE OF INFORMATION-BASED TEACHING FOR TEACHING MENTAL HEALTH EDUCATION

Information-based teaching makes full use of the advantages of modern teaching media such as computers and Internet, bringing advantages that traditional teaching media cannot

match, mobilizing more teaching media and information resources, thus building an informative and knowledge-rich learning environment. In addition, the characteristics of computer interactivity, multimedia features, and hypertext features make it easier to create a situational teaching environment, which improves students' learning enthusiasm and allows them to actively explore knowledge instead of passively receiving knowledge and information.

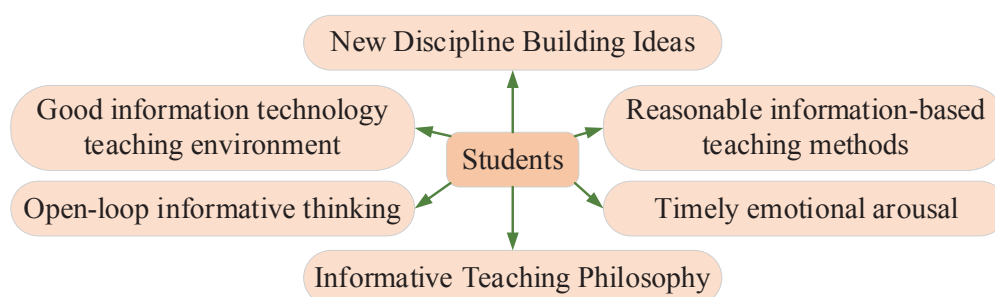

Mental health education activity course is a course guided by teachers, using activities as a carrier, allowing students to feel, experience, think and feel in the activities and gain psychological growth, forming a sound personality and good psychological quality. The traditional college mental health classroom is usually the teacher's lecture, abstract teaching, boring and empty theory is difficult to stimulate learning enthusiasm, and even the classroom teaching content and the actual life of students are disconnected, students have a lot of confusion is difficult to get answers, emotional experience blank, it is difficult to achieve the purpose and effect of teaching.

Therefore, it is especially important to let "information technology" into the mental health class. The main purpose of information-based teaching is to make use of the technical conditions provided by the network environment, abandon the teaching mode of "filling the classroom", and fully arouse students' interest in learning. In order to optimize the teaching content, improve teaching efficiency and stimulate students' creative thinking.

### 3. DESIGN OF FOUR-DIMENSIONAL TEACHING MODEL OF MENTAL HEALTH BASED ON GROUP INTELLIGENCE ALGORITHM

#### 3.1. CONSTRUCTION OF FOUR-DIMENSIONAL INTEGRATED MENTAL HEALTH EDUCATION TEACHING MODEL

Led by the idea of new discipline construction and informatization teaching concept, through constructing a good education and teaching ecological informatization environment, adopting reasonable and effective informatization teaching methods, and building a complete open-loop informatization mind map. Covering the emotional arousal of the teaching process, a new student-centered, four-dimensional integrated mental health education classroom informatization teaching method that cultivates students' comprehensive ability is proposed, and the structure of this model is shown in Figure 2.

**Figure 2.** A four-dimensional model for teaching mental health

In this method, the first three are external factors and the latter are internal factors. In the process of cultivating people, stimulating the subjective initiative of the trained person through emotional arousal is the guarantee for the realization of the cultivation goal. The information environment of education and teaching, the reasonable and effective information teaching method and the open-loop information thinking map as the external factors provide the external conditions for the realization of the goal of cultivating people.

### 3.2. FOUR-DIMENSIONAL INTEGRATED TEACHING DESIGN BASED ON SWARM INTELLIGENCE ALGORITHM SOLVING

Swarm intelligence is a general term for the collective intelligent behavior of a class of decentralized self-organized systems, which mainly simulates the phenomenon of collaboration or competition among individuals in the process of foraging or survival of natural groups of low-energy organisms, or the existence of interaction between individuals and the environment, and finally characterizes the intelligent behavior. The swarm intelligence optimization algorithm formed by scientists according to this has special advantages in solving engineering problems, such as the advantages of not requiring the continuity of the problem to be solved, derivability and not relying on gradient information, which has become a favorable tool for solving optimization problems nowadays.

In this example, although the objective function is relatively simple, there are more constraints, and it belongs to the optimization problem solving with nonlinear constraints, so the construction method of the penalty function in the course textbook is used to design. In this example, the outer point method is used, and the penalty function is constructed together with the constraints. With  $\max(\cdot, \cdot)$  denoting the larger of the 2 elements in parentheses selected, the penalty function can be written as

$$P(X) = \sum_{j=1}^n (\max(0, g_j(X)))^2 \quad (1)$$

where  $g_j(X)$  is an inequality constraint.

The fitness function that incorporates the penalty function and the objective function can be written as

$$F(X, \gamma) = f(X) + \gamma \cdot P(X) = f(X) + \gamma \cdot \sum_{j=1}^n (\max(0, g_j(X)))^2 \quad (2)$$

Where  $\gamma$  is the penalty factor, and if it is chosen large enough, the solution of the unconstrained problem  $F(X, \gamma F(x, \gamma))$  will be close to the solution of the original problem  $f(X)$ , and the complex nonlinear constrained optimization problem is transformed into a relatively simple unconstrained problem.

As a result, the design of the four-dimensional teaching model can be realized through mathematical quantification, and then the information-based teaching of efficient mental health education can be realized, and the information-based development of mental health teaching in colleges and universities can be promoted.

### 4. EMPIRICAL ANALYSIS OF THE FOUR-DIMENSIONAL INFORMATION TEACHING MODEL OF MENTAL HEALTH IN COLLEGES AND UNIVERSITIES

In order to verify the effectiveness of the four-dimensional all-in-one informative teaching model of mental health education in colleges and universities designed based on the swarm intelligence algorithm in this paper, this chapter takes the mental health education course of a university in S city as an example and carries out a semester of teaching with the four-dimensional all-in-one informative teaching model. At the end of the semester, the role of the four-dimensional integrated informatization teaching mode in improving the teaching effect of the mental health education course was investigated, and the specific results are shown in Figure 3.

In terms of the role of the four-dimensional integrated information-based teaching mode in

improving the teaching effect of mental health education courses, the highest percentage of agreement was 78.52%, which believed that the information-based teaching mode could effectively improve students' attention, and the second highest percentage of agreement was 75.61%, and indicated that the mode could effectively promote the use and sharing of learning resources. The remaining roles all have an approval rate of more than 55%, and the larger the percentage chosen, the higher the recognition and deeper the students' knowledge of the role.

**Figure 3.** Teaching effectiveness of the four-dimensional teaching model

According to the proportion of students' choices, the effects of the information-based teaching mode on improving the teaching effectiveness of mental health education courses are, in order, enhancing students' attention, promoting the use and sharing of learning resources, enriching teaching contents, enhancing teacher-student interaction, deepening the understanding of teaching contents, improving students' interest in learning, and promoting cooperative learning among students. This shows that the four-dimensional integrated information-based teaching mode constructed in this paper can effectively promote the characteristics of innovative teaching methods, diversified information presentation, sharing of teaching resources and flexible teaching strategies, which can effectively enhance students' learning interests in mental health teaching courses and promote the development of information-based mental health education in colleges and universities.

## 5. CONCLUSION

This paper starts from the main problems of mental health education in colleges and universities, and analyzes the specific significance of information-based teaching to mental health education teaching. Based on the idea of new discipline construction and informatization teaching theory, the four-dimensional one mental health education teaching model was constructed and given a group intelligence algorithm for teaching design. The teaching effect of the four-dimensional one information-based teaching model was analyzed with examples, and the results showed that 78.52% of the students thought that the information-based teaching model could effectively improve students' attention. This shows that the four-dimensional integrated informatization teaching mode given in this paper can promote the informatization development of mental health education in colleges and universities.

## ABSTRACT

This paper firstly discusses the classification of diversified financing channels in universities and analyzes the specific significance of diversified financing channels. Secondly, in order to better avoid the risks arising in the process of financing, the risk control of financing is based on differential game theory to achieve the optimal control of financing channels in colleges and universities. Finally, taking College A as an example, the empirical analysis was conducted and rationalized suggestions were given. The results show that the current financing channels of colleges and universities are mainly financial allocation and tuition fee income, which account for more than 90% of the total. This indicates that colleges and universities need to further optimize the financing channels and use BOT mode and donation to achieve financing from multiple perspectives to improve the efficiency of college operation.

## KEYWORDS

Universities; Financing channels; Risk control; Differential game; Diversification; BOT model

## 1. INTRODUCTION

With the continuous reform of higher education system, the expansion of colleges and universities and the accelerated pace of massization of higher education, the scale of higher education has been growing. The expansion and development of higher education cater to the demand of social and economic development for high-quality workers and meet the strong desire of people to receive higher education [1-2]. However, many problems that cannot be ignored have emerged in the process of expansion and vigorous development of colleges and universities, such as inadequate running conditions, structural shortage of faculty, and difficulty in guaranteeing teaching quality [3-4].

Although the central and local governments have been increasing financial allocations, their growth has not been able to keep pace with the development of higher education. The traditional financing mode of relying solely on government appropriation has become more and more difficult to meet the funding needs of universities, and the shortage of funds has become a major development obstacle to the expansion of university scale and quality improvement [5-6]. Therefore, actively expanding diversified fundraising and financing channels to enrich school running funds has become an important concern for universities.

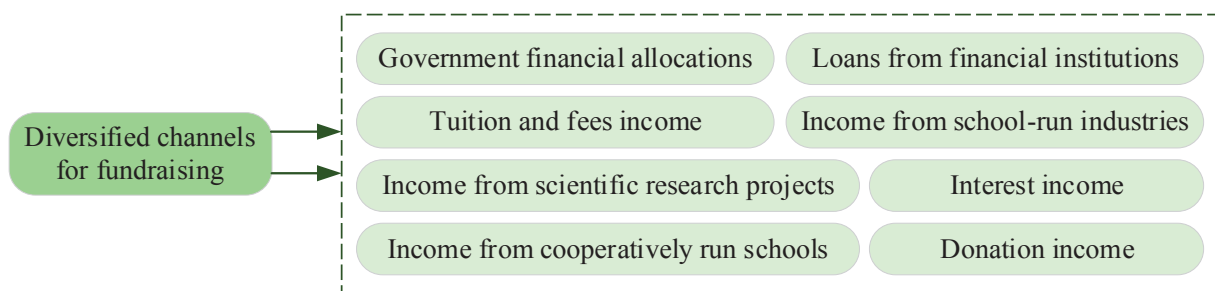

In order to solve the above problems, colleges and universities generally adopt such means as expanding campus area, building new buildings, introducing talents, purchasing books and materials, acquiring instruments and equipment, and improving teaching facilities to improve the school conditions, all of which require sufficient financial support [7-8]. Therefore, universities must rely on their own "management" ability, expand diversified financing channels,

break the bottleneck of capital shortage, and at the same time, avoid various risks brought by financing, so as to truly achieve sustainable development [9-10].

## 2. DIVERSIFICATION OF FINANCING CHANNELS AND SIGNIFICANCE OF UNIVERSITY FUNDRAISING

### 2.1. CLASSIFICATION OF DIVERSIFIED CHANNELS OF FUNDRAISING IN HIGHER EDUCATION

With the introduction of the national policy of encouraging colleges and universities to raise funds through multiple channels, colleges and universities have started to actively explore diversified financing modes and make efforts to broaden financing channels to meet their growing fund demands. At present, the diversified financing mode of colleges and universities has taken shape, and a diversified education financing structure mainly based on financial allocation and tuition fees, supplemented by other financing channels has been formed initially. The classification of diversified financing channels for colleges and universities is shown in Figure 1.

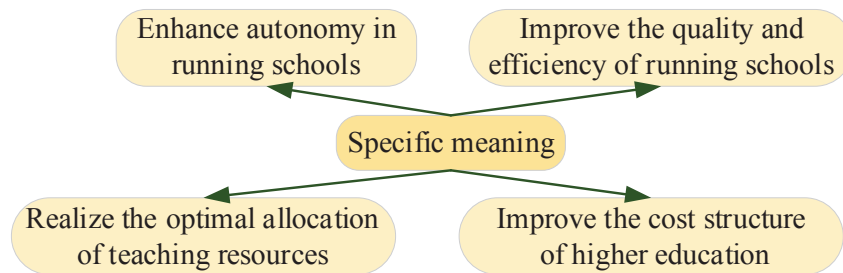

**Figure 1.** Diversified channels for raising financing for colleges and universities

The financial allocation refers to the educational expenses arranged and allocated to the University by the central or local governments, including the allocation for educational expenses, research expenses, infrastructure expenses and other expenses. The income from tuition and fees mainly refers to tuition and accommodation fees collected from students. Loans from financial institutions mainly refer to the reimbursable funds for teaching, scientific research and infrastructures obtained by universities through various financial institutions, which are mainly loans from commercial banks at present.

### 2.2. SIGNIFICANCE OF DIVERSIFYING FINANCING CHANNELS IN HIGHER EDUCATION

As colleges and universities are the positions of spreading knowledge, developing science and technology and transforming science and technology, colleges and universities must analyze their own advantages and disadvantages by combining international and domestic forms of education to carry out the sustainable development of colleges and universities. The diversification of financing channels of colleges and universities can effectively enhance the autonomy of colleges and universities, further improve the cost structure of colleges and universities, realize the optimal allocation of resources, and improve the quality and efficiency of colleges and universities. The significance of diversified financing channels of colleges and universities is shown in Figure 2.

**Figure 2.** The significance of diversifying financing channels

At present, the unbalanced development of running conditions and running environment of colleges and universities has caused the low utilization rate of running resources and high management cost of colleges and universities which seriously affect the quality and efficiency of running colleges and universities. Therefore, enhancing the internal construction of colleges and universities and optimizing resource allocation have become the outstanding for colleges and universities to improve the quality and efficiency of running schools at present.

### 3. RISK CONTROL OF UNIVERSITY FUNDRAISING BASED ON DIFFERENTIAL GAME

College financing is the way to improve the quality of college operation and optimize the optimal allocation of educational resources. However, the diversification of financing channels also makes the financing of colleges and universities have certain risks. Based on the big data analysis technology, this chapter proposes the differential game to realize the risk control of college financing, so that colleges and universities can better realize financing and ensure the safety of college financing even if the financing channels are diversified.

The idea of differential games can be applied to rational human decision making, so differential games have been intensively studied and widely used in various decision making scenarios in management and economics. If the time interval is  $[t_0, T]$ ,  $t_0$  is the initial time,  $T$  is the end time, and the game participant is written as  $i \in \{1, 2, \dots, n\}$ , there exists a control variable strategy  $u_i(t)$  for the game player and a state variable strategy  $x(t)$  satisfying:

$$x(t) = f(t, x(t), u_1(t), \dots, u_n(t), x(t_0)) = x_0 \quad (1)$$

where,  $x_0$  is the initial condition of the state equation.

At this point the objective function is:

$$\max \int_{t_0}^T g_i(t, x(t), u_1(t), \dots, u_n(t)) dt + Q_i(x(T)) \quad (2)$$

$i, t, f, g$  above are differentiable, and it is clear from the presentation that the differential game is essentially an optimal control problem on a continuous time interval.

### 4. EMPIRICAL ANALYSIS OF DIVERSIFIED FINANCING CHANNELS FOR UNIVERSITIES

#### 4.1. DATA ANALYSIS OF FUNDRAISING MODELS IN HIGHER EDUCATION

In recent years, the internal structure of education funds of colleges and universities has been changing, and the proportion of financial education funds in the total income is decreasing year by year. The business income, such as tuition and miscellaneous fees and revenue-generating income, shows a rising trend year by year, which indicates that colleges and universities have gradually established a diversified financing mode mainly based on financial

appropriation, supplemented by tuition fees, income from school-run industries and social donations. In this section, we take the fundraising and financing channel data of College A in the past five years as an example, analyze the problems arising from the diversification of fundraising and financing channels of College A, and then give certain suggestions for the construction of diversified fundraising and financing channels.

Figure 3 shows the composition structure of College A's revenue sources from 2017-2021.

From the composition structure of College A's revenue sources from 2017-2021, College A's financial allocation and tuition and fees can account for more than 90% of the total revenue in all years. Especially after the successful restructuring and promotion of College A in 2019, the proportion of financial appropriation increases significantly, reaching 71.56% in 2021, and financial appropriation and tuition and fees reach more than 98% of the total revenue. Other financing channels only account for a very small portion, and even show a decreasing trend year by year. This shows that the overall financing structure of College A is relatively single, with financial allocation and tuition and fees accounting for the majority of revenue sources, while other financing channels, such as revenue-generating income and social donations, are negligible. Under the constraints of the traditional system, College A lacks the enthusiasm and innovative thinking of multi-channel fundraising, and only focuses on finance and students, which ultimately cannot provide a broad source of funds for its long-term development.

In addition, a survey was conducted for the changes of College A's debt from 2017-2021. Due to unclear property rights, poor operation and management, and debt disputes, College A's school-run industries have deteriorated in recent years and have been closed or disposed of one after another. As a result, College A lacks an important source of funds, which is the income from school-run industries. In addition, due to the low visibility of College A and the lack of a well-developed local social donation organization system, the school's other income such as donations is extremely limited, accounting for less than 5% of the total income since 2017.

**Figure 3.** College A's revenue streams from 2017 to 2021

## 4.2. SUGGESTIONS FOR DIVERSIFYING FUNDRAISING CHANNELS IN HIGHER EDUCATION

Universities should take the initiative and actively seek donations from all walks of life. Set up a special fund-raising agency with dedicated staff responsible for raising funds, and establish a practical endowment fund management system and a long-term effective fund operation and development mechanism. Give full play to the role of the alumni liaison office, establish long-term contact mechanisms with graduates, and take the initiative to return to their alma mater when they have the ability to do so, and donate funds to run and develop their alma mater. Universities should improve their own scientific research, establish a perfect cooperation mechanism, actively seek projects that can bring into play the school's professional expertise, and actively seek cooperation. Joint education with enterprises can solve a series of problems such as lack of facilities and financial constraints, provide students with internship sites and increase their practical experience. Colleges and universities should make full use of the BOT mode for financing construction projects, by signing construction contracts, during the validity of the agreement, the project company will finance the construction of college infrastructure and be responsible for the operation and maintenance, and regularly collect usage fees. Colleges and universities can also apply for special funds for national bonds and issue education bonds for financing mainly with negotiable long-term type and ultra-long-term type bonds.

## 5. CONCLUSION

This paper analyzes the risk control strategy of college fundraising and financing by using differential game, starting from the classification and specific meaning of diversification of college fundraising and financing channels. In order to seek the diversification of college financing channels, an empirical analysis was conducted using College A and rationalized suggestions were put forward. The results show that the financing channels of colleges and universities are mainly financial appropriation and tuition and fees, which can account for more than 90% of the total income in all the years. This shows that the current financing channels of colleges and universities are relatively single, and it is necessary to use BOT mode, donation investment and other aspects to diversify financing channels, further improve the efficiency of college financing and realize the effective improvement of college operation efficiency.

## ABSTRACT

The rapid development of technologies such as the Internet, 5G technology, and artificial intelligence has not only changed the form of education, but also made the advantages of STEM education, which aims to cultivate innovation and problem-solving abilities, increasingly apparent. Through the literature published in core journals in the field of STEM education in China, we can glimpse the current research status, research issues, and development trends in the field of STEM education in China. This not only has great significance for the development of STEM education research in China, but also provides some supplementary research data for international STEM education. The bibliometric method was used to analyze the overall trend, high-frequency word distribution, and clustering of the literature from 2012 to 2023 in the CNKI database of Peking University core and CSSCI journals as data sources, and to construct a knowledge map with the visualization advantage of CiteSpace tool to examine the current situation, hot topics and development trend of STEM education research in China. The results show that, based on the Internet and artificial intelligence, the number of STEM education research in China has been steadily increasing in general, and the hot topics cover three aspects: STEM education philosophy and education policy, STEM curriculum design and STEM literacy, and the emerging research frontiers cover curriculum design, but the cooperation network of research scholars and research institutions is scattered and the depth of research needs to be strengthened.

## KEYWORDS

STEM Education; Interdisciplinary Literacy; Innovation Awareness; STEM Curriculum; CiteSpace

## **1. INTRODUCTION**

As an internationally recognised form of interdisciplinary education, STEM education is becoming increasingly evident for its interdisciplinary problem-solving capabilities. With the rapid development of technologies such as the Internet, 5G technology and artificial intelligence, STEM education is also an opportunity for collaborative human-machine teaching [1]. STEM education originated in the United States and has been developed over the past 30 years. It has gradually become a strategic choice for countries around the world to implement new changes in education in the 21st century [2-3]. With the global spread of STEM education, China has also made use of the opportunity of innovation and entrepreneurship to make STEM education flourish, and has made great progress in terms of theoretical research, educational application practices and related science and technology policies [4-5], although there are also problems and challenges. This study takes advantage of the bibliometric method to visualise and measure the literature in a specific field. The aim is to track and analyse the research trends and directions of STEM education in China, explore and find the frontiers of research, in order to provide some reference for further research and localised practical application of STEM education in China. In addition, it reveals the current research status and research hotspots of STEM education in China, as well as forward-looking recommendations, with a view to providing data references for international STEM education.

## **2. DATA SOURCES AND STUDY DESIGN**

### **2.1. DATA SOURCES**

In order to ensure the authority of the literature and the reliability of the data sources, the Peking University core journals and CSSCI journals in China Knowledge Network (CNKI) were used as the data sources for this study. In addition, in order to ensure the comprehensiveness of the literature, we searched the literature with “STEM education” or “STEAM education” as the theme, title and keywords, and searched the literature collected from January 1, 2012 to June 13, 2023 (because the research on STEM education in China started to develop after 2012(China Academy of Educational Sciences, 2017), so the search The study was based on these 820 Chinese literatures. This study uses these 820 Chinese literature as the research sample to conduct bibliometric statistics and visual analysis of STEM education research in China based on the Internet and artificial intelligence.

### **2.2. RESEARCH METHODOLOGY AND TOOLS**

CiteSpace is a visual analysis tool developed by Professor Chao-Mei Chen, a Chinese-American scholar at Drexel University in the USA, which combines the principles of co-citation analysis and pathfinding network algorithms [6-7] to present the evolution of knowledge domains in a It is designed to represent the evolution of the knowledge domain on a network map, and to characterise the research hotspots and frontiers in a co-occurrence knowledge map [8]. In view of this, this study uses CiteSpace (version 6.2.R2) to create a visual knowledge map to collate and analyse research results on STEM education in China, with a view to revealing the current status, hot spots and development trends of STEM education research in China in a more objective manner.

## **3. THE GENERAL STATE OF STEM EDUCATION RESEARCH**

### **3.1. DISTRIBUTION OF THE NUMBER OF STEM EDUCATION RESEARCH PAPERS**

The number of research papers published can present the evolution and development of research results in the research field, revealing the trends and hotness of the field.

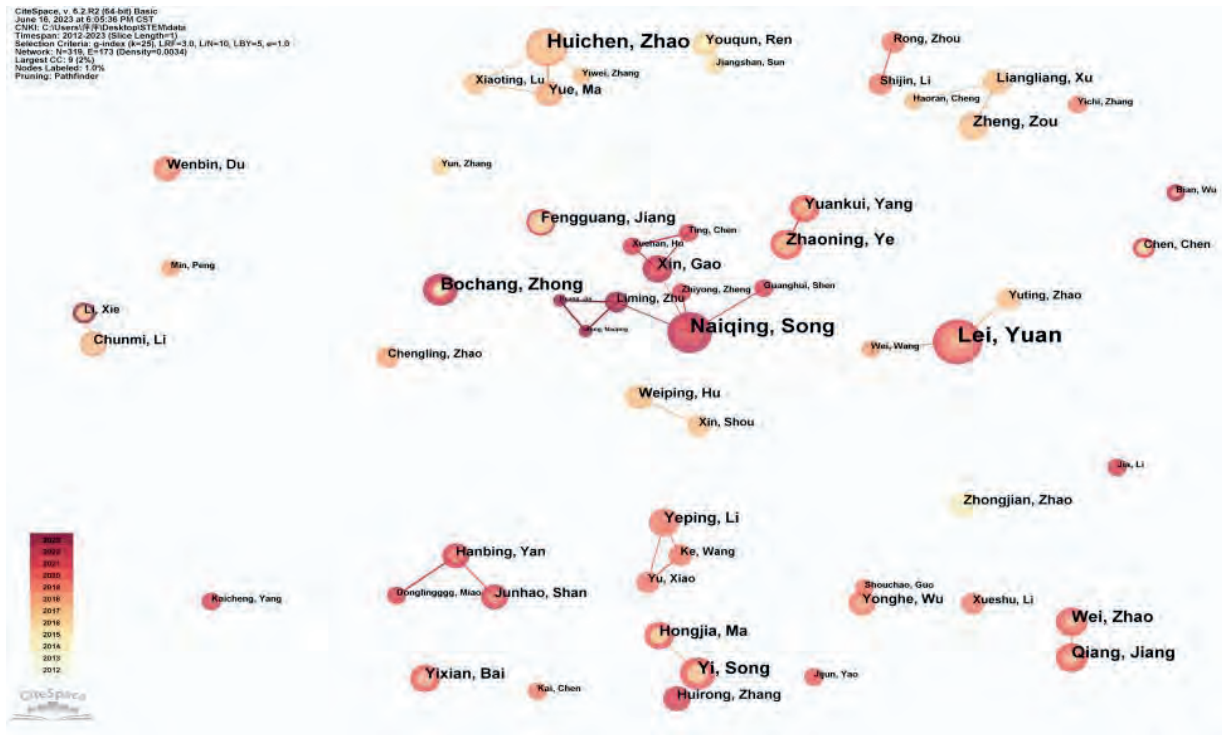

**Figure 1.** Distribution of annual publication volume from 2012 to 2023

The statistics of the 820 valid papers collected according to time distribution (Figure 1) reveal that: the year 2019 is the watershed year for STEM education research, and the number of studies from 2012 to 2019 shows a steady upward trend. From 2015 to 2019, STEM education research explodes, research content deepens, and STEM education receives increasing attention from scholars; from 2020 to 2023, although the number of publications is weak, even with the incomplete number of publications in 2023, the average annual volume of literature in this period reaches 103. This indicates that STEM education research in China has entered a phase of rapid development and is becoming a hot spot for scholars.

### 3.2. ANALYSIS OF THE NUMBER OF CORE AUTHOR PUBLICATIONS AND COLLABORATIVE NETWORKS

The development of STEM education research cannot be achieved without a core of researchers with a significant number of publications and scholarly research capabilities, so core authors need to be examined in terms of indicators such as author publications and author collaboration analysis. According to Price's law and Locat's law, the core authors can be identified by  $M = 0.749\sqrt{N_{\max}}$  ( $N_{\max}$  is the number of articles by the most prolific authors), the minimum number of articles by core authors in STEM education research in China from 2012 to 2023 is calculated as three. The most prolific author is Yuan Lei, and the top six core authors are presented: Yuan Lei(15 articles), Song Naiqing (13 articles), Zhao Huichen (13 articles), Zhong Bochang (9 articles), Song Yi(8 articles), Ye Zhaoning (8 articles). It can be seen that they are the high-output scholars in the field of STEM education in China, and they have made pioneering attempts in the pre-research work on STEM education in China.

Using CiteSpace (Author module) to analyse the collaboration of posting authors and plotting to form an author collaboration network map (Figure 2), the distribution and collaboration of core authors in STEM education can be obtained. In terms of author collaboration networks, six research teams have basically formed in the field of STEM education research in China. These research teams are mostly colleagues from the same institution, with less inter-institutional and interdisciplinary collaboration. There are also many independent authors outside the core authors, some of whom have collaborated on a single occasion, but the collaborations are fragmented and do not form a team.

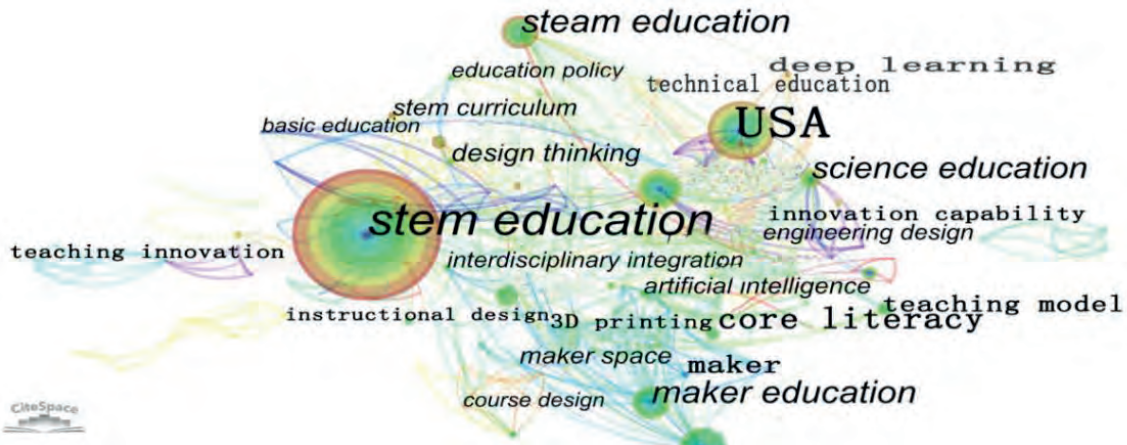

**Figure 2.** Mapping of the collaborative network of study authors

(Note: the brighter the colour and the thicker the line, the more collaborative the study author.)

#### 4. HOT TOPICS IN STEM EDUCATION RESEARCH

Knowing the research hotspots and research themes of a research field can plan future research directions. Therefore, through the analysis of keyword word frequency and co-occurrence clustering analysis, the hot topics of STEM education research in China can be further explored [9].

**Figure 3.** STEM education research topic word co-occurrence mapping

##### 4.1. KEYWORD WORD FREQUENCY AND CO-OCCURRENCE ANALYSIS

Keywords are a high level summary of the research topic of an article, and with the help of keyword word frequency analysis, the research hotspots and development trends of the research field can be obtained. CiteSpace (Keyword module) was used to analyse the keyword frequency statistics, with the annual interval of 2012-2023, the density between nodes was 0.0047. The top 14 most frequent keywords were extracted according to their frequency, forming Hot topic words in the field of STEM education research in China from 2012 to 2023, plotted to form a co-occurrence map of research topic words (Figure 3).

It can be seen that the current research in this field is mainly focused on STEM education, involving the research of STEM, science education, creative education, steam education, interdisciplinary, design thinking and other branches in the United States.

## 4.2. KEYWORD CLUSTERING ANALYSIS

After word frequency and co-occurrence analysis of keywords to obtain hot topics, clustering analysis can be performed to obtain research hotspots in STEM education. Keyword clustering was performed in CiteSpace and the effect of the clustering map was judged by the module value  $Q$  and the average profile value  $S$ <sup>①</sup> based on the network structure and the clarity of the clusters. After selecting pathfinder analysis, only the top 10 clustering labels were retained to improve the readability of the map, which was drawn to form a clustering map of STEM education research (Figure 4). The clustering atlas showed that the  $Q$  value = 0.8689 > 0.3, indicating a significant delineated association structure, and the  $S$  value = 0.987 > 0.7, indicating that the clustering was efficient and convincing. The STEM education cluster mapping therefore delineates associations with significant structure and good clustering, and is able to reveal development hotspots from the overall characteristics of STEM education research.

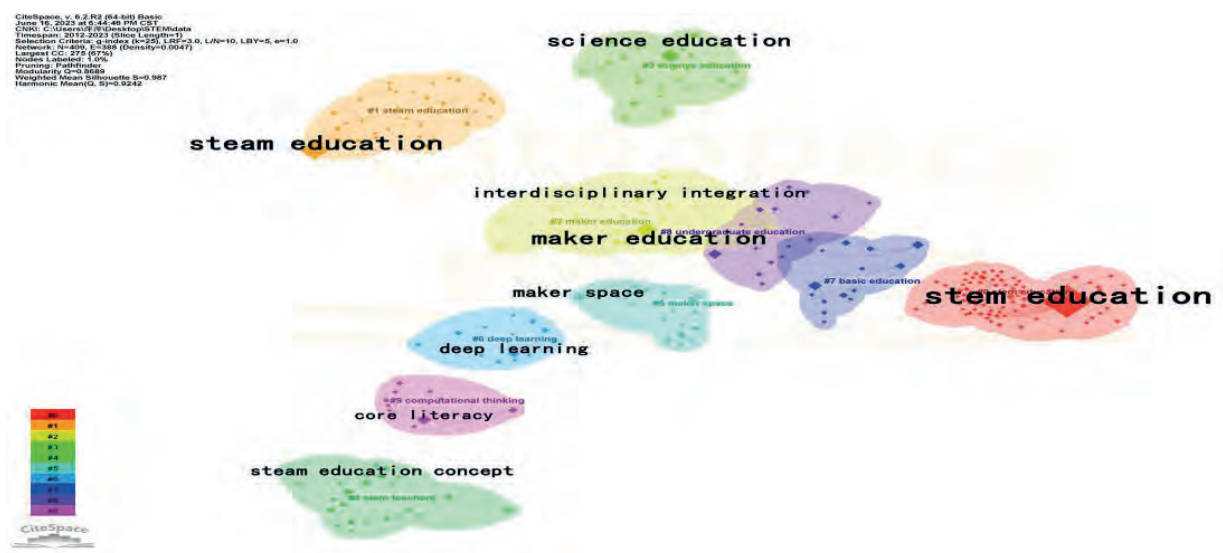

Figure 4. STEM education clustering mapping

In Figure 4, the ten main clusters are: #0 stem education, #1 steam education, #2 maker education, #3 science education, #4 stem teachers, #5 maker space, #6 deep learning, #7 basic education, #8 Undergraduate education, and #9 core literacy. By organizing the cluster information (Table 1), it can be found that “stem education” is the largest cluster, which indicates that stem education research embodies the STEM education concept. The clusters with the highest cluster efficiency are “stem education,” “stem education,” “maker education,” and “maker education. maker education” and “stem teachers”. As can be seen from Table 1, most of the clusters were born in 2016-2018 and 2019, which correspond to two “active periods” of STEM education research in China, during which the research scope gradually gathered and research results began to be abundant.

Using the clustering information aggregation function provided by CiteSpace and the content of the clustered class clusters, the 10 main keywords can be clustered into three

①  $Q$  value (Modularity) is a measure of modularity in the interval  $[0, 1]$ ,  $Q > 0.3$  means that the structure of the delineated associations is significant;  $S$  value (Weighted Mean Silhouette) is a measure of the homogeneity of the network,  $S > 0.5$  means that the clustering is reasonable,  $S > 0.7$  means that the clustering is efficient and convincing.  $S > 0.5$  means that the clustering is reasonable, while  $S > 0.7$  means that the clustering is efficient and convincing.

major hot topics of STEM education research. The three hot themes cover focus on STEM education philosophy and education policy (#0 stem education, #1steam education, #4 stem teachers), focus on curriculum design (#2 maker education, #3 science education, #4 stem teachers, #5 maker space, #6 deep learning, #7 basic education, #8 Undergraduate education), and focus on STEM literacy (#9 core literacy).

**Table 1.** Keyword clustering summary table

Subject Number	Cluster Number	Cluster Name	Silhouette Degree	Clustering Size	Average year
1	#0	stem education	1	78	2018
	#1	steam education	1	38	2018
	#4	stem teachers	1	24	2019
2	#2	maker education	1	28	2016
	#3	science education	0.984	28	2018
	#5	maker space	0.996	18	2018
	#6	deep learning	0.961	15	2019
	#7	basic education	0.967	15	2017
3	#8	Undergraduate education	0.959	14	2018
	#9	core literacy	0.875	11	2018

## 5. RESEARCH TRENDS IN STEM EDUCATION

With the time variable as the horizontal axis and the cluster name and number as the vertical axis, CiteSpace can be plotted into a cluster timeline mapping, showing the historical trajectory and time span of each cluster theme, which provides a reference for us to study the evolutionary path of each theme [10]. Based on the keyword timeline mapping, the research on STEM education in China from 2012-2023 can be divided into three phases:

Phase 1: The beginning of STEM education research (2012-2014). The number of STEM education research literature in this phase is relatively small, involving fewer subject terms and clusters, mainly related to STEM education, the United States, technology education and science education, and other subject terms and clusters have not yet been generated. The relevant articles mainly focus on topics such as STEM education philosophy, STEM education in the US and changes in education policies, which are positive guides for subsequent STEM education research.

Phase 2: The development period of STEM education research (2015-2019). The number of STEM education research literature in this stage has grown explosively compared to the nascent stage, involving more subject terms and clusters, and most high-frequency subject terms have been revealed in this stage. Relevant articles mainly focus on creative education, creative spaces, interdisciplinarity, project-based learning, artificial intelligence, computational thinking, core literacy and curriculum design, which have an important leading role in subsequent STEM education research.

Phase 3: The consolidation period of STEM education research (2019-2023). The number of STEM education research literature in this phase decreases compared to the previous phase but the average annual number of publications is still high, and new themes emerge from the existing themes, such as integration, deep learning, knowledge construction, innovation ability, and learning progression.

## 6. RESEARCH FINDINGS

This study based on the Internet The current situation, hot topics and development trends of STEM education research in China were discussed based on the Internet and artificial intelligence, and the following conclusions can be obtained:

First, in terms of the overall research trend, the wide range of sources of research papers published in journals and the high number of papers indicate that STEM education research in China is currently showing rapid development, with a new research high in 2019. It is evident that Chinese STEM education research is gradually maturing, and the future STEM education research fever will also be in a period of academic prosperity.

Secondly, from the co-occurrence map of core authors and research institutions, a core author research team has basically been formed for STEM education research in China, but the density of author and research institution cooperation network is low and the cooperation network is relatively scattered, indicating the lack of academic links between research authors and between research institutions. Teacher training colleges and universities are currently the main site of STEM education research, but further strengthening of the integration of theory and practice is needed.

Thirdly, from the keyword co-occurrence mapping, the more frequent subject terms are “stem education”, “United States”, “creator education”, “science education”, “steam education”, “maker education”, and “science education”, “science education”, “steam education”, “maker education”, “ science education”, “core literacy”, etc. Based on the keyword cluster analysis mapping, the three hot topics of STEM education research in China are sorted out: STEM education philosophy and education policy, STEM curriculum design and STEM literacy.

Fourth, the keyword timeline mapping and keyword emergence mapping reveal the development trend of STEM education research in China, and can be categorised into the starting period (2012-2016), the development period (2016-2019) and the consolidation period (2019 -2023). In addition, the analysis of timeline mapping and keyword emergence mapping summarises the next frontier directions of STEM education research development for reference in the next relevant research.

## ABSTRACT

At present, the data of online service hall and application system cannot be exchanged in both directions, which leads to duplication or fragmentation of services between online service hall and application system. To this end, this paper designs a converged online service hall based on the service governance concept, frames the service hall platform, innovatively designs its service functions, and uses convergence technology and service governance technology to realize the deep integration of data, applications, services, messages, and pages, thus providing users with a unified service portal, and finally tests the platform, and the test results are consistent with the expected results. This shows that the data fusion technology effectively solves the data sharing problem, and the service flow technology effectively realizes the business system process reengineering.

## KEYWORDS

Syncretic online service hall; Service management; Data fusion technology; Service Governance Technology; Cordys

## 1. INTRODUCTION

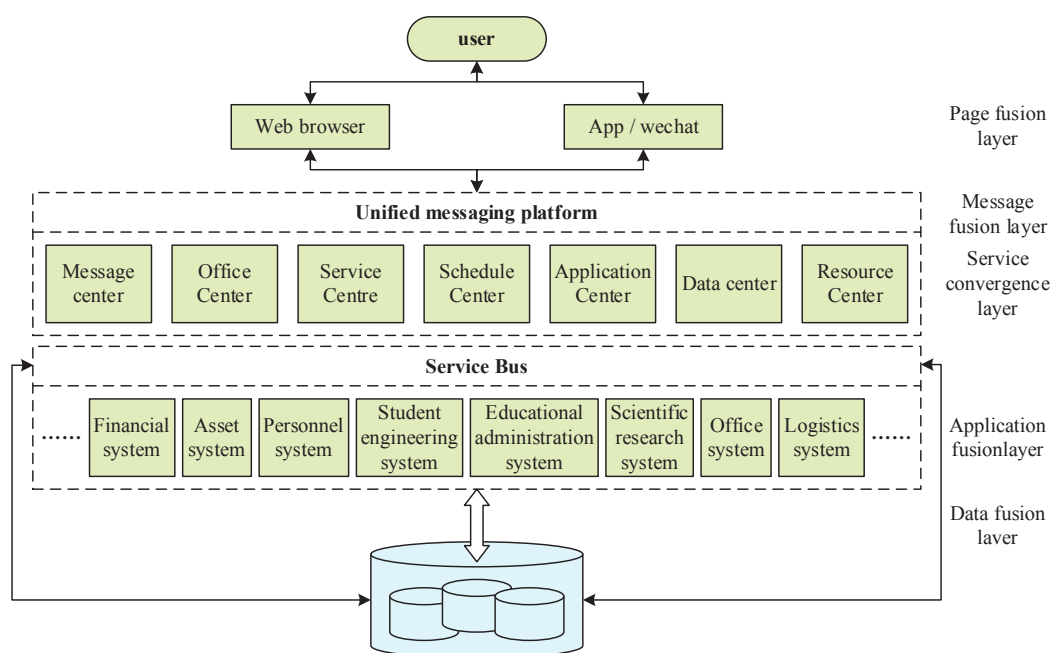

The informatization level of colleges and universities has experienced the stage of networking and digitization, and is entering the stage of smart campus construction. In the construction stage of smart campus, colleges and universities are in full swing to build various user-oriented portals and application systems, such as school website, information portal, OA office system, network teaching, campus card and various management systems. Each application system "acts in its own way", the business and data are separated, and the business work, filling in data. When searching for data, the application system is often switched constantly. It is difficult to find information, services and affairs, resulting in low utilization rate of the application system [1].

In order to solve this problem, colleges and universities have begun to build a unified portal, online service hall and one-stop service hall in recent years. They want to realize online service, online approval and provide one-stop service, but in fact the user experience has not been substantially improved. Therefore, based on the concept of service governance, an integrated online service hall is proposed. Through the integration and interworking of data layer, application layer and information layer, it provides teachers and students with one-stop services of unified page entry, unified information service, unified service, unified application service and unified data, so as to truly realize one-stop service [2].

## 2. PLATFORM ARCHITECTURE

The integrated online service hall based on service governance is based on the traditional online service hall. Driven by service, it microservices the application functions of each application system, separates the involved information, applications and data from the application system [3], integrates them according to business process and service process, and integrates them in the integrated online service hall to realize one-stop integrated service, provide a unified service entrance for teachers and students, and teachers and students do not need to pay attention to each application system.

Figure 1 is the system hierarchy diagram of the integrated online service hall, including five levels: data fusion layer, application fusion layer, service fusion layer, message fusion layer and page fusion layer from bottom to top.

**Figure 1.** Overall architecture of the system.

## 3. SERVICE FUNCTION DESIGN

(1) Message Service Center: The message center is to integrate news, notifications and messages from the platform, OA, information portal, WeChat official account and other platforms seamlessly to the fusion portal of the platform, forming the notification center of the fusion portal, and realizing the unified view, unified release and management of the fusion portal.

(2) Office Center: The service center aims to provide a visual process service platform, break the barriers between various departments and systems of the school, comprehensively integrate and reengineer the processes scattered in different fields with the advanced process service concept [4], and effectively realize the process connection and data integration of the business systems of various departments according to the service object, event type Business departments and other ways to provide services to users, establish an online service center that truly meets the campus affairs of teachers and students, and improve work efficiency and service quality.

(3) Service Center: The service center mainly provides various information services for teachers and students, such as service guidance, policy consultation and information inquiry services.

(4) Schedule Service Center: The schedule service center uniformly manages and notifies the schedules related to teachers and students, including meetings, activities, timetables, reports, lectures, business trips, school or department arrangements, etc.

(5) Application Service Center: The application service center gathers all business systems, micro applications, applets and other applications together to realize unified management, unified authentication and unified services, mainly including the following types of applications: first, put all business systems (including mobile applications), micro applications and applets of the school on this center to realize unified management and provide unified services through single point authentication; Second, it is open to teachers and students.

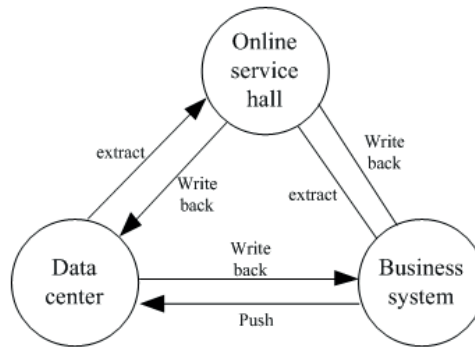

## **4. KEY TECHNOLOGIES**

### **4.1. DATA FUSION TECHNOLOGY**

The hall will eventually become the only entrance to the smart campus application of the school, that is, users can access any application and service only by installing the platform, so as to realize the unified entrance of data and business services, which will require the continuous exchange of data among the client, data center and business system database, so how to effectively solve the data exchange between the three will directly affect the data security and user experience [5].

(1) The traditional data exchange technology is a two-way exchange between the data center and the business system, while the network office hall only allows data to be obtained from the data center, and cannot directly obtain or write back data from the business system. It is mainly considered that it is difficult to achieve unified rules and real-time data synchronization when writing back data to the data center or business system. This will inevitably lead to data errors or inconsistencies between the data center and the data table of the business system [6]. However, data exchange according to the traditional mode is difficult to achieve data fusion, which greatly affects the user experience.

(2) Fusion data exchange technology. In order to solve the contradiction between data exchange security and user experience, the hall adopts data fusion technology to realize two-way and two-way exchange between the three, as shown in figure 2. It solves the problem of how to write data back to the business system after realizing the unified entrance of data collection. In order to enhance the sense of user experience, the integrated network office hall integrates all the data reporting functions originally scattered to various business systems into the unified data collection page of the data center of the network office hall, which solves the trouble of the original users jumping to different business systems to fill in data.

**Figure 2.** Data exchange mode of integrated network office hall.

## 4.2. SERVICE GOVERNANCE TECHNOLOGY

### 4.2.1. SERVICE PROCESS REENGINEERING DESIGN

By building a service platform independent of the business management system, the integrated online service hall drives business process reorganization with service, integrates business processes with the concept of service governance, separates user oriented services from the business system, seamlessly connects the service process with the business system process, and teachers and students have the same use experience of all service processes, There is no need to focus on services from specific business systems [7]. The idea of business process reengineering is as follows:

The first step is to reorganize all business systems of the school, reconstruct the business process according to the business life cycle, and construct the full life cycle business processes such as teacher development, student growth, equipment management, project construction, fund use, professional construction, curriculum construction, classroom teaching, campus consumption and school enterprise cooperation. The second step is to split each link of each life cycle business process into business processes or service processes. Next, take the student growth life cycle business process as an example.

### 4.2.2. SERVICE PROCESS IMPLEMENTATION TECHNOLOGY

In this paper, cordys is used to solve the problem of cross department and cross business system business process reengineering, which is developed and implemented based on cordys workflow engine [8], and on this basis, the functions of process template configuration, process initiation, to-do processing interface, multi-level branch signing, countersigning, transfer and so on are extended. The four steps of modeling, execution, monitoring and optimization are used to realize the business process reengineering of cross department and cross business system. Since the process template configuration uses the user-defined table to configure the process flow rules, the process flow needs to write the corresponding code to configure the rules, so as to realize the flow of the process engine according to its own intention. The main business process management of the network office hall is process modeling and process template configuration.

Process modeling: in order to meet the flexible configuration of process nodes and realize that all Link nodes can reach each other, it is necessary to select a flexible modeling method from the technical level, point to all all Link nodes through a judgment node, and then set the node number to the next Link to be equal to the Link node number. During the process operation, change the node number of the next phase of the current process as needed, so as to drive the process to the next phase. If there are three process link nodes, in order to realize

the mutual process of the three nodes, according to the original process modeling configuration, six lines need to be drawn to realize the mutual process of the three nodes. For the modified process modeling, as shown in figure 3, a judgment node is designed. When the process enters any link, it enters the judgment node first, When a node in the while loop sends a node for processing, the while loop will be triggered again. If you want Link 3 to be transferred to Link 1 and Link 2, you only need to configure the numbers of phase 1 and Link 2 in the Next\_Path field of the workflowstep table of Link 3.

Figure 3. Cycle flow modeling diagram.

## 5. PLATFORM TEST

### 5.1. TEST ENVIRONMENT

Test environment: including the business module environment of the network office hall, shared data center, various business systems and cordys process engine environment, operating system: Linux, middleware: Apache server and Weblogic, database: Oracle and DB2.

### 5.2. DATA FUSION TEST

Data fusion test method uses page embedding to write back and push data. The test cases and test results are shown in table 1.

Table 1. Data fusion test

Method	Test case and description	Expected results	Actual results
Page embedding to write back and push data	Users can continuously enter scores through the score entry page of the educational administration system embedded in the online office hall.	The entered results can be found in the educational administration system database and data center, and displayed in the data center of the network office hall in real time.	Consistent with expected results
	Users input several papers continuously through the paper entry page of the scientific research system embedded in the online office hall.	The input papers can be found in the scientific research system and data center, and displayed in the personal data center of the network office hall in real time.	Consistent with expected results

### 5.3. PROCESS MANAGEMENT FUNCTION TEST

Cordys process management functions include process modeling, process template configuration, process link configuration, link switch maintenance and process monitoring. Test cases and test results are shown in table 2.

**Table 2. Test cases and test results**

Number	Test case and description	Expected results	Actual results
1	The administrator logs in to the cordys platform, creates a process template and publishes it.	The process template is successfully created and sent.	Consistent with expected results
2	Enter the link switch configuration function and add switch information.	Successfully added phase switch information.	Consistent with expected results
3	Enter the process monitoring function, click query to read the process instance table and view the currently running process instances.	The process instance table can be opened normally	Consistent with expected results

## 6. CONCLUSION

This paper focuses on two key issues affecting the user experience of online service hall. One is to design a data fusion technology for the data fusion and sharing among online service hall, data center and business system, which effectively realizes the two-way data exchange between online service hall and various business systems; Second, various user oriented applications and businesses are scattered in each business system center, which can not be effectively unified to provide services in the online service hall. Service process reengineering technology is used to effectively realize cross business system process integration. The solution of the two key problems effectively realizes the integration and interworking of data layer, application layer and information layer, and provides teachers and students with unified page entry, unified information service, unified service and unified data service. As the era of big data, big data centers have been built one after another. How to integrate the data and applications of big data centers with various business systems and application systems more intelligently and efficiently will need to be further studied. The next research work will focus on the big data center fusion technology to realize the efficient fusion storage and fusion application of big data.

**ABSTRACT**

This paper firstly describes the main components of the artificial intelligence metering system and the functions of the background system modules, mainly including user management module, measurement management module and calibration management module. Then the main sources of errors and methods to eliminate errors are analyzed, and the system error model is established and calibration algorithms are used for calibration or compensation to eliminate the system errors. Then the basic algorithm of DC bias and ratio-difference correction is studied. Finally, the system performance is analyzed using the system results compared with the actual results. With the system signal-to-noise ratio set to -3dB, the abnormal state of each meter to be measured recorded by using the system tracking error monitoring is basically the same as the real record, and the system stability is basically more than 30% since. The system in this paper can realize the error monitoring and tracking of

smart metering device measurement, and the error monitoring results are accurate and reliable, with high practical application effect.

## **KEYWORDS**

big data; artificial intelligence; metering system; error correction; DC bias; error tracking

## **1. INTRODUCTION**

Artificial intelligence has been developed in recent years, the level of technology has advanced greatly, and it is used in many fields, and the depth and breadth of its applications are increasing. [1]. Metrology is a measurement activity that uses technical means to achieve uniformity of units and to ensure accurate and consistent values [2].

The literature [3] suggests that to obtain new discoveries, achievements and progress in scientific research also requires attention to metrology, and that only by relying on advanced metrological instruments and equipment as well as accurate testing techniques can we continuously improve the level of scientific research, promote its capabilities and improve its methodological procedures. The literature [4] proposes the use of a measurement method applicable to fixed frequency conditions - random asynchronous sampling method. In the literature [5], in order to solve the problem of poor error stability caused by the digitization of metering devices, the system of simultaneous measurement of the overall error of digital metering devices and the single error of electronic transformers and digital energy meters is designed and simulated and verified. The literature [6] proposed a field calibrator metering error monitoring system based on a fusion model with multidimensional conditions. The literature [7] used an improved staking method to obtain a fusion model reflecting the influence of the multidimensional environment on the metering error of the field calibrator, and solved the influence of the complex field environment on the metering performance of the gateway-type energy meter. In the literature [8], an improved template-matching measurement method based on image rule edges is proposed for the problem of difficult detection of varying morphologies.

This paper first introduces the module and function introduction of the artificial intelligence metering system. Then the error sources, and error correction methods are introduced, which are mainly caused by the current standard transformer, inaccurate internal reference of the metering device, zero drift of the op-amp, DC bias, gain offset, differential nonlinearity, integral nonlinearity, etc. The DC bias error and ratio difference correction methods are used to eliminate the effect of DC bias. Finally, the

performance and practical application effects of the smart metering system are analyzed.

## **2. ARTIFICIAL INTELLIGENCE MEASUREMENT**

### **2.1 ARTIFICIAL INTELLIGENCE MEASUREMENT INTELLIGENCE SYSTEM**

Artificial intelligence-based measurement of intelligent systems will be integrated from inspection and testing, control processing, results analysis and data application of each intelligent platform has the degree of intelligence to handle a range of work processes, with an intelligent interface for interaction with people, tacit collaboration with people, can complete the processing of big data and other applications to achieve all the measurement needs. Intelligent system is the brain of the measurement work, forming a neural network-like system, building application development framework, and human interaction to complete the measurement work.

### **2.2 BACKEND SYSTEM MODULE FUNCTION DESIGN**

The backend is to manage the functions of the whole system, including user, measurement, calibration, analysis and visualization platform modules, and also contains the core business management of the system.

User management: The administrator can add users and administrator operations in the background, and the successfully added users can log in in the foreground, and the successfully added administrator can log in in the background. At the same time, the administrator can delete users and administrator operations in this page.

Measurement management: collect and analyze sensor data, and convert parameters such as detection working current, voltage, power and electricity into bookable data.

Calibration management: compare and analyze the system data with the standard value to calculate the system error, and use the calibration algorithm to calibrate or compensate the system error to eliminate the system error.

Platform visualization management: visualize the data completed by the system conversion to facilitate real-time reception and monitoring of platform data.

## **3 AUTOMATIC CORRECTION OF MEASUREMENT ERRORS**

### **3.1 ERROR SOURCES AND ANALYSIS**

Part of the system error remains unchanged or measured under the same conditions, the error change is following a certain law in the change of the error is called the system error, which is caused by the internal factors of the whole device system, such as the error caused by the current standard transformer, measurement device internal reference inaccuracy, zero drift of the op-amp, DC bias, gain offset,

differential nonlinearity, integral nonlinearity and other factors. Since the system error has a certain regularity, the measurement instrument can be analyzed from the root cause of the system error, establish the system error model, and use the calibration algorithm to calibrate or compensate in order to eliminate the system error. According to the different sources of error of the measurement device can be mainly divided into hardware circuit error and software error. The hardware circuit error is mainly caused by the electronic components in the circuit with dispersion, sampling resistance network and A/D analog-to-digital converter.

### 3.2 DC BIAS AND RATIO DIFFERENCE CORRECTION

DC bias refers to the amount of bias misalignment caused by electronic components with dispersion in the hardware circuit, sampling resistor networks, and A/D analog-to-digital converters. The offset varies with the electronic components and the ambient temperature. To achieve accurate measurement of power parameters under dynamic loads with high accuracy, the effect of DC bias must first be eliminated.

DC bias error and ratio difference correction. Let the discrete signal of the A/D voltage sampling channel be  $u(n)$ , the discrete signal of the current sampling channel be  $i(n)$ , the DC bias voltage be  $u_{DCV}$ , and the DC bias current be  $i_{DC}$ . Since the system is sampled at a determined time equal interval for uniform sampling, the DC bias voltage  $u_{DCV}$  and DC bias current  $i_{DC}$  are the discrete voltage signal and the discrete current signal respectively in a fixed sampling time of several integer times the sampling time. The average value of the discrete voltage signal and discrete current signal in a fixed sampling time. When the discrete sampling point voltage and current values within a number of integer times sampling time are time  $\bar{U}_n, \bar{I}_n$ . Then we have  $U_{DCV} = \bar{U}_n, i_{DC} = \bar{I}_n$ , then the corrected expressions of DC bias error of voltage and current channels are:

$$u_1(n) = u(n) - u_{DCV} \quad (1)$$

$$i_1(n) = i(n) - i_{DC} \quad (2)$$

In the signal conditioning circuit used are high-precision 1%, good temperature characteristics of the resistor, but due to the function of electronic components and the discrete nature of the parameters, so that the actual value of the components and the

nominal value of the error between. Therefore, the actual input A/D in the voltage and current values  $u_{in}(n)$ , and the ratio of its corresponding voltage divider network have proportional error correction coefficients  $k_u$ ,  $K_i$ , namely:

$$k_u = \frac{u_1(n)}{u_i(n)} = \frac{u(n) - u_{DCV}}{u_{in}(n)} \quad (3)$$

$$K_i = \frac{i_1(n)}{i_{in}(n)} = \frac{i(n) - i_{DC}}{i_{in}(n)} \quad (4)$$

The measurement method of power under dynamic load of the system adopts the instantaneous power measurement method of IEEEStd 1459-2010 standard, so the product of the voltage signal channel ratio difference coefficient  $K$ . and the current signal channel ratio difference coefficient  $K'_i$ ,  $K'_p$ , which is the ratio difference correction coefficient of active power is:

$$K'_p = K'_u K'_i \quad (5)$$

#### 4. SYSTEM ERROR CORRECTION PERFORMANCE ANALYSIS ANALYSIS

This paper takes a metering institute as the experimental object, uses this paper system error monitoring, this measurement station in the smart metering device data measurement, through this paper system error monitoring results obtained from the field tester, and the comparison of the results of the real state record, test the performance of this paper system and practical application effect.

The test uses the field comparison method to test the performance of this system, through this system monitoring to obtain the meter error to be measured, compared with the meter error to be measured by the 0.06 level field tester, through the comparison results to verify the rationality of this system design. The rated current is 10A, the expected accuracy is 0.05 level for active and 0.2 level for reactive, and the field tester model is LWS3800. 3 measuring instruments are randomly selected from the experimental design institute as the parameters to be measured. Table 1 shows the comparison results of the error of the meter to be measured.

The absolute difference between the active power error of each meter to be measured by the system monitoring and the field tester is less than 0.05%, and the absolute difference between the reactive power error is less than 0.2%, which are in line with the expected accuracy, thus indicating that the performance index of the system can reach the expected standard and meet the requirements of the

metrological regulations, which can replace the field tester and other relevant test equipment applied for manual testing.

**Figure 1** Error monitoring alarm records versus realistic records

Parameters				
Results from this system	Current/A	1.23	0.23	0.331
	Voltage/V	103.6	105.76	108.4
	Power Factor	0.88	0.45	0.83
	Active power/W	256.8	234.5	54.5
	Reactive power/VAR	29.6	36.7	-29.4
	Active power error	0.019	-0.98	-0.016
	Reactive power error.	-0.177	2.56	0.063
Field tester results	Current/A	1.386	0.234	0.316
	Voltage/V	103	1.567	109.7
	Power Factor	0.88	0.45	0.85
	Active work/W	0.76	36.5	53.6
	Reactive power/VAR	0.065	-9.7	-29.4
	Active power error	0.045	-0.063	-0.046
	Reactive power error.	-0.345	0.163	-0.018

Figure 1 shows the comparison results between the error monitoring alarm records and the real state records of the system. With the system signal-to-noise ratio set to -3dB, the abnormal state of each meter to be measured using this system tracking error monitoring record is basically the same as the real record. It can be seen that this system can realize the tracking error monitoring of smart metering device data measurement, and timely implementation of the alarm and record according to the error monitoring abnormalities, the error monitoring results are accurate and reliable, with high practical application effect. Figure 1 shows the comparison between the alarm record and the real record of error monitoring.

Figure 1 Error monitoring alarm records versus realistic records

## 5. CONCLUSION

This paper verifies through experiments that the system in this paper has high performance and practical application effect, the error monitoring results are highly accurate and can replace the manual test equipment to implement error monitoring. It can achieve the expected standard of smart metering device data measurement error monitoring, meet the requirements of metrology regulations, can replace the field testers and other relevant test equipment applied to manual testing, solve the problem of high labor, material and time spent on the error monitoring method of manual field testing, realize the tracking error monitoring of smart metering device measurement, and the error monitoring results are accurate and reliable, with high practical application. The results are accurate and reliable, and have a high practical application.

## **ABSTRACT**

With the gradual acceleration of people's pace of life, the traditional process and management mode can no longer meet the requirements of modern construction projects. Through the study of BIM5D, construction projects are no longer limited to the modeling calculation of BIM5D, and gradually BIM5D is used as an intelligent engineer to manage most of the contents of the building from the contract period to the acceptance period, such as the progress of both sides of the contract on the construction period, and the expected distance from the target, how to control resources in terms of cost, how to make the best possible use of materials and even reduce the waste of materials completely, etc. The application of BIM5D in building construction realizes the parameterization, visualization and integration of the whole project, improves the information level and quality of green construction, and achieves good implementation effect.

## **KEYWORDS**

BIM5D; information management; construction engineering; cost control; green construction; assembly building

## **1. INTRODUCTION**

In recent years, against the background of the steady development of the construction industry, each construction enterprise has gradually changed its management mode, and new management techniques and management concepts have been gradually promoted and applied in construction projects [1]. At present, the overall development of the construction industry has accelerated, and if the traditional construction management mode is still adopted, it is not only unable to achieve the

management and control of various dynamic factors, but also unable to achieve effective collaborative management [2-3]. And BIM5D technology can play a good management effect in dynamic management and collaborative management, so that all engineering resources in construction projects can play their maximum value and realize the optimization of construction project management [4-5].

The literature [6] proposes that the high degree of digitization being experienced in the construction industry requires a re-examination and re-conceptualization of the collaboration between project teams. The literature [7] proposes that building information models generate accurate information in an explicit manner and enable project participants to easily access various types of information, thus greatly improving the transparency of information in the facility lifecycle. The literature [8] relates contemporary industry management experience to the industry reality of construction projects and analyzes ways to improve the design management of construction projects. The literature [9] makes a horizontal comparison of project management in the domestic and foreign architectural design industry and illustrates the need to use project management in engineering design.

In this paper, BIM technology is introduced into the construction industry for information management research. The application of information management of construction projects is based on the traditional management of quality, progress, cost and safety, information management of construction sites, combination of prior control and dynamic control, continuous improvement, seeking to coordinate the economic interests of the project with the protection of resources and ecological environment, unification with people and society, and striving for the maximum harmony between project personnel and the social and natural environment of the project site Unification.

## **2. CONSTRUCTION PHASE BIM5D DEEP INTEGRATION RESEARCH AND APPLICATION**

### **2.1 INFORMATION CREATION AND INTEGRATION**

The establishment and integration of information need to be developed around the various aspects of the project, such as deepening the design, construction progress, resource management, construction site and other aspects, so that a scientific and perfect engineering information management model can be truly established, and the establishment of project information based on the whole life cycle management can be realized, and the continuity and integrity of information will thus better serve the utility of BIM technology.

## **2.2 THREE-DIMENSIONAL INTERPRETATION OF TWO-DIMENSIONAL FLAT DRAWINGS**

Establish a complete model before construction, solve problems in plan drawings in advance, merge and collision check the models of each profession, deal with the contradiction points between each profession, solve problems in advance and reduce the temporary adjustment of each profession later. Integrate the 3D model into the daily project work such as drawing review, technical delivery and program simulation.

## **2.3 ESTABLISHMENT OF INFORMATION-BASED PROJECTS**

Today, with the popularity of smart devices, modernization can be effectively used to widely arrange information points in the project, each of which can convey project-related information and show the project image to the outside. By establishing a BIM information sharing platform, project personnel can freely extract and upload project information with a terminal device to achieve information sharing.

## **3. CONSTRUCTION PHASE BIM TECHNOLOGY RESEARCH AND APPLICATION**

### **3.1 CIVIL PART MODEL**

The BIM modeling process of the assembled building is different from the traditional modeling. The civil part of the traditional building generally adopts the building and structure modeling method separately, but through research and practice, the assembled building is more suitable to adopt the prefabricated part and cast-in-place part modeling method separately.

### **3.2 3D DRAWING REVIEW AND COLLISION CHECK**

After the modeling is formed, each profession can first run the spatial collision check, retrieve the parts where the components conflict or do not meet the spatial distance, and make preliminary adjustments to the model. Then, according to the integration of the model, run the collision check again, adjust and deepen the model of each profession, until the final deepening design model.

### **3.3 SITE MASTER PLAN**

Using the three-dimensional visibility of BIM, the construction site plan is planned, mainly including the layout of the temporary construction, the installation and dismantling of large machinery, the positioning of the construction yard, the planning of the construction road, etc.. It is also managed in the information management platform, and the construction site components are updated and managed according to the construction progress, so that the construction site layout is updated according to the construction progress.

### **3.4 BIM5D CONSTRUCTION SIMULATION, INTEGRATED INFORMATION CONTROL**

With the support of BIM technology application, time and resource dimensions, the "5D-BIM" model can establish "dynamic construction planning" based on the project's resource input and construction reality. The "5D-BIM" model can establish "dynamic construction planning" based on the project's resource input and construction reality, which can clarify the information of resource input, phased funding, schedule arrangement and construction process of the assembled building. The "5D-BIM" model can also achieve a high level of simulation of construction planning problems, and at the same time carry out reasonable optimization in conjunction with the problems, so that the construction unit may cause delays and cost increases caused by poor consideration can be better avoided. It is worth noting that the "5D-BIM" model can also ensure that the technical and management personnel of the project have a deep understanding of the cost and resource input and construction process arrangement of the whole project, so that the cash flow optimization, rational arrangement of resource supply, construction plan and sequence optimization can be carried out to truly realize the dynamic cost and schedule planning of the project construction. management.

## **4. O&M STAGE BIM TECHNOLOGY RESEARCH AND APPLICATION**

### **4.1 IMPROVE EQUIPMENT MAINTENANCE MANAGEMENT IN THE OPERATION AND MAINTENANCE PHASE**

With the support of the information management platform based on BIM technology, the project can establish prefabricated components and equipment operation and maintenance system, which can provide strong support for the development of building operation and maintenance work. Take the emergency management and data management functions of BIM technology as an example, if a sudden fire occurs in the operation and maintenance stage of an assembled building, firefighters can accurately locate the location of the fire with the support of building and equipment information provided by BIM technology, so that the target of fire extinguishing and rescue work can be guaranteed. In addition, BIM technology can also better serve the maintenance of assembled buildings and ancillary equipment, through direct access to model, parameters, manufacturers and other prefabricated component information from the BIM model, the efficiency of maintenance work can naturally be better guaranteed.

## **4.2 STRENGTHEN THE QUALITY AND ENERGY CONSUMPTION MANAGEMENT IN THE OPERATION AND MAINTENANCE PHASE**

The assembled building can realize the whole life information of itself under BIM technical support, so the operation and maintenance management personnel can easily obtain the important information of the assembly building prefabricated components manufacturers, transporters, installers, etc., and if the assembly building prefabricated components have late quality problems, BIM technology can be applied to realize the traceability from the operation and maintenance stage to the production stage, and the clear attribution of responsibility can be realized. It is worth noting that the green operation and maintenance management of prefabricated buildings is also inseparable from the support of BIM technology, with BIM technical support to carry out energy consumption monitoring and analysis, you can accurately find the location of high energy consumption and targeted treatment, the use of BIM technology to screen the secondary development of assembled buildings to recycle resources, but also to avoid the waste of resources when the building is dismantled.

## **5. ESTABLISHMENT OF ENGINEERING INFORMATION MANAGEMENT SYSTEM BASED ON BIM TECHNOLOGY**

### **5.1 BIM APPLICATION PLAN**

The project takes green construction as the purpose, the construction party in the process of construction, in order to ensure safety, quality and. Under the premise of the construction period, the construction company will implement the guiding ideology of giving priority to environmental protection and the efficient use of resources, pursuing environmental protection, high efficiency and low consumption, and achieving the green construction mode of maximizing the comprehensive benefits of environmental protection, economy and society.

To ensure more efficient implementation of the green construction mode and to meet the requirements of the construction side, the construction side of the project introduced BIM technology in the green construction process, and the BIM project application plan is shown in Table 1. The technology is fully used in deepening the design, construction process, project progress, site management, information integration with the main daily management system of the construction party, and information integration with the project operation management system, so as to fully realize the objectives of the project in terms of schedule, cost, quality, safety, environmental protection, etc. The establishment of engineering information management system with BIM application as the carrier can improve the project construction efficiency, improve the level and quality of building construction, shorten the construction period, save resources and reduce costs to a certain extent.

The application of BIM in engineering needs to rely on a practical work plan to clarify the work content and application effect. Combining the overall goal of BIM application, actual project duration requirements, project construction difficulties and characteristics, the BIM application plan of the project was formulated.

**Table 1** BIM project application plan

Serial No.	Project Name	Project Layering
1	BIM model building	Civil construction professional model
		Steel structure professional model
		Mechanical and electrical professional model
2	Deepening the design	Comprehensive pipeline deepening design
		Complex node deepening design
		Curtain wall deepening design
3	Construction Program Planning	Surrounding environment planning program
		Site layout plan
		Special construction plan
4	General Contractor Construction Project Management	Construction Equipment Management
		Construction Material Management
		Construction Environment Management

## 5.2 CONSTRUCTION IMPLEMENTATION EFFECT OF BIM TECHNOLOGY

The application of BIM technology in the construction of building projects achieves the application objectives of BIM, realizes the parameterization, visualization and integration of the whole project, improves the information level and quality of green construction, and achieves good implementation results. Figure 1 shows the implementation effect of saving material resources utilization. It can be seen that the budgeted loss of steel is 380t, the actual consumption is 305t, the budgeted loss of concrete is 1200m<sup>3</sup>, the actual consumption is 910m<sup>3</sup>, the budgeted loss of wood is 40m<sup>3</sup>, the actual consumption is 28m<sup>3</sup>. 19.7% of steel, 24.2% of concrete and 30% of wood are saved after the establishment of engineering informatization management system. Table 1 shows the overall economic benefit analysis of the construction. The final cost saving of the project reached 2.34 million RMB, and the saving far exceeded the expected 1.45 million RMB. Therefore, the BIM5D-based construction information management system achieved a good cost control effect, and the construction cost of the whole project did not exceed the budget of safety and civilization construction cost, and also reduced the total construction and building cost to achieve good economic benefits. It shows that the use of BIM technology-assisted construction can not only ensure the implementation effect of construction, but also save the cost of construction.

**Figure 1** Effect of material saving implementation

**Table 2** Analysis of overall economic benefits of construction

project	Target value	Actual value
Construction increase cost	≤490000 yuan	430000 yuan
Construction cost saving	≥2 million yuan	2.67 million yuan
Total cost savings	≥1.45 million yuan	2.34 million yuan
Cost savings as a percentage of total output	≥0.6%	1.7%

## 6. CONCLUSION

In the context of vigorously developing information management of construction projects, the combination of engineering management and BIM technology has triggered the deep integration and rapid development of construction industry and information industry. Among them, the wide application of key technologies about conflict detection, green building, cost and schedule management, safety and quality management, supply chain management, operation and maintenance has begun to promote the effect of the development of the whole industry chain of construction industry. The BIM5D-based information management system for construction projects built in this paper has resulted in 19.7% savings in steel, 24.2% savings in concrete, and 30% savings in wood in the construction application of building projects. The final cost saving of the project reached 2.34 million RMB, and the savings far exceeded the expected 1.45 million RMB. Therefore, BIM technology has an extremely important role in the current construction industry, especially in the development of project management.

## ABSTRACT

In this paper, the target figure acquired by 3D laser scanning is segmented by edge contour, and the segmented feature points are mapped to 2D space for 3D information reconstruction of the object. In the image processing, a series of improved algorithms such as denoising processing, image grayscale binarization and laser stripe refinement are used to better achieve the extraction of laser stripe image information, thus obtaining a more ideal effect map. Compared with the traditional method, the accuracy of the system in this paper is improved by 28.47% and the processing time is reduced by 22.14%. Therefore, the object images collected by the 3D laser image processing system in this paper are clearly targeted and achieve a better image processing effect.

## KEYWORDS

3D laser scanning; Image processing; 3D information reconstruction; Edge contour segmentation; Grayscale binarization; Laser stripe refinement

## 1. INTRODUCTION

3D laser scanning technology is the latest technology in the whole system of 3D data acquisition and reconstruction techniques, which aims to obtain 3D contour data of the object under test and mainly includes data measurement and subsequent processing of the data [1-2]. It can quickly obtain the coordinates of the spatial position of each sampling point on the surface of the object, and then with the help of computer software processing, the three-dimensional model is described in the form of points, lines, polygons, curves, and surfaces, and then the surface model of the entity can be reconstructed [3-4].

The literature [5] used 3D laser scanners for bridge appearance scanning with its high-density point cloud data and high-resolution image data to provide apparent information of the bridge, which can be used as a new method for bridge health diagnosis and safety monitoring. In the literature [6], the point cloud data collected by the 3D laser scanner followed the decreasing time interval of sampling and the data increased, and the load size of the system increased proportionally to the amount of point cloud data to the extent that the data volume increased to a certain level leading to the system not operating properly. The literature [7] extracts target feature points can be directly used to achieve a method of 3D reconstruction of the target using 3D laser scanning data, and constructs feature lines and feature surfaces from feature points to reconstruct 3D targets. The literature [8] analyzed the error sources of 3D laser scanner, analyzed the quantitative relationship between single-point point position error, coordinate component error and distance, vertical angle and horizontal angle in detail from theory, and summarized the distribution law of error.

In this paper, we perform edge contour segmentation on the graphics acquired by 3D laser scanning, map the segmented feature points into 2D space for 3D information reconstruction, and perform edge enhancement and sharpening of the image. In the process of image processing, after denoising, binarization and laser stripe refinement, a more ideal effect map can be obtained. In this paper, the algorithm is studied and improved to a certain extent in terms of denoising, binarization threshold selection and refinement processing, and the theory and practice show that the algorithm can significantly improve the accuracy.

## 2. 3D LASER SCANNING IMAGE PROCESSING

### 2.1 3D LASER SCANNING IMAGE EDGE CONTOUR SEGMENTATION

In order to achieve the reconstruction of 3D laser dynamic information, it is necessary to first carry out image acquisition, image acquisition using 3D laser scanning method, laser detection method to obtain massive data of target information, and then carry out coarse and fine alignment of scanned laser images, remove the noise generated by image acquisition, and carry out sampling of key points of target information, based on which the target reconstruction is realized:

$$E_{\text{int}}(v_i) = \frac{1}{2} \left( \alpha |d - |v_i - v_{i-1}|^2 + \beta |v_i - 1 + 2v_i + v_{i+1}|^2 \right) \quad (1)$$

Where  $d = \frac{1}{n} \sum_{i=0}^{n-1} |v_i - v_{i-1}|$ , indicates  $d$  is the average distance between the control

points of the initial profile, and the chromatic contrast of the rendered graphics is improved by the 3D fiber to provide an accurate model basis for the drawing of the moving target image features.

## 2.2 DESIGN OF 3D LASER DYNAMIC INFORMATION RECONSTRUCTION ALGORITHM

The segmented feature points are mapped into two-dimensional space for three-dimensional information reconstruction, the edge enhancement and sharpening of the image are performed, the dynamic feature points are sampled by the sampling point lasso method, and the Euclidean distance between the feature points and the edge pixel points is minimized as the constrained cost function to obtain the maximum weight of the edge features of the three-dimensional laser scanning image calculated as:

$$Int(C) = \max_{e \in MST(C,E)} w(e) \quad (2)$$

Where  $w(e)$  is the full domain vector decomposition vector, the target image is feature decomposed, the edge pixel points of the image form a closed loop interval after feature segmentation, the nesting technique is used to contour point marker to the reconstructed figure, the contour point marker set is  $G$ , where  $g_i = (g_{ix}, g_{iy}, g_{iz}) (i = 0, 1, \dots, N_g - 1)$  is the  $i$ th vertex in the center vector  $V$  of the contour point marker, using the scale center distance invariance, the fixed point information of the scanned grid model is obtained as  $G(x, y, t)$ , the edge enhancement operator of the image is introduced, and the edge enhancement result of the 3D laser image is obtained as:

$$f(g_i) = c_1 \tilde{\lambda}_i \frac{\sum_{j=0}^{N_{np}} \frac{\rho_j \vec{v}_{ij}}{|\vec{v}_{ij}|^{\sigma_1} + \varepsilon}}{\sum_{j=0}^{N_{np}} \frac{\rho_j}{|\vec{v}_{ij}|^{\sigma_1} + \varepsilon}} \quad (3)$$

Where,  $c_1$  denotes the center distance of the target image features plotted,  $\tilde{\lambda}_i$  is the pose invariance coefficient, and  $\varepsilon$  is the interference parameter.

### 2.2.1 DENOISING PROCESS

The magnitude of noise and the location of its appearance are generally random and essentially isolated points, and they are irregular and have the nature of scattered data points. In order to pick out these spurious points, a comparison method is designed in this paper, given two thresholds  $g$  and  $N$ , such that  $H(i, j)$  denotes the gray value of the pixel in the  $j$ th column of the  $i$ th row without loss of generality, assuming that there is no noise at the  $(i, j)$ th pixel, i.e.,  $H(i, j)$  is a normal gray value, if there is :

$$|H(i+1, j) - H(i, j)| < g \quad (4)$$

Then it is proved that the grayscale value is continuously changing and pixel  $(i+1, j)$  is not a noise point that should be rejected.

### 2.2.2 IMAGE GRAYSCALE BINARIZATION

Image binarization is one of the most basic and crucial problems in the field of image processing, which refers to the division of a multi-gray level image into two fields, namely object and background, i.e., transforming into a binary image with two gray levels of black and white. Binarization is beneficial to image recognition, extraction and highlighting of signal features, image segmentation and reconstruction, and compression of image data, which not only compresses data in a large amount, but also greatly simplifies the later analysis and processing and improves the speed of video measurement. Image binarization principle: Let the original image be  $f(x,y)$ , find a gray value  $t$  in  $f(x,y)$  as a threshold with certain criteria, segment the image into two parts, and the segmented binary image  $g(x,y)$  as:

$$g(x,y) = \begin{cases} 1 & f(x,y) \geq t \\ 0 & f(x,y) < t \end{cases} \quad (5)$$

The part of 0 is considered as background and the part of 1 is considered as target. In this way, the target is distinguished from the complex scene and its shape is extracted, and the selection of the threshold value is the key of image binarization technique. If the threshold is chosen too high, too many target points will be mistaken for the background. If the threshold is too low, the opposite will happen, which will affect the size and shape of the target in the segmented binary image, or even make the target be overwhelmed.

### 2.2.3 LASER STRIPE IMAGE REFINEMENT

Laser stripe refinement is the process of continuously removing contour pixels on the curve that do not affect the connectivity, so as to obtain the central skeleton of a single pixel. But no matter what refinement algorithm is used, it should meet the refinement results should be maintained with the original map of topological equivalence, should maintain the continuity of the graphics in the original map, should be (or close to) the center of the original line shape, refinement of the line width should be a pixel, refinement results are not sensitive to the original map boundary noise, retain the curve endpoints, cross part of the center line is not distorted, refinement speed and other characteristics.

For refinement of laser scan lines, the surface contour of an object is usually recovered by extracting the set of highest brightness points of the laser line image or the centerline of the line area, characterizing the intersection line between the brightest light plane within the beam and the surface of the object. However, the obtained stripe image may be partially missing due to various reasons. For example: The material of the object itself is not homogeneous, and some black spots, dark spots may appear. The object's surface may be obscured by protrusions, so that some of the stripes cannot be captured. Imaging system lens or CCD itself caused by defects.

### 2.2.4 LASER LIGHT BAR CENTER EXTRACTION ALGORITHM

The image has been denoised, assuming that all noise signals have been removed, and the main information of the image has been retained intact in the processed image. We use a front contour line detection method to extract the position of the laser light bar. The laser light blade will form a light bar with a certain width when it hits the object. Due to the high brightness of the laser, there is an obvious brightness change compared with the background image, so the front contour line (or the back contour line) of the light bar can be extracted as the light bar. A non-lightbar information pixel point in the image, if its neighboring pixel points are lightbar information, then the difference between the brightness of these two pixel points will be very

obvious, the response in the light intensity Gaussian distribution graph is expressed as a steeper tangent line of the point, then the point with the steepest slope is both the frontier critical point pixel. Thereafter, the slope is gradually moderated until the extreme value point (that is, the brightest pixel in the center of the light bar).

### 3. EXPERIMENTAL DESIGN AND CONTENT

#### 3.1 PERFORMANCE COMPARISON WITH TRADITIONAL METHODS

A number of images were selected as data sets for testing in response to the experimental need to accomplish the requirements of fast and effective image processing. Comparing the traditional method with the processing method of this paper, this research method uses 5 nodes, 1 master node and 4 slave nodes. Using the determined image data size of 2,000, 4,000, 6,000, and 8,000 experiments to view the time required to process the images for both methods will reflect the relationship between the time and number of images processed, as shown in Figure 1.

When processing 100 images, there is not much difference in time consumption between the two methods. However, as the image data size increases to 2000 images, the time calculated by the method in this paper is 198.43s less than that of the traditional processing method, which takes longer time. It can be seen that when 6000 and 8000 images are selected, the processing method time starts to grow slowly, and the method in this paper is 22.14% less than the traditional method, which can perform fast processing of large-scale image data.

Figure 1. Image processing speed comparison

#### 3.2 ALGORITHM PROCESSING SPEED

Most of the existing image segmentation uses accuracy rate to measure the performance of image segmentation algorithms, and a set of metrics is defined for the comparison of crack segmentation algorithms.  $P_r$  is the accuracy rate,  $T_p$  is the number of correctly detected objects,  $F_p$  is the number of mis-detected objects,  $P_r = T_p / (T_p + F_p)$ . The parameters of the algorithms corresponding to the accuracy rate are shown in Table 1, from which it can be seen that the accuracy rate of this research method can reach 87.41%, which is a significant improvement over other traditional algorithms and can process images better.

Table 1. Comparison of accuracy rates

Methods	Number of images	Accuracy
Ostu	2000	48.84%
Canny	2000	58.94%
FD	2000	55.37%
Methodology of this article	2000	87.41%

#### 4. CONCLUSION

This paper discusses the algorithmic process of optical strip image processing in laser 3D scanning technology, using the high directionality and high brightness of the laser to form fine and bright contour lines on the surface of the object, and then using a CCD camera to capture hundreds of contour lines on the surface of the object in a short period of time. These images are pre-processed by image pre-processing such as image denoising, filtering, binarization and image post-processing using laser stripe center extraction, and sent to a computer system for real-time processing to calculate the 3D coordinates of the measured object shape. The studied system based on the algorithm of this paper reduces the image processing time by 22.14% compared to the traditional method, and the accuracy of the algorithm of this paper reaches 87.41%, which is 28.47% higher than Canny.

## ABSTRACT

In this paper, we adopt 3D oscilloscopic laser scanning technology for image acquisition and information measurement of the target, combine the envelope contour detection method for image noise reduction processing, adopt the information fusion filtering model for feature enhancement and scalar information extraction of the 3D laser scanning image of the target, and realize the arithmetic optimization design of the target information model. The error between the simulated and calculated results of the constructed model is less than 1%, the

linear relationship between laser power and current, the system distance error and angle error are less than 1.25mm and 1.02° respectively, which indicates that the constructed model can effectively control the 3D oscillator laser scanning system for high precision laser scanning.

## **KEYWORDS**

Information fusion technology; 3D vibroscopic laser; Image acquisition; Information measurement; Image noise reduction; Envelope detection method

## **1. INTRODUCTION**

The creation of laser technology has led to a new era of awareness of the surrounding environment. Industries employing laser distance measurement and detection are proliferating. Laser devices are gradually replacing the original optical instruments because of their small size, high accuracy and speed [1-2]. In most construction companies, the use of laser instruments is also gradually being upgraded and transformed. Laser scanning is one of the most applied technologies in recent years, and the most used in the application of laser scanning technology is the 3D vibrating mirror laser scanner [3]. The so-called laser oscillator refers to the laser scanning instrument that uses the reflected beam deflection to image the object for scanning [4]. The use of three-dimensional vibrating mirror laser scanners allows rapid acquisition of spatial data and rapid spatial reconstruction [5].

In the literature [6], laser 3D marking based on the vibroscope was realized and the technique was used to achieve the positioning of the compound layout and the positioning of the aircraft skin making holes. In recent years, some researchers have started to abandon the traditional idea of modeling the system based on the actual construction principle of the vibroscope system, and instead adopt a new modeling idea for the calibration of the vibroscope system. The literature [7] implemented a laser cutting shearing of feathers based on the vibroscope system based on the calibration method of the vibroscope system completed by the camera calibration algorithm. In the literature [8], the 3D coordinates of the laser spot in the monocular camera coordinate system were used as the model output data, and the 2D coordinates of the spot in the camera image plane together with the deflection of the vibrating mirror system corresponding to the spot were used as the input data of the model, and a triangulation model based on the vibrating mirror system was constructed with the help of neural networks, support vector machines, ridge regression and other fitting means.

In this paper, we propose a method of calculating target object information model based on 3D vibrating mirror laser scanning technology. The 3D vibrating mirror laser scanning technology is used for image acquisition and information measurement of target objects, combined with the envelope contour detection method for image noise reduction processing, and the information fusion filtering model is used for feature enhancement and scalar information extraction of 3D laser scanned images of buildings to realize the optimized design of target object informatization model arithmetic, and finally simulation experiments are conducted to draw conclusions on the effectiveness.

## **2. IMAGE ACQUISITION AND INFORMATION MEASUREMENT OF BUILDINGS**

### **2.1 3D LASER SCANNING BASED BUILDING IMAGE ACQUISITION**

In order to design the building information model arithmetic based on 3D laser scanning technology, 3D laser scanning image acquisition of the building needs to be carried out first, and the fuzzy laser scanning images acquired are edge-enhanced to improve the accuracy of information quantification processing. The 3D laser scanned image is disturbed by the additive

noise term  $\eta(x, y)$ , and the image detection is performed with the laser  $X$  ray beam to obtain the template pixel values of the original image, and the scanned template of the image is divided into 3x3 pixel blocks by the 4x4 neighborhood grid distribution method of seed points to obtain an estimate of the original image  $\hat{f}(x, y)$ . In the reconstruction of the building image, the laser scanned pixel statistics values of the image acquisition are decomposed by vector quantization obtained:

$$d = \frac{1}{n} \sum_{i=0}^{n-1} |v_i - v_{i-1}| \quad (1)$$

$d$  of the above equation is the average distance between the laser scanning points, and the quantitative statistical values of the image feature distribution vary in characteristics  $H$  and  $\eta$ . When  $H$  and  $\eta$  have more information, the obtained building informatization feature estimate  $\hat{f}(x, y)$  will be closer to  $f(x, y)$ .

The fusion process of the image pixel-level neighborhood parametrization is performed, and the information measurement of the building image acquisition is obtained by adaptive local noise reduction as:

$$g(x, y) = f(x, y) + \eta_m(x, y) \quad (2)$$

Where,  $f(x, y)$  denotes the input image,  $g(x, y)$  denotes the grayscale value of the output building image after 3D laser scanning,  $\eta_m(x, y)$  denotes the feature difference value between pixel points, and satisfies  $\eta_m(x, y) \in \{-1, 0, 1\}$ . By the above processing, the 3D laser scanning-based building image acquisition is realized.

## 2.2 BUILDING 3D LASER SCANNING INFORMATION MEASUREMENT

The empirical modal decomposition (EMD) method is used to discretize the 3D laser scanned images of buildings, and the multi-grained coarse pixel feature expression is performed using the transverse scan and block scan models, and the modal function of the separated frequency band information measurement of each feature point frame of the laser scan is described as follows:

$$x(n) = \frac{1}{\sqrt{N}} \sum_{k=0}^{N-1} X(k) \exp(j2\pi kn/N), n = 0, 1, \dots, N-1 \quad (3)$$

where  $X(k)$  is the magnitude characteristic of the laser-scanned frame and  $\exp(j2\pi kn/N)$  is the separated phase characteristic of the data in both frames.

In order not to lose generality, a batch model is used for feature segmentation of the laser scanned building images, such that the normalized expression for the gradient value of the 3D laser scanned information measurement of the building is:

$$K = \frac{(\text{Grad} - \min \text{Grad})}{(\max \text{Grad} - \min \text{Grad})} \quad (4)$$

The gradient value of the 3D laser scan image calculated by the above method realizes the accurate measurement of the 3D laser scan information of the building and provides an accurate data base for framing the building information model.

## 2.3 OPTIMIZED DESIGN AND IMPLEMENTATION OF BUILDING INFORMATION MODEL

### 2.3.1 IMAGE NOISE REDUCTION PROCESSING

Based on the image acquisition and information measurement of the building using 3D laser scanning technology, an optimal design analysis of the building information model calculation is carried out. Combined with the envelope contour detection method for image noise reduction processing, the  $(p+q)$ nd order dark primary color feature spectrum of 3D laser scanning imaging  $f(x, y)$  is calculated for:

$$m_{pq} = \sum_{m=1}^M \sum_{n=1}^N x^p y^q f(x, y) \quad (5)$$

Combined with grayscale feature segmentation, the global search for noise of 3D laser scanning building imaging is carried out for image noise reduction processing, and the discriminant function of image noise reduction is obtained as:

$$x_i(t) = [w_{i1}^{lk}, \dots, w_{in}^{lk}] [x_1(t-k), \dots, x_n(t-k)]^T \quad (6)$$

where is the quadratic polynomial kernel function of the  $[w_{i1}^{lk}, \dots, w_{in}^{lk}]$  building informatization model, and  $[x_1(t-k), \dots, x_n(t-k)]^T$  is the error control coefficient after the image noise reduction process.

### 2.3.2 BUILDING INFORMATION FEATURE ENHANCEMENT AND SCALAR INFORMATION EXTRACTION

An information fusion filter model is used for feature enhancement design of 3D laser scanned images of buildings, and a cascade filter model is constructed as a filter structure model for building information feature extraction, and the output  $I_{(k)}(i, j)$  of the rate feature enhancement of the building information pixel value  $I(i, j)$  is obtained as follows:

$$I(i, j) = \sum_{k=1}^P I_{(k)}(i, j) \times 2^{k-1} \quad (7)$$

Combined with the information fusion filtering model, the envelope contour detection result of the image is obtained as:

$$g_i^* = \begin{cases} Rs_j & z \leq i \leq x - y \\ g_i & otherwise \end{cases} \quad (8)$$

where,  $R$  a normative constant, divides the set of building laser scan image results from the detection output into several subsets, and obtains the modular subset of building information as :

$$g(x, y) = f(x, y) + \varepsilon(x, y) \quad (9)$$

where  $f(x, y), g(x, y), \varepsilon(x, y)$  represents the output error amount of the building information model within the same subset, respectively, denoted as  $\sigma_n^2$ . Through the above processing, the feature enhancement and scalar information extraction of the 3D laser scan

image of the building are carried out using the information fusion filtering model to realize the arithmetic optimization design of the building information model.

### 3. RESULTS AND ANALYSIS

ZEMAX software can realize the modeling and analysis functions within the optical system, covering all the functions required in the optical design process, and also has the advantages of good tolerance performance, speed and flexibility. Therefore, ZEMAX software is used to simulate and analyze the mathematical model of the 3D oscillator laser scanning system constructed in this paper. Using ZEMAX software this paper model control under the three-dimensional oscillator laser scanning system simulation focal length of 40 mm, 320 mm, 560 mm of the three focusing lens, the distance between the first focusing lens and the second focusing lens is 360 mm, the distance between the second focusing lens and the third focusing lens is 0 mm. In comparison with the simulation results of ZEMAX software, the relationship values between the moving distance of the focus point  $\Delta S$  and the moving distance of the first lens  $Z$  were obtained by calculation, and the results are shown in Table 1.

There is a nonlinear relationship between the first lens travel distance  $Z$  and the spotting point travel distance  $\Delta S$ , and the relationship between them is close to a straight line, which means that the first lens travel distance  $Z$  and the spotting point travel distance  $\Delta S$  are in a uniform state, and the error between the simulation results and the calculation results does not exceed 1%. The experimental results show that the model-controlled 3D oscillator laser scanning system is feasible.

**Table 1.** ZEMAX software simulation parameters table

14	597.76	47.02	46.97	0.95

In order to verify the correction effect of the three-dimensional oscillator laser scanning system under the control of the model of this paper, the experimental objects are selected using the model of this paper and the mathematical model of the three-dimensional oscillator laser scanning system based on the theory of deformation monitoring. Under the control of this model, the average number of calculations is 5 when the 3D oscilloscope laser scanning system is corrected for the ranging error, and the corrected distance value is obtained according to the real moving angle of the motor when the angle error is corrected. Figure 1 shows the experimental results of range error and Figure 2 shows the experimental results of angle error.

During the ranging process of the three-dimensional vibrating mirror laser scanning system controlled by the model in this paper, the acquired measured values are basically consistent with the actual values, and the error is controlled within 1.25 mm. The error between the measured value and the actual value obtained by the three-dimensional vibrating mirror laser scanning system controlled by the mathematical model based on the deformation monitoring

theory is between 2.1 and 4.6 mm. The error between the measured value and the actual value obtained by the model in this paper is within 1.02, while the error between the measured value and the actual value obtained by the 3D vibrating mirror laser scanning system based on the deformation monitoring theory mathematical model is between 1.47 and 3.2% when testing the range angle error of different models. These experimental results show that the three-dimensional vibrating mirror laser scanning system under the control of the model in this paper has a good error correction effect and can achieve high precision laser scanning.

**Figure 1.** Experimental results of distance measurement error

**Figure 2.** Angle error experimental results graph

#### 4. CONCLUSION

In this paper, we construct a new 3D oscilloscopic laser scanning method to correct the ranging error and angular error in the system respectively, and improve the scanning accuracy of the scanning system. The 3D laser scanning of buildings using this paper effectively improves the image quality, provides effective image input for the measurement of building information, and finally realizes the feature enhancement and scalar information extraction of 3D laser scanning images of buildings. The study shows that the range error and angle error of the 3D oscilloscope laser scanning system in this paper are lower than 1.25mm and 1.02°,

respectively. The results show that the model in this paper can effectively control the smooth operation of the 3D oscilloscope laser scanning system, and the error correction effect is good, which can improve the scanning accuracy of the 3D oscilloscope laser scanning system.

## ABSTRACT

The optimal structure of the 3D woven composite is derived from the analysis of the response to the anti-bird impact. In this paper, 3D woven composite panels with different structures are constructed based on the simulation system, and simulation experiments of bird impact are designed. Comprehensive response analysis is carried out in terms of impact pressure at the impact surface, deformation process during impact, response changes of different units and damage. Based on the analysis results, attention should be paid to the amount of 45° plies to be laid down in the impact resistant design of the 3D woven composite to avoid excessive stress values during the impact. The research in this paper provides an effective reference for the enhancement of bird impact resistance of 3D woven composites.

## 1. INTRODUCTION

Bird collision is a type of flight accident that accompanies the emergence of aircraft. It is the abbreviation for a flight accident caused by the collision of a flying machine, etc. with a bird flying in the sky [1]. The parts of a bird strike include high risk parts such as engines, air intakes, radiators, windshields and radomes and low risk parts such as wings and landing gear [2].

The literature [3] suggests that there are still many problems with the numerical simulation analysis of bird collisions, and that the numerical simulation results do not match the experimental results to a high degree and cannot be used directly to guide the design development of aircraft windshields. The main reasons for this are: the intrinsic relationship between the bird body and the aircraft windscreen, the shape of the bird body, the damage criterion of the aircraft windscreen, etc. The literature [4] suggests that composite materials have high specific stiffness and strength as well as low density and other characteristics that

can effectively absorb impact loads. When designing the leading edge of the flat tail structure, the reasonable use of composite materials can effectively reduce the impact of weight gain due to the design of bird collision resistance, and improve the safety of civilian aircraft while greatly improving the economy. The literature [5] suggests that for composite materials, the mechanical properties are mainly dependent on the properties of the reinforcement and matrix materials, as well as the interface bond between them. In [6], the effect of the preparation of plain weave laminated composites on the mechanical properties was investigated, and these studies have given great insight into the improvement of the mechanical properties of laminated composites. The literature [7] used the coupled solution method to systematically analyse the bird impact problem of aircraft windshields, and recently some research has also been carried out on the bird impact problem of composite structures. The literature [8] investigated the failure behaviour of laminated structural composites in wet environments.

This paper focuses on the bird impact resistance of 3D woven composites, analysing the pressure and response during impact, which is important for the study of the mechanical properties of composites.

## 2. ANALYSIS OF THE DYNAMIC PRESSURE OF THREE-DIMENSIONAL WOVEN COMPOSITES AGAINST BIRD IMPACT

In the initial phase of the impact, as the bird body comes into contact with the plate, the velocity of its contact part changes abruptly so that a large shock wave is generated and propagates backwards. The pressure on the surface of the plate can be expressed by the following equation:

$$PH = pv_s v \frac{p' v_s'}{p' v_s' + pv_s} \quad (1)$$

Where  $p$  indicates the density of the bird body,  $p'$  the density of the plate,  $v_s$  the propagation velocity of the shock wave in the bird body,  $v_s'$  the propagation velocity of the shock wave in the plate and  $v$  the impact velocity of the bird body. Afterwards, as the bird body in contact with the plate section rheologises and spreads outwards, this creates an unloading wave, whereupon the pressure of the bird body on the plate is consequently reduced and the bird impact enters a phase of constant flow.

During constant flow, a stationary point with velocity 0 is created at the centre of impact of the bird body, and if the plate is assumed to be rigid and the bird body to be non-compressible flow, the pressure at the centre of impact can be expressed as follows:

$$p_s = \frac{1}{2} pv^2 \quad (2)$$

Taking into account the influence of non-ideal conditions, the following correction to the formula is often made in practical applications:

$$p_s = \frac{k}{2} pv^2 \quad (3)$$

$k \geq 1$  in the formula. The impact pressure will eventually become 0 as the impact process progresses.

The 3D woven composite damage model established for bird impact composites is explored in terms of both dynamic response and damage, respectively, so as to provide a

basis for the design of 3D woven composites for composite materials.

In the dynamic response analysis of the 3D woven composite, a 3D woven composite with a lay-up of [0/45/90/45/0] was selected, and the bird body and the surrounding air domain were given a relative velocity of 120 m/s to impact the four-sided solidly supported composite 3D woven composite head-on.

### 3. IMPACT PROCESS AND DEFORMATION OF BIRD BODY AND PLATE

Figure 1 shows the variation of contact pressure with time at the centre of impact of the 3D woven composite. The bird body is falling rapidly while rheologising in the plane of the 3D woven composite, and at the same time the 3D woven composite is failing from damage due to its impact on the 3D woven composite, which is eventually penetrated by the rheological bird body. At  $t=456.96\mu\text{s}$  the bird body just starts to contact the 3D woven composite, at this time neither the bird body nor the plate is deformed. After that the bird body rapidly descends and the 3D woven composite is deformed, at  $t=674.87\mu\text{s}$  it can be seen that the bird body has penetrated the 3D woven composite due to damage to the 3D woven composite and some of the bird body rheology has reached the bottom surface of the 3D woven composite. As the impact process continues, the bird body continues to impact downwards and the rheological bird body continues to extrude through the damaged parts of the 3D woven composite to the bottom surface of the 3D woven composite.  $t=845.99\mu\text{s}$ , the 3D woven composite has produced a large deformation and a large scale penetration of the bird body has occurred. At  $t=100\mu\text{s}$ , the bird impact process ends due to the programmed setting, at which point the three-dimensional woven composite has the largest deformation and the largest damage area.

At approximately 0.52 ms, the impact begins, at which point the pressure increases rapidly and begins to decrease after reaching a maximum of 68.5 MPa, followed by a continuous oscillation of the pressure value, although the amplitude decreases and the pressure value eventually reaches zero due to the complete failure of the cell. It can be seen from this process that the 3D woven composite also exhibits four stages of rapid pressure build-up, pressure decay, pressure stabilisation and pressure termination when subjected to a bird strike, similar to the dynamic response of an aluminium plate when subjected to a bird strike, which is mainly determined by the characteristics of the impact load, i.e. due to the rheology of the bird body during the high speed impact.

**Figure 1.** Pressing pressure variation curve at the centre of the composite

#### 4. DIFFERENT CELL RESPONSE VARIATIONS FROM CENTRE TO EDGE

Variation of response of different cells from the centre to the edge To further investigate the response process of bird impact, five cells on the same line from the centre to the edge of the 3D woven composite were selected in this paper to extract their contact pressure. Figure 2 shows the variation of the contact pressure of the selected cells.

Cell A, which is at the centre of the three-dimensional woven composite, is the first to suffer the impact, so its stress value first reaches the maximum, and then decays rapidly, while the pressure change trend of cells B, C, D and E is similar to that of A. This is due to the rapid decrease in speed and pressure increase when the bird first hits, but the pressure decays rapidly again due to the rheological changes of the bird's body; when the time reaches 0.8 ms, cell C decays after of the stress starts to increase again, and when it reaches a certain value it starts to decay a second time, while cell B has the same trend at 0.9 ms, which is due to the second increase in stress caused by the rebound of the shock wave, and D and E do not show similar phenomena due to the termination of the calculation time.

This shows that after a three-dimensional woven composite suffers a bird impact, on the one hand its stresses will increase rapidly and spread around, and on the other hand the stress waves will also pass back and forth in the plate in an oscillating manner, thus interacting continuously with the plate until they finally decay to zero.

Figure 2. Variation in contact pressure of selected units

#### 5. 3D WOVEN COMPOSITE DAMAGE ANALYSIS

Figure 3 shows the variation of the equivalent effect force with time for each layer of a unit in the centre of the 3D woven composite. A~E in the figure represent the 1~5 layers of the 3D woven composite from top to bottom, i.e. 0°, 45°, 90°, 45° and 90° layers respectively. It can be seen from the graphs that the overall trend of the equivalent stresses for the five layers is basically the same, all increasing at the beginning of the impact, followed by a decrease in the stress value as the bird body rheologically changes, and then increasing again when the stress wave rebounded again, followed by another decrease, followed by oscillations until the end of the impact process. The difference is that the stress values are higher and fluctuate more in the 45° plies compared to the 0° and 90° plies. The amount of 45° plies should

therefore be taken into account in the impact design of 3D woven composites in order to avoid excessive stress values during the impact process.

**Figure 3.** Equivalent force diagram for each layer of a cell in the centre of the composite

## 6. CONCLUSION

This paper focuses on the bird impact resistance of three-dimensional woven composites and analyses the change in contact pressure of the woven composites during impact as well as the change in cell response from the centre to the edge of the woven material and the damage of the composite woven material at five different locations. The following conclusions are drawn:

1. During the impact, the impact starts at about 0.52 ms, when the pressure of the woven composite increases rapidly and starts to decrease after reaching a maximum of 68.5 MPa, followed by a continuous oscillation of the pressure value, although the amplitude decreases and eventually the pressure value becomes zero due to the complete failure of the cell.
2. In terms of losses, the stress values in the 45° layer are higher and fluctuate more in comparison to the 0° and 90° layers.
3. Unit A, being at the centre of the three-dimensional woven composite, is the first to be impacted, whereupon its stress values first reach their maximum and then decay rapidly, while the pressure trends of units B, C, D and E are similar to those of A.

## ABSTRACT

Based on the principle of high-speed impact damage to carbon fibre composites, the finite element software Abaqus was used to simulate and analyse the damage state of carbon fibre composites and their internal stress changes after being subjected to high-speed impact. According to the damage pattern of the target plate and the final deflection deformation at the centre of the target plate, the plain weave plate is better than the multidirectional laminate after the speed is greater than 10 m/s. Although both of them are isotropic in structure, the deformation ability of the plain weave plate is significantly better than that of the multidirectional laminate. After a velocity greater than 20m/s, the multidirectional laminate is the first to reach damage. It can be concluded that for the low speed impact of the target plate, the smoother the outer surface of the impacting object, the better the impact resistance of the target plate when other conditions are certain. In addition, due to the woven form of plain weave panels, the impact resistance of plain weave panels is generally better than that of multidirectional laminates.

## 1. INTRODUCTION

Carbon fibre composites are widely used in the design of lightweight structures for advanced equipment such as spacecraft, high-speed rail vehicles and high-performance vehicles due to their excellent tensile properties [1-2]. With the increasing complexity of the application environment, in-plane weaving has received much attention as an important way to effectively improve the mechanical performance of carbon fibre composite panels [3-4].

Identifying the effect of in-plane braiding on the mechanical behaviour of carbon fibre composite foundations is key to further improving the design and application of carbon fibre composite structures in transient strong dynamic loading environments [5].

The literature [6] investigated the mechanical properties of carbon/basalt fibre reinforced epoxy composites by experimental and numerical research methods. The experimental results showed that the stacking order had a significant effect on the strength and bending modulus of the composite sheets, but had a small effect on the tensile modulus. Literature [7] et al. investigated the effect of stacking order and blending ratio on the mechanical properties and damage modes of the composites in tensile, compression and bending, and the experimental results showed that the tensile, compression and bending properties of the blended composites were significantly improved compared with those of the polyimide fibre composites, while the damage strain and damage energy were better than those of the carbon fibre composites. In [8], quasi-static tests were carried out on triaxial woven composites under in-plane transverse loading conditions and finite element analysis was performed to study their damage behaviour. A mesoscale model was proposed and validated, which can be further used to study the mechanical properties of similar materials. The literature [9] et al. investigated the indentation mechanical characterisation of carbon nanotube-reinforced polymer composites, and the results showed that the addition of small amounts of carbon nanotubes improved the fracture interface stiffness and prevented the evolution of microcracks, which well improved the mechanical properties of the composites.

This paper is based on the Abaqus finite element analysis method to simulate and analyse the damage behaviour of carbon fibre composites under high speed crash conditions. The damage patterns and impact resistance of multidirectional laminates and plain weave laminates are mainly discussed. The effects of different impact objects and different impact velocities on the damage pattern are also analysed in relation to the centre point deflection and final deflection.

## **2. TRENDS IN CARBON FIBRE COMPOSITES**

Due to the high specific strength, high specific modulus, high thermal conductivity and low coefficient of thermal expansion and many other excellent properties of carbon fibres, carbon fibre composites as structural materials for spacecraft have a significant effect on their weight reduction. As a result, carbon fibre composites are rapidly developing into a basic structural material for the aerospace industry, and the proportion of their use in the aerospace sector is already as high as 80%, showing an incomparable potential for application.

With the increasing demand for carbon fibre composites from the cutting-edge science and technology of the aerospace industry, carbon fibre composites are developing in several directions:

(1) High performance, including the high performance of raw materials and high-performance composite products. For example, the carbon fiber used for aerospace products has gradually developed from T300 to T700, T800 and even T1000 with higher strength and modulus, while the traditional epoxy resin has also been gradually replaced by toughened epoxy resin with higher temperature resistance and better toughness, bismaleimide resin and polyimide resin. The performance of composite products is also gradually developed into light weight, radiation resistance, high temperature resistance and oxidation resistance, etc.

(2) Low-cost, requiring from raw materials, production processes and quality control and other aspects of cost reduction.

(3) Multi-functionalization, advanced composite materials for aerospace are gradually realizing the integration of structure and function, i.e. gradually developing from pure structural type to multi-functionalization.

Thermoset resin matrix composites, as an essential and important material in the aerospace sector, have been an important aspect of high performance carbon fibre . An important aspect of composite research. Epoxy resin as the most widely used resin system in carbon fiber composites, with its excellent mechanical and thermal properties, excellent electrical properties, good heat and moisture resistance and processability and many other characteristics, has been the main body of matrix resin for high-performance composites in the aerospace industry. Such as solid engine shell using fiber winding molding epoxy resin-based composite manufacturing, so that its density is small, high strength, good rigidity, good dimensional stability, and has excellent corrosion resistance, high temperature resistance and radiation resistance performance. For example, epoxy-based and epoxy phenolic fiber-reinforced composites are used to manufacture solar cell array substrates, missile warheads and satellite fairings, as well as exothermic materials for spacecraft, which can greatly reduce the quality of the structure and improve the radiation resistance, high temperature resistance and oxidation resistance of the structure. Over the years, bisphenol A epoxy resin has been in the application of aerospace epoxy resin matrix occupies a dominant position, such as in the United States of America's "Trident-1", "Trident-2" missiles and "Pegasus The "Pegasus" rocket has been widely used. Carbon fibre/epoxy composites have also been successfully used in China's aerospace industry, such as the antenna system of the Dongfang communication satellite (DFH-2, DFH-3) and the solar array structure of the first sun-synchronous orbiting "Feng Yun-1" meteorological satellite, which both use carbon fibre composites. However, as epoxy resins have relatively poor impact damage resistance and low heat resistance, and are usually used at temperatures not exceeding 150 degrees, general-purpose epoxy resins can no longer meet the increasingly demanding requirements of the aerospace industry. Bismaleimide (BMI) resin overcomes the disadvantages of the relatively poor heat resistance of epoxy resins, while having the advantages of high temperature resistance, humidity and heat resistance, radiation resistance of polyimide resins, as well as the advantages of easier processing similar to epoxy resins, therefore, BMI resin-based composites have become a new research hotspot with its excellent performance, and the application in the aerospace field has begun to accelerate.

### 3. THEORETICAL EQUATIONS FOR HIGH-SPEED COLLISIONS

The collision process of this test is a non-linear dynamic contact problem, including static mechanical analysis and transient dynamic analysis of carbon fibre materials. This study uses the Standard module in Abaqus to solve the non-linear structural statics problem of the system, and the Explicit module to solve the simulated transient dynamic impact process, using the Lagrangian description increment method, the collision process of the whole test system follows the energy conservation, and the energy conservation equation is:

$$E = Vs_{ij}\varepsilon_{ij} - (p + q)V \quad (1)$$

Where:  $V$  is the volume of the present configuration.  $\varepsilon_{ij}$  is the strain tensor.  $s_{ij}$  is the strain deflection.  $q$  is the strain pressure. During the simulation, the stress on the experimental projectile consists of the static and dynamic intrusion resistance, which is expressed by the equation:

$$\sigma_n = mY_t + n\rho_l v^2 \quad (2)$$

Where:  $m$  is the static penetration resistance.  $n$  is the dynamic resistance coefficient, which is related to the shape of the projectile.  $Y_t$  is the yield strength of the target material.  $\rho_t$  is the density of the target material.  $v$  is the velocity. In the process of high-speed collision, when the change in material elongation line reaches the material itself brittle breaking elongation line strain, the material will fracture damage, so that the maximum strain criterion conditions for damage is:

$$(\sigma_x - v_x \sigma_y) \leq X_t \quad (3)$$

$$(\sigma_y - v_y \sigma_x) \leq Y_t \quad (4)$$

#### 4. ANALYSIS OF THE IMPACT PARAMETERS ON THE IMPACT RESISTANCE

Figure 1 gives a graph of the maximum deflection and final deflection of the centre point of the backside plate of the plain woven plate under the effect of different velocities of the ball-head impactor. rate is much larger than the final deflection, when the speed is greater than 20m/s, the two deflection values of the target plate almost no longer change, so at this time, the target plate has reached the stage of near-complete destruction, the speed reaches 25m/s or so target plate has been destroyed. From the growth rate of the two curves, the carbon fibre plain weave plate shows brittleness and the final deflection after impact is very small before damage, which indicates that the plain weave plate is less inclusive in terms of damage. Further from the difference between the maximum and final deflection at the same velocity, the difference between the two gradually increases until 20m/s and remains almost unchanged when greater than 20m/s, indicating that the difference between the maximum and final deflection at the centre point does not change with increasing velocity after the failure of the target plate.

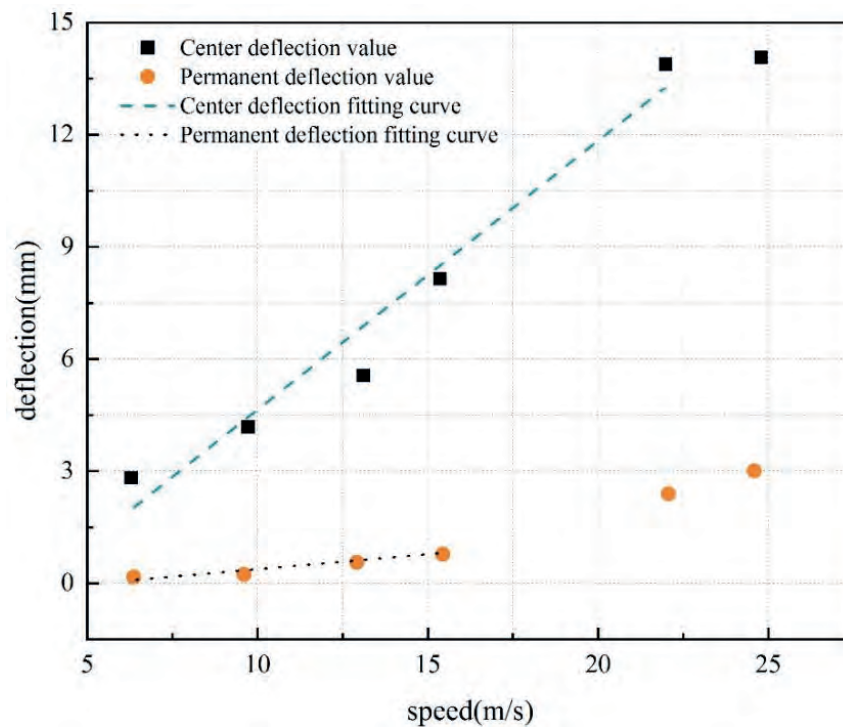

Figure 1. Maximum deflection and final deflection

## 5. ANALYSIS OF THE IMPACT RESISTANCE OF THE WEAVE WITHIN THE FIBRE FACE

The structure of carbon fibre composite panels has a large influence on the mechanical properties of the target panels. Therefore, it is also necessary to investigate the impact resistance of carbon fibre plates with different in-plane weave forms. In this section, the maximum deflection and final deflection of the centre of the back panel of carbon fibre multidirectional laminates and plain weave panels of the same thickness are selected for analysis and comparison under the action of a ball impactor. Figure 2 shows the fitted curves of the maximum deflection and final deflection of the two target plates with the change of velocity, comparing the fitted curves of the maximum deflection of the two, it can be seen that the two curves have an intersection point (the point corresponds to the impact velocity of about 10m/s). The maximum deflection of the plain weave laminate is significantly greater than that of the multidirectional laminate after 10 m/s. This indicates that the impact resistance of the two laminates is comparable when the impact velocity is less than 10 m/s, whereas after the velocity is greater than 10 m/s, the plain weave laminate outperforms the multidirectional laminate, although both are isotropic in structure, the deformation capacity of the plain weave laminate is significantly better than that of the multidirectional laminate. In addition, comparing the final deflections of the two, it was found that the final deflections of the two were basically the same before the speed of 20m/s, indicating that the two recovered the deformation ability equally. After velocities greater than 20m/s, the multidirectional laminate is the first to reach damage.

Figure 2. Maximum and final deflections

## 6. CONCLUSION

According to the simulation of the high-speed impact damage behaviour of carbon fibre materials, as well as the analysis of the target plate centre point and final deflection deformation according to the target plate damage mode, after the speed is greater than 10m/s, the plain weave plate is better than the multi-directional laminate, although both show isotropic structure, but the deformation ability of the plain weave plate is significantly better than the

multi-directional laminate. After a velocity greater than 20m/s, the multidirectional laminate is the first to break. In summary, the impact resistance of the plain weave laminate is generally better than that of the multidirectional laminate.

## ABSTRACT

In order to solve several problems in computerized stereo 3D positioning, a neural network-based measurement method is proposed based on the principle of stereo vision. This paper uses neural networks to establish a non-linear mapping relationship between spatial point world coordinates and image coordinates, enabling the system to correspond two-dimensional image coordinates (input) to three-dimensional object coordinates (output) one-to-one without complex calibration of internal and external camera parameters, and compares it with traditional localization methods. Experiments show that the average value of the synthetic position deviation is 0.082 and verify that the method is effective and feasible, simplifying the calibration and positioning calculation of the vision system, more scientific than the traditional method and achieving good results in terms of positioning accuracy. This study reduces the positioning error and achieves fast and highly accurate spatial positioning with this structure.

## KEYWORDS

Computers; Stereoscopic 3D; Neural networks; Vision principles; Non-linear mapping relationships; Localization errors

## 1. INTRODUCTION

Stereo vision measurement is based on the parallax of the same 3D spatial point in images taken by two (more) cameras at different spatial locations, and the spatial geometric relationship between the positions of the cameras to obtain the 3D coordinate values of the point [1-2]. The greatest difficulty facing stereo vision measurements, the accuracy and precision of spatial feature points extracted and matched across multiple digital images, is among other issues [3-4]. The use of binocular stereo vision to provide coarse target depth information, combined with improved image segmentation algorithms, can segment target locations in video images in a high-speed environment, while traditional target segmentation algorithms have difficulty in obtaining satisfactory results in a high-speed real-time environment [5-6].

The literature [7] suggests that the key technologies involved in binocular positioning and tracking systems are camera calibration, stereo matching and 3D reconstruction. In the 3D reconstruction stage, the least squares method is used to calculate the 3D coordinates of the markers on the positioning target using the matching results. In the literature [8], a 3D positioning algorithm based on binocular stereo vision was proposed for the lunar rover. A framework diagram of the lunar rover 3D positioning system based on binocular stereo vision was established and the main modules in the framework were analysed. The image processing aspects such as image pre-processing, feature point extraction, stereo matching of feature points, 3D reconstruction and tracking matching algorithm of feature points were studied to obtain matching environmental features before and after the motion of the lunar rover.

This paper presents a new method for 3D coordinate measurement of target points, which uses a Nikon camera as an image sensor to identify the location of feature points and an artificial neural network to learn the relationship between image information and 3D information directly, without determining the specific internal and external parameters of the camera, or knowing a priori knowledge about the model or parameters. In the case of binocular vision, the relationship between the positions of the two cameras does not need to be found specifically, but is implicit in the neural network. The RBF network structure is linear in output and weight, and the training method is fast and easy, with no local optimum problems and fast convergence. As the input vector is mapped directly to the hidden layer space, this non-linear mapping relationship is determined once the centre of the RBF is determined. Therefore, the learning algorithm of the RBF first determines the centre of the radial basis function, and then solves the output layer weights by linear equations, and finally verifies the feasibility of this research through simulation experiments.

## 2. STEREO 3D POSITIONING METHOD

### 2.1 TRADITIONAL STEREO VISUAL POSITIONING METHODS

In a body vision system, the  $C$  matrices of the left and right cameras are:  $C_1, C_2$ , and the coordinates of a point  $P_i$  in space in the world coordinate system are  $(x_i, y_i, z_i)$ , and the coordinates of the left and right images are:

$$\begin{bmatrix} ut \\ vt \\ t \end{bmatrix} = \begin{bmatrix} c_{11} & c_{12} & c_{13} & c_{14} \\ c_{21} & c_{22} & c_{23} & c_{24} \\ c_{31} & c_{32} & c_{33} & c_{34} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \quad (1)$$

$$\begin{bmatrix} u_{ir} t_{ir} \\ v_{ir} t_{ir} \\ t_{ir} \end{bmatrix} = C_r \begin{bmatrix} x_i \\ y_i \\ z_i \\ 1 \end{bmatrix} = \begin{bmatrix} c_{r00} & c_{r01} & c_{r02} & c_{r03} \\ c_{r10} & c_{r11} & c_{r12} & c_{r13} \\ c_{r20} & c_{r21} & c_{r22} & c_{r23} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ z_i \\ 1 \end{bmatrix} \quad (2)$$

$$[x_i, y_i, z_i]^T = [A^T A]^{-1} A^T B \quad (3)$$

$(u_{il}, v_{il})$  and  $(u_{ir}, v_{ir})$ , we have equations (1) and (2). In equations (1) and (2), we can eliminate  $t_l$  and  $t_r$  respectively to obtain four equations about the relationship between  $(u_{il}, u_{il}, u_{ir}, v_{ir})$  and  $(x_i, y_i, z_i)$ , and when  $(u_{il}, v_{il}, u_{ir}, v_{ir})$  and  $C_l, C_r$  are known, we can find the spatial coordinates  $(x_i, y_i, z_i)$  of the point  $P_i$  through equation (3), which is the traditional

method of solving three-dimensional coordinates by stereo vision.

$$A = \begin{bmatrix} u_{il}c_{l20} - c_{l00} & u_{il}c_{l21} - c_{l01} & u_{il}c_{l22} - c_{l02} \\ v_{il}c_{l20} - c_{l10} & v_{il}c_{l21} - c_{l11} & v_{il}c_{l22} - c_{l12} \\ u_{ir}c_{r20} - c_{r00} & u_{ir}c_{r21} - c_{r01} & u_{ir}c_{r22} - c_{r02} \\ v_{ir}c_{r20} - c_{r10} & v_{ir}c_{r21} - c_{r11} & v_{ir}c_{r22} - c_{r12} \end{bmatrix} \quad (4)$$

$$B = [c_{l03} - u_{il}c_{l23} \quad c_{l13} - v_{il}c_{l23} \quad c_{r03} - u_{ir}c_{r23} \quad c_{r13} - v_{ir}c_{r23}] \quad (5)$$

## 2.2 STEREO VISUAL LOCALIZATION OF RBF NETWORK MODELS

RBF network is a good performance forward network, compared with other forward networks (such as the widely used BP network), it not only has the global approximation property, but also has the best approximation performance, RBF network structure has output, weights linear relationship, while the training method is fast and easy, there is no local optimum problem, and convergence speed is fast.

The number of nodes in the input layer, the hidden layer and the output layer are  $n$ ,  $m$  and  $s$  respectively, and there are  $p$  sets of input samples  $(X^{(i)}, Y^{(i)})$ ,  $i = 1, \dots, p$ , where  $X^{(i)}$  and  $Y^{(i)}$  are  $n$  and  $s$  dimensional vectors respectively, the connection weights from the input layer to the hidden layer are set to 1, and the activation function of the hidden layer points is an  $n$  dimensional radial basis function.

$$\Phi(x) = \Phi\left(-\|x^{(i)} - c_j\|\right), (j = 1, \dots, m) \quad (6)$$

$c_j$  is the centre of the basis function,  $\|\cdot\|$  is the distance measure, usually the Euclidean distance, and the output of the network can be expressed as:

$$y^{(i)}_k = \sum_{j=1}^m w_{jk} \Phi^{(i)}_j + \theta_k \quad (k = 1, \dots, s) \quad (7)$$

Where  $w_{jk}$  is the connection weight from the hidden layer node  $j$  to the output layer node  $k$ ,  $\Phi^{(i)}_j$  is the output value of the hidden layer node and  $\theta_k$  is the threshold value of the output point. Expressed in matrix form as:

$$y = \Phi w, \Phi \in R^{p \times (m+1)}, w \in R^{s \times (m+1)} \quad (8)$$

$$y = \begin{bmatrix} y_1^{(1)} & y_2^{(1)} & y_s^{(1)} \\ y_1^{(2)} & y_2^{(2)} & y_s^{(2)} \\ \dots & \dots & \dots \\ y_1^{(p)} & y_2^{(p)} & y_s^{(p)} \end{bmatrix}, \Phi = \begin{bmatrix} \Phi_1^{(1)} & \Phi_2^{(1)} & \Phi_m^{(1)} \\ \Phi_1^{(2)} & \Phi_2^{(2)} & \Phi_m^{(2)} \\ \dots & \dots & \dots \\ \Phi_1^{(p)} & \Phi_2^{(p)} & \Phi_m^{(p)} \end{bmatrix}, w = \begin{bmatrix} w_{11} & w_{12} & w_{1s} \\ w_{21} & w_{22} & w_{2s} \\ \dots & \dots & \dots \\ w_{m1} & w_{m2} & w_{ms} \\ \theta_1 & \theta_2 & \theta_s \end{bmatrix} \quad (9)$$

Commonly used radial basis functions include Gaussian functions, multi-quadratic functions and thin-slab spline functions, etc. In this paper, Gaussian functions are used as radial basis functions. As the input vector is directly mapped to the hidden layer space, this non-linear mapping relationship is determined after the centre of the RBF is determined, so the learning algorithm of the RBF firstly determines the centre of the radial basis function, and then solves the output layer weights by linear equations. A K-mean clustering-based approach is used to

determine the centre of the basis function, and the least squares method is used to determine the hidden layer to output layer connection weights, denoted as:

$$y^{(1)} = \Phi_1^{(1)} w_{11} + \dots + \Phi_m^{(p)} w_{m1} + \theta_s \quad (10)$$

This is a linear system of equations solution problem, where  $W$  can be obtained by least squares:

$$W = (\Phi^T \Phi)^{-1} \Phi^T Y \quad (11)$$

The normalisation process is applied to ensure that the input data is in the range of (-1, 1) by applying the normalisation formula. The sample data is then used to train the RBF neural network to complete the calibration of the system, and the trained network can then be used for the measurement of spatial target points.

### 3. ANALYSIS OF SIMULATION EXPERIMENTS

Figure 1 shows a stereo vision system. The simulation conditions are: two cameras with the same internal parameters, two cameras with parallel optical axes, with a baseline length of 0.5 m and a focal length of 12 mm, two cameras with parallel optical axes and image coordinate systems with axes  $u$  and  $v$  parallel to axes  $X$  and  $Z$  of the world coordinate system respectively. The image resolution is  $1024 \times 1024$  pixels. The  $Y$  coordinate can be 45, 50 or 55 in mm.

**Figure 1.** Experimental system

Let  $(X_w, Y_w, Z_w)^T$  be the 3D coordinates of the point  $P$  of the object in the 3D world coordinate system and  $(u, v)^T$  be the image coordinates of the corresponding point on the image plane.  $(u_1, v_1)^T$  denote the coordinates of the point on the left image and  $(u_2, v_2)^T$  denote the coordinates of the point on the right image.

The network structure is shown in Fig. 1. A three-layer feedforward network is used, with the input of the network being the image coordinates  $u_1, v_1, u_2, v_2$  of the corresponding points in the two images, and the output of the network being the 3D coordinates  $X_w, Y_w, Z_w$ . 3 neurons are used in the hidden layer, and the experimental procedure is as follows:

#### 3.1 SYSTEM CALIBRATION

Moving the target  $P$  backwards and forwards in parallel in  $W$ , 36 sample data pairs (projection  $u, v$  of the target point in the two cameras, 3D coordinates in the world coordinate system  $W$ ) are collected and the network is trained with the weights. and the results are stored

in the computer.

### 3.2 POSITIONING CALCULATIONS

A white noise of 0 mean  $\sigma$  standard deviation is added to the image data to obtain the projection of the two cameras as input to the network. Using the above calibrated stereo vision system, the spatial position of the target point is calculated using equation (3) using the position calculation method presented in this paper.

### 3.3 RESULTS AND ANALYSIS

The simulation results are shown in Figure 2, which shows that the neural network model has a relatively strong resistance to noise. The maximum deviation in direction  $X$  is 0.2658 and the minimum is 0.006, the maximum deviation in direction  $Y$  is 0.1513 and the minimum is 0.003, the maximum deviation in direction  $Z$  is 0.131 5 and the minimum is 0.007 8, and the average synthetic position deviation is 0.082.

Figure 2. simulation result

The spatial coordinates of each feature point were calculated using the traditional stereo vision method and compared with the spatial coordinates of each feature point calculated using the neural network localisation method, with the distances taken as 45, 50 and 55, respectively, and averaged. The results are shown in Table 1:

Table 1. error comparison of the two methods

Relative error of general solution			Relative error of neural network solution		
$x$ coordinate	$y$ coordinate	$z$ coordinate	$x$ coordinate	$y$ coordinate	$z$ coordinate
1.410	0.304	0.357	0.570	0.120	0.141
0.693	0.151	0.176	0.323	0.067	0.071
0.369	0.081	0.073	0.153	0.039	0.035

#### 4. CONCLUSION

This paper combines binocular vision measurement methods and proposes the use of neural network methods for camera calibration, without the need to pre-build the model structure of the imaging system or make too many assumptions about the nature of the system itself, but by directly learning the input and output data of the system and generalising the input-output relationship of the imaging system. The effectiveness, rationality and realizability of the method in solving spatial localization problems are verified through simulation experiments. Compared with traditional stereo vision localization methods, the localization error is reduced and fast and high-precision spatial localization is achieved under this structure.

## **ABSTRACT**

Through theoretically guided research, countermeasures for rural industrial revitalization can be better proposed. This paper discusses the optimization path of rural industrial governance based on optimization theory, and studies the methodology of rural industrial revitalization under the guidance of Marxism. Then, through the analysis of rural revitalization problems, countermeasures for rural revitalization are proposed. In the current rural industrial structure, the contribution of primary industry to regional economic development is low. This study helps to promote the breakthrough development of rural industries in the new situation.

## **KEYWORDS**

Optimization theory; Marxism; rural industrial revitalization; industrial structure

## **1. INTRODUCTION**

Industry is the foundation and breakthrough for any countryside to achieve revitalization. If the industry thrives, the countryside thrives [1-2]. When industry is strong, farmers will be rich. Only when a countryside achieves sustained industrial prosperity can it ensure the stability of rural economy and society, promote farmers' continuous income and wealth, and realize the prosperity of rural society [3-4]. Therefore, the status of industrial development is crucial in the rural revitalization strategy, and governments, societies and farmers at all levels must take industrial revitalization as the task of rural revitalization to grasp it tightly.

The research results on rural industrial development are relatively abundant and are divided into two major categories here according to the different research objects and elements. One category is the macroscopic research on the development of

Chinese rural industries, which mainly analyzes the scientific connotation of the revitalization of rural industries with Chinese characteristics, clarifies the key tasks of the revitalization of rural industries with Chinese characteristics and the support policies to accelerate and improve the revitalization of rural industries with Chinese characteristics [5-7]. The other category is the perspective of northern Shaanxi region and the research aspect of rural industrial development in its region, mainly discussing the problems in the structure of leading industries in the county economy of northern Shaanxi as well as the selection and development countermeasures of leading industries in the future [8-9]. Accordingly, this paper explores the path of rural industrial revitalization in the new era under the guidance of optimality theory and Marxist thought.

## **2. RURAL GOVERNANCE AND INDUSTRIAL REVITALIZATION**

### **2.1 OPTIMIZATION THEORY**

Optimization theory is the theory and methodology of optimal design, optimal control, and optimal management problems of a system. Optimization is the process of organizing a system to have the desired optimal function under certain constraints. It is to make the optimal choice from many possible options so that the objective function of the system is maximized or minimized under the constraints. Optimization is the basic purpose of the system approach. There are several basic elements of optimization methods: the system objective, the possible options for achieving the objective, the price paid for implementing each option, and modeling the system.

### **2.2 OPTIMIZATION OF RURAL INDUSTRIAL GOVERNANCE**

#### **2.2.1 INDUSTRIAL MARKET OPTIMIZATION**

The choice of governance method to achieve the "optimization" of village governance is undoubtedly an inevitable issue in rural governance. In the field of economics, microeconomics is concerned with the behavior of individual consumers and vendors in the market, and market transactions are seen as an interaction between individuals. Individuals always seek to maximize their profits. The buyers and sellers in the commodity market are similar to the plaintiffs and defendants in the courtroom in terms of behavior patterns. The choice of behavior under the rule of law and the choice of behavior under the market price reside in the same mechanism. Both sides of the lawsuit pursue the optimization of rights.

#### **2.2.2 OPTIMIZATION OF INDUSTRIAL ORDER**

Whether to choose the rule of law or the traditional governance model or a combination of the two has been hotly debated in the academic community, and I believe that this is actually an optimal choice for rural governance. Whether through

judicial, administrative, civil mediation or any other means, and whether or not lawyers intervene. An important part of building a constitutional democracy in China is that the Chinese peasants actually become citizens and actually enjoy the rights directly granted by the state, instead of enjoying local rights and having to rely more on networks of acquaintances or natural communities for help, as is the case in many areas today.

## **2.3 RURAL INDUSTRIAL REVITALIZATION FROM A MARXIST PERSPECTIVE**

### **2.3.1 AGRICULTURAL MODERNIZATION**

Marx Engels' theoretical thought of agricultural modernization fully reflects the characteristic that Marxism is essentially a science of development. Marx believed that the modernization of agriculture and the commercialization and marketization of agricultural products are mutually accompanying processes. Therefore, the process of modernization of agriculture can be understood as a process of realizing commodity economy in the field of agriculture. Industrialization in the field of agricultural production has led to the gradual replacement of the traditional smallholder economy by modern large-scale agricultural production, and the capitalization and entrepreneurial operation of agriculture have contributed to the establishment of modern agricultural production methods in developed capitalist countries.

### **2.3.2 AGRICULTURAL COOPERATIVE**

Marx and Engels were very supportive of the development of various types of agricultural cooperatives, especially agricultural production cooperatives. Marx and Engels believed that in the operation and development of agricultural cooperatives, the state should focus on supporting the development of agricultural cooperatives. Marx and Engels advocated achieving economies of scale through centralized production. Thus, it can be seen that the concept about agricultural cooperatives and scale production was put forward as early as the time of Marx and Engels, which provided the basic theoretical followings for promoting the development of modern agricultural cooperatives and realizing high-quality scale benefits of agricultural industries.

### **2.3.3 AGRICULTURAL INDUSTRIALIZATION**

Marxist industrialization of agriculture is to break the old pattern of business system and inherent management mode, realize the optimal combination of all factors, improve the level of productivity, and thus increase the supply of commodity market. The Marxist idea of industrialization of agriculture is embodied in China as under the premise of adhering to the guiding position of Marxism and the theoretical system of socialism with Chinese characteristics, and under the premise of stabilizing the family contract responsibility system in the market economy system, facing the domestic and

foreign markets, improving the efficiency of the market economy and accelerating the transformation from subsistence agriculture to modern commodity agriculture.

### 3. ANALYSIS OF RURAL REVITALIZATION UNDER OPTIMAL MARXIST GUIDANCE

#### 3.1 ANALYSIS OF RURAL REVITALIZATION ISSUES

The distribution of the scale structure of rural industries is shown in Figure 1. The industrial classification of rural areas is mainly manifested in the primary industry, which is dominated by farming, the secondary industry, which is supplemented by petroleum, coal and by-product food processing, and the tertiary industry, which is supplemented by rural tourism, leisure tourism and e-commerce logistics. From the proportion of the three industries to GDP from 2014 to 2020, the primary industry accounts for the smallest proportion, where the proportion of the primary industry to GDP from 2014 to 2020 shows a continuous growth trend, and the proportion of the primary industry from 2019 to 2020 shows a decreasing trend. The secondary and tertiary industries account for a relatively large proportion, of which the proportion of the secondary industry from 2014 to 2020 is a continuous downward trend, and in 2019 to 2020 is a growth trend; the proportion of the tertiary industry in general shows a growth trend, with a slight decline in 2020. From the overall situation, among the three industries, the contribution of the primary industry to economic growth is always small, and the contribution of the secondary and tertiary industries to economic growth is larger, of which the contribution of the tertiary industry to economic growth increases year by year.

### **Figure 1 Rural industrial scale structure distribution**

From the above analysis, it can be seen that the contribution of primary industry to regional economic development is low, and economic growth mainly relies on the drive of secondary and tertiary industries. As the development of the primary industry is the main development of the vast rural areas, how to optimize the adjustment of industrial scale structure, to achieve the development of the primary industry, mainly farming industry to the rural economy drive is particularly urgent and important.

### **3.2 RURAL REVITALIZATION STRATEGY**

In order to guarantee the orderly implementation of rural revitalization and improve the implementation efficiency of rural revitalization, it is recommended that the government organize the preparation of industrial development planning at the city, county, town and village levels, implement planning-led actions, and guide and regulate rural revitalization. In the planning process, it should comprehensively promote the pace of scientific and technological innovation of rural industries in Yan'an, continuously accelerate the pace of transformation of production and operation mode of modern agricultural industries, increase the standardized production and promotion of modern agricultural industries, and vigorously promote industrial integration. Vigorously develop the countryside agricultural products processing industry. Use the advanced concept of industrialization to manage and guide the development of agricultural industry, attach great importance to the rearrangement of agricultural industry, continuously extend the industrial chain, and vigorously promote the integration and upgrading of rural industry.

### **4. CONCLUSION**

Under the perspective of optimization theory and Marxism, this paper explores the problems of rural industrial revitalization and proposes countermeasures for rural industrial revitalization. The revitalization of rural industries needs a step-by-step process, and it is impossible to achieve the goal of China's rural revitalization strategy overnight, and it requires continuous exploration, adjustment and optimization in reality. In particular, rural revitalization involving specific regions needs to be combined with the actual situation and specific analysis of specific problems, so as to find a targeted way to achieve it.
