# IV INTERNATIONAL CONFERENCE ON TECHNOLOGY, ENGINEERING: PROCESSES AND PRODUCTS

September 28 to 30, 2023

ONLINE CONFERENCE

Organized by:

 **3ciencias** - [info@3ciencias.com](mailto:info@3ciencias.com)

## PRESENTATION

From **3Ciencias**, we are thrilled to introduce the latest edition of the **IV International Conference on Technology, Engineering: Processes and Products**. This conference was initiated with the primary objective of fostering the dissemination and exploration of cutting-edge scientific discoveries across various disciplines within the realms of Technology and Engineering.

Scheduled to unfold from **September 28 to 30, 2023**, this event is all set to break boundaries and overcome the traditional constraints of time and place. By adopting a **virtual** format, we are eliminating geographical and temporal barriers, making it accessible to professionals worldwide, be they experts, educators, researchers, or anyone with an interest in these fields.

The conference promises a diverse array of engaging content, including abstracts, presentations, and videos featuring keynote speakers who are at the forefront of their respective domains. These presentations will be readily available to anyone keen on gaining insights into the latest developments in Technology and Engineering.

Furthermore, the culmination of this event will result in the creation of the **Book of Proceedings**, a compendium that encapsulates the collective knowledge shared during the conference. Published with an **ISBN**, this book will serve as a valuable resource for scholars and enthusiasts alike. To ensure its reach and impact, it will undergo a process of indexation in various esteemed conference proceedings databases. Notably, it will be submitted for inclusion in the **Conference Proceedings Citation Index of Clarivate** and **EI Compendex**, thus cementing its place in the annals of esteemed scientific literature.

In this ever-evolving age of technology and engineering, the **IV International Conference on Technology, Engineering: Processes and Products** is poised to be a significant platform for fostering collaboration, sharing innovative research, and contributing to the advancement of these vital fields. We invite you to be a part of this extraordinary journey and join us in exploring the frontiers of knowledge and innovation.

The **main lines** of research will be the following:

- **The application of big data and artificial intelligence technology in social sciences.**
- **The application of big data in economic and financial management.**
- **Application of Data Model and machine learning technology.**
- **Big data, neural network algorithms and their applications.**
- **Applications of artificial intelligence in engineering.**

WELCOME TO

# IV ICTEPP

IV International Conference on Technology,  
Engineering: Processes and Products

# EDITORIAL BOARD

## President

**Haci M. Baskonus**

## Organizing Committee

**María J. Vilaplana Aparicio**

**Maria Vela Garcia**

**David Juárez Varón**

**F. Javier Cárcel Carrasco**

## Scientific Committee

**Dra. Ana Isabel Pérez Molina.**

Universitat Politècnica de València (Spain)

**Dr. Julio C. Pino Tarragó.**

Universidad Estatal del Sur de Manabí (Ecuador)

**Dra. Irene Belmonte Martín.**

Universidad Miguel Hernández (Spain)

**Dr. Jorge Francisco Bernal Peralta.**

Universidad de Tarapacá (Chile)

**Dra. Mariana Alfaro Cendejas.**

Instituto Tecnológico de Monterrey (Mexico)

**Dr. Roberth O. Zambrano Santos.**

Instituto Tecnológico Superior de Portoviejo (Ecuador)

**Dra. Nilda Delgado Yanes.**

Universidad de las Ciencias Informáticas (La Habana, Cuba)

**Dr. Sebastián Sánchez Castillo.**

Universitat de València (Spain)

# AIMS & SCOPE

## PUBLISHING GOAL

**3Ciencias**, through **3C Conferences**, wants to transmit innovative projects and ideas to society. This objective is achieved through the publication of **original scientific articles**. **3C Conferences** is a group that organizes **social-scientific conferences**, where original works are disseminated, written in English.

The **main lines** of research for **IV ICTEPP** are the following:

- The application of big data and artificial intelligence technology in social sciences.
- The application of big data in economic and financial management.
- Application of Data Model and machine learning technology.
- Big data, neural network algorithms and their applications.
- Applications of artificial intelligence in engineering.

## SUBMISSION GUIDELINES

**3Ciencias** is an arbitrated journal that uses the **double-blind peer** review system, where external experts in the field on which a paper deals evaluate it, always maintaining the anonymity of both the authors and of the reviewers. The citations follows the standards of publication of the APA for indexing in the main international databases. The **maximun number of pages** is 15 per article. **Recommended** 6-8 pages.

## OUR TARGET

- Research staff.
- PhD students and Professors.
- Companies that develop research and want to publish some of their works.

## ETHICAL RESPONSIBILITIES

Previously published material is not accepted (they must be **unpublished works**). The list of signing authors must include only and exclusively those who have contributed intellectually (authorship). **Items that do not strictly comply with the standards are not accepted.**

# PLENARY SPEAKERS

## **PRAVEEN AGARWAL**

**Vice Principal | Chief Coordinator-International Relations,  
Anand-ICE**

Dr. P. Agarwal was born in Jaipur (India) on August 18, 1979. After completing his schooling, he earned his Master's degree from Rajasthan University in 2000. In 2006, he earned his Ph. D. (Mathematics) at the Malviya National Institute of Technology (MNIT) in Jaipur, India, one of the highest ranking universities in India. Dr. Agarwal has been actively involved in research as well as pedagogical activities for the last 20 years. His major research interests include Special Functions, Fractional Calculus, Numerical Analysis, Differential and Difference Equations, Inequalities, and Fixed Point Theorems.

ORCID: [0000-0001-7556-8942](https://orcid.org/0000-0001-7556-8942)

## **ZULQURNAIN SABIR**

**Doctor of Mathematics in Hazara University**

Zulqurnain Sabir was born in Pothi, Jhelum, Pakistan. He received the M.Sc. degree in mathematics from Punjab University, Lahore, Pakistan, and the M.Phil. degree in mathematics from Preston University Kohat, Islamabad Campus, Pakistan. He is currently pursuing the Ph.D. degree in mathematics with Hazara University, Mansehra, Pakistan.

ORCID: [0000-0001-7466-6233](https://orcid.org/0000-0001-7466-6233)

## **ABDON ATANGANA**

**Professor of Applied Mathematics. Natural and Agricultural  
Sciences, Institute of Groundwater Studies**

Prof Abdon Atangana is a leading applied Mathematics professor at the UFS. He obtained his honours and master's degrees from the Department of Applied Mathematics at the UFS with distinction. He obtained his PhD degree in applied mathematics from the Institute for Groundwater Studies. He serves as an editor for 18 international journals and is also a reviewer of more than 200 international accredited journals and has been awarded the world champion of peer review twice, in 2016 and 2017. He also serves on more than 20 editorial boards of applied mathematics and mathematics.

ORCID: [0000-0002-1886-3125](https://orcid.org/0000-0002-1886-3125)

### **SERGEI ODINTSOV**

**ICREA Research Professor at Institut de Ciències de l'Espai (CSIC - ICE). Experimental Sciences & Mathematics**

ICREA Research Professor at ICE (CSIC-IEEC) since 2003. Author of about 700 articles cited over 55000 times. Two ms were cited more than 3000 times, while six ms and two books – more than 1000 times each. Foreign Member of the Royal Norwegian Academy, member of Eur. Phys. Soc., Italian Grav. Soc. Awarded by Amaldi Gold Medal: European Prize for Grav. Physics 2014. Editorial Board Member of six journals, Editor-in-Chief of journal Symmetry and referee of about 20 journals (with dozen excellence certificates). Hirsh index  $h=115$ (Google S.),  $h=105$ (inspirehep),  $h=97$ (Scopus). Supervisor of 14 PhDs. Speaker/lecturer of about 120 and organizer of 40 int. workshops. Top Cited Clarivate Analytics Researcher in 2014-2018. Honorary Professorship: TSPU(2019), TUSUR(2020). Golden sign Grain of Truth from professors Union (2022).

ORCID: [0000-0002-3529-7030](https://orcid.org/0000-0002-3529-7030)

### **HACI M. BASKONUS**

**PhD, Professor (Full) at Harran University, Turkey**

Dr. Haci Mehmet Baskonus is currently an Assoc. Prof. in Harran University. He has published more than 165 articles in various reputed and leading journals being SCI and SCI-E and many others. His research interests include ordinary and partial differential equations, analytical methods for linear and nonlinear differential equations, mathematical physics, numerical solutions of the partial differential equations, fractional differential equations (of course ordinary and partial) and computer programmings such as Mathematica, Pascal and Maple. He is an active reviewer of a plethora of papers and books, and has received several national and international awards. He has supervised two PhD students, several MSc. and undergraduate students, and has been the external evaluator for many PhD theses various countries from all over the world.

ORCID: [0000-0003-4085-3625](https://orcid.org/0000-0003-4085-3625)

### **JUAN L. G. GUIRAO**

**Full Professor of Applied Mathematics**

Juan Luis García Guirao is Full Professor of Applied Mathematics at Technical University of Cartagena in Spain. He obtained his Degree in Mathematics at Universidad de Murcia (Spain) in 2001. Covering all the subjects of the Degree in four year, he used the last one for working on his Master Thesis. Under the supervision of Professor Francisco Balibrea, Full Professor of Mathematical Analysis and founder the Dynamical Systems Group of the Region of Murcia (<http://www.um.es/sistdynamics>) he defended his Master Thesis in 2001 and PhD Thesis in 2004. The PhD had European Mention and the predoctoral research stay was done at Instituto Superior Tecnico in Lisbon under the supervision of Professor José Sousa-Ramos, one of the main researchers in Dynamical Systems in Portugal, who passed away in 2007.

ORCID: [0000-0003-2788-809X](https://orcid.org/0000-0003-2788-809X)

# SCHEDULE

All conferences of the **Plenary Speakers** will have **morning hours** and will be offered openly to anyone who has **the link that will be sent via e-mail in the days prior to the start of the congress.**

During the presentation of the speakers, all microphones will remain closed until the speaking turn, which will be attended to one by one, until the schedule is complete.

All times indicated are **Spanish Time** (Madrid). UTC +2.

Schedules may be **subject to change due to technical issues.** However, they will be indicated as soon as possible, unless canceled.

The conference schedules for those **Selected Articles** will be informed by e-mail at least 15 days before the start of the conference.

## SEPTEMBER 28, 2023 - First Day

▽ 9:00 h. - 11:00 h.

**SPEAKER: ABDON ATANGANA**

*“On Fractional Calculus: A Review”*

Chairman: Juan L.G. Guirao

**Abstract:**

The aim of the talk is to make a review of the recent advances of fractional calculus. New results and new trends will be stated.

▽ 11:30 h. - 13:30 h.

**SPEAKER: JUAN L. G. GUIRAO**

*“Periodic Points in Dynamical Systems”*

Chairman: Abdon Atangana

**Abstract:**

In this talk we will make a survey on different methods for obtaining periodic orbits in dynamical systems. In particular we shall compare the classical combinatorial dynamics and the new methods coming from Algebraic Topology and Lefschetz fixed point theory.

## SEPTEMBER 29, 2023 - Second Day

▽ 9:00 h. - 11:00 h.

**SPEAKER: SERGEI ODINTSOV**

*“Modified Gravity for Unification of Inflation with Dark Energy: Higher-derivative Equations and Dynamical System Approach”*

Chairman: Zulqurnain Sabir

**Abstract:**

The brief review of modified or extended gravity which is higher-derivative extension of general relativity is given. Number of such models is presented. It is demonstrated that such theories may give the consistent resolution for the universe history puzzle, as they naturally explain early-time as well as late-time acceleration.

▽ 11:30 h. - 13:30 h.

**SPEAKER: ZULQURNAIN SABIR**

*“Modern Cosmology: An Overview on Dark Energy”*

Chairman: Sergei Odintsov

**Abstract:**

I develop the theory which should describe our universe evolution as a whole. My main purpose is to resolve the fundamental puzzle of modern cosmology: why and how the universe accelerates? What is Dark Energy and Inflation? In fact, I proposed the first modified gravity which may describe the consistent universe history. In relation with modified gravity we proposed new very general and non-singular entropy which generalises known earlier variants.

## SEPTEMBER 30, 2023 - Third Day

▽ 9:00 h. - 11:00 h.

**SPEAKER: PRAVEEN AGARWAL**

*“New Concepts of Fractional Quantum Calculus and Applications to Impulsive Fractional Q-Difference Equations”*

Chairman: Sergei Odintsov

**Abstract:**

We define new concepts of fractional quantum calculus by defining a new q-shifting operator. After giving the basic properties we define the q-derivative and q-integral. New definitions of Riemann-Liouville fractional q-integral and q-difference on an interval are given and their basic properties are discussed.

▽ 11:30 h. - 13:30 h.

**SPEAKER: HACI M. BASKONUS**

*“Cancer Treatment Model with the Caputo-Fabrizio Fractional Derivative”*

Chairman: Juan L.G. Guirao

**Abstract:**

A model for cancer treatment is examined. The model is integrated into the Caputo-Fabrizio fractional derivative first, to examine the existence of the solution. Then, the uniqueness of the solution is investigated and we identified under which conditions the model provides a unique solution.

# PAPER INDEX

- p. 30**     **Construction of Multimedia Higher Vocational Education Management System Based on K-Means Algorithm**  
*Meihua-Chen*
- p. 38**     **Computer-Assisted Teaching in the Teaching of Endodontics**  
*Zhixing-Jing*
- p. 46**     **A Study on the Correlation Between English Learning Anxiety and English Learning Autonomy Based on Artificial Intelligence**  
*Hua-Shang*
- p. 54**     **The Use of Traditional Elements in Modern Interior Design Based on Decision Tree Model in the Context of Big Data**  
*Kun-Yu*
- p. 61**     **Motivation and Motivation of Higher Education Teacher Trainees in Teaching Based on Random Forest Algorithm Psychological Health**  
*Min-Xiang*
- p. 69**     **The Application of Artificial Intelligence Technology in Integrated English Reading and Writing Classroom Teaching in Universities**  
*Qing-Li*
- p. 76**     **Artificial Intelligence-Based Packaging Design for Folk Art and Creative Products**  
*Hongwei-Nie*
- p. 83**     **A Statistical Study of Recent Migration in Sichuan, Yunnan, and Tibet Based on the Background of Computerized Big Data**  
*Shuang-Qian*
- p. 91**     **Research on the Development of Cross-Innovative Applications of Computer Imaging and Newspaper Design**  
*Hui-Li*
- p. 98**     **Research on the Challenges and Responses to the Construction of University Teachers' Ethics in the Era of Big Data**  
*Yelu-Zhou*
- p. 107**    **The Application of Big Data Technology in the Study of the Development of the Library Business in Modern Hainan**  
*Xiaohui-Wang*
- p. 114**    **Cross-Cultural Penetration of Folk Traditional Decorative Arts With the Aid of Artificial Intelligence**  
*Liyuan-Zhang*
- p. 122**    **The Application of Big Data Technology in the Informative Teaching of College English Speaking**  
*Qing-Li*
- p. 131**    **Analysis of the Value of Virtual Simulation Experimental Teaching in Tourism Management Based on Discrete Regression Algorithm in the Context of Big Data**  
*Hongmei-Li*
- p. 139**    **Research on the Application of Shanghai's Non-Heritage Resources IP in the Field of Cultural and Tourism Apparel Products Based on Big Data**  
*Yan-Lu*
- p. 148**    **Optimal Allocation of English Teaching Resources in Universities Based on Decision Tree Model**  
*Yunru-Chen*
- p. 156**    **Policy Construction of National Promotion of Film and Television Industry Based on SVM Model in the Context of Media Convergence**  
*An-Jiang*

- p. 166** IoT-Based Multi-Channel Information Fusion Method for Wireless Sensor Networks  
*Qiu-Xu*
- p. 175** Statistical Inference of Panel Data Models With Measurement Errors  
*Weiping-Deng*
- p. 184** BP Neural Network-Based Short Video Dissemination Path Optimization for Agricultural Products in the Context of Rural Revitalization  
*Zhilan-Li*
- p. 193** The Dilemma of Cultivating Cross-Border E-Commerce Innovation and Entrepreneurship Talents in the Context of Big Data Driving and the Path to Break It  
*Yihan-Wen*
- p. 203** Building Strategy of MIS Base Module Based on BP Neural Network  
*Bin-Zhou*
- p. 211** Identification of Typical Movements of Chinese Folk Dances Based on SVM Model  
*Minjing-Li*
- p. 217** Analysis of Financial Management Innovation Strategies in the Context of Internet Finance  
*Fei-Li*
- p. 225** Analysis of Colleges and Universities' Discourse in Students' Thinking and Political Education Based on Artificial Intelligence  
*Yantao-Ma*
- p. 233** The Application of Frequency Regulation Technology in Mechanical Engineering Transformation Based on the Background of Big Data  
*Zhuang-Kang*
- p. 240** Artificial Intelligence-Based Evaluation of the Utility of the Development of College Curriculum Thinking and Political Education  
*Hailei-Shang*
- p. 251** The Application of Big Data Technology in the Cost Management of University Engineering Construction Period  
*Yihang-Wang*
- p. 260** Research on the Reform of Teaching Mode in Diversified Music Environment Based on Big Data Cloud Platform  
*Mulan-Han*
- p. 271** Cultivation of Students' Vocational Ability Based on Innovative Teaching of E-Commerce in Higher Education in the Context of Big Data  
*Bo-Li*
- p. 280** Practice and Consideration of Cultivating Innovative and Entrepreneurial Talents of College Students in the Context of Big Data  
*Lingyong-Zhang*
- p. 291** Artificial Intelligence-Based Sensor Multi-Point Control Robot Interaction Method Research  
*Yalin-Chen*
- p. 298** The Application of Big Data in the Evaluation of Development Level of Rural Revitalization  
*Hailin-Wang*
- p. 307** Design of Basketball Players' Passing Action Decomposition in the Context of Deep Learning  
*Yawei-Li*
- p. 318** Optimization of Youth Sports Training Methods Based on VAR Model  
*Hao-Qian*
- p. 328** The Application of Big Data Technology in Rural Tourism Enterprise Marketing Under the Background of New Media Era  
*Qianying-Wang*
- p. 338** Research on LSTM Power Load Peak Prediction Method Based on Bayesian Network  
*Rongbin-Yao*
- p. 347** Construction of Modern Hybrid Instrument Analysis Experimental Teaching Mode Based on Artificial Intelligence  
*Ying-Liu*
- p. 357** Research on the Application of Piano Work Appreciation in Students' Quality Education Under the Perspective of Big Data  
*Yuan-Lu*
- p. 367** Effective Planning of Town Development Boundary Based on Linear Regression Model  
*Qiuquan-Zhao*
- p. 375** The Design of Business English Platform for College Business Based on Artificial Intelligence in the Context of Big Data  
*Rui-Cong*

- p. 383** **Music Education Reform and Talent Cultivation Model Optimization in Universities Under the Perspective of Big Data**  
*Yu-Wang*
- p. 394** **Innovative Management of College Students' Thinking and Politics Based on Big Data Technology**  
*Liang-Chang*
- p. 405** **The Information Education Model of College Students' Ideological and Political E-Ban Based on Artificial Neural Network**  
*Rongli-Sun*
- p. 416** **The Application of Big Data Technology in the Ideological and Political Education of Eban Network**  
*Lingjun-Meng*
- p. 426** **Exploring the Innovation Path of College Physical Education in the Era of Big Data**  
*Chunmin-Lu*
- p. 435** **Analysis of the Expression Path of Internet Music Culture in College Music Education Under the Perspective of Big Data**  
*Shan-Gao*
- p. 444** **The Application of Big Data Technology in the Optimization of Incense Cultural Resources and Industrial Development in Dongguan in the Context of Intelligence**  
*Guanglin-Chen*
- p. 453** **Reform of Diversified Art Design Professional Teaching Mode Based on Big Data Cloud Platform**  
*Chuan-Xue*
- p. 462** **Inheritance and Development of Tatar Drama Art of Xinjiang Ethnic Minority in the Context of Big Data**  
*Linlin-Hou*
- p. 471** **Application of Artificial Intelligence Technology in Piano Fingering Feature Analysis**  
*Yang-Hong*
- p. 480** **Optimization of Talent Cultivation Path of Preschool Education Majors in Universities Under the Use of Multimedia**  
*Ruojue-Hu*
- p. 490** **Application of Information Fusion Technology in College Nursing Practice Education**  
*Lulu-Zhang*
- p. 499** **Research on the Current Situation, Dilemmas, and Their Countermeasures in Medical Care in the Era of Big Data**  
*Hongmei-Tan*
- p. 508** **Research on the Application of University Mental Health Education Resources in the Construction of Psychosocial Service System Based on the Background of Big Data**  
*Bei-He*
- p. 519** **Study on the Information Realization Path of Electronic Cross-Border Commerce in Rural Agriculture**  
*Shanshan-Wang*
- p. 528** **The Construction of a Model for Cultivating the Rule of Law Thinking Ability of College Students in the Big Data Environment**  
*Yujun-Chen*
- p. 536** **Application of Artificial Intelligence Technology in Teaching Painting in Universities**  
*Nan-Ren*
- p. 545** **The Construction of Student Management System in Universities Based on Artificial Intelligence Technology**  
*Xiaoyan-Shi*
- p. 554** **Application of Big Data Technology in Intelligent Teaching Guidance of Rehabilitation Therapy Technology Major**  
*Xiong-Zhao*
- p. 563** **Application of Agricultural Water and Fertilizer Integrated Automatic Control System in Farming Operation**  
*Yongfeng-Ma*
- p. 572** **Application of Artificial Intelligence Technology in Cultivating Innovative and Entrepreneurial Talents of College Students**  
*Yajing-Zhang*
- p. 583** **Reform and Practice of Integrating Mathematical Modeling Ideas into the Teaching of Public Mathematics Courses in the Context of Educational Informatization**  
*Xifang-Ge*

- p. 596** Study on the Synergy Between State Audit and Social Audit Based on SFIC Model  
*Xia-Guo*
- p. 605** The Application of Big Data Technology in the Development of Music Education in Higher Education Institutions Integrating Local Music Culture Industry  
*Dongmei-Tan*
- p. 615** The Application of Big Data Technology in the Owner's Information Self-Governance Management Platform Under the Perspective of Residents' Life  
*Weixu-Tian*
- p. 624** Research on the Integration of Art Elements into Logistics Packaging Design Based on Artificial Intelligence Technology  
*Mingyue-Xiang*
- p. 634** SWOT Analysis of Cross-Border E-Commerce Development of Agricultural Products Based on Big Data  
*Yilun-Li*
- p. 645** Effects of Pesticide Pollution on the Functional Diversity of Soil Microbial Communities Based on Big Data Environment  
*Hui-Liu*
- p. 656** The Application of Big Data Technology in Foreign Law Identification System in the Context of "One Belt, One Road"  
*Lin-Yang*
- p. 665** Research on Talent Cultivation Model of Integration of Science, Industry, and Education Under the Concept of Curriculum Thinking and Government  
*Mingyue-Xiang*
- p. 675** The Traction of Experiential Psychological Training on Teacher Development Model Based on the Background of Internet Informatization  
*Dan-Xie*
- p. 684** Research on the Application of Data Mining Technology in Teacher Evaluation System  
*Dan-Xie*
- p. 690** Research on Panoramic Image Processing Technology Based on Multi-Objective Optimization Algorithm  
*Xueting-Yang*
- p. 695** Research on the Application of Traditional Cultural Elements in Animation Design Based on Information Fusion Technology  
*Linye-Tang*
- p. 700** An Exploration of the Challenges of Cross-Border Data Flow to International Investment Law Based on Fuzzy Numerical Analysis Method  
*Lin-Yang*
- p. 707** The Design and Practice of the Course "Introduction to Social Work" Based on the OBE Concept in the Context of the Construction of a New Liberal Arts  
*Panpan-Yang*
- p. 712** The Construction of an Innovative Model of Employment Education Based on Information Fusion Technology in the Context of Civics Teaching in University English Courses  
*Fei-Gao*
- p. 719** Exploring the Training of Applied Talents in Cultural Industry Management in the Era of Big Data  
*Xianghong-Yuan*
- p. 725** The Construction of Traditional Education Management System of Universities in the Context of Cultural Industry Development Based on Information Fusion Technology  
*Xianghong-Yuan*
- p. 730** Analysis of the Impact of Chinese and Western Cultural Differences on the Perception of British and American Film Literature Based on Big Data  
*Yang-Liu*
- p. 735** A Study on the Construction of Inter-Regional Ecological Governance Mechanism in the Huanghe River Basin Under the Perspective of Big Data  
*Jinlong-Shi*
- p. 742** A Simulation Study on Modeling the Development of Vocal Music Teaching Paths in Universities Based on Big Data Analysis  
*Yuan-Wang*
- p. 747** Practice and Innovation of Information-Based Teaching in Universities in the Context of Big Data  
*Jiahai-Ke*

- p. 752** **Research and Practice on the Civics of University Physics Courses in the Context of Big Data**  
*Xiaofei-Zhu*
- p. 757** **Analysis of Operational Risks and Financial Management of Cloud Accounting Model Based on Big Data Technology**  
*Jie-Li*
- p. 762** **Research on the Construction of Training System for Rural Tourism Practitioners in the Context of Rural Revitalization**  
*Jiaping-Chen*

## ABSTRACT

Multimedia technology is one of the hottest technologies currently being used in all walks of life. The integration of multimedia technology in higher education will lead to a new teaching model in education. In this paper, a segmented sample data selection method based on the K-mean clustering algorithm is used to experiment with three different neural network classifiers in combination with manual and UCI datasets managed by multimedia higher education. The problems of applying multimedia technology to higher education and the solutions can effectively improve higher education teaching. BP had the highest correct rate on the test set of the training set with 84.64% under the training set where teachers were not mature enough to master the technology. On the lack of teacher-student interaction, the correct rate of LVQ was 66.47%. In terms of incorporating advanced network technology degree, LVQ has the highest correct rate of 65.79% on the test set. It indicates that the

sample set selected by the monks dataset has a high classification accuracy on LVQ.

## **KEYWORDS**

K-means; Multimedia Technology; Higher Education Institutions; Teaching Management

## **1. INTRODUCTION**

Multimedia technology is a new teaching tool, and the integration of multimedia technology in higher education teaching can not only change the learning mindset and improve teaching quality, but also stimulate students' enthusiasm and enthusiasm for learning and enhance their interest in participating in teaching [1-2]. Therefore, in higher vocational teaching, teachers should constantly learn new multimedia technologies, improve their teaching level, enrich teaching resources, and promote students' active learning initiatives [3]. Schools should continuously improve the network teaching conditions, provide convenience for student teachers, realize networked teaching, and then realize the overall improvement of teaching effect. With the continuous development of the Internet and multimedia technology, multimedia intelligence began to penetrate in all aspects of life, which has brought a lot of change thinking about the development of education [4-5].

The literature [6] analyzed the role of multimedia technology in physical education and put forward the method of computer-assisted physical education in conjunction with the development of multimedia technology in higher vocational education. The literature [7] pointed out that the application of multimedia technology in badminton teaching mode can improve the quality of badminton teaching in a targeted way, enhance the communication ability and cultivate the spirit of solidarity among students. In the literature [8], a scenario-based teaching in higher education institutions supported by 5G network technology and artificial intelligence was constructed based on information technology and artificial intelligence. Literature [9] used multimedia technology to update teaching methods, evoke students' enthusiasm and motivate them to learn. With the vigorous promotion of education informatization and in the process of

vigorously advocating innovative education, the extensive use of modern educational technology, especially computer multimedia, in the English classroom has become an inevitability [10].

This paper firstly puts forward the influence of multimedia technology on the management of higher education. Among the advantages of multimedia application in classroom education, it can make the teaching content more visual and concrete, and is conducive to inspiring students' innovative thinking. However, at the same time, there are problems in applying multimedia to classroom education, mainly including teachers' lack of maturity in mastering technology, lack of teacher-student interaction and insufficient integration with advanced network technology. Then, under the clustering algorithm of K-means, three training sample sets based on monks2 dataset are tested by BP, LVQ and ENN respectively under the segmented sample data selection method, which are used to verify the problems of multimedia application in higher education management system.

## **2. THE IMPACT OF MULTIMEDIA TECHNOLOGY ON THE MANAGEMENT OF HIGHER EDUCATION**

### **2.1. ADVANTAGES OF MULTIMEDIA APPLICATION IN CLASSROOM EDUCATION**

The application of multimedia technology can promote a new color of teaching methods, inject fresh blood into the traditional teaching mode, promote the teaching reform, and promote the development and progress of education. The advantages of multimedia application in the classroom can be reflected in the following aspects.

#### **(1) Make the teaching content more image specific**

Higher vocational education focuses on vocational skills training and application technology operation, which mainly cultivates students' operation ability. However, in many cases, students can't or shouldn't practice directly, at this time, the introduction of multimedia teaching will make up for this defect. Multimedia technology shows the teaching content through sound, video and other forms, turning invisible into visible and obscure into concrete, which enriches the teaching content and improves students' learning enthusiasm.

#### **(2) It helps to inspire students' creative thinking**

Higher vocational students are generally lazy in learning and lack the initiative to think in learning. Teachers can use multimedia technology to reasonably design pictures, animations, sounds and other forms to gradually guide students to learn, feel and understand the teaching content. Change the original sequential teaching into flashback or interpolation teaching, so that students can discover problems, seek solutions, expand their thinking ability and improve their innovative consciousness in the learning process, so as to achieve better teaching purposes.

## **2.2. EXISTENCE OF PROBLEMS**

### **(1) Teachers are not mature enough**

At present, most of the teachers in higher education are not professional multimedia technicians, and the technology they master is limited, so the designed courseware is relatively single, and the teaching content cannot be shown in a comprehensive and deep level. This restricts students' enthusiasm for learning, and the quality of teaching cannot be improved, which to a certain extent affects students' learning efficiency and quality, resulting in multimedia teaching staying in form, but no substantial breakthrough.

### **(2) Lack of teacher-student interaction**

The process of teaching is a process of cooperation and interaction between teachers and students, and the students' reaction will affect the teachers' teaching ideas and teaching process. Some teachers use multimedia teaching only as a process of playing, ignoring students' reactions and weakening the role of multimedia technology. Moreover, most higher vocational students lack self-confidence and are not willing to interact with teachers in class. This loses the original meaning of multimedia teaching and does not achieve the proper teaching effect.

### **(3) Insufficient integration with advanced network technology**

Due to objective or subjective reasons, the use of multimedia is not integrated enough with the network, and the network coverage rate of some schools is not high enough. In today's era of continuous progress and change, the form of teaching is constantly updated, and along with the advent of the information era, multimedia technology is being used more and more widely in modern teaching. With the

popularity of projectors, computers, tablet PCs and the Internet, multimedia technology is increasingly used in teaching, which injects new vitality into traditional teaching and provides new ways for students to learn, which is of great significance to improve the quality of teaching.

### 2.3. SURVEY RESULTS AND ANALYSIS OF THE CURRENT STATUS OF MULTIMEDIA TECHNOLOGY APPLICATION

Teachers are the main body of multimedia technology application, and whether the teachers' needs for equipment and technology are met is directly related to the efficiency of multimedia teaching. The following is an analysis of teachers' demand for multimedia technology training, hardware equipment demand and the demand for multimedia technology types. The results of the analysis of the current situation of the application of multimedia technology are shown in Table 1. Some teachers think they need to improve the college's network environment, some think they need to improve the school's computer configuration, some think they need to improve the college's audio and microphone, and some think they need to improve the college's projector.

**Table 1.** Analysis of the current application of multimedia technology

Multimedia technology application status	Test Dimension	Percentage %
Teachers' training needs for multimedia technology	Very much needed	34
	Need	39
	Not required	27
Teachers see the need for better hardware and equipment	Very much needed	29
	Need	46
	Not required	25
Faculty needs for types of multimedia technology	Very much needed	31
	Need	48
	Not required	21

### 3. ANALYSIS OF THE APPLICATION OF MULTIMEDIA HIGHER EDUCATION MANAGEMENT SYSTEM UNDER K-MEANS

Under the clustering algorithm of K-means, this paper designs a management system classifier design method based on K-means for multimedia higher education by using segmented sample data selection method. The method can select typical samples and reduce the number of training samples, while ensuring the quality of the

neural network classifier. The selected data train the neural network classifier, which effectively improves the performance of the neural network classifier. In order to verify the problems of multimedia application in higher education management system, 999 sample data were selected and the sample set was equally divided into each training set. Here, the monks2 dataset from UCI is used for the experiment, and the problematic sample data selection method is combined with the neural network classifier and the experimental results are analyzed and summarized, and the details of each dataset are shown in Table 2.

**Table 2.** Analysis of monks2 dataset

Training set	Sample set size	Network Model	Test set correct %
Teachers are not mature enough to master the technology	333	LVQ	70.34
		ENN	34.59
		BP	84.64
Lack of teacher-student interaction	333	LVQ	66.47
		ENN	33.46
		BP	65.74
Insufficient integration with advanced network technologies	333	LVQ	65.79
		ENN	34.54
		BP	64.70

For the three training sample sets of the monks2 dataset were tested by training BP, LVQ, and ENN respectively, all three neural networks failed to achieve the classification error accuracy (0.02). Under the training set where the teachers did not master the technique well enough, BP had the highest correct rate of 84.64% on the test set of the training set. On the lack of teacher-student interaction, LVQ had the highest test set correct rate of 66.47%, but it was not much different from that of BP. In terms of advanced network technology integration, LVQ had the highest test set correct rate of 65.79%.

#### 4. CONCLUSION

In this paper, based on the K-mean algorithm, the maximum influencing factors of the problems of multimedia applications in higher education management system are verified from the perspective of UCI dataset design, and the design effect of the method is verified in the process of practical application. Three training sample sets of monks2 dataset are used to test the three problems of multimedia application in higher education management

system by BP, LVQ and ENN training respectively. BP had the highest correct rate in the training set with 84.64% correct rate in the test set under the training set where the teachers did not master the technology maturely enough. LVQ had the highest test set correct rate on the lack of teacher-student interaction, with a test set correct rate of 66.47%. In terms of advanced web technology integration, LVQ had the highest test set correctness with a test set correctness rate of 65.79%. The sample set selected for the monks dataset has higher classification accuracy on LVQ, indicating that the sample set selected for the monks dataset has higher classification accuracy on LVQ.

### **ABSTRACT**

The study of the practical results of computer-assisted teaching in endodontics is to better grasp the students' learning status and improve their ability to perform surgical operations. In this paper, a digital approach combining computer-aided design and fabrication techniques, 3D printing technology and digital colorimetric technology are used in order to achieve minimally invasive aesthetic restorations for oral surgery. At the same time, the hardware construction and teaching software production are optimized to maximize the teaching effect. The results showed that after the computer-assisted teaching surgical practice, the students' scores of root canal positioning treatment and interrupted tooth surgery reached 75 and 86, 5-6 points more than predicted, and the scores of simple surgical implantation and extraction reached 95-96, respectively, 9-10 points higher than before the practical training. This shows the positive significance of computer-assisted teaching in endodontic teaching.

## KEYWORDS

Computer-assisted instruction; Endodontics; 3D Printing; Digital

## 1. INTRODUCTION

With the rapid popularization and development of computer applications, computer-assisted teaching CAI, has become an important part of modern educational science and teaching methods [1]. As an important part of educational technology reform in higher education institutions, computer-assisted teaching is an advanced teaching method combining computer technology, information technology, educational theory and professional knowledge. Compared with the traditional chalk and blackboard teaching method computer-assisted teaching has great superiority in both form, content and teaching effect [2]. Since 1998, computer-assisted teaching has been tried in the theoretical teaching of endodontics, and hardware, software and teachers are the three elements of computer-assisted teaching. In order to give full play to the superiority of computer-assisted teaching, many efforts have been made in these three aspects by previous authors, and good teaching effects have been received through several years of practice and improvement [3-4].

In addition, there is a risk of postoperative infection, which can affect the aesthetics and masticatory function of the patient's teeth, and some media reports indicate that the long-term treatment effect of dry pulp surgery is poor [5]. Root canal therapy can effectively remove necrotic material from the root canal and pulp chamber of the affected tooth, and perfect root canal filling after adequate swabbing and disinfection of the root canal, which can avoid periapical lesions and improve the patient's masticatory function. Root canal treatment RCT is one of the basic treatment methods for endodontic disease, and the conventional treatment method is multiple times method RCT, which has better treatment effect. However, with the development of modern root canal treatment technology, disposable RCT is gradually promoted and applied in the clinic, and its efficacy and safety are affirmed by more and more clinicians [6]. Computer-aided teaching applied to medicine can be fully optimized in terms of treatment efficiency, medication, treatment time, tooth occlusion force, bleeding

index, gingival index, inflammatory factor level, and complications, shortening the surgical treatment cycle and reducing patients' pain [7].

Based on this, this paper investigates the effectiveness of computer-assisted teaching techniques in teaching endodontics. Firstly, through computer-aided design and computer-aided fabrication process, 3D printing technology and digitally optimized colorimetric technology are used to achieve the purpose of minimally invasive aesthetic restorations for dental treatment. Computer-aided teaching hardware creation and software production were used to reach the computer-aided teaching practical method, and the students' performance before and after the practical training was compared to verify the advantages of computer-aided teaching in endodontic teaching. Computer-assisted teaching is an important element of educational technology reform in higher education institutions, and has great superiority compared with traditional teaching. Computer-assisted teaching can improve students' receptivity and improve their surgical level.

## **2. Computer-aided design and computer-aided fabrication of digital minimally invasive restorations**

### **2.1. 3D Printing Technology**

While traditional processing techniques are mainly applied to the reduction process, 3D printing can quickly obtain personalized information and precisely control the forming material by the method of "layer-by-layer scanning, layer-by-layer stacking, and overall forming", and finally obtain a finished product that fits the affected area. In the treatment of malocclusion, 3D printing technology has been used to successfully locate the root canal orifice in vitro and to create a root canal orifice positioning guide, thus achieving precise positioning of the clinical root canal orifice [8-9]. In the treatment of invagination, 3D printed teeth can help clinicians to accurately distinguish the pulp chamber and invagination cavity, make an invagination cavity opening guide, thus avoiding pulp cavity damage and helping to preserve the living pulp. The use of 3D printing to

obtain a solid model of the periapical lesion area helps to develop surgical plans in vitro, simulate surgical operations, and create accurate apical surgical guides to achieve precise and minimally invasive surgical treatment of periapical lesions. With the arrival of the era of big data, the exploration, popularization and industrialization of 3D printing technology will bring new opportunities for the field of dentistry.

## **2.2. Digital colorimetric technology**

The digital colorimetric system includes data collector, data processor, terminal and related software, etc. Through the computer colorimeter, the color is converted into digital information, and the computer search database is applied to select the most matching restorative material. Using the combination of computer colorimetry and color matching technology, the colorimetric process is fast, quantitative, not affected by the environment, the colorimetric results are objective and credible, can provide a base color reference for special dental colorimetry, and repeatability is significantly better than visual colorimetry.

## **2.3. Computer-assisted teaching in endodontics in practice**

### **(1) Hardware Construction**

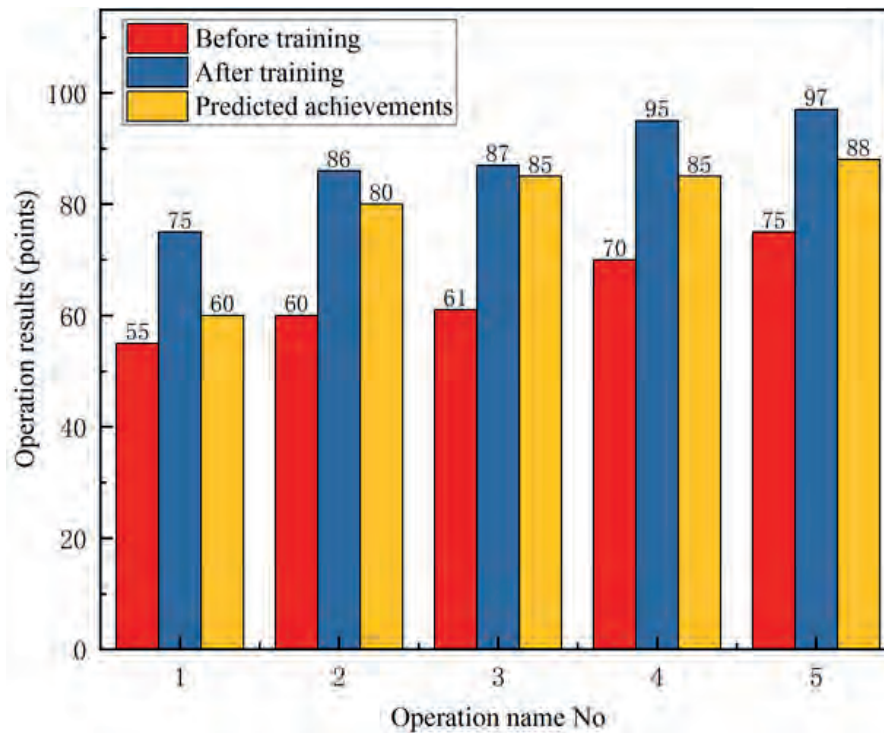

To meet the needs of teaching in the new situation, most institutions actively build multimedia classrooms, including multimedia computers, various media playback equipment, projection systems and sound reinforcement systems. At present, for university lectures above undergraduate students have all adopted multimedia presentation teaching. In order to facilitate the production of CAI courseware, colleges and universities have purchased hardware equipment such as scanners, digital cameras, CD burners, video capture cards and so on. Other institutions have established small local area networks for endodontic teaching using existing computers and network equipment, so that students can use teaching materials on the local area networks and obtain professional information through the Internet in small classes.

## (2) Software Production

Software is the core of computer-assisted teaching. According to the course characteristics and requirements of endodontics, this paper uses powerpoint, authorware, director and other tools to produce a full set of electronic teaching materials including seven-year, five-year undergraduate, three-year college and other levels of dentistry. At the same time, the key and difficult contents of the course cooperate with software companies and actively develop CAI teaching courseware. The courseware that have been completed and applied to teaching so far include caries, restorative dentistry, cavity preparation simulation training, endodontic disease expert diagnosis system, etc.

## **3. Analysis of the effectiveness of computer-assisted teaching in endodontics**

Computer-assisted teaching has the advantages of diverse forms, visualization, information richness and interactivity, but the actual teaching effect applied in endodontics is yet to be verified. In this paper, we compare the performance of students' oral treatment simulation surgery after receiving practical training of computer-assisted dental teaching with the performance of surgery before receiving practical training of computer-assisted teaching to investigate the differences between them. Root canal positioning treatment, interrupted tooth surgery, orthodontics, dental implants, and tooth extraction were numbered 1-5, respectively, and the results of the changes in students' performance before and after the practical training are shown in Figure 1.

**Figure 1.** Changes of students' scores before and after practical training

Before teaching, the instructor predicted that the average score of students' surgery would be 79.6, and in practice, the overall average score of students' surgery before receiving practical training was 64.2, and the overall average score of students' surgery after receiving practical training was 88. This shows that computer-assisted teaching can better promote students' practical training effect on surgery and achieve teachers' teaching expectations. Among the five types of oral surgery, the most difficult ones were root canal positioning treatment and interrupted tooth surgery. After long-term training, students scored 55 points for root canal positioning treatment and 60 points for the obstructive dentistry surgery, which basically just reached the passing level of the examination, but not up to the level of real practical surgery. After the application of computer-assisted teaching, the students' scores for the two surgeries reached 75 and 86 respectively, which were 5-6 points higher than the predicted value, and their scores basically reached the level of oral clinical treatment. In the simple dental implant and tooth extraction surgery students scored as high as 95-97 points, which is basically a perfect score. This shows that the application of computer-assisted teaching in endodontics is effective, and it helps to promote students'

intuitive perception of surgery, improve the practical level, and then promote the development of dental clinical treatment.

#### **4. CONCLUSION**

This paper investigates the effectiveness of computer-assisted teaching technology in endodontics teaching by using 3D printing technology and digitally optimized colorimetric technology to achieve the purpose of minimally invasive aesthetic restorations in dental treatment. In addition, computer-aided teaching hardware creation and software production were used to achieve the purpose of computer-aided teaching practical operation, and then the advantages of computer-aided teaching in endodontics teaching were investigated by comparing the students' performance before and after practical training. From the results of this paper, the overall average surgical score before the students received practical training was 64.2, and the overall average surgical score after the students received practical training was 88, an increase of 23.8 points. The score of root canal positioning treatment before practical training was 55 and the score of obstructed tooth surgery was 60.

## **ABSTRACT**

Studying anxiety and learning autonomy in English learning with artificial intelligence technology can help teachers and students conquer English learning difficulties together and expand students' English learning effectiveness. This paper explores the impact of artificial intelligence (AI) on teachers and students in English learning in the context of AI technology, and quantifies students' English learning anxiety and autonomy to derive the full-text study results. In learning anxiety, students' skill anxiety was 3.8512, which was at the highest of all anxiety symptoms, and general anxiety was 3.6501. In autonomous learning, self-requirement was 3.752 and monitoring and evaluation was 3.2150, and there was an association between students' English learning anxiety and learning autonomy. The deep integration of college English education and AI will help the development and change of college English teaching, and support expand teachers' teaching management and students' learning motivation.

## **KEYWORDS**

Artificial Intelligence; English learning anxiety; Autonomy; Teaching English as a Foreign Language

## **1. INTRODUCTION**

In the context of implementing the theory of "people-oriented" and "lifelong education", more and more foreign language educators are aware of the importance of cultivating learners' initiative, and improving students' English learning initiative has become an important issue [1]. AI technologies have been developed to the stage of multi-type cross-comprehensive use in many fields, among which the intelligent scoring technology is constructed on image and text recognition technology and natural language dispensation technology [2]. AI has become an operative means of enlightening efficiency and technology in numerous industries, and will also lead to inordinate changes, and the technology is till touching the transformation of education and calculation thoughts and models in all features [3]. The use of AI scoring is based on social demand, and this demand mainly comes from the need to develop language checking applies. The present development tendency of language checking is to expand the authenticity and efficacy of checking, and the introduction of AI technology is essentially to expand the authenticity, assessment efficacy, and scoring accuracy of assessment. In the future, the writing and translation of all exams including CET-4, CET-6 and College English will be graded by AI. [4].

Foreign language learning nervousness is a complex psychological phenomenon definite to foreign language learners. It is not a general classroom nervousness, but a complex self-image, beliefs, feelings and behaviors related to language classroom learning caused by the uniqueness of the language learning procedure [5]. Therefore, foreign language learning anxiety has become a focus of attention for foreign language research specialists as well as foreign language teaching professionals. Studies in Europe and the United States have shown a consistent negative correlation between foreign language anxiety and foreign language performance [6]. Students with high anxiety use much lower explanatory parts when describing pictures than students with low anxiety, which suggests that anxious students are reluctant to use their own thoughts to express some relevant information in foreign language conversation. One study found that anxiety reduces the performance of future language teachers in oral interviews [7]. Learning initiative refers to students' conscious and voluntary learning with purpose, governed by their sense of subjectivity. The more motivated students are, the better they will learn a new language. The

rate at which they learn a new language depends on how motivated they are as individuals [8]. If learners are motivated to learn a language and find it useful, they will learn it better than those who believe that the language they are learning is useless. If students believe that they cannot learn a new language well, then this belief can be a barrier to learning. The teacher is another influential factor for students in the language learning procedure, and if students respect the teacher who teaches the language, this will help them to learn more effectively [9].

This paper explores the impact of AI on students in terms of English learning anxiety and learning autonomy in the context of AI technology. First, AI technologies are classified into three categories of big data, speech recognition, and machine learning from the technical aspect to clarify the principles of AI technologies. Then the relationship between AI technologies in the field of English teaching and students' English learning is explored separately to clarify the principle of its role. Finally, students' English learning anxiety and autonomy are quantified and analyzed to arrive at the findings that AI technology has a positive effect on promoting students' autonomous learning and alleviating their learning anxiety.

## **2. AI Technology and English Learning**

In the context of the development trend of AI technology gradually penetrating into all aspects of society, the traditional language education industry is also deeply affected [10]. One of the most typical cases is English education. Nowadays, many schools are gradually introducing AI technology into English teaching to make up for the shortcomings of the traditional teaching mode and improve the teaching quality. At the present stage, English learning mainly has difficulties in three aspects: listening, writing and translation, and the application of AI can solve the problems in these three aspects.

### **2.1. AI Technology Components**

AI technologies are briefly described as follows:

#### **(1) Big Data**

Big data, till identified as huge data, denotes to a wide variety of information resources that require new data procedure methods in

order to be able to have very solid decision, keen comment, and precise use of procedure.

## (2) Voice Recognition

The technology of speech appreciation raises to the procedure of appreciation, analysis and understanding using machines. The pure adaptation of speech gestures into explicit words or pertinent instructions is a novel high technology. Speech recognition normally consists of three main aspects, which are information abstraction techniques, design matching philosophies and related testing designs. Speech recognition needs human and computer to collaborate with each other, fixing on solving the hearing problem of robots, mainly so that robots can obviously receive what people say. The furthestmost innovative technology in the change of AI up to now is speech appreciation.

## (3) Machine Learning

Machine learning requires that machines can have a sturdy learning ability like humans and study how computers simulate to complete the learning performance of machines. In order to contract more knowledge and expertise for learning, re-integrating the prevailing knowledge and then unceasingly improving and cultivating the presentation of the machine for several uses is the most significant part of AI.

## **2.2. The relationship of AI in the field of English language teaching**

The teaching procedure of college English includes various teaching objectives such as listening, speaking, reading, writing, translating, and discriminating, which is a very complex procedure and requires the use of AI based on information technology to develop scientific teaching modules to help students master the basic knowledge of English. By applying AI technology to college English teaching, students can watch videos or PPTs to preview or review their English knowledge through online teaching. Through homework exercises, students can memorize words at any time, complete a variety of vocabulary self-assessment questions, learn texts, listen to audio recordings, and continuously improve their learning style, anytime, anywhere, whenever they want to learn. The scientific teaching model

developed using AI can break the traditional college English classroom and pay more attention to language input. Students can learn through human-computer dialogue, friendly interaction, intelligent scoring of spoken language, and practice speaking on the go to get rid of the embarrassing situation of Chinese people's "dumb English". Through the intelligent assessment method to produce questions to form the paper, read the paper, score statistics and other time-consuming procedure, can greatly reduce the workload of teachers and improve efficiency.

### **2.3. The relationship between AI technology and students' English learning anxiety and autonomy**

The homework exercise element is designed with students as its foremost users. Students could see from high-quality videos to study texts, remember words, exercise speaking, income tests and query questions. This module shelters listening, reading, writing, word choice and satisfying in the blanks, and offers bright review purpose for essays. Besides, students who learn the same sequence can form a mutual learning community to contend with each other and study accommodatingly. Through individual homepage and learning dynamic display data, students could demonstrate their learning achievements, cut their learning practice, lodge the protection and weekly effort list, so that students can simplify their situation and inspire their learning interest. Students can also assess each other's answers to collaboratively complete learning tasks, share the learning procedure, create an exclusive circle of friends with mutual learning interests, and enhance students' initiative in English learning.

For students with insufficient vocabulary to learn writing, the AI word memory software can assess students' individual situation, make a learning plan that suits their steady vocabulary growth, push the daily learning plan words, and deepen their memory through the combination of sound and pictures. For students who have difficulty expressing themselves freely in writing with long and difficult sentences, the AI software can make a learning plan for complex and difficult sentences according to the students' personal situation, pushing exercises to explain them and helping students master key grammar effectively by doing problems. For students who need to improve their comprehensive writing, the automatic writing review

system plays an important role. For topics that need to be written about, the system will provide ideas, frameworks, and vocabulary references to help students write according to the grammar rules they have mastered. Once completed, the system will automatically correct the content, critique it sentence by sentence, analyze the errors and type a comment to give corrections. This immediate feedback and assessment helps students to find out their shortcomings in a timely manner so that they can go through the gaps and alleviate their English learning anxiety.

### 3. Analysis of the results related to English learning anxiety and learning autonomy

To investigate the relationship between AI and students' English learning anxiety and learning autonomy proposed in this paper, the English learning autonomy and English learning anxiety of non-English majors in a university were quantified and analyzed, and the results of the correlation between students' English learning anxiety and learning autonomy are shown in Table 1.

**Table 1.** Correlation between students' English learning anxiety and learning autonomy

Learning anxiety			Autonomous learning		
Type	Mean value	Standard deviation	Type	Mean value	Standard deviation
Negative comments	2.7080	0.6517	Teacher recognition	2.7798	0.6472
Skill anxiety	3.8512	0.5730	Self demand	3.7520	0.8520
General anxiety	3.6501	0.5312	Monitoring and evaluation	3.2150	0.6588
Correlation value between learning anxiety and autonomous learning (R)					
-0.451			-0.423		

We can see that the learning anxiety is -0.545 and the independent learning is -0.423 when the correlation value between learning anxiety and independent learning is R. The results are less than or equal to 0.4, so this paper verifies that the algorithm is valid. From the results, students with high self-directed learning ability generally have low anxiety, while students with low self-directed learning ability generally have high anxiety. Skill anxiety was 3.8512, which was at the highest of all anxiety symptoms, and general anxiety was the second highest at 3.6501, indicating that hindrance in skill learning in

English language learning can cause anxiety to students' learning. In descending order of the factors influencing independent learning, self-requirement was the highest at 3.752, monitoring and evaluation was the second highest at 3.2150, and teacher approval was the lowest at 2.7798, indicating that AI technology can facilitate students' independent learning. In conclusion, there was a correlation between autonomous learning and negative evaluation, skill anxiety, and general anxiety, and both were negatively correlated.

#### **4. CONCLUSION**

This paper examines the relationship between English learning anxiety and English learning autonomy based on AI technology. Firstly, the relevance of AI technology to students' English learning anxiety and English learning autonomy is explored by clarifying the technical support in the full paper from the technical aspect of AI and English learning. From the results of this paper, there is a correlation between learning anxiety and learning autonomy among non-English major undergraduate students. Students' skill anxiety was 3.8512, which was at the highest of all anxiety symptoms, and general anxiety was the second highest at 3.6501, where the hindrance of skills in English learning can cause anxiety to students' learning. Students' self-requirement is 3.752 and monitoring and evaluation is 3.2150, students' independent learning is more concerned with the improvement of their own ability. The current application of AI technology in English teaching in colleges and universities is still at a low level of development, and it is believed that with the development and improvement of AI technology, it will be more efficient to improve students' learning effect, so that both teachers and students can find pleasure in English teaching and learning.

## ABSTRACT

The use of traditional elements in interior design is explored in order to meet the pursuit of new Chinese style by users in the current decoration market. This paper designs a modern interior design method based on decision tree model for traditional elements to optimize the current interior design effect. The principles of the use of traditional elements in modern interior design are constructed and tested to verify the advancedness of the proposed method. The data show that the overall integration of traditional style elements with modern interior design is 8.2, which is four times higher than the current market interior design integration, 8.0 in terms of visual effect creation, and 7.8 in terms of style matching, so it is relevant to explore the application of traditional elements to modern interior design to make it reflect the national cultural connotation.

## KEYWORDS

Decision tree model; Traditional Elements; Modern Interior Design; New Chinese

## 1. INTRODUCTION

Traditional cultural elements are the crystallization of the wisdom of the Chinese nation and the symbols of national characteristics in the current situation of globalization in the world. In the context of

modernization of interior design, preserving the excellent cultural traditions of the nation is an imperative that designers need to deal with [1]. As symbols of cultural elements with unique national characteristics and regional differences, traditional Chinese decorative elements are aesthetic symbols that convey specific messages, and these conform to the heritage and use in modern interior design should be designed and arranged in a unique way [2]. The relationship between traditional cultural elements and modern interior design is based on the understanding of modern interior design. Modern interior design is a complex discipline that involves a very comprehensive aspect and can be described as a synthesis of science and art as well as life. It requires not only architecture and sociology, but also an organic combination of knowledge from various disciplines such as material science and structural science [3-4].

The relationship between traditional Chinese culture and modern interior design is very obvious. Highlighting traditional cultural elements in modern interior design and emphasizing the use of traditional cultural elements in interior design has a guiding significance for modern interior design. This can lead to the acceptance of modern interior design by a wider audience and better outreach to the world. The connection between the two is mainly reflected in the way of thinking about interior design, the patterns or symbols with traditional cultural symbolic connotations used in the design [5-6]. Traditional elements are influenced by traditional culture and aesthetic views, and inevitably have certain limitations. With the development of the times, people pay more and more attention to the combination of practicality and culture, and the forms of traditional meaning and modern fashion have produced certain collision and conflict [7]. In the practical application, the traditional element forms should not be imitated singularly, but the refined traditional elements should be simplified, deformed and reconstructed to make them more modern, more refined and easier to produce. With a modern vision, we abstract and generalize them into a modern design language, and strive to use the essence of traditional elements from the past to the present, to push forward and explore, to summarize and design a modern interior space with the charm of Chinese style.

This paper explores the effectiveness of the application of traditional elements in modern interior design based on decision tree model in

the context of big data. Based on this, a modern interior design method based on the decision tree model is first designed to optimize the current interior design effect. In the design process, two basic methods are followed to create the visual focal point of the interior space by applying the emission composition technique and to create the rhythm of the interior space by applying the repetition composition technique to maximize the effectiveness of the interior design. Then the principles of using traditional elements in modern interior design are constructed in order to integrate traditional elements with modern interior design in a high degree of conformity with modern aesthetics. Finally, the advancedness of the method proposed in this paper is verified through testing. The use of traditional elements in modern interior design based on decision tree model in the context of big data is beneficial to the development of interior design and home improvement market.

## **2. A modern interior design approach to traditional elements based on decision tree model**

Decision tree model is a method for dealing with multidimensional data, and decision trees are built as a branch formation process, where each branch is a division of regions of the multidimensional space under certain rules, which are presented using a tree structure diagram [8]. Frequently used multidimensional interaction decision tree models include the cardinality automatic interaction detection method, classification and regression tree method, C4.5 algorithm, fast unbiased effective statistical tree method, ID3 algorithm, etc. Among them, the CHAID model, formerly known as the automatic interaction detection algorithm model, differs from CARTC4.5 in that CHAID deals with categorical variables. Its main features are multi-way bifurcation and forward pruning, and its advantages include the ability to generate multi-branch interaction decision trees, the ability to determine branching variables and segmentation values from the perspective of statistical significance, and the optimization of the branching process of the tree. the CHAID model is built in causality exploration to achieve numerous level divisions of input variables based on target variables. Applied to interior design, the specific methods are:

(1) Applying emission composition to create visual focal points in interior spaces

Emission constitutes a strong focus and symmetry in multiple directions and other characteristics that can create a strong visual impact, so that all images either focus toward the center or emanate outward.

(2) Applying repetitive composition to create a sense of rhythm in interior space

Repetition composition in interior design has the function of strengthening the visual image of space. It produces a continuous, rhythmic visual impression in interior spaces through regular repetition. The use of repetitive composition in interior design, using the same or similar visual elements, as a carrier to shape the sense of rhythm in the design of interior space, can achieve a repetitive, regular spatial composition, so that people visually produce a sense of coherence and fluidity.

## **2.1. The use of traditional elements in modern interior design**

### **2.1.1. Design of interactive objects with traditional elements**

In the process of traditional design, the size of the space to be used and the personal emotions need to be integrated into the design. By combining people and space, the interactive emotional experience of visual design can be fully expressed. This interactive visual experience can not only effectively meet people's physical and emotional needs, but also can be combined with traditional Chinese elements to make a closer connection between people and space. Through the traditional Chinese elements, it can promote a closer relationship between people and space, and realize the precipitation of design and culture in all aspects. In the face of different customers, the sense of artistic impact and experience that emerges is very different, and it is important to be creative and embellish the traditional elements in accordance with different designs.

### **2.1.2. The deformation and deconstruction of traditional elements**

Traditional elements are constantly being innovated in the development of the times, and people's spiritual needs for traditional

art are showing changes, and thus traditional elements are producing a series of structures and deformations. In order to meet the new requirements for the integration of cultural elements in interior design, designers should not only copy traditional cultural elements, but also restructure them through unique conceptual design to form a unique style of design language. Specifically, through the combination and matching of design elements with characteristics, and with reference to actual design needs, new forms of decoration are formed on the basis of maintaining the characteristics of traditional elements, which are more in line with modern aesthetic requirements. By extracting the essence of the mood in traditional painting and calligraphy and suspending it in the decorative space, it can manifest the cultural connotation and at the same time reflect the simplicity and vitality of the times, and the combination of real and imaginary moods, more modern and design sense. Element reorganization is to combine different elements, and on the basis of understanding the characteristics of various elements, the planned combination of the patchwork, forming a unique design model. In addition, when the corresponding inheritance of classical culture, certain improvements in the form, so that it can have the original fresh vitality, but also to a certain extent can help it and the combination of modern culture.

### **3. Analysis of the results of modern interior design with traditional elements**

This paper proposes a modern interior design method for traditional elements using a decision tree model algorithm, based on which the current commercially available interior design is compared with the proposed method in this paper to test the effectiveness of the practical application of the design method in this paper. The results of the comparison test of the two design methods are shown in Table 1.

Table 1. Detection Results of the wo Design Methods

	Visual effect	Style matching	Space image	Decorative components	Fusion degree
Current market	5.5	4.8	5.3	4.0	4.2
Methods in this paper	8.0	7.8	6.9	7.0	8.2

The current market interior design visual effect is 5.5, style matching is 4.8, spatial image is 5.3, decorative elements are 4.0, and overall integration is 4.2. This only meets the general needs of users, and users often need to pay a lot of money when they want to continue to add design elements. The decision tree model interior design method proposed in this paper has an overall integration degree of 8.2 for traditional style elements and modern interior design, which is four times higher than the current market interior design integration degree and basically meets the user's design requirements. In terms of visual effect creation, the level under the decision tree model algorithm reaches 8.0, and the style matching is 7.8, and users basically do not make secondary corrections to the proposed design scheme. This shows that the method designed in this paper has high efficiency, high precision and high performance in interior design, and can meet the high aesthetic requirements of traditional elements and modern interior design.

#### **4. CONCLUSION**

This paper explores the effectiveness of the application of traditional elements in modern interior design based on the decision tree model in the context of big data. By examining the results of the decision tree algorithm, it is found that the overall integration of traditional style elements with modern interior design by the design method proposed in this paper reaches 8.2, which is four times higher than the integration of interior design in the market. This shows that by tapping into the essence of traditional art elements and combining advanced algorithmic techniques with interior design methods, traditional Chinese cultural elements can be inherited and carried forward in modern design.

## **ABSTRACT**

In order to improve the willingness of senior teacher training graduates to teach, this paper is based on random forest algorithm to study the motivation and psychological health factors of senior teacher training students. Firstly, the random forest algorithm model was constructed, and the prediction results were evaluated with rough set correction, so as to obtain the results of motivation and psychological quality of higher education teacher-training students. The data showed that among the factors of motivation for teaching, the correlation between self-efficacy factor and career choice satisfaction was -0.12, social utility value, social experience factor and career choice satisfaction was 0.60, personal utility value factor was 0.28, career pay was only 0.21, which was less than the

predicted value of 0.50, and psychological health satisfaction was 0.60. The research of this paper can provide some reference value for teacher-training students' motivation for teaching. The study of this paper can provide some reference value to teacher educators' motivation to teach.

## **KEYWORDS**

Random Forest; Higher education teacher training students; Motivation for teaching; Mental Health

## **1. INTRODUCTION**

Teacher educators are future educators who are in the pre-service period of teacher education - the "prospective teacher" stage [1]. Teacher educators' beliefs about teaching are a belief system based on their knowledge and deep understanding of the educational career they are engaged in. It includes a genuine desire to commit to and participate in the cause of education from the bottom of one's heart, a firm determination to overcome the difficulties and setbacks encountered along the way, and a high degree of conscious action governed by this scientific outlook [2]. The formation and consolidation of beliefs in teaching are not only related to the activity experience of teacher educators before their professional studies, but are also influenced by factors such as teaching practice, social environment, and their own knowledge reserves at a later stage [3]. Strong beliefs in teaching and the professional learning and growth of teacher educators in school are related to each other and influence each other. Beliefs about teaching influence whether teacher educators can be firmly and long-term dedicated to education after graduation, and affect the quality of teaching, students' outlook, and professional growth of teacher educators when they engage in education [4].

How to carry out the work of mental health education for teacher-training students is a major issue that higher education institutions must face [5]. Only by building a consensus and forming a synergy can higher vocational institutions do a good job of mental health education for teacher-training students. The purpose of education is to cultivate and develop people. The work of mental health education

in higher education institutions should adhere to the student-oriented principle and respect, cultivate and develop the subjectivity of students. It is student-centered, closely focused on students, and everything starts from serving students' growth and cultivating them into physically and mentally sound people [6]. Every educator should always take the responsibility to serve students, enter their inner world, enter their academic world, and approach their life world. On the road of students' growth, we will be the leader and guide of students' learning, promote their coordinated development and all-round development, and lay a solid foundation for higher education teacher trainees to embark on the education stage in the future.

This paper investigates the factors influencing motivation and mental health of higher education teacher educators based on the random forest algorithm. Firstly, the framework of the full-text technical level was laid down by constructing a stochastic algorithm model, followed by data correction of the random forest algorithm prediction result evaluation and rough set. The current situation of higher vocational teacher-training students' intention to teach and mental health education was investigated, and then the correlation result analysis between a higher vocational teacher-training student's motivation to teach, career identity, career choice, and satisfaction with psychological quality was proposed under the random forest algorithm, and the full-text conclusion was drawn. The factors influencing motivation to teach and mental health of higher vocational teacher training students studied in this paper have positive effects.

## **2. Random forest algorithm model construction**

The random forest algorithm obtains a sampling set containing  $m$  training samples by self-sampling method, after  $m$  times of random sampling in a given  $m$ -sample data set. Then a decision tree is constructed based on each sampled set for training, while at the node of the decision tree, a subset containing  $k$  attributes is first randomly selected from the set of attributes of that node, and then an optimal attribute is selected from this subset for division [7]. When the random forest is constructed, test samples are entered into each decision tree for type output or regression output. In the case of classification problems, the final category is output by voting; in the case of

regression problems, the mean value of each decision tree output is used as the final result.

## **2.1. Prediction result evaluation and rough set correction**

### **(1) Judging criteria for prediction results**

After the results were obtained by using the random forest regression model for forecasting, this paper used the mean absolute error, mean relative error, and R2 to measure the fit of the forecasting results to the true curve, i.e., the correlation coefficient pass rate to judge the forecasting results.

### **(2) Rough Set Theory**

When using random forest or other regression algorithms for regression prediction, the specificity of regression theory will make the prediction results tend to be conservative and smooth. When there are multiple peaks in the predicted curve or the variation of the difference square is large, it will make the prediction results have more error near the peak, and rough set can overcome this drawback. Rough set is a mathematical tool proposed by Z. Pawlak to deal with fuzzy problems and uncertainty in big data. It can effectively analyze and deal with incomplete information that is incorrect, needs error compensation, inconsistent and has data missing, and mine from it to get the implied knowledge and reveal the potential laws in the original data.

## **2.2. Willingness of higher education teacher trainees to practice**

From the perspective of personal characteristics, the factors influencing whether higher-level teacher educators are willing to teach include established circumstances such as gender, major, family income, family residence, parents' occupation, personality traits, social responsibility, and the professional identity, subject competence, and teacher quality competencies developed after entering teacher training institutions. From the perspective of training talents in teacher training institutions, the training objectives, training mode, and curriculum of teacher training students in teacher training institutions may affect the willingness of teacher training students to teach. From the perspective of teachers' treatment, the national policy orientation, social recognition, and the actual working treatment and environment may also affect teacher educators' willingness to teach.

Although the results of the study showed that higher-level teacher educators perceive teaching as low salary, demanding and stressful career, and negatively correlated or less correlated with career choice satisfaction in terms of alternative careers, personal utility value, and career pay, higher-level teacher educators still maintain a high level of career choice satisfaction. This result indicates that teacher attrition cannot be simply attributed to the specialized job requirements, heavy workload, and low salary and social status of the teaching profession. Social experience and social utility value factors are the most important factors driving career choice and career choice satisfaction of higher education teacher trainees. In addition, some studies based on narrative studies of Chinese teachers at different stages of their careers noted that those who entered teacher education programs reluctantly remained in the profession and began to develop altruistic values for their teaching. Some studies also point out that Chinese teachers are more attracted to jobs with establishment security, especially elementary school teachers, female teachers, and young teachers, so the overall career choice satisfaction of higher-level teacher education students remains high.

### **2.3. The significance of mental health education for higher education teacher trainees**

Teacher trainees have to take the teaching qualification exam while they are in school and will take various teacher recruitment exams when they graduate in order to take up positions in basic education, but most of them are rather confused and anxious at first and have no way to start. In the practice of mental health education with picture book reading, it can practically improve the teacher trainees' oral expression, teaching design and management skills, etc., and then improve their self-confidence. In the process of communicating with elementary school students, teacher trainees also have a clearer understanding of their profession and a good professional identity, which helps them to strengthen their ideal beliefs and actively pursue a healthy life. Some students said, "Since I entered school I have been preparing myself to become a teacher in the future, learning all kinds of skills and theoretical knowledge, however, when I actually stand on the podium, will these really be useful? So I'm glad that I had the opportunity to go to school to lead a reading during my school years, which really exercised my teaching ability. It also made me

more and more confident and comfortable when I stood on the podium." The mental health of teachers is a topic that must be taken seriously in order to develop a highly qualified teaching force.

### 3. Analysis of motivation and psychological quality of higher education teacher trainees in teaching

To verify the correctness of the algorithm proposed in this paper, the random forest algorithm was used to obtain the correlations among motivation to teach, career identity, career choice, and satisfaction with psychological quality of a higher education teacher-training student. The correlation results among motivation to teach, career identity, career choice, and psychological quality satisfaction are shown in Table 1.

Table 1. Correlation between teaching motivation, professional identity, career choice and psychological quality satisfaction

	1	2	3	4	5	6
Social experience	1	—	—	—	—	—
Social utility value	0.79**	0.66**	0.80**	—	—	—
Personal utility value	0.40**	0.38**	0.28**	1	—	—
Self efficacy	0.66**	-0.12**	—	—	—	—
Career giving	0.40**	0.46**	0.39**	0.32**	0.21**	1
Career rewards	0.42**	0.47**	0.44**	0.35**	0.36**	1
Satisfaction with career choice	0.77**	0.55**	0.78**	0.52**	0.49**	—
Psychological quality	0.79**	0.77**	0.70**	0.87**	0.65**	0.63**

The overall significant correlation between motivation to teach, career perceptions, and career choice satisfaction of higher education teacher educators. Among the factors of motivation to teach, the self-efficacy factor was significantly and negatively correlated with career choice satisfaction -0.12, indicating that teacher educators perceived that self-worth was not fully reflected in the influence of motivation to teach. Social utility value, social experience factor has the strongest correlation with career choice satisfaction at 0.60 and above. The personal utility value factor was 0.28, which had the weakest correlation with career choice satisfaction. Satisfaction with

psychological health all reached 0.50, and students' psychological quality is good, which indicates that students have a higher recognition of the talent training system of teacher training. Career awareness was positively and significantly correlated with career choice satisfaction, and career pay and career reward were positively and significantly correlated with career choice satisfaction, indicating that these factors may have a mutually reinforcing effect with career choice satisfaction.

#### **4. CONCLUSION**

This paper investigates the motivation and psychological health factors of higher education teacher trainees based on random forest algorithm. By constructing the random forest algorithm model, the prediction results were judged and corrected to obtain the results of motivation and psychological quality of higher vocational teacher-training students. The results showed that the psychological health level of senior teacher trainees was maintained above 0.6, and the psychological health education of teacher trainees in school was good. Among the factors of motivation for teaching, the correlation between social utility value, social experience factor and career choice satisfaction was 0.60, which was positively correlated. The personal utility value factor was 0.28, and career pay was 0.21, which was less than the predicted value of 0.50. It can be seen that low career reward and career pay harvest are the main factors affecting the current motivation of higher education teacher trainees to teach. Therefore, improving teachers' treatment and employment environment and social identity value have an improving effect on increasing higher level teacher educators' willingness to teach.

## **ABSTRACT**

In order to improve the efficiency of integrated teaching of English reading and writing in colleges and universities, this paper explores the application of artificial intelligence technology in the integration of English writing in colleges and universities. Firstly, the focus of the integrated teaching mode of reading and writing is identified, and the automatic evaluation system of composition is used to revise and review students' writing essays, and the results of changes in students' writing levels are obtained. The data showed that it takes teachers 6 hours to review 100 essays, while the AI system takes only 0.33 hours, saving nearly 5.6 hours. In terms of score improvement, the low group increased from 10.2 to 18.3, an increase of more than 8 points, basically reaching the passing level. This shows that AI technology has an important role to play in improving students' English writing skills.

## **KEYWORDS**

Artificial Intelligence Technology; High School English; Read and write integration; Teaching Model

## **1. INTRODUCTION**

Computer-assisted teaching in the context of artificial intelligence is a new form of teaching that uses computers as a medium to integrate teaching content, teaching experience, and computer technology. It is a new form of teaching and learning that transmits knowledge and trains skills to students through lecture dialogues, simulation exercises and problem solving to achieve certain educational purposes [1]. The emergence of computer-assisted teaching has brought a series of changes to English teaching methods and teaching means. Artificial intelligence information technology has become an important part of the reform and practice of English teaching in universities and has a revolutionary impact on English teaching [2]. Technologies such as human-computer interaction, intelligent analysis, and deep learning are being continuously integrated into the teaching field, building intelligent and personalized intelligent learning environments that effectively optimize traditional classroom teaching [3]. While providing an intelligent and personalized smart learning environment, artificial intelligence also provides new ideas and methods for English teaching, which is an important part of the reform and practice of university English teaching [4].

At present, in the process of English teaching, there still exists the traditional teaching mode which is mainly based on teachers' lectures, and this teaching mode does not fully respect the main position of students. Students cannot learn independently, cannot practice well, and have an average learning effect. In the process of reading and writing English, students play the roles of reader and writer respectively. Although on the surface they seem to be relatively independent individuals, thinking about them from another perspective, there is an obvious interactive relationship between them [5]. According to the characteristics of the English curriculum and the integrated teaching mode of reading and writing, teachers can effectively enhance students' learning effects and exercise their thinking skills by adopting such programs as task teaching method and inquiry-based teaching method [6]. According to the input-output learning theory, students are constantly involved in the process of independent learning, which makes the English language thinking and thinking skills improve effectively. Therefore, we should adopt project-based, task-driven, and cooperative learning programs to

teach English courses, and under the basic learning mode of "reading-discussion-writing", students can constantly summarize and analyze what they have learned through the learning and application of knowledge, and gradually develop the ability to think about problems. Under the basic learning mode of "reading-discussion-writing", students are able to summarize their knowledge through learning and application, and gradually develop the ability to think about problems.

This paper studies the results of the application of artificial intelligence technology tools in the integrated teaching of English reading and writing in colleges and universities. Firstly, it expounds the theory of artificial intelligence computer-assisted language teaching and the teaching mode of integrated reading and writing to clarify the theoretical basis of the whole paper. Then it clarifies the necessity of artificial intelligence in the integrated English reading and writing classroom in colleges and universities by comparing the teacher's traditional correction speed and artificial intelligence correction speed. The effectiveness of the application of college English reading and writing integrated classroom teaching is explored through the automatic evaluation system of writing with artificial intelligence technology, and it is concluded that artificial intelligence technology has a facilitating effect on improving college students' English writing level. It shows that the integrated classroom teaching of English reading and writing in colleges and universities based on artificial intelligence technology can achieve good results.

## **2. Artificial intelligence computer-assisted language teaching theory**

Artificial intelligence computer-assisted language teaching theory, or ICALL for short, is used in foreign language teaching mainly for speech recognition and semantic analysis, intelligent assessment, intelligent feedback, online discussion, and personalized learning [7]. ICALL can stimulate students' interest and motivation in learning foreign languages, increase students' language output and improve students' writing ability. For example, the automatic scoring system of Critique.com can generate scores of students' essays based on timely feedback of writing problems based on corpus information.

Students independently revise their errors based on the feedback, and the improvement is particularly evident in areas such as writing vocabulary richness and sentence complexity. Thus the development and application of artificial intelligence has enriched teaching methods and approaches, and provided conditions and technical support for blended English writing instruction.

### **2.1. Integrated teaching model of reading and writing**

Reading and writing integration is based on the duality theory of language learning, combined with the current college English syllabus and the actual teaching situation, and selectively draws on the traditional English teaching methods to explore a new teaching mode [8]. Reading and writing are two important elements of English course learning, and it is of great significance to correctly analyze the connection between reading and writing and scientifically deal with the relationship between them to enhance the thinking ability of English majors. In the pedagogy, reading and writing are independent of each other and interdependent. In the teaching of English courses, reading teaching requires the ability to understand the basics of word recognition, grammar, context, etc., and to be able to analyze the structure of the text and understand the author's thoughts and opinions according to the expression of the text. The teaching of writing requires students to be able to express their own opinions appropriately and to apply the corresponding sentences and vocabulary to the layout of the structure of the text. Therefore, the integrated teaching mode of reading and writing fits the characteristics of the English curriculum and the rules of students learning language courses.

### **2.2. Automatic essay evaluation system**

In 1966, Ellis Page et al. developed PEG, the first software that could automatically review essays by computer, which marked the birth of automatic essay evaluation systems. Subsequently, in the 1990s, E-Rater and IEA emerged, and the development of automatic essay evaluation systems took a new step forward, but all of these software had certain defects, which led to the credibility still being questioned to some extent. At the beginning of the 21st century, Criterion, My Access and other software emerged, making the automatic essay evaluation system widely used in English tests such as TOFEL and

GRE, which marked the intelligent stage of the automatic essay evaluation system.

### **2.3. The Need for Artificial Intelligence in Integrated English Reading and Writing Classrooms in Colleges and Universities**

English teachers in colleges and universities generally teach in large class sizes and multiple shifts, and the volume of student writing corrections is quite hefty and very time-consuming. With the development of AI technology, the number of AI writing products in English writing teaching in colleges and universities has increased and improved. With the upgrading of AI and automatic grading systems, it has become possible to apply AI to English writing teaching. The level of the teacher's own composition review can also have an impact on students' ability to improve their expression. Most English teachers in colleges and universities only pay attention to whether there are grammatical problems, word spelling problems, and off-topic questions in single sentences when they roughly correct compositions, but they pay less attention to or carefully analyze the complexity of single sentence patterns, the inner articulation before sentences and sentences, and the difficulty of vocabulary richness, and so on, which does not guarantee 100% to correct all problems. On the contrary, if a college English teacher is asked to correct a composition in detail and to pick out the problem areas correctly and in detail, the teacher needs to read it repeatedly, consult a dictionary, and so on for a cumulative time of 6-6.5 hours or more. According to surveys and interviews, more than 75% of students who received feedback from teachers would only revise the English teacher's errors, and 25% of students would ignore the errors. The application of artificial intelligence technology to English composition correction in colleges and universities will greatly improve teachers' efficiency and increase the rate of correction errors.

### **3. The results of teaching English writing integrated classroom in colleges and universities**

This paper explores the effectiveness of the application of integrated English reading and writing classroom teaching in colleges and universities using artificial intelligence technology. In order to understand the changes in English writing levels before and after different writing level groups, students were divided into three groups:

high group, medium group and low group, and the method was compared with the traditional English writing classroom to test the effectiveness of the practical application of the method proposed in this paper. The comparative verification results of students' score changes after traditional writing and AI writing are shown in Table 1.

**Table 1.** Scores change after students' traditional writing and AI writing

Variant	Number of people	Traditional Writing		AI Writing		T value
		Average	Standard deviation	Average	Standard deviation	
Low grouping	20	10.2	3.72	18.30	3.51	0.56
Medium group	35	20.5	3.92	25.25	3.40	0.43
High grouping	15	24.5	3.10	28.10	3.21	0.20

The results showed that after the AI writing guidance and essay review, the essay writing level of students in the high, middle and low groups improved significantly. Among them, the low group had the largest increase, with the average score rising from 10.2 to 18.3, an increase of more than 8 points, basically reaching the passing level. The middle group had the next highest increase, with the mean score rising from 20.5 to 25.25, an increase of 5 points, and the students' writing ability reaching an excellent level. In contrast, the higher group increased by just over 4 points, but among the English writing scores out of 30, the average score of 28.10 is already quite a high level. It indicates that AI technology has a positive contribution to integrated English reading and writing classroom teaching in colleges and universities, which helps to improve students' writing ability and enhance their self-efficacy in writing.

#### 4. CONCLUSION

This paper studies the effectiveness of artificial intelligence technology in the integrated English reading and writing classroom in colleges and universities. From the results of this study, after AI writing instruction, the average score of the low subgroup rose from 10.2 to 18.3, an increase of 8 points. The average score of the middle group rose from 20.5 to 25.25, an increase of 5 points, and the students' writing ability reached an excellent level. The average score

of the high group reached 28.10, which basically met the requirements of high-level English writing. Thus, artificial intelligence technology in the integrated teaching of English reading and writing in colleges and universities can effectively help students improve their English writing ability and motivate them to write. This model is generally successful and worth promoting and applying in future teaching.

## ABSTRACT

This paper firstly continues to analyze the development trend of packaging design sex, including the development of new materials, new morphological shape development and the development trend of new process technology. Secondly, the basic steps of packaging design form recognition are analyzed based on two-dimensional space, and the steps of the two-dimensional space analysis algorithm are optimized using local feature extraction. Finally, the comparative analysis of recognition rate using product packaging design shows that the average accuracy of the algorithm in this paper is 86.72%, which is 3.47%, 4.55% and 20.24% higher than 2DPCA, 2DLDA and 2DLPP respectively. This shows that the packaging design form with spatial analysis and local feature extraction has good recognition rate, which in turn promotes the innovation and optimization of packaging design form.

## KEYWORDS

spatial analysis; local feature extraction; packaging design; morphology optimization; recognition rate; 2DPCA

## 1. INTRODUCTION

New products are constantly appearing, and some of them involve new areas that have not been accessible to humans before. For example, microelectronics, superconductors, biogenic products, nano products, etc. These new products pose new challenges to packaging design itself, how to protect and preserve them, how to get them safely into circulation, and how they can be successful in commercial sales [1-2]. These new topics have contributed to the constant updating and progress in packaging structures, new materials, and visual communication to adapt to the needs of new product packaging [3-4].

Design expression is the deepening and development of the design concept, not the end. The success or failure of a design depends on both artistic conception and formal expression, and a unique and clever artistic conception needs a certain artistic form to be fully reflected. The design performance cannot be limited to the image of the product itself, nor can it only start from the function [5-6]. The packaging design is shaped by the image of goods with strong artistic influence, which must have aesthetic value, meet the psychological feelings of consumers about the goods, and adapt to the aesthetic needs of consumers [7].

This paper analyzes the development trend of packaging design forms, including the development trend of new materials, the development trend of new form and shape, and the development trend of new process technology. Two-dimensional spatial analysis is used to identify the packaging design forms, and the algorithm is optimized by local feature extraction. In order to verify the effectiveness of the algorithm of this paper, a comparative analysis of experiments is conducted, and the results show that the packaging design form recognition based on spatial analysis and local feature extraction has a high recognition rate and can help designers optimize the packaging design form.

## **2. DEVELOPMENT TREND OF PACKAGING DESIGN FORM**

### **2.1 NEW MATERIAL DEVELOPMENT TREND**

With the deepening of economic globalization and the accelerated change of science and technology, many new materials are emerging in contemporary product packaging design. Product packaging materials and systems tend to reduce costs, invest in green technologies and materials, and commit to more applicable services and functional designs. The world of corrugated box manufacturing is now highly competitive, and the corrugated packaging industry in European countries is choosing the best cost solutions by analyzing orders and raw material inventories. As China's corrugated carton industry continues to advance in lightweighting and quantification technologies, it will be of value to the entire packaging industry and to the product industry as a whole.

Figure 1 shows the product packaging material output value possession analysis chart. According to the basic positioning and trends of the packaging industry in the last 5-10 years shown in the analysis of the basic status of the product packaging industry, the output value of the paper packaging category accounts for 37.13% of the entire packaging industry in the first place, plastic packaging second 25%, glass packaging 4.87%, packaging decoration accounted for 17%, packaging machinery 6%, 3% of other packaging industries. Paper packaging industry due to express logistics, physical marketing, brand promotion, increasingly become consumers and various industries

rely on the industry, and at a rapid pace, to absorb a variety of demand for technical components.

**Figure 1** Packaging Materials Production Value Share Analysis Chart

## 2.2 NEW FORM MODELING TRENDS

Zero packaging, simplified packaging, green packaging is becoming the new outer packaging development trend, green goods, green packaging combination has become more attractive to the public highlights. Modeling design changes from the traditional neat and tidy flat geometric outer packaging design, to shaped design, bionic shape design, curved shape design, breakthrough conventional visual aesthetics, in the realization of a unique new shape at the same time, the transformation of functional upgrades.

Shaped design is a design method to achieve special use, special product demand and special public taste with complex and unconventional shape; it has a new trendy sense of shape in display, show and sale. From the packaging design point of view, if there is a reasonable combination of design planning, shaped outer packaging design not only needs to be perfect in terms of storage and transportation, but also in terms of the fit of the product itself to be able to fit perfectly. Bionic design is a symbiotic design science that combines traditional and contemporary, natural and human, art and technology, micro and macro, unique and universal, and other popular multicultural fusion.

## 2.3 NEW PROCESS TECHNOLOGY TRENDS

In today's global economic boom and the rise of real and virtual industries, the packaging revolution is based on the concept of "zero-degree packaging", "green packaging" and "simplified packaging" and is being implemented. The implementation of environmentally friendly green goods and biodegradable green packaging has become a new social hotspot. Due to the growing demand for paper packaging market, the original plastic process is gradually used in paper packaging. Extrusion, stamping, integrated molding, these processes solve the traditional paper packaging form process problems, to assist the development of paper packaging form. Emerging wet processing

technology, ultraviolet drying technology, high-temperature bonding technology, vacuum technology, digital laser cutting technology are aiding the high-tech contemporary development of the paper packaging industry.

### **3. PACKAGING DESIGN MORPHOLOGY ANALYSIS BASED ON SPATIAL ANALYSIS AND LOCAL FEATURE EXTRACTION**

Based on the previous analysis of the development trend of packaging design form, in order to be able to understand more intuitively and help designers to carry out innovative design of product packaging. This chapter introduces spatial analysis and local feature extraction to provide a new research method for packaging design morphology analysis.

#### **3.1 PACKAGING DESIGN FORM RECOGNITION BASED ON TWO-DIMENSIONAL SPACE ANALYSIS**

One-dimensional principal component analysis first converts the packed two-dimensional image into a one-dimensional vector. The image is already high in dimensionality, and the transformed dimensionality is even higher, which greatly increases the complexity of calculating the sample covariance. Stretching the image data into a one-dimensional vector will destroy the original data structure of the image. Two-dimensional spatial principal component analysis can maintain the original structure of the packaging design data to a certain extent.

The 2DPCA algorithm process is as follows:

(1) Construct the matrix  $X = [x_1, x_2, \dots, x_N]$  and the covariance matrix.

(2) Construct the projection subspace, use the eigenvectors of the covariance matrix as the projection axes, and solve for the coordinates.

(3) Compress the data, and perform the corresponding transformations on the training and test samples to obtain the corresponding low-dimensional matrices, respectively.

(4) Classify and identify, and categorize the samples to be tested.

#### **3.2 OPTIMIZATION OF TWO-DIMENSIONAL SPATIAL ANALYSIS ALGORITHM INCORPORATING LOCAL FEATURE EXTRACTION**

Suppose we obtain the data  $X = [x_1, x_2, \dots, x_n]$ ,  $X \in M$  and  $M$  is a manifold hidden in the space of  $R^D$ . The main purpose of 2DPCA is to find the projection matrix  $A, R^D$  that maps the data  $X$  in space to the low-dimensional  $R^d (D \geq d)$  space,

and the projected sample is denoted as  $Y = [y_1, y_2, \dots, y_n]$ , where  $y_i = Ax_i$ . The idea of the algorithm can be briefly described as follows:

(1) Detect the acquired sample data  $X = [x_1, x_2, \dots, x_n]$ .

(2) Construct the adjacency matrix  $W$ , i.e., the weight matrix of the neighborhood connectivity graph, for the neighborhood of the sample  $x_i$ . The  $\varepsilon$ -neighborhood and  $k$ -nearest neighbor methods are usually used.

(3) Determine the weights, so that  $w_{ij} = 1$  or  $w_{ij} = \exp(-\|x_i - x_j\|^2 / t)$ ,  $t$  are parameters, which need to be set by us manually.

(4) Solve for the eigenroots, converting the optimization problem for the objective function  $\sum_{ij} (y_i - y_j)(y_i - y_j)^T w_{ij}$  and the orthogonal constraint  $y^T U y = 1$  into a problem of solving for the minimum eigenvalue and eigenvector of  $XLX^T a = \lambda XUX^T a$ , where  $L = U - W$  is called the Laplacian matrix.

(5) Let  $\{a_0, a_1, \dots, a_{k-1}\}$  be the solution of the above equation with corresponding eigenvalues  $\lambda_0 < \lambda_1 < \dots < \lambda_{k-1}$ , and be able to calculate the corresponding eigenvector  $A = [a_0, a_1, \dots, a_d] \in R^{d \times k}$ , i.e.,  $y_i = A^T x_i$ .

The 2DPCA algorithm incorporating local feature extraction, which can keep the local information of the data well and is linear mapping with good clustering and classification effect, well promotes the application of local feature extraction in packaging design form optimization.

#### 4. EXPERIMENTAL RESULTS AND ANALYSIS

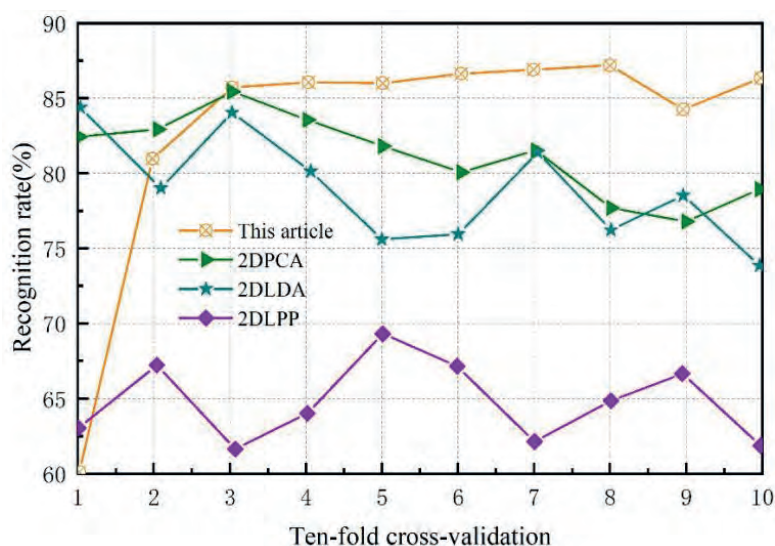

In order to verify the effectiveness of the method in this paper and its advantage in recognition rate, the experimental environment MATLAB is programmed to form a dataset by collecting the images of packaging products involved on the Internet. It is also compared with other existing algorithms to prove the effectiveness of the algorithm given in this paper on the recognition of packaging design forms.

This experiment pre-processes a total of 500 product packaging images in advance to facilitate subsequent operations without changing the gray scale. The first 80 images

are randomly selected as training samples to form a training set of 50\*80, and the rest are used as the test sample set, and the average value is taken as its final recognition rate using the ten-fold cross-validation method. The algorithms compared in this paper include 2DPCA, 2DLDA, and 2DLPP algorithms, and the classification method uses the nearest neighbor classifier with Euclidean distance. The comparison of recognition rates of each algorithm is shown in Figure 2.

From the algorithm comparison, the average accuracy of ten-fold cross-validation of the 2D spatial analysis algorithm incorporating local feature extraction in this paper is 86.72%, which is 3.47%, 4.55% and 20.24% higher than 2DPCA, 2DLDA and 2DLPP, respectively. This indicates that spatial analysis and local feature extraction can better identify packaging design forms, provide designers with more possible packaging design forms, and then promote the optimization and development of product packaging forms.

**Figure 2** Comparison of recognition rates by algorithm

## 5. CONCLUSION

Starting from the development trend of packaging design forms, this paper analyzes the trends of new materials, new form shapes and new process technology development. The two-dimensional spatial analysis algorithm is optimized by using local feature extraction to realize the effective recognition of packaging design forms. The results show that the average accuracy of this algorithm is 86.72%, which is 3.47%, 4.55% and 20.24% higher than that of 2DPCA, 2DLDA and 2DLPP respectively. This shows that the spatial analysis and local feature extraction can effectively carry out the recognition of packaging design forms, and then provide new possibilities for designers to innovate product packaging design forms.

## **ABSTRACT**

In order to improve the accuracy of the statistics of recent immigrants in Sichuan, Yunnan and Tibet, this paper constructs a statistical model of recent immigrants in Sichuan, Yunnan and Tibet by relying on the big data statistical method. Firstly, the geographical scale is used to stratify the migration situation in Sichuan, Yunnan and Tibet. Secondly, the criteria of migration are determined by setting the criteria of migration according to the different zones. Finally, we rely on multidimensional data sources to obtain the recent migration situation in Sichuan, Yunnan and Tibet. For the accuracy of the model, simulation experiments are designed in this paper, and the results show that the model migration measurement results of this paper are very close to the actual statistical migration results of the experimental cities, and the errors are within 5%. It can be seen that the statistics of recent migration in Sichuan, Yunnan and Tibetan areas can be realized based on the computerized big data background.

## **KEYWORDS**

Sichuan, Yunnan and Tibetan immigration situation; Big Data Statistics ; Geographical scale division; Multidimensional Data Sources

## 1. INTRODUCTION

There are various factors affecting the economic development of a certain place, among which the influencing factor of topography is particularly prominent among many factors [1-4]. In addition, statistical work based on big data is performed by machines and algorithms from data collection, data storage to data processing, which greatly reduces human intervention and can ensure the objectivity of statistical results [5-8].

The literature [9] analyzed the changes in domestic population mobility using the United States as an example, quantified the evolution of internal mobility and migration patterns in the United States through domestic migration data, and pointed out that the human and natural environment had a great impact on population mobility in the United States, such as human development index, education level, climate, cost of living index, house price index, and crime rate. The literature [10] uses Sichuan province as the study area and county-level administrative districts as the study units. Based on the median values of ecological quality index and economic growth index of each unit, Sichuan province was divided into double pressure zone, economic backwardness zone, ecological crisis zone and coordinated development zone, and the coupling coordination degree of each unit was studied. The results of the study showed that the economic development of Sichuan province is very unbalanced and migration occurs in this context.

Therefore, based on the background of computerized big data, this paper relies on the big data statistical method and the accuracy-oriented big data statistical system of migration situation to construct a statistical model of the recent migration situation in Sichuan, Yunnan and Tibet. Firstly, the geographical scale is stratified into four levels: national, provincial, municipal, and county, and the migration situation in Sichuan, Yunnan, and Tibet is obtained. Secondly, the criteria of migration are determined by setting the criteria of migration according to the different partitions. The determination of migration criteria can rely on big data statistics to draw a portrait of each observer, outline the scope of their work and life, and draw the red line of migration. Finally, relying on multi-dimensional data sources, abnormal data are eliminated to obtain the recent migration situation

in Sichuan, Yunnan and Tibet, and the statistical data counted are verified and corrected. In order to verify that the statistical model constructed based on the big data statistical method can accurately measure the migration situation in Sichuan, Yunnan and Tibetan areas in recent times, simulation experiments are designed in this paper. The results show that the migration measurement results of the model in this paper are very close to the actual statistical migration results of the experimental cities. It can be seen that the statistics of the recent migration situation in Sichuan, Yunnan and Tibet can be realized based on the computerized big data background.

## **2. Migration statistics from a big data perspective**

### **2.1. Big Data Statistics**

Big Data takes data as the main subject, and statistics is the science about data. Accordingly, big data has injected new vitality into statistics with its four major characteristics: large data volume, many data types, huge commercial value and fast processing speed, and big data statistics has emerged and is increasingly becoming the direction of research applications in official statistics departments. Big data statistics use multiple data collection methods to integrate multiple data sources, and use modern information technology and architecture to process and mine data at high speed, which has high application value and decision support functions.

### **2.2. Accuracy-oriented statistical system for big data migration situation**

In order to make the statistical model of modern migration in Sichuan, Yunnan and Tibet meet the six key requirements of unified system, scientific application, methodological innovation, cooperation and global vision. Based on the big data statistics, this paper constructs a statistical model of the recent migration situation in Sichuan, Yunnan and Tibet based on a big data system that is in line with the development trend of the recent migration in Sichuan, Yunnan and Tibet and is compatible with the world data system and suitable for multi-dimensional data sources.

### **2.2.1. Geographical scale stratified statistics on migration**

The statistics of recent migrants in Sichuan, Yunnan and Tibet cannot be taken as the grassroots statistical unit at the county level, but should be summarized by reporting at each level to finally obtain the overall statistics at the municipal, provincial and national levels. The number of immigrants and other information obtained by using the county level as the basic statistical unit may have large errors. Big data statistics on migration should correctly assess and judge the current situation of migrants in their respective jurisdictions from different levels and pay attention to migration statistics at different scales. Stratified statistics of immigrants by geographical scale, reasonable assessment and judgment of geographical scale should be divided into four levels: national, provincial, municipal and county.

### **2.2.2. Differentiation of immigration criteria by region**

The rules for determining the migration situation should be different for different era backgrounds and regions. Wanting to set the judgment of migration differently by partition can rely on big data statistics to draw a portrait of each observer, outline the scope of his or her work as well as life, and draw the red line of migration. For example, if people in the Sichuan, Yunnan and Tibetan areas leave their jobs in the Sichuan, Yunnan and Tibetan areas for too long, that is, more than 6 months and have not returned to the Sichuan, Yunnan and Tibetan areas, they are considered immigrants.

### **2.2.3. Selection of multidimensional data sources**

The statistics of recent migration in Sichuan, Yunnan and Tibet based on big data mainly use the cell phone signaling data with full-area coverage to conduct statistics. With the popularity of cell phones, the current signaling data of three major communication operators have basically covered the full amount of users, full time location information data and behavioral data. Using the signaling data of communication operators as the main data source, after cleaning and reasonable model algorithm, it is basically close to the data of the full-area migration volume. While the operator's signaling data is the main data source, multi-dimensional data sources supplemented by other data are also used for modeling and computing. With its massive electronic and unstructured data, the multidimensional data source

greatly enriches the source of Sichuan, Yunnan and Tibetan migration statistics .

### **2.3. Statistical model of recent migration in Sichuan, Yunnan and Tibet**

Accordingly, this paper firstly stratifies the migration statistics according to the geographical scale, secondly eliminates the special data based on the migration criteria set by partition and multi-dimensional data sources, and finally derives the recent migration situation in Sichuan, Yunnan and Tibet. Then, a statistical model based on big data statistics is designed for the recent migration situation in Sichuan, Yunnan and Tibet.

When censoring special data on non-immigrants, the first step is to cull the regular commuters. Most of the regular commuters have been eliminated by setting the criterion of immigrants differently by partition, but students and workers are often ignored. Therefore, we need to calculate the students who leave Sichuan, Yunnan and Tibet to go to school in other provinces and cities and the students who come to school in Sichuan, Yunnan and Tibet from provinces outside Sichuan, Yunnan and Tibet based on the big data.

### **3. Comparison and validation of statistical data on recent migration in Sichuan, Yunnan and Tibet**

To verify that computer-based big data statistics can be derived for the recent migration in Sichuan, Yunnan and Tibet, this paper takes Leshan and Mianyang cities in Sichuan Province, Kunming and Zhaotong cities in Yunnan Province, and Tibet as examples, and measures the recent migration in the three regions using the above-mentioned methodological model and compares it with the actual data published in the three regions.

Since this paper only studies the recent migration in Sichuan, Yunnan and Tibet, it is not necessary to consider domestic and foreign migration when making data measurement and comparison.

**Table 1.** Comparison of Big Data statistical measurement and actual statistical results

Region	Model measurement value / 10,000 people	Actual value / 10,000 people	Error/%
Leshan	152	150	1.3
Mianyang	155	150	3.3
Kunming	138	132	4.5
Zhaotong City	170	168	1.1
Tibet	170	169	0.1

As can be seen from Table 1, the model measurement results of this paper are very close to the actual statistical results of the experimental cities. The number of immigrants in Leshan City, Sichuan Province is 1.52 million, and the actual number of immigrants in Leshan City is 1.5 million, with an error rate of 1.3%. The actual number of migrants in Mianyang City, Sichuan Province is 1.5 million, which is 50,000 less than the estimated value of 1.55 million by the computerized big data statistical model, with an error rate of 3.3%. The actual migration in Kunming City, Yunnan Province is 1.32 million, which is only 60,000 less than the model prediction, with an error of 4.5%. The model measured 1.7 million immigrants in Zhaotong City, Yunnan Province, but the actual number of immigrants in the city was 1.68 million, with a difference of only 20,000 between the two and an error rate of only 1.1%. The error between the statistical measurement of big data in Tibet and the actual statistical results is only 0.1%. Based on the computerized big data statistical model, the total number of immigrants in Tibet is 1.7 million, and the actual number of immigrants in Tibet is 1.69 million, and the number measured by the model is only 10,000 more than the actual number.

#### **4. CONCLUSION**

At present, migration statistics are still inferred based on traditional sample surveys or Internet data, which leads to the problems of high cost, low data accuracy, and poor data continuity in migration statistics. Accordingly, based on the relevant theories and existing research, this paper relies on three major dimensions of big data statistics: geographically scaled stratified statistics, partitioned and differently set migration criteria, and multidimensional data sources to eliminate special data to derive the recent migration situation in Sichuan, Yunnan and Tibet, and then constructs a statistical model of

the recent migration situation in Sichuan, Yunnan and Tibet. In order to verify that the constructed model can have accurate statistics of the recent migration situation in Sichuan, Yunnan and Tibet, this paper designs a simulation experiment and obtains the following results: the number of migrants in Leshan City, Sichuan Province is 152 based on the computerized big data statistical model, and the actual number of migrants in the area is 1.5 million, with an error of only 1.3%. It can be seen that the migration big data statistical model proposed in this paper has high accuracy and can realize the statistics of the recent migration in Sichuan, Yunnan and Tibet based on the computer big data background.

### **ABSTRACT**

In order to make newspaper design more in line with people's aesthetic requirements, this paper builds a coding software platform for computer-generated art. Data collection is conducted through sensors, and the coding program constructed by using multi-sensory perception conversion and data visualization technology converts data into images to realize the development of cross-innovative applications of computer imaging and newspaper design. The innovation effect was verified by the change of newspaper reading, purchase rate and positive feedback rate, and the result showed that the reading volume of newspaper increased from 158,000 copies to 364,000 copies. This shows that the intersection of computer imaging and newspaper design has achieved the innovative development of newspaper design.

### **KEYWORDS**

Computer-generated art; Perceptual conversion; Data Visualization

## 1. INTRODUCTION

Multidisciplinary cross research is the development trend of scientific research and design innovation today, and it has a wide range of theoretical significance and application value in hot research areas such as computer graphics, natural human-computer interaction, artificial intelligence, big data, emotional computing and medicine [1-3]. In recent years, with the rapid development of artificial intelligence, human-computer collaborative innovation design has been widely emphasized, which is not only important for computer-aided design research, but also puts forward new thinking and challenges for the future of design [4]. For example, interaction design based on affective computing, multi-channel cognition and interaction, intelligent habitat design, intelligent medical and health research, aesthetic computing, innovative design of new media art, and theoretical and methodological research of new media design and communication are all international research hotspots, and related technologies and achievements will have important impacts on future academia, industry and society.

The integration of art and science is an important direction for future research in cross-disciplinary fields, and its harmonious unity is a driving force for strategic, fundamental and forward-looking innovations. The literature [5] evaluates newspaper design in desktop publishing courses based on the opinions of graphic design students. Students pointed out that the existing newspaper design relies solely on art theory and lacks innovation. The literature [6] noted that the digital experience lacks the physical experience of flipping through a photo album, reading a newspaper, or strolling through a bookshelf, and that the use of computer technology is a promising way to bridge this gap. Based on this, the literature proposes an interaction design and recommends design guidelines. In summary, newspaper design relies more heavily on art theory and ignores technological tools such as computer imaging, to the detriment of innovation in newspaper design.

Therefore, this paper achieves cross innovation in computer imaging and newspaper design by building a coding software platform for computer-generated art. In the process of building the platform, firstly, relevant data are collected through specific sensors, and physical

analog parameters are used as input ports. Next, the coding program of the platform is constructed using a multisensory perceptual transformation construct approach and data visualization techniques. Then computer recognition of the input digital language is performed, and computer imaging technology is used to convert the data into images to achieve cross-innovation application development of computer imaging and newspaper design. In order to verify the effect of cross-innovation application development, this paper calculates the changes of relevant data of newspapers before and after cross-innovation. The significant increase of newspaper reading and purchase rate proves that the crossover of computer imaging and newspaper design has realized the innovative development of newspaper design.

## **2. Computer Imaging and Newspaper Design**

### **2.1. Computer image generation**

Computer imaging is in fact computer-generated art, i.e., algorithmic art [7]. This technique uses computer 2D animation and 3D animation software to generate the images needed for newspaper design, starting from the creation of the teaching word model until the generation of the images needed for newspaper design, without any conflict at all with the images taken by the camera during the whole process. The images generated based on the computer images are also referenced to real objects. When an image is taken and ready to be applied to a newspaper, a generation command is sent to the digital model. When the command is received, the computer immediately searches the repository for similar images that have been done or seen in the past. The computer then makes the necessary modifications to the similarly successful images in the repository according to the requirements of the given image and the newspaper design to produce an image that matches the newspaper design, i.e., the current frame generated is a partial modification of the previous frame. It can be seen that computer-generated art has designed certain rules through the construction of a programming language and given the computer great autonomy to obtain a computer-automated writing program. Relying on computer-automated writing programs allows the creation of artworks that are

visually associated, resulting in results that cannot be reproduced and have a unique visual form [8].

## **2.2. Multisensory perceptual transformation constructs**

The intersection of computer imaging and newspaper design enables the interaction of images and the search for connections between phenomena in different perceptual domains. Newspaper images are different from real-life situations and require the use of images to help readers perceive the world in a way that places them in a changing world filled with various colors of light and shadow, silence and sound, call and response. The aesthetic intervention of computer-generated art in perception introduces new perspectives to newspaper design through the construction of situations and temporal and environmental contexts, and the creation of video art. The transformation between perceptions is gradually explored, choosing the appropriate programming language and rules to relate and transform the various elements of newspaper design with each other. For example, sound is transformed into image or color, touch into visualization of visual motion images, etc. This crossover both affects the way people receive and perceive newspaper information, and makes the emotional expression of newspapers less one-way and unique. With the design of newspaper image generation based on computer imaging, people can truly receive information through multi-sensory channels.

## **2.3. Data Visualization**

The transformation of data into a visual representation within people's cognition and giving it the image flow, interaction and real beauty of the here and now is another embodiment of the application of computer imaging at the intersection with newspaper design [9-10]. It can provide newspaper readers with a sense that everything is connected through the collection, extraction, reorganization, planning and analysis of data, and even artistic expression and design, visually presenting the controlled energy of technology and nature together, allowing readers to participate in it for change and exploration, and also empowering the real world with the formal results it presents. When discrete data are combined together, an image with a hidden basis in fact is obtained, allowing readers to have a surreal sense of travel when reading the newspaper.

It is thus clear that to achieve the development of cross-innovative applications of computer imaging and newspaper design, computer technology can be used to capture behaviors through specific sensors, using physical analog parameters as input ports. A computer-generated art coding software platform is built using multisensory perceptual transformation constructs and data visualization techniques to construct a coding program that recognizes the input digital language by computer and then converts the data into artistic results, such as light on images.

### 3. Analysis of the effect of computer images applied to newspaper design

In order to verify the effectiveness of the platform constructed in this paper on cross-innovation of computer imaging and newspaper design, this paper calculates people's reading, purchase rate and positive feedback on newspapers before and after the application of the platform, and the results are shown in Table 1.

**Table 1.** Changes in newspaper readership, purchase rate and positive feedback

	Newspaper readership / million copies	Newspaper purchase rate/%	Good rating rate /%
Pre-cross innovation	15.8	61	40
After cross-innovation	36.4	89.3	66

Prior to the intersection of computer imaging and newspaper design using the computer-generated art coding software platform, the newspaper had a quarterly readership of 158,000 copies. However, after integrating computer imaging with newspaper design, the quarterly readership of the newspaper was 364,000 copies. Before and after the intersection of computer imaging and newspaper design, the newspaper readership increased by 206,000 copies per quarter. At the same time, the purchase rate of the newspaper increased significantly before and after the crossover between computer imaging and newspaper design. Before the newspaper design innovation, its purchase rate was only 61%. In other words, for every 100 copies of the newspaper printed by the publisher, 39 copies would be left unsold. In contrast, after the newspaper design

innovation, the purchase rate of newspapers increased by 28.3% to 89.3%. Similarly, just under 11 copies would be unsellable.

The change in favorable newspaper ratings was also extremely evident after the crossover innovation between computer imaging and newspaper design. Before the crossover of computer imagery and newspaper design was achieved using a coding software platform for computer-generated art, the favorable rating of newspapers was only 40%. Another 60% thought the newspaper was deficient in image design. In contrast, after the crossover innovation between computer images and newspaper design, the favorable rating of newspapers reached 66%, an increase of 26%. The increase in newspaper readership, purchase rate, and favorable rating shows that the crossover between computer imaging and newspaper design has achieved innovative development.

#### **4. CONCLUSION**

This paper innovates newspaper design by building a coding software platform for computer-generated art and crosses computer images with newspaper design, and verifies the innovative effect in the process of practical application. Compared with the traditional newspaper design, the purchase rate of newspaper increased from 61% to 89.3% after the intersection of computer image and newspaper design, and the positive feedback rate of newspaper increased from 40% to 66%. This shows that the intersection of computer imaging and newspaper design has achieved innovative development of newspaper design.

## ABSTRACT

In order to meet the objective demand of teacher morality and teacher style construction in the era of big data, this paper designs a kind of evaluation mechanism of teacher morality and teacher style in colleges and universities based on big data analysis. Through big data analysis technology, the data of the grassroots, management and social layer are mined and designed by using top-level design, and on this basis, the multi-directional data are organized to construct the data evaluation index of teacher morality and teacher style. The simulation results show that the evaluation subject inclusion degree of this evaluation mechanism is 9.36, the comprehensive index parameter is 96.75%, and the number of evaluation indexes is 6+58. It can be seen that the big data analysis technology can improve the professionalism of college teachers and promote the construction of college teachers' ethics and morality.

## KEYWORDS

Big Data Analytics Technology; Teacher ethics and teacher style construction; Evaluation Indicators

## 1. INTRODUCTION

With the continuous expansion of the scale of colleges and universities, the crisis incidents involving the misconduct of teachers in colleges and universities gradually show a rising trend, and the

demand of society for excellent teachers in higher education is increasing [1-2]. In the face of the call for teacher ethics construction, scientific evaluation of college teachers in the context of big data is conducive to the overall improvement of teaching ability and professionalism of college teachers to meet the needs of the development of the new era [3-4].

With the gradual spread of scientific evaluation methods, they have played an important role in the work of teacher evaluation. For example, the literature [5] investigated teachers' perceptions of evaluation feedback and self-efficacy of teaching practices and tested the self-efficacy of teachers' teaching practices and the specificity of feedback from the evaluation system using the Teacher Efficacy Scale. The literature [6] analyzed teachers' and administrators' perceptions of implementing teacher evaluation policies through motivational theories that motivate professional behavior. The findings indicated that the overall goal of improving teacher practice through accountability was driven by intrinsic motivation to improve local control of stakeholder institutions. The literature [7] used a qualitative spectrum approach to teacher evaluation research, using factor analysis to rate items in relative order to identify common perspectives on the salience of items in a particular area. In summary, the current evaluation construction of teacher ethics and teacher morality is too heavily weighted toward quantitative evaluation and has insufficient credibility of the evaluation body and lacks an effective monitoring mechanism to meet the goals of teacher training in the context of the data era.

Based on this, this paper designs an evaluation mechanism of university teachers' ethics based on big data analysis based on the background of big data era. In the process of design, the data mining standard is unified from the perspective of top-level design through big data analysis technology, and the data of grassroots, management and social layer are mined and designed. On this basis, we collect and organize multi-dimensional data, and set 6 primary indicators and several secondary indicators to build teacher ethics data evaluation indexes by grasping from two dimensions of moral and moral development. And the practical effect of the evaluation mechanism is confirmed by simulation results. It shows that the evaluation mechanism of university teachers' morality based on big

data analysis promotes the construction of university teachers' morality and is conducive to the leading role of teachers' morality.

## **2. Big data analysis and evaluation mechanism**

### **2.1. Top-level design for data mining**

The network development in the era of big data has reconfigured the educational resources, and the extensive and complicated network information has impacted the teacher's authority, professional authority and academic authority of college teachers. In order to solve the current realistic problems in the construction of university teachers' morality and style, it is necessary to further improve the scientific evaluation mechanism of university teachers and fully mobilize the teachers' work enthusiasm. Based on the big data analysis technology for the construction of the evaluation mechanism of teachers' moral and moral style in colleges and universities, data mining is needed from the perspective of top-level design [8-9].

Data mining is the process of converting the collected raw data into useful information, and it is inherently difficult to extract the useful information implied in it from a large amount of fuzzy raw data [10]. Data mining with teacher ethics as the evaluation goal is not only dealing with numerical structured data in traditional databases, but also with semi-structured and unstructured data, which leads to a huge amount of data and uneven quality. Therefore, in the process of data evaluation mechanism construction, it is necessary to unify data mining standards to lay the foundation for subsequent data storage, data analysis and other operations. The specific work can be summarized into the following three levels:

(1) Data mining design at the grassroots level: The grassroots level mainly refers to the data collection at the college faculty level. The faculty is the main body of college teachers' performance appraisal, moreover, it is the organizer of college teachers' teaching and education and the receiver of information feedback, which has extremely rich information resources. With the continuous development of informatization construction of colleges and universities, the information of teachers at the faculty level has accumulated a lot of data. In the process of data mining at the

grassroots level, it is necessary to further extract the relevant data and information reflecting teachers' moral and moral style.

(2) Data mining design of management: Management mainly refers to the data collection of personnel management department of colleges and universities. Personnel management department is the researcher and maker of university faculty policy, which not only has the function of collecting data related to each faculty, but also has the macro design and guidance role. Especially in the cross-field data mining, the personnel department of colleges and universities can carry out data collection and processing related to teacher management information on behalf of the university.

(3) Data mining design of social layer: social layer is mainly the extension of colleges and universities to social level. The information collection space of college teachers is further expanded through the feedback information of relevant activities such as industry-university-research cooperation and various associations. The evaluation of teachers' ethics cannot only depend on a momentary event of teachers' behavior at school, but needs to collect information from social level extensively and analyze and summarize it in order to get comprehensive information feedback of teachers' ethics evaluation.

## **2.2. Building a data evaluation mechanism**

Big data analysis technology provides sufficient and reliable information and data for teaching resources, and also improves the comprehensive quality of teachers [11-12]. From the top-level design of data mining for teacher ethics construction, it can be seen that the real application of big data for teacher ethics evaluation is a systematic project with a large workload. Therefore, it is necessary to construct teacher ethics data evaluation indexes on the basis of the top-level design. As shown in Table 1, the index construction of teacher ethics evaluation mechanism can be grasped from two dimensions of morality and moral development, and six primary indicators and several secondary indicators are set.

**Table 1.** Indicators of Teacher Ethics Evaluation System

Classification	Tier 1 Indicators	Remarks
Basic	Academic Competence Indicators	Explicit Indicators
Li-Te	Political Performance Indicators	Hidden Indicators
	Personality Quality Indicators	
	Social Norms Indicators	
Tree People	Teacher Moral and Ethical Indicators	
	Academic Guidance Metrics	

The evaluation mechanism of university teachers' ethics based on big data analysis adopts visualization technology to show the basic data including evaluation subjects. The evaluation subjects show diversified expressions, and different evaluation subjects have different evaluation authority and weights. The evaluation system takes secondary indicators as the landing point for sub-evaluation, designs the focus of the algorithm according to the actual needs of the school, gives different indicators with different weights and divides them into different levels. Using big data technology, data from departments that generate direct or indirect relationships with teachers are integrated, and evaluation scores and grades are collected from different evaluation subjects, which are summarized and organized to form standard evaluation data. Teachers' academic ability indicators are also presented as explicit indicator data within the mechanism, and the rest of the implicit data are tagged and aggregated and displayed according to the rules set in the background. Through the corresponding label names configured, different dimensional data of teachers are displayed in the form of word clouds and radar charts according to the popularity of hot labels in order to achieve the goal of teachers' self-monitoring and improve the construction of teachers' ethics and morality in colleges and universities.

### **3. Analysis of simulation results of big data evaluation mechanism**

In this paper, we use visualization technology to promote the formation of evaluation mechanism in the background of big data era, and design a kind of evaluation mechanism of university teachers'

ethics based on big data analysis. The method is deeply applied to the actual teaching activities and compared with the traditional teaching system evaluation method, and the simulation comparison results are obtained as shown in Table 2.

**Table 2.** Simulation Comparison Results

Evaluation Type	Evaluation Subject Inclusion Degree	Number of Evaluation Indicators	Evaluation of Equipment Support Requirements	Comprehensive
Traditional Teaching System Evaluation Method	6.9	8	Teaching Service Platform	72.3%
Big Data Evaluation Mechanism	9.36	6+58	Internet Explorer	96.75%

The degree of inclusion of evaluation subjects in the traditional teaching system evaluation method is 6.9, and the evaluation subjects must use the school intranet to enter the teaching service platform to evaluate the teachers' moral and teaching style when using the traditional teaching system evaluation method, which is extremely inconvenient for the teachers and students who teach and attend classes at home. In contrast, the evaluation subject inclusion degree of the evaluation mechanism of teacher morality and teacher style based on big data analysis is 9.36, and the evaluation subject can evaluate teacher morality and teacher style only by using IE browser to log in the account password, which crosses the time and space barrier of the traditional evaluation method and helps the benign construction of teacher morality and teacher style.

The comprehensive index parameters of the evaluation method of traditional academic affairs system are 72.3%, and the number of evaluation indexes is 8. The comprehensive index parameters of the evaluation mechanism of university teachers' ethics based on big data analysis are 96.75%, and the number of evaluation indexes is 6+58, among which there are 6 primary evaluation indexes including academic ability indexes and 58 secondary evaluation indexes including the number and level of teaching papers. It helps teachers to have a comprehensive understanding of their own professional

quality level and actively search for the painful points of teacher moral failure, so as to promote the construction of teacher moral and teacher style in universities.

#### **4. CONCLUSION**

In this paper, from the perspective of data-based construction of teacher morality and teacher style, an evaluation mechanism of university teacher morality and teacher style based on big data analysis is designed, and the application effect of this evaluation mechanism is verified in actual teaching activities. Compared with the traditional teaching system evaluation method, the evaluation subject inclusion degree of the evaluation mechanism based on big data analysis is 9.36, the comprehensive index parameter is 96.75%, and the number of evaluation indexes is 6+58, which is an obvious optimization effect. It indicates that the evaluation mechanism designed in this paper is conducive to the implementation of teacher morality and teacher style construction of college teachers and promotes the benign development of college teachers' team.

## **ABSTRACT**

In order to promote the process of library information management, this paper applies the big data technology to the management process of Hainan library. The big data technology is used to establish data tags, build an intelligent book collection and editing system, and promote the integrated management of book resources. The big data transfer search technology is adopted to optimize the reference consulting service and provide users with personalized service methods. The simulation results show that the resource sharing efficiency of the method reaches 97.64%, the book recommendation performance reaches 84.6%, and the user demand mining time is 30 s. Thus, it can be seen that the application of big data technology to the management process of the modern Hainan

library can improve the management efficiency and service quality of the library.

## **KEYWORDS**

Big Data Technology; Library Management; Data Tags

## **1. INTRODUCTION**

With the rapid development of network information technology, library collections have realized the transformation from print-based resources to digital resources [1]. Hainan libraries generate a large amount of data information of diverse types when storing library materials and serving users [2]. How to integrate the resources of existing data and information to meet the dynamic reading needs of users and enhance personalized management services has become a key issue that needs to be addressed urgently in the construction of Hainan libraries.

In recent years, big data technology has been widely used in library management to provide new ideas for the management of traditional libraries. For example, the literature [3] constructed an information retrieval model for intelligent libraries starting from virtual reality technology, proposed a strategy for constructing an extended resource context for intelligent library knowledge services, and realized the interconnection of extended resource context for library knowledge services. The literature [4] designed an intelligent recommendation system for library books based on artificial intelligence. Artificial intelligence technology is used to clean and normalize the data, automatically extract the historical evaluation data of users for books, and demonstrate the service management performance of the system through user clusters. The literature [5] analyzed the video recovery and video software requirements of digital libraries, and proposed the design goals and concepts of video retrieval. The video retrieval experiments were carried out step by step from the video data of the digital library. The experimental results showed that the number of enhanced dynamic clustering algorithms increased to ensure the complexity of the images. In summary, the number of cooperative consultations for internal library management services is relatively small, and reference consulting services are still

in their infancy, which cannot help libraries to keep abreast of their readers and their own shortcomings.

Based on this, this paper applies the big data technology to the management process of Hainan library in order to innovate the management service concept of the library. Firstly, we use big data technology to establish book data tags, build an intelligent book collection system, and optimize the utilization process of books by using the interaction between the hardware layer, logic layer and application layer of the system. Secondly, it adopts big data transfer search technology to enrich the search form and update the information resources in the big data repository. Finally, the applicability of the method in Hainan library is proved through experiments, demonstrating its superiority in book resource management and service performance. It is shown that the application of big data technology to the management process of Hainan library can improve the information service management of Hainan library.

## **2. Library management based on big data technology**

### **2.1. Create a resourceful storage of books**

Big data technology allows people to get more in-depth value information resources from the data system to help people make major decisions in a timely manner. In the management process of modern Hainan library, big data technology can transform the stored data of Hainan library into information resources and provide personalized services for readers.

The use of big data technology to Hainan library's collection of books to establish the corresponding data tags, through the data tags can allow users to quickly find the library material resources they need [6]. Using big data technology to obtain, process and analyze data such as books in the collection and users' borrowing information, we can find out which part of the books have high utilization rate, so as to provide a basis for the consolidation and organization of books. At the same time, it can also collect and organize the feedback information of users with the help of big data to provide reference indexes for subsequent book procurement.

Big data technology can realize the retrieval of book resources anytime and anywhere, solving the limitation of having to access materials in the library, and through big data analysis of students' borrowing behavior, time and other related data, it can realize the functions of book reservation, automatic borrowing and return [7]. For Hainan library management, the application of big data technology makes the organization and classification of books, storage and storage and utilization processes have been optimized, advancing the combination of intelligence, books and collections, and enhancing the effectiveness of Hainan library management through integrated operation.

## **2.2. Building an intelligent book collection and editing system**

In the recent book harvesting process of Hainan library, book unpacking and acceptance, processing and cataloging and sorting shelves and other operations require a lot of manual processing [8]. The interaction between the hardware layer, logic layer and application layer of the intelligent book harvesting system based on big data technology can jointly complete the book harvesting function. Among them, the hardware layer mainly completes the signal transmission network erection of book data analysis system, electronic bookshelf and terminal equipment, and provides hardware support for the whole picking and editing system. The logic layer has the function of positioning engine, providing the required logical service content to the hardware layer, and realizing the management of input and output information through conversion, verification, screening and other functions. The application layer mainly realizes the interactive interface between the collection and editing system and the librarians and reader users, to meet the needs of library managers and readers, to realize the personalized and diversified services of Hainan Library, and to provide security for the database. The intelligent book collection and editing system based on big data technology realizes the automatic collection and editing of book resources in an automated, intelligent and visualized way, solving the problem of book backlog and shortening the collection and editing cycle.

## **2.3. Optimize reference consulting services**

Libraries need to always meet the needs of users in the first place, in the era of big data Hainan libraries want to achieve continuous development should be to meet the needs of users. Big data era of Hainan library need to computer and some other hardware facilities continue to improve, establish a more reasonable open network system, promote the progress of reference consulting services [9].

Hainan library's reference consulting user services are quite diverse, not only have ordinary users and professional users. Therefore, at this stage of Hainan library should enrich the search form, take big data transfer search technology to make the search content contains semantic search and other search modes, which is convenient for users to query and retrieve, meet the personalized needs of users and improve the service quality. In addition to update the information resources in the big data repository, to ensure the reasonable allocation of resources in the library, to establish a network service platform that meets the needs of users, to absorb and solve the comments and problems raised by users in a timely manner, to provide support for library operations. The library should also establish a perfect user interest model and use the model as a basis to find out the actual preferences of users, so as to provide them with accurate information delivery.

### **3. Analysis of Simulation Results for Library Data Management**

Based on big data technology, this paper improves the shortcomings of the management process of the recent Hainan Library, and applies the big data technology to the management process of Hainan Library in order to optimize the management services of Hainan Library. In order to verify the applicability of this management approach to Hainan Library, the operational effect experiment was conducted, and the simulation results are shown in Table 1.

**Table 1.** Comparison of Simulation Results

	Traditional Library Management	Management of Big Data Technology
Resource Sharing	83.2%	97.64%
Recommended Performance	32%	84.6%
Feedback Effect	72%	83.6%
Open Rate	83.6%	84.9%
Service Level	73.86%	97.56%
Digging time comparison	6min	30s
Borrowing convenience	72.8%	94.97%

Compared with the traditional management approach of Hainan Library, the library management approach based on big data technology has achieved 97.64% efficiency of resource sharing and 84.9% open shelf rate in terms of book resource performance. In terms of service performance, the level of information consultation service is 97.56%, the borrowing convenience is 94.97%, and the recommendation performance of user books reaches 84.6%, which is nearly three times higher compared to the traditional management approach. It shows that the management approach can provide personalized reading service mode for library users and optimize the allocation of information service resources of Hainan library. The user demand mining time of the library management approach based on big data technology is 30s, which can make the management service of Hainan library more efficient and faster, and de-boundaryize the traditional library storage, and truly realize the book management with user demand as the goal-oriented.

## **. CONCLUSION**

Based on big data technology, the paper improves the shortcomings of Hainan library in the management process and designs a library management approach based on big data technology to optimize the management service work of the library. The applicability of the method for Hainan Library is verified in the process of practical application, and the results show that: the library management approach based on big data technology optimizes the efficiency of library resources utilization by making the resource sharing efficiency and open shelf rate reach 97.64% and 84.9%, respectively, in terms of book resources performance. And the overall service performance reached 85% and the user demand mining time was shortened to 30 s. It shows that the management approach can facilitate the business

management of Hainan Library and promote the continuous improvement of Hainan Library's information service level.

### **ABSTRACT**

In order to improve the cross-cultural communication ability of folk traditional decorative arts, this paper designs a cross-cultural penetration pathway of folk traditional decorative arts with the assistance of artificial intelligence. By building an intelligent platform, the interactive effect of art products is achieved by using human-computer collaboration technology. The immersive art product experience was carried out from the digital penetration subject, interactive recognition and building intelligent penetration scenes. The results show that the parameter indicators and impact values of cultural penetration and impact strength of each audience group reached 87.45% and 88.9% on average. It can be seen that the cultural penetration strength of folk traditional decorative arts has been improved with the assistance of artificial intelligence.

### **KEYWORDS**

Cultural penetration; Folk Decorative Arts; Human-Machine Collaboration Technology; Artificial Intelligence

## 1. INTRODUCTION

With the advancement of economic globalization and information networking, cross-border and cross-regional cultural exchanges are increasing, various cultures interact with each other, and cross-cultural penetration has become an inescapable phenomenon and communication method in today's world [1-2]. Folk traditional decorative arts are facing the threat of monoculture, and how to take active countermeasures to maintain traditional cultural security has become a key issue that needs to be urgently addressed in the cultural communication pathway [3-5].

Currently, traditional crafts have begun to be empowered by the use of emerging technologies in the process of penetration. The literature [6] studied the cultural characteristics and intelligent transmission of Chinese Xiang brocade by collecting qualitative data through in-depth interview method. It also measured more than 1,000 pieces of Xiang brocade from the Suzhou Archives in China and analyzed its artistic characteristics such as pattern design, color matching techniques and weaving processes, which provided important references for its cultural and weaving heritage. The literature [7] constructed a big data platform for an automated production line of handicraft structures to achieve a closed loop of art creation in a unique way with high efficiency and precision and stability. The literature [8] used new media and information technology to bring new development opportunities for folk art crafts, and tried to verify the value of folk traditional crafts to manufacturing enterprises by interweaving big data. In summary, the exploration of emerging technologies into the field of folk traditional arts is still in its infancy, and although folk crafts are aware of the value of emerging technologies to their penetration and dissemination business, there are still development challenges in terms of data quality and usage.

Based on this, this paper designs a cross-cultural penetration path for folk traditional decorative arts with the assistance of artificial intelligence. Firstly, it constructs an intelligent platform through intelligent interaction design and uses human-computer synergy technology to improve the interaction between art design products and the audience. Secondly, in the path of cross-cultural penetration, the immersive experience scene is created from digital penetration

subject, interactive identification and building intelligent penetration scene. Finally, the experiment proves that the cross-cultural penetration path with the assistance of artificial intelligence can effectively improve the cross-cultural communication ability of folk traditional decorative arts.

## **2. Artificial intelligence-assisted art and culture penetration**

### **2.1. Intelligent Interactive Art Design**

Along with the rapid development of artificial intelligence technology and the Internet, the interactive attributes of decorative art design have become more prominent and distinct. As a new art form, interactive art design is a fusion of folk traditional decoration technology and art, which can realize not only human-human interaction, but also human-computer interaction, thus bringing different sensory and psychological experiences [9-10]. The "interaction" in interactive art design refers to the two-way information exchange between the participants and the artwork, which can be either the interaction between the audience and the artwork or the exchange of ideas between the creator and the audience. With the application of artificial intelligence to traditional folk art design, the interaction of such works not only brings new creative experiences to the creators, but also increases the immersion and interactivity of the audience's experience.

### **2.2. Intelligent platform construction**

Intelligent platform-oriented interactive art design is the application of artificial intelligence to design platforms or the use of artificial intelligence to assist in the design of folk traditional decorative art products to form art designs that can be created by human-computer interaction in intelligent platforms [11]. When designing and creating folk traditional decorative art products in an intelligent interactive platform, it is necessary to analyze and model the massive amount of data and deconstruct the works from the database to simulate the works of intelligent decorative art design when the designer needs it. This intelligent platform is designed with four types of matching, namely text matching text, text matching image, image matching text and image matching image. The intelligent interactive art design platform can solve some design tasks of repetitive manual labor and

apply more energy to creative activities to improve the design quality of decorative art works.

### 2.3. Human-Machine Collaboration Technology

Intelligent machine-oriented interactive art design is a mode in which intelligent robots create works by simulating human works. This model has a more direct visual art effect than other models. Through the interaction mode of machine and human collaboration, designers can use language, expressions and brain thinking to create various decorative artworks, combining human-machine interaction to complete the works. In this process, the machine learns from human behavior, thus inspiring folk artists about traditional decorative art design and realizing the interaction between art design products and the audience.

## 3. Cultural penetration path

### 3.1. Digitalization of the penetration subject

With the assistance of artificial intelligence, folk traditional decorative arts show a trend of normalization, and intelligent communication devices are not only an effective cultural penetration channel, but also a new communication object. Through natural language understanding and machine real-time learning technology, intelligent communication devices become virtual inheritors in the process of folk traditional decorative arts dissemination. Compared with human inheritors, artificial intelligence has an extremely strong advantage in learning efficiency and logical combining, which can not only grasp a large amount of raw data and information in a short period of time, but also organize and connect unstructured data in series. It can also change to the existing knowledge output according to the change of external environment and the specific needs of the audience in different cultural communication environments.

### 3.2. Interactive penetration recognition

Through natural human-computer interaction technology, the audience's raw physiological data can be used to guide the production and creation of communication content, which can form a virtuous closed loop in which content dissemination and user feedback promote each other. The quantitative analysis of users' raw physiological responses can better enable the understanding and

processing of user experience. The widespread use of feedback interaction technology in various new media platforms enables audiences to publish, give feedback and communicate at any time in the process of receiving information, thus transforming broadcast communication into social communication. By combining with human-machine hybrid enhancement technology, experiential interaction technology effectively combines human comprehension and machine data processing ability to build a virtual cultural penetration environment for folk traditional decorative arts. This compensates to a certain extent for the shortcomings of the lack of experience of design works due to the differences in spatial environment.

### 3.3. Build intelligent penetration scenarios

With the maturity and popularity of artificial intelligence technology, artificial intelligence assistance can be used to innovate the cultural penetration of design works of folk traditional decorative arts in terms of form and content. A deep simulation of folk traditional decorative art and its growth environment, an intelligent and optimized reproduction of conceptualized scenes such as humanistic environment and architectural style on the basis of retaining detailed features, builds a simulation environment to display and disseminate in a more vivid way. With the help of mobile devices such as tablet PCs, viewers can independently choose the viewing angle and the direction of experience through natural movements such as movement and rotation. The design process of the work is viewed and felt in all aspects in the native environment of traditional folk decorative artworks, creating an immersive experience scene for users and generating a unique experiential penetration effect.

## **4. Analysis of the effect of art penetration with the aid of artificial intelligence**

This paper designs a cross-cultural penetration pathway for folk traditional decorative arts with the assistance of artificial intelligence, starting from digital penetration of subjects, interactive recognition and building intelligent penetration scenarios. To verify the feasibility of the penetration pathway, cultural penetration experiments were conducted for cultural audience groups aged 0-25, 26-40, 41-65 and over 65. The cultural penetration effect of the pathway was analyzed by the cultural penetration index parameters, the strength of cultural

influence and the degree of understanding of the artistic connotation of the works.

**Table 1. Result Analysis of Cultural Penetration Pathways**

	Understanding of Art Types	Understanding of the Content of Works	Strength of Cultural Penetration	Cultural Influence
0-25 Years	73.46%	86.64%	92%	95.64
26-40 Years	92.6%	94.65%	91.66%	91.72
41-65 Years	84.65%	81.9%	84.25%	83.2
65 Years Old and Above	72.6%	78.65%	81.94%	84.95

As can be seen from Table 1, after the art and culture infiltration of audience groups of different age groups, the degree of knowledge of each audience group about the types of folk traditional decorative arts reached more than 70%, and the degree of knowledge about the connotation of art works reached more than 80%. It indicates that with the assistance of artificial intelligence, folk traditional decorative arts have positive significance in the process of localized infiltration, further promoting the dissemination and development of folk traditional decorative arts. At the level of cultural penetration strength, the parameter indicators for different age groups of audience reached 87.45% on average. Among them, the audience group aged 0-40 performs the best, reaching an excellent level of 91.83%, improving the efficiency and quality of cultural penetration of folk traditional decorative arts. At the level of cultural influence strength of folk traditional decorative arts, the influence value of audience groups of different age groups reached an average of 88.9%, making folk traditional decorative arts gain a broader design space.

## 5. CONCLUSION

This paper actively explores the cross-cultural penetration path of folk traditional decorative arts with the assistance of artificial intelligence, and verifies the actual penetration effect of the path through the analysis of experimental results. The results show that the degree of understanding of each audience group about the types of folk traditional decorative arts and the connotation of the works reached over 70%. At the level of cultural penetration and influence strength, the parameter indicators and influence values of different age audience groups reached 87.45% and 88.9% on average. Thus, it

can be seen that with the assistance of AI, folk traditional decorative arts have improved their ability of cross-cultural communication and have positive cross-cultural penetration.

---

## **ABSTRACT**

This paper takes the combination of big data technology and English classroom as a premise to analyze the existing problems of teaching spoken English in college in the context of big data. It explores the current problems of teaching spoken English in the context of information technology, identifies the advantageous aspects of big data technology in the teaching process and verifies its advantages in classroom practice. In the initial stage, the students' scores in Contextual Spoken English out of 30 were 10 for fluency, 9 for completeness, 4 for grammatical correctness, and 12 for pronunciation. In the later stages, the scores increased in all categories, with fluency increasing by 10, completeness by 14, grammatical correctness by 16, and pronunciation by 15. Thus, it can be seen that the application of big data technology in oral information teaching can optimize the college English oral classroom and improve the English oral communication ability of college students.

## **KEYWORDS**

Big Data; University English; Informative Teaching; Oral Communication

## 1. INTRODUCTION

With the development of the times, network informatization teaching has been gradually promoted and applied in major universities. Universities are also scrambling to reform the traditional teaching mode with the help of online information technology teaching methods [1]. However, the reform of college English speaking course is not very strong, and some universities have hired foreign teachers to undertake the task of college English speaking teaching, but the achievement is not optimistic [2]. The application of big data technology in college English teaching can effectively collect and use various data resources, accurately analyze the actual learning needs of students, and help improve the relevance of teaching, and then achieve the goal of personalized teaching [3].

The advantages of big data technology in information collection, semantic analysis, data association, data storage and utilization provide convenient technical support for college English teaching. Using big data technology for English courseware production and presentation, building an online English interactive classroom, and simulating English speaking rehearsal scenarios has innovated the university English teaching mode [4]. First, it is conducive to the cultivation of scientific teaching concepts. The practice of college English teaching relies on scientific educational guidelines, and big data technology enables educational guidelines to be built on a solid data foundation, so that educational guidelines makers can obtain educational information in a timely manner, analyze data through science and technology, and overcome subjective bias [5]. Second, it is conducive to creating a good classroom atmosphere. College English teaching has formed a relatively solid teaching style, and students' interest in English learning needs to be improved [6]. Through big data technology, intelligent teaching courseware is designed to create speaking practice scenarios with the help of English film and TV clips, which can provide professional pronunciation guidance and enrich English teaching resources [7]. In addition, with the dynamic monitoring of classroom data, problems in teaching can be improved in a targeted manner. Third, it is conducive to smooth communication channels between teachers and students. College English teaching should pay more attention to students' learning initiative and enthusiasm, and close communication between

teachers and students is an important guarantee for teaching effect improvement. By building an English interactive window through big data technology, it can provide students with functional services such as knowledge Q&A, practical exercises, homework review, and demand feedback, so that teachers can grasp the learning dynamics of students in a timely manner [8].

Based on this, this paper studies the results of applying big data technology in the informatization teaching of college English speaking. Firstly, by analyzing the existing problems of university English speaking informatization teaching, the focus of the whole paper is derived, and then two major advantages of informatization English speaking teaching are proposed. Then, based on the research needs of this paper, the main points of informatized teaching of college English speaking and the possible misunderstandings in teaching practice are proposed and practically verified in the contextual English speaking classroom of college students. Under the background of big data, English teaching in colleges and universities faces a new development opportunity, and timely teaching reform can promote the overall improvement of English teaching quality in colleges and universities.

## **2. Big Data and Information Teaching of College English Speaking**

### **2.1. Existing Problems of College English Speaking Teaching in the Context of Big Data**

#### **(1) Traditional Teaching Model**

Since college English speaking courses are generally not taken seriously by major universities, the degree of innovation in major universities is relatively low. The teachers generally adopt the traditional lecture style teaching. Even in speaking courses, students' interest is not high and the difficulty in speaking is still a common situation among college students. Since the course is not taken seriously, teachers are not very motivated to innovate and reform the course. In fact, speaking is the key to language learning, especially in English, where the ability to speak is the final criterion for a student's English proficiency.

#### **(2) Hire foreign teachers**

Currently, more and more colleges and universities are hiring foreign teachers to teach college English as a foreign language. However, the current situation of hiring foreign teachers in universities shows that the number of experienced foreign teachers is low and they are usually fresh graduates. Therefore, foreign teachers can only create a good language training and communication atmosphere for students with good English proficiency, while students with average or poor English proficiency still cannot be effectively improved.

## **2.2. Advantages of Informative Spoken English Teaching**

(1) The use of information-based teaching can change the way of teaching and learning

The phenomenon of teachers lecturing unilaterally and students accepting passively mainly exists in traditional English classrooms, and this teaching mode ignores the subjectivity of students. The application of information-based teaching mode has broken the closed, isolated and one-sided way of English teaching, and the teaching tools have gradually developed from a single traditional paper textbook to diversified media, with multimedia courseware and various online teaching platforms becoming the common tools and carriers of English teaching [9]. This makes the presentation of knowledge more intuitive and clear, and the sources more abundant. The use of information-based teaching methods, especially online learning in the classroom using cell phones on learning platforms, has greatly stimulated students' enthusiasm for learning, increased their participation, and made the transfer of knowledge in the classroom more convenient and efficient.

(2) The application of information technology promotes the change of teaching evaluation method

Modern information technology can effectively monitor students' independent learning, and students' learning process on the online platform can also be automatically recorded by information technology, which facilitates later evaluation. In the traditional English classroom teaching, it is not correct to evaluate students only summatively; such evaluation is too one-sided and not objective. In order to promote students' learning efficiency and overcome the above drawbacks, a combination of teaching and assessment should

be used to set teaching goals, track and observe the teaching process, and provide feedback on the final effect of teaching.

### **2.3. The key points of the application of English speaking information teaching with big data technology**

#### **(1) Develop students' independent learning skills**

With the widespread use of information technology, the information-based teaching model should permeate all subjects in the context of the new curriculum reform. Teachers need to integrate the application of multimedia devices, computer systems, networks and social media, and other tools to promote the progress of the information-based teaching model and develop students' independent and autonomous learning abilities. It is recommended that teachers improve their teaching philosophy, respect students' subjectivity in the classroom, follow the teaching principle of tailoring teaching to students' needs, aim to cultivate students' independent learning abilities, and encourage students' innovative thinking. The potential abilities of students are explored in classroom practice, so that students can gradually become composite talents and lay the foundation for future job practice. For example, when teachers explain texts with certain cultural background connotations, teachers can use the Internet to introduce to students the differences in Chinese and American holidays and customs, and guide students to respect Western culture and do their pre-course work with a dialectical attitude. In turn, students can work on their own to enhance their interest and broaden their horizons and vocabulary in what they see in life, which will help them in their subsequent English reading, composition writing and speaking training.

#### **(2) Stimulate students' interest in learning English**

Information-based teaching plays an important role in the college English classroom, as it can greatly stimulate students' interest in learning. In fact, interest is the biggest motivation for students to participate in learning and get the best results, so using information technology to increase students' motivation for learning English can help them improve their own learning efficiency. Teachers need to make full use of fresh video and audio materials in their daily teaching process to attract students' attention to English learning content, so that students can be fully engaged in English classroom learning.

(3) Teachers and students use the information-based learning platform to communicate in English

Teaching English in college is not enough to use only the time in class, which cannot solve all the learning problems of the students. Therefore, teachers and students can build an English communication and learning QQ group together, so that students can ask questions together and exchange English learning experience with each other, and teachers can give online guidance to students in the group on important and difficult problems that they do not understand. Such an educational learning mode is not limited by space and time, and builds a bridge of online learning between teachers and students.

### **3. Misconceptions in Teaching English as a Foreign Language**

(1) Ignore the actual situation of students and make extensive use of digital teaching tools

Some teachers present all lectures in an informational way, which does not take into account the actual situation of students' learning. The teachers show the content that students need to think alone more directly, so that students do not have time to think and digest, and thus their logical reasoning ability is not improved. Some teachers simply show PPTs in the classroom, displaying all the content on the screen, and not only that, but also put all the knowledge on the information-based learning platform. In addition, in the process of making courseware, some teachers put too much emphasis on the playback effect, thus using a lot of sound effects and pictures to show their lecture contents, which in turn distracts students' attention in class and deviates from the teaching objectives.

(2) Neglecting individualized teaching evaluation

During personalized English teaching in colleges and universities, teachers need to reasonably apply big data technology to adjust teaching evaluation methods, comprehensively assess students' daily learning performance and assessment results, and give targeted guidance by comprehensively analyzing students' strengths and weaknesses in English learning through data. In addition to teachers' evaluation, students can also conduct mutual and self-evaluation to investigate students' satisfaction with teaching, and analyze and

study students' evaluation results through big data technology, and then adjust teaching programs in a targeted manner.

#### 4. Analysis of the results of information-based teaching of spoken English in college

In order to test the actual teaching effectiveness of big data technology in the teaching of English speaking informatics in college, five college students were randomly selected to analyze their performance in English contextual oral communication classroom. Each of the five students' spoken language was reviewed in the form of audio recordings to analyze the students' English speaking fluency, completeness of utterance, grammatical correctness, and pronunciation. The college students' English speaking performance is shown in Figure 1.

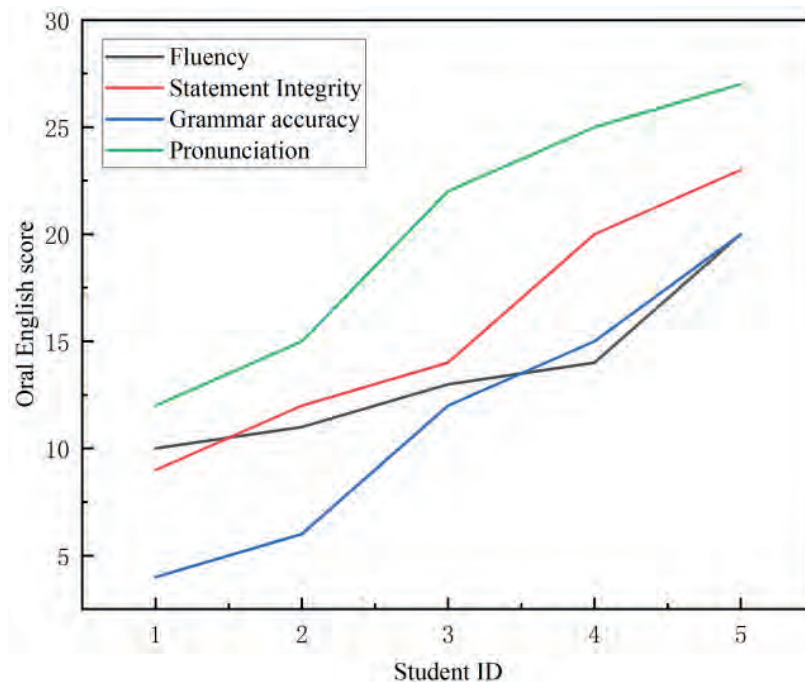

Figure 1. College Students' Oral English Performance

In the initialization stage, students scored 10 points for fluency, 9 points for completeness of utterance, 4 points for grammatical correctness, and 12 points for pronunciation in a contextual oral communication out of 30 points. In oral English teaching, students often lack fluency and completeness of their utterances due to interference such as poor language learning. With the unlimited expansion of students' English learning resources and learning platforms under big data technology, students' language accumulation is abundant, and emotions such as lack of confidence

will decrease in the face of oral communication. Under the guidance of university English speaking informatization teaching, students' scores of corresponding examination items have all increased, specifically: fluency 20 points, utterance completeness 23 points, grammatical correctness 20 points, pronunciation 27 points, an average increase of 10-16 points compared with initialization, students' English speaking ability has significantly improved, and teachers' teaching results have received positive feedback.

## **5. CONCLUSION**

This paper explores the results of the application of big data technology in the informational teaching of spoken English in college. By exploring the existing problems in the informational teaching of college English speaking, the focus of the full-text study is derived, and then two major advantages are proposed that informational teaching of English speaking can change the methods of teaching and learning and promote changes in the way of teaching evaluation. The distribution of students' English speaking scores under the guidance of informational teaching of college English speaking is 20 points for fluency, 23 points for completeness of utterance, 20 points for grammatical correctness, and 27 points for pronunciation, which is 10-16 points higher than the initialization. Thus, it can be seen that big data technology has a positive role in the informational teaching of college English speaking, and the integration and development of big data technology and college English is a new change in college English teaching and an important practice to explore a new model of college teaching in the new era.

## ABSTRACT

By constructing a virtual simulation experimental teaching model of tourism management based on big data technology, this paper seeks to explore the importance of virtual simulation experiments in the teaching of tourism management. Based on the virtual simulation experiment teaching case sharing platform construction, the students' written scores are compared with the practical training scores to verify the teaching value of the virtual experiment platform. After the practical training, the students' performance of guided tour explanation is 90 points, which is 5 points higher than the written performance, bed-making skill is 92 points, which is 17 points higher than the written performance, and meeting planning is 96 points, which is 18 points higher than the written performance. This shows that the virtual simulation experiment teaching is more suitable for tourism management students than the pure theory teaching mode.

## KEYWORDS

Big Data; Tourism Management Major; Virtual Simulation Experiment; Tourism Practical Training

## 1. INTRODUCTION

Along with the booming development of tourism industry, the construction of tourism management majors in China's general higher

education institutions has emerged and gradually connected with the international level, which has cultivated a large number of excellent tourism management and service talents [1]. It is an important mission for the high-quality development of tourism education in the new era to strengthen the cultivation of tourism management professionals in higher education institutions, especially the cultivation of application-oriented and excellent talents in line with the development trend of new tourism industry, new modes and new technologies [2]. Tourism management is a comprehensive and applied profession that covers both socio-economic content and natural science attributes. Virtual simulation experiments use computer, multimedia, artificial intelligence and other high technology to solve the problems of irreversible traditional practical teaching scenarios, high cost of courses and high risk of practice, and broaden the time and space of practical teaching, which has become the mainstream trend of practical teaching in tourism management majors in colleges and universities [3-5].

Due to the suddenness and irreducibility of tourism management situations, on-site practical teaching may have a longer period of waiting, higher time cost and high environmental risk, and traditional practical teaching can no longer meet the needs of tourism management professional talent training [6-7].

This paper firstly constructs the virtual simulation experimental teaching model of tourism management based on big data technology, establishes the virtual simulation experimental program over discrete counting, and archives the experimental materials of three directions of travel agency operation and management, hotel management and exhibition service and management. And then build the virtual simulation experimental teaching case sharing platform and point out the current realistic dilemma of practical teaching in tourism management to further clarify the research direction. In order to verify the effectiveness of the method proposed in this paper, the students' written results are compared with the practical training results in order to find out the necessity of virtual simulation experiments in teaching tourism management majors. By building a first-class virtual simulation experiment system, designing a first-class virtual simulation interaction and collaboration mode, forming a first-class virtual simulation sharing platform, taking the demand of tourism

industry as the guide, innovating teaching concept, and integrating tourism disciplines and information technology resources, we can give new momentum to the cultivation of excellent talents in tourism industry and sustainable development of industry.

## **2. Tourism management professional virtual simulation experimental teaching model building**

### **2.1. Over discrete counting tourism scenery virtual experiment program establishment**

Create a SAS scenic virtual dataset named "nbd1" using SAS data synchronization program:

```
data nbd1;  
infile 'd: \SASTJFX\mdvisit. Dat';  
input id numvisit reform badh age edu loginc;  
run;
```

Program Description: Enter all 2228 lines of data in this example into the computer in "text format" with the file name "mdvisit.dat" and store it in the D drive folder named "LVYOUSASTJFX " in the D drive folder named "LVYOUSASTJFX". There are 8 data in each line, named as "Travel Agency Management", "Hotel Management" and "Exhibition Service and Management". The three experimental materials will be archived one by one to generate virtual simulation sample materials for students' professional practice.

### **2.2. Travel virtual simulation experimental teaching case sharing platform building method**

#### **(1) Establishment of a special fund for sharing platform**

According to their own development requirements and their own economic conditions, each university raises funds to build a special sharing platform for the practice teaching case base of tourism management majors, so that the funds can be earmarked for specific purposes and the fund chain for the later construction of the sharing platform of each university can be guaranteed. For schools that are short of funds, they can raise funds through appropriation, fundraising and sponsorship, and make a perfect plan for using funds to achieve

comprehensive planning and integrated management in terms of equipment, technology and talent training.

#### (2) Development of unified platform construction, supervision and management standards

Led by outstanding colleges and universities, a team of experts is set up to develop a unified supervision and management standard for the shared platform of practice teaching case base in tourism management. Among them are case quality standards, case development standards, platform linking standards and standards for supervision and use. Emphasis is placed on being detailed and strict, and regulating every link and means of operation for the construction and use of the shared platform. After the standards are formulated, they should be quickly promoted and used to guide all universities to build their own excellent case base platforms under the unified standards and lay a solid foundation for the links and links established between major sharing platforms.

#### (3) Colleges improve practice measurement system

In order to ensure the quality of practice teaching, it is necessary to improve the practice measurement system and to strengthen the cooperation between schools and enterprises, as well as to strengthen the control of students. Schools should contact students and enterprises in a timely manner to get the current status of students so that they can evaluate the performance of the practice process. For example, regular inspections during the internship period allow students to give feedback and summarize the process, and the school should evaluate the practice process in combination with the final grade.

### **2.3. The realistic dilemma faced by the practical teaching of tourism management in the context of big data**

#### (1) Limited practical teaching courses

In the practical teaching of tourism management profession, students need to learn various operation or service skills in a real environment by creating complex and realistic scenarios. However, the current curriculum design of practical teaching in tourism management majors is limited, and the practical training sessions lack a specific scenario background. The practical teaching about tourism

destination planning only instructs students to carry out sandbox simulation practical training by means of pre-set scenarios, without considering the authenticity of the scenarios. The complexity of tourism scenarios makes the practical teaching of tourism management professions have the limitations of high cost, high risk and low efficiency . For example, the crisis management practice of sudden passenger congestion in scenic spots has high on-site teaching time and economic costs, and students face a large safety risk factor. In this context, virtual simulation experiments can organically integrate virtual and reality, and use big data and artificial intelligence science for practical teaching course design, opening up new ideas to solve the limitations of practical teaching course design.

## (2) Insufficient use of new technologies

At present, the achievements of new information technology revolution such as big data, cloud computing, 5G communication technology and artificial intelligence have been fully applied in many fields such as education, finance, marketing, business intelligence and enterprise management, and the new liberal arts talent training mode has undergone profound changes .

### **3. Analysis of virtual simulation experiment on tourism management students' service skills improvement**

The practical operations of students in the travel agency operation and management direction, hotel management direction, and exhibition service and management direction in tourism management were videotaped and analyzed by comparing them with their performance with the written design at the end of the experimental class, focusing on the changes in students' understanding of hospitality service skills and techniques. The students' service skill scores are shown in Table 1.

**Table 1.** Student service skill scores

Operation and management of travel agencies		
Practical training project	Average score of written design	Average score of practical training
Visiting guide	85	90
Progress supervision	80	92
Hotel management		
Practical training project	Average score of written design	Average score of practical training
Table setting table	80	88
Bedmaking skills	75	92
Exhibition service and management		
Practical training project	Average score of written design	Average score of practical training
Meeting arrangement	68	93
Meeting planning	78	96

The average score of students in the written design was between 75-80, and the score was distributed between 85-96 after the practical training operation, which improved by 10-16 points, which indicates that compared with the theoretical teaching, students accept the service environment simulated by the virtual experiment more. In the more abstract session of meeting layout, due to too many design elements, students are easily unable to find a sense of direction in the huge theoretical narrative, so they do not get high scores in the written design, only 68 points, not reaching the excellent level. Virtual simulation practice can directly simulate the required theme exhibition site for reference layout, which is easier for students to understand, which explains why the average score of students' practical training operation in meeting layout and meeting planning is as high as 93-96. The bed-making and table-setting in the hotel direction are more oriented to practice, and after several practice sessions, students' scores are as high as 88-92, which meets the standard of professional training for top-up practice. This shows that students' practical service skills have all improved after the virtual simulation test.

#### 4. CONCLUSION

This paper constructs a virtual simulation experiment program of tourism management based on big data technology, and points out the realistic dilemma of the current practical teaching of tourism management by building a virtual simulation experiment teaching

case sharing platform, which provides a reference for the reform and innovation of the practical teaching of tourism management in colleges and universities. In this paper, it is shown that compared with students' written design scores, students' scores increased by 10-16 points respectively after practical training operation, and the highest difficulty meeting layout scores increased by as much as 25 points. Thus, compared with theoretical teaching, virtual simulation experiment teaching uses modern information technology to innovate traditional practical teaching in terms of teaching content, teaching methods and teaching management, which can effectively solve the problems of high cost, high risk and irreversible reality of traditional practical teaching, fully reflecting the new trend of practical teaching in tourism management profession in the era of big data.

# Research on the application of Shanghai's non-heritage resources IP in the field of cultural and tourism apparel products based on big data

---

Yan Lu\*

Faculty of Art & Design, Shanghai Business School.

Shanghai (China).

E-mail: [ly071213@126.com](mailto:ly071213@126.com)

---

## ABSTRACT

Combining Shanghai's non-heritage resources with cultural travel apparel products is conducive to the secondary innovation of Shanghai's non-heritage resources. This paper explores the suitability of Shanghai non-heritage resources IP in the field of cultural and travel apparel products with the background of big data technology. By sorting out the types of Shanghai non-heritage items, integrating them with the Republican style apparel, and proposing a design, while the design samples were then put into the market for research. In terms of design elements, consumers expect 30% for Shanghai non-heritage elements, 15% for new Chinese style and old vintage style, and 31% for clothing cut. The solution proposed in this paper obtains the expectation of the consumer market, which is conducive to the promotion of the integration of Shanghai's non-heritage resources and cultural tourism resources with apparel products, thus expanding the dissemination of Shanghai's non-heritage resources.

## KEYWORDS

Big Data Technology; Shanghai Non-Foreign Heritage Resources IP; Cultural Travel Apparel

## 1. INTRODUCTION

Shanghai intangible cultural heritage (hereinafter referred to as "ICH") originates from Chinese civilization and is rooted in the soil of national folklore, which is not only a witness of historical development but also a precious cultural resource with important value [1]. With the arrival of the era of big data and the development of information technology, it provides a good opportunity for the digital protection of NRMs. At

the same time, the development of technological changes such as the Internet, artificial intelligence, virtual reality, and mixed reality has provided new media and means for the protection and dissemination of NRMs [2]. When society has developed into the network era, NRM cannot leave digital and network means even more [3]. The variety of NRMs, the complexity of resource types, the cultural space, inheritance forms and complexity of their existence, whether they can be managed and applied with the help of big data, and how to actively promote NRMs into modern life and promote the creative transformation and innovative development of NRMs are worthy of in-depth study by experts and scholars [4]. Today, with the rapid development of information technology, there is an urgent need for the public to deepen their knowledge of traditional culture, and we should dig deeper into the essence of traditional culture, stimulate the vitality of traditional culture, and enhance cultural confidence and self-awareness [5].

NRMs contain a rich cultural essence and are, to some extent, a kind of "living fossil". The excellent NRMs of the Chinese nation should also shine in today's society to further enhance people's sense of identity and belonging to the Chinese nation, promote cultural prosperity, and enhance cultural confidence [6]. The intervention of digital technology has brought about fundamental changes in the way NRM traditions are preserved. Its ability to preserve NRM resources systematically and from multiple perspectives reflects the regional cultural space of NRM in the community [7]. The big data drive empowers the further enhancement and application of digital conservation paths for NRMs. Digital acquisition and storage technologies transform information related to NRM items into digital resources that facilitate permanent and comprehensive preservation. In addition, the core of big data is not massive data, but data mining. Data itself does not have value, but mining the laws and values behind it is the basis of academic research and application. The construction of relationships among massive data can assist researchers in discovering the intrinsic knowledge of NRMs and the connections between them, which is conducive to the excavation of deep cultural connotations [8]. In conclusion, in the context of big data, massive data is an important information resource for research on non-hereditary heritage, the core for the dissemination and promotion of non-heritage, and a rich cultural resource for the tourism industry [9].

This paper takes the integration of Shanghai's non-heritage resources IP and cultural and travel apparel products as the starting point of the study, and explores more possibilities of Shanghai's non-heritage

resources based on the background of big data. At the beginning of the study, firstly, the types of Shanghai's non-heritage resources are investigated to clarify the scope. Then, according to the types of Shanghai's non-heritage resources, the suitability of the city's temperament with them is analyzed, and the combination of Shanghai's non-heritage resources IP with the Republican style cultural and tourism clothing is determined. Finally, we propose a corresponding costume research plan and put the designed costume samples into the market for testing to find out the feasibility of the designed plan.

## **2. Research on Shanghai's non-heritage resources IP and cultural tourism costumes**

As one of the earliest commercial ports opened in modern China, Shanghai is a place where Chinese and Western cultures converge and has the characteristics of modern industrial and commercial civilization. Therefore, Shanghai's NRMs are unique and very different from those of other urban areas where the agricultural civilization is the main focus [10]. Rescuing, protecting and utilizing Shanghai's NRM is an important step to enhance the soft power of culture. Shanghai has a scientific and perfect working system for the protection of NRM, and has been leading and pioneering in the protection of NRM in the country.

### **2.1. Shanghai Non-Foreign Heritage Projects**

As one of the second batch of famous historical and cultural cities in China, Shanghai has colorful and unique performing arts NRM resources. The prominence of these non-heritage resources reflects the regional historical and cultural characteristics of Shanghai and the folk customs and aesthetic interests of Shanghai people, and is an important carrier of Shanghai culture and an important resource for urban tourism development [11]. Performing arts NPLs are an important part of Shanghai's NPLs. Two of them, namely Kunqu and Peking Opera, are world-class NPLs in the performing arts category in Shanghai. As of the end of 2018, 20 of the 55 national-level ICH projects in Shanghai are performing arts ICH projects, and 50 of the 236 municipal-level ICH projects are performing arts ICH projects. The project categories include folk music, folk dance, traditional drama, opera and acrobatics. Among the many NPL projects in Shanghai, performing arts NPL occupies a very important position in

terms of both quantity and level. Some of Shanghai's NPL projects are represented as shown in Table 1.

Table 1. Representatives of Some Intangible Cultural Heritage in Shanghai

Entry name	Item No	Project category
Shanghai opera	IV-54	Traditional Drama
Puppet show (Shanghai style puppet show)	IV-92	
Comic opera	IV-156	
Rolling lamp (Fengxian rolling lamp)	III-16	Folk dance
Dragon Dance (Around the Dragon Lantern in Pudong)	III-4	
Pudong Storytelling	V-59	Traditional Quyi
Pudong Xuanjuan	V-118	
Suzhou Pingtan (Suzhou Tanci)	V-1	

## 2.2. Analysis of Shanghai's Urban Temperament and the Suitability of Republican Costumes

Starting from the 1930s, cheongsam was considered to be an important dress for Chinese women and flourished for a while. The main materials used in cheongsam are domestic and imported printed fabrics, silk, silk, cloth, as well as jacquard velvet, brocade, chambray, and even lace openwork fabrics and color woven fabrics and clothiers. The delicate cheongsam also has embroidery, lace, rolling, beading and other decorations. As a school uniform cheongsam is more simple and elegant, the length is a little shorter, the sleeves are completely western-style sleeves; factory women's cheongsam is usually simple, plain, economical and practical; two types of cheongsam are popular in Zhejiang in the Republic of China, which are Beijing cheongsam and Haifa cheongsam. Beijing cheongsam is characterized by Chinese flat cutting, wide clothes straight, ankle-length, emphasizing the decorative beauty of clothes, basically continuing the characteristics of Manchu cheongsam. While the sea school cheongsam is with western style cutting and clothing making way, to reflect the female body curve beauty as the

characteristics, with which is the western style coat, velvet jacket, glass silk stockings, high heel shoes, big wave perm, handbags, etc.. This kind of cheongsam is mainly worn by socialites, while the cheongsam of female college students is slightly slim and elegant with color, between Beijing cheongsam and Haifa cheongsam.

### **2.3. Research and Development Program of Shanghai Non-Foreign Heritage Resources Republican Style Costumes**

The Republican period is a special period in history, which symbolizes the fierce collision and integration of traditional and western cultures, and the formation of pluralism and integration, which is reflected in the clothing culture and the emergence of many characteristic clothing. This project proposes a feasible design concept by applying knowledge of national costume culture, costume aesthetics, dressing psychology, and qualitative and quantitative evaluation of existing costume design elements. Four series of clothing and cultural tourism products are designed, which are businesswoman clothing series, young student clothing series, casual life clothing series, and wedding dress series. The design is inspired by the "East-meets-West architecture", "Jiangnan water town" and "Shanghai culture", analyzing the color, style and style of Shanghai architecture, and extracting the typical cultural elements of Shanghai. For example, the lake, silk, bamboo, fan, calligraphy, lotus leaves of Xiaolianzhuang, etc. are used as design elements to form the style, tone and pattern of the Republican style clothing. The description of the design of "Businesswoman's Dame Series" mainly reflects the elegant and delicate, gentle and soft characteristics of Jiangnan women. Cheongsam is the main style, using satin, brocade, lace openwork fabric, supporting clothing accessories include lace shawl, pearl necklace, wool wig, exquisite embroidery fan, embroidered silk clutch bag, embroidered and lace decorated satin umbrella. The design of the "Young Students' Wear Series" mainly reflects the intellectual, innocent and beautiful characteristics of young students. The style of the top and the bottom of the skirt is the main style, and the style of female students is a seven-part sleeve, slightly loose style, knee-length pleated skirt, and the color system is mainly blue dress and black skirt or light white top and long blue skirt. The color palette is generally plain and elegant, with lotus flowers and bamboo as the main dress patterns, and simple tie-dye and simple embroidery as the main patterns. In addition, a small number of cotton and linen material cheongsam with plaid, stripes, plain as the main fabric pattern, clothing accessories are bamboo handbag, bamboo luggage, oil paper umbrella.

### **3. The effectiveness of the integration of Shanghai's non-heritage resources IP and cultural tourism clothing**

Based on the above research and development scheme of Shanghai non-heritage resources and Republican style cultural travel apparel products, some research samples are first put into the market for testing. The three major aspects of the market environment, market demand and market supply survey are scrutinized in the embodiment of cultural travel apparel products in Shanghai's non-heritage elements, as well as the embodiment of clothing scene suitability, material and tailoring, transmission of new Chinese style and vintage style. We also collect consumers' evaluation and consumption orientation of this type of clothing style, and then grasp personalized consumption behavior.

The results of the design clothing sample market first test are shown in Figure 1. In the market survey, it is found that there are not a large number of cultural travel clothing about Shanghai's non-heritage elements on the market, and there are only a few market suppliers. This indicates that the market saturation of Shanghai non-heritage cultural travel apparel is not high, and the apparel design solution proposed in this paper has market prospect. In the sample sales feedback, the market expectation of consumers for the integration of Shanghai non-heritage elements into apparel is 30%, and the apparel cut is 31%. This indicates that we should continue to increase the integration of Shanghai non-heritage IP in the subsequent garment sampling, and explore more and wider elements that can be integrated, instead of just limiting to traditional single elements such as Shanghai opera style, dragon dance and lion dance. Consumers have the highest expectations for clothing style cutting, so special attention should be paid to the standard of clothing cutting, to prevent the situation that the goods are not the right version. In terms of clothing style, the expectation value of both the new Chinese style and the old vintage style is 15%, which means that both are favored by consumers. In research and development, we should focus on the mass production of new Chinese style and old vintage style to meet consumer demand, so as to better drive the dissemination of Shanghai's non-foreign heritage IP. The feedback on the applicability of clothing scenes is only 9%, and the restrictions on clothing are not too strongly reflected by consumers in a free dressing environment. Thus, the design of Shanghai non-heritage resources IP and Republican style clothing cultural travel clothing products proposed in this paper has market feasibility, and with the promotion of the market, Shanghai non-heritage resources will be known to more people,

which will help the development and protection of Shanghai non-heritage resources.

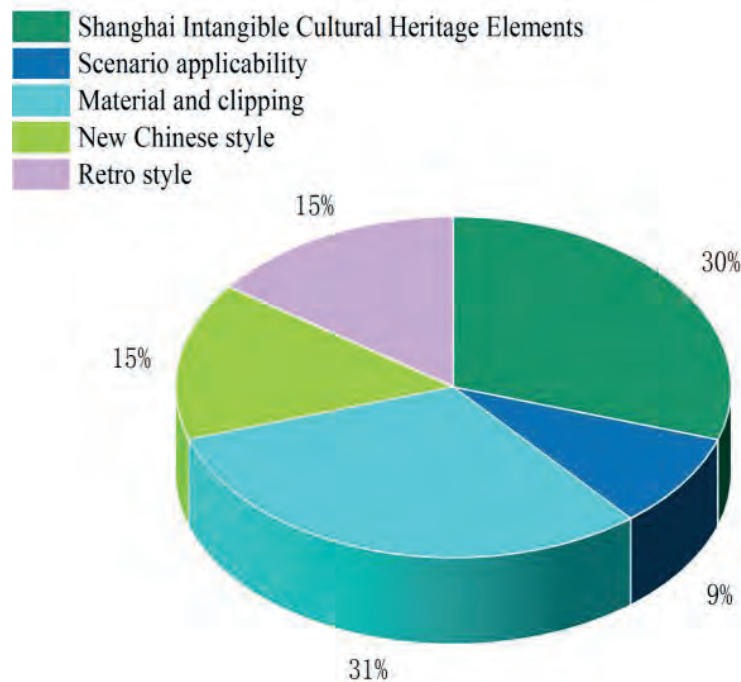

Figure 1. Market leading test results of design clothing samples

#### 4. CONCLUSIONS

This paper takes the integration of Shanghai's non-heritage resources IP and cultural travel apparel products as the starting point to explore more possibilities for the design of Shanghai's non-heritage resources and cultural travel apparel products. The innovative proposal is to combine the IP of Shanghai's non-heritage resources with the Republican-style cultural travel apparel, and the designed apparel samples are first put into the market for testing, so as to explore the feasibility of the proposed scheme. In the sample test, the expectation value of integrating Shanghai non-heritage elements into clothing is 30%, the clothing cut is 31%, the clothing style is 15% for both new Chinese style and old vintage style, and the clothing scene is 9%, and the market feedback is more positive. Thus, the scheme designed in this paper is innovative, market prospective, and helps open up the awareness of Shanghai's non-heritage resources to a certain extent.

## **ABSTRACT**

Rational and optimal allocation of English teaching resources is favorable to charitable full show to the effectiveness of using various types of English resources and balancing the demand for the use of English resources by college students. This paper tries to explore the possible results of applying the conclusion tree model to the allocation of English teaching resources in colleges and universities, and proposes a scheme for the normal distribution of teaching resources. According to the scheme planned in this paper, the allocation of each resource is as follows: online video course resources 60%, online reading materials 55%, English examination question bank 70%, paper English reading materials 30%, and paper English examination question materials 40%. The mean score of teachers' approval of the program was 7.8, and the mean score of students' satisfaction was 8.6. The article analyzes and researches the problem of rational allocation as well as efficient use of university English teaching resources, which has strong practical significance.

## **KEYWORDS**

Decision Trees; Teaching English in Higher Education; Resource allocation; Student Satisfaction

## **1. INTRODUCTION**

Since the relevant documents of the Ministry of Education were issued, university English teaching (ET) in China has developed in leaps and bounds. This situation shows a bright future for the development of university ET, but at the same time, it is also necessary to calmly see that university ET is facing serious challenges and problems [1]. China's university ET started late, and

there is an obvious gap between the level of university foreign language teaching and that of the western developed countries, especially in the allocation and utilization of teaching resources and independent development [2]. Even in China, there is a considerable gap in the level of university ET between the east and the west, between big cities and small towns, and between urban and rural areas. Less economically developed regions, compared with more developed regions, have a large imbalance and unevenness in the allocation and utilization of teaching and learning resources due to the constraints of economic conditions [3].

Teaching resources are of great significance in teaching actions and are the basic conditions for teaching actions to be carried out [4]. In order to better implement the spirit of the Outline and realize the transformation of knowledge and skills to competence, reasonable allocation of college ET resources can optimize college English classroom teaching to a great extent [5]. The reasonable expansion and operation of teaching possessions is an important part of building an efficient classroom. In college ET, teachers actively develop ET resources and use them in classroom teaching, which can expand the professionalism of college English classroom and inspire students' interest in learning English [6]. It is only by following economic principles and educational laws to allocate and use university ET resources that teaching resources can be enriched and the quality of teaching in university English classrooms can be further improved [7]. ET in colleges and universities must be oriented to all students, show its humanistic concern, and focus on the grouping of appreciation education and quality education [8]. In actual teaching, college English teachers should pay attention to students' thoughts and emotions, fully stimulate their eagerness and interest in English learning, and guide them to establish a sense of achievement and self-confidence, thus continuously improving college students' language application ability, humanistic literacy, practical ability and novelty realization. The development and progress of students is the starting and ending point of English course teaching in colleges and universities [9]. Therefore, teachers would aggressively change their teaching concepts, establish a humanist view of education, and reflect their unique humanist spirit.

Based on this, this paper takes decision tree model and college ET resources allocation as the entry point of the study, and explores the possibility of smearing decision tree model to college ET resources allocation. Firstly, the problems in the allocation and application of college ET resources are studied, and the decision tree ET resources allocation improvement method is proposed according to the

problems, and there is also the application scheme and application method for the reasonable distribution of college ET resources. Then the allocation ratio of five common English resources for college students is derived according to the scheme, and the satisfaction of teachers and students with the scheme is tracked to determine the credibility of the proposed scheme, which leads to the conclusion of the whole paper.

## **2. Research on the method of optimizing the allocation of ET resources in colleges and universities**

### **2.1. The problem of resource allocation and application of university ET**

(1) Teachers lack the ability to develop and deploy teaching resources

Teachers' ability to allocate and utilize teaching resources directly affects the quality of the expansion and application of college ET resources. Most college English teachers do not have a correct concept of English curriculum resources and tend to regard themselves as the chief body of teaching activities when allocating and utilizing teaching resources. Teachers ignore the role of teaching resources and do not realize that the reasonable allocation of teaching resources can promote the improvement of college English classroom teaching. Because of the lack of proper methods, the teaching resources developed by many teachers have a single structure and do not match the learning requests of college students.

(2) Teachers' conception of teaching resources application is insufficient

Under the inspiration of traditional teaching philosophy, most college English teachers attribute too much position to textbook teaching and mostly use teachers' books to guide themselves to use teaching materials. Some teachers also regard textbooks as the only ET resources, neglecting the expansion and utilization of special teaching resources on campus, and do not take the initiative to develop ET resources outside campus. College English teachers think that teaching is their main task, and only care about the development and utilization of teaching resources, neglecting the development of students' learning resources. The insufficient concept of developing and allocating teaching resources makes college ET unable to keep up with the needs of the times and is not favorable to

the cultivation of correct English learning concepts among college students.

## 2.2. Decision Tree ELT Resource Allocation Improvement Method

First, optimization of teaching data. When using the resolution tree to build the evaluation model of the effectiveness of business English practice teaching, repeated calculations are needed to ensure the performance of English majors, which puts a certain burden on the teachers when conducting the assessment and decreases the efficacy of the conclusion tree procedure to a positive amount. Particularly when the number of teaching data rises, the speed of conclusion tree operation becomes very sluggish, which rises the school's expenses on data procedure. To enhance the conclusion tree, the data can be treated according to the data set in the practice teaching to reduce the time consumed. When processing data, the data can be restricted to a fixed value, assuming that the fixed value interval is  $[c, d]$ , and the teacher can use the computer to procedure the data as a function. For example, when the current data float is marked, when  $(x) > 0$ , the data will be concave in the occupation table, and when  $f(x) < 0$ , then the data will be convex in the number table. When estimating a student's presentation, the teacher can hand-pick a value to carry it into the  $[c, d]$  interval. For example, if a student scores 98 in Business English practice, the teacher can transport the dissimilar scores of the student into the formula 
$$\frac{f(x) = a_0 + a_1 + a_2 + \dots + a_n}{a_n}$$
 to find the average score of the student.

First see if the value found matches the value in the intermission, then see if the score is in  $f(x) > 0$  or  $(x) < 0$ , and finally evaluate the shape of the student's grade in the function table.

Second, the training content is optimized. In conducting English practice teaching, as the number of practices increases, the decision tree will also change to some extent. In the procedure of data dispensation, the conclusion tree will build dissimilar trees according to the growth of content. Due to the growth of trees, misperception can occur when exchanging information, which leads to the effectiveness of decision tree assessment affecting the teachers' processing of data. To make the decision tree assessment more operative, the first step is to expand the content in business English practice teaching. The memory of the data processing system should

be expanded, the practice content should be integrated, each student's presentation in business English training should be evaluated, and a table should be drawn based on the students' practice skills. The decision tree is prone to algorithmic instability, so it has been improved to meet the teaching needs. The decision tree can be used to evaluate the effectiveness of the practical teaching system, which can transfer more practical contents and use the data with the least variation as the basis for estimation.

### **2.3. Rational allocation and application methods of university ET resources**

Only by reasonably allocating and applying university ET resources can the advantages of rich teaching resources be developed and the level of university English classroom teaching be promoted. Optimizing the allocation and utilization mode of university ET resources is the only way to make university ET keep pace with the development of the times.

(1) Changing the role of teachers, rational allocation and use of teaching resources

Contemporary university English teachers should change from the traditional role of knowledge transfer to that of classroom activity designer and organizer, and actively improve their personal ET skills. In the process of appropriating and utilizing ET resources, teachers should be open-minded and make reasonable use of teaching resources so that they can play the role of "treasure trove". First, strengthen the awareness of personal curriculum resource allocation and utilization. Teachers' choice determines the characteristics and nature of college English courses. In the process of developing university ET resources, teachers should actively identify all kinds of resources, choose the most suitable part for their students, and combine them with the classroom teaching content, insisting on the method of localization and specific analysis of specific problems.

(2) Reform the teaching mode, rational allocation and use of teaching resources

Develop ET resources using modern technologies. Accepting brand-new teaching resources and developing and utilizing these teaching resources with the nature of the times requires college English educators to actively update classroom teaching methods. Teachers should guide college students to understand the meaning of English learning in the English classroom, master the necessary basic English knowledge points, and organize some communicative

activities in the classroom to mobilize college students' English learning enthusiasm. Communicative competence development is an important goal of college ET, but the fact is that communicative activities are rarely implemented in English classrooms. College English teachers should recognize the shortcomings of traditional college English classroom teaching and use new teaching resources to make up for the loopholes of traditional teaching and make the college English curriculum system more complete.

### **3. The effectiveness of optimizing the allocation of ET resources in colleges and universities**

Based on the trend of paperless reading for college students, the resources tend to be divided into 5 main categories of online video course resources, online reading materials, English examination questions, paper English reading materials, and paper English examination materials in the allocation of college English resources. With the decision tree ELT resource allocation improvement scheme as technical support, the allocation ratio of the 5 main categories is calculated by combining the reading material preferences of college students.

The allocation ratios of the main English resources in the five universities are shown in Table 1. According to the paperless learning habits of college students, the percentages of various resources given by the improved ET resource allocation scheme under the decision tree algorithm are 60% for online video course resources, 55% for online reading materials, 70% for English examination question banks, 30% for paper English reading materials, and 40% for paper English examination question materials. The teacher recognition scores assigned out of 10 were 8, 7, 9, 9, and 6, with an average score of 7.8. The overall score of teachers' rating is moderate and the program is approved by teachers. The main body of ET in higher education is student-centered, so students' satisfaction with the distribution of resources and ease of use needs to be investigated. In actual use, students assigned a score of 10 to online video course resources, 9 to online reading materials, 9 to English test bank, 8 to paper English reading materials, and 7 to paper English test materials, with an average student satisfaction score of 8.6, which is in the upper middle level. The program is highly recognized by students and the research in this paper has practical value.

Table 1. The proportion of English resources in five major universities

	Online Video Course Resources	Online reading materials	English Test Bank	Dissertation English Reading Material	Paper English examination materials
Allocation proportion of technical level(%)	60%	55%	70%	30%	40%
Teacher recognition (points)	8	7	9	9	6
Student satisfaction (points)	10	9	9	8	7

#### 4. CONCLUSION

This paper takes the decision tree model under which college ET resources can be allocated moderately as the main point of research, tries to explore the rationality of applying the decision tree model to college ET resources allocation, and proposes an application scheme for reasonable allocation of college ET resources. Under the scheme proposed in this paper, the shares of each resource are as follows: 60% for online video course resources, 55% for online reading materials, 70% for English examination question bank, 30% for paper English reading materials and 40% for paper English examination question materials. Meanwhile, the opinion evaluation scores of university teachers and students on the distribution program were obtained, in which the average score of teachers' evaluation was 7.8 and the average score of students' satisfaction was 8.6. It can be seen that the scheme is highly recognized by teachers and students, and the ET resources in colleges and universities based on the decision tree model can be reasonably and optimally allocated.

## ABSTRACT

This paper is an attempt to apply the SVM model to the policy construction of the film and television industry, with the aim of exploring effective ways to standardize the policy of the film and television industry. This paper first clarifies the existing film and television policy construction contents in key regions of China, tries to find out the aspects that have not been covered by previous authors,

and based on this, proposes the policy construction principles as the keynote of the study, and judges whether it holds according to the prediction accuracy of SVM model. The data show that the mean values of the accuracy of the film and television drama policy construction are 0.7065 for financial subsidies, 0.6581 for industry standards, and 0.5891 for the release licensing system, which are all less than the predicted value of 0.8, i.e., the model is valid. The research in this paper can help optimize the film and television industry policies and promote the healthy development of the film industry.

## **KEYWORDS**

Media convergence; SVM model; Film & TV Industry; Policy Construction

## **1. INTRODUCTION**

The film and television industry is an important part of the cultural industry, characterized by high capital activity, high creative concentration, high talent density and high product refinement. It shoulders the important mission of inheriting a new culture of modernity and nationality, gathering new momentum for economic growth, creating a new mode of economic development, and shaping a new image of international communication, and has become the object of most attention in the development strategy of China's cultural industry [1-2]. At the present stage, Chinese domestic films and TV dramas are developing well, not only in terms of production and social benefits, but also gradually developing overseas markets, playing an increasingly important role in the construction of China's cultural communication and soft power.

Chinese domestic films have made some progress in terms of creation concept and financing [3]. First of all, in terms of creation, a combination of melodrama, art and commerce has been formed, and the aesthetic idea of reflecting national values is gradually highlighted, based on the popularization of emotions. In terms of financing, the channels of sole proprietorship, joint venture, private financing and cross-strait co-production have initially formed a virtuous cycle. In the field of TV series, the industry investment and

financing system has been initially completed, and with the promotion of the integration process of the three networks, the broadcasting platform and marketing methods have become increasingly diversified, but the situation of supply exceeding demand makes the competition within the industry fierce [4]. The film and television industry is not only a commercial activity, but also an important form of culture and art to build national ideology and meet the needs of the people for a better life, and must adhere to the principle of putting social benefits in the first place and unifying social and economic benefits [5]. Since the founding of New China, state-run film studios have been established in various regions, contributing a large number of excellent film and television works to the promotion of regional characteristics and the construction of a socialist cultural system [6]. since the 1980s, China's film and television industry has become more and more market-oriented, with diversified types of development, constantly updated industrial policies, and regional characteristics in the development path [7]. Broadcast film and television is the core element of traditional media, which should not only clarify its own positioning and become a link between the government and the masses, but also be a facilitator and integrator of the development of the times [8].

This paper uses the SVM model to study the effective ways of policy construction in the film and television industry. Firstly, we explore the development of film and television industry and its policy construction in key regions of China in the context of media convergence, and find out the shortcomings of existing policies and make them the focus of this article. Based on the research, the principles of policy construction for the film and television industry are proposed as a guide for the subsequent research. Then, based on the proposed SVM model to predict the accuracy of the film and television policy construction and determine whether it holds, the focus of the film and television policy construction in this paper is determined. Only in this way can we understand the direction of the policy construction of China's broadcasting film and television industry and promote the film industry to continuously improve its influence, gain more public support, and achieve its own sustainable development.

## **2. Policy Construction of China's Film and Television Industry in the Context of Media Convergence**

### **2.1. Policies of China's key regional film and television industries in the context of media convergence**

#### **(1) Film and Television Production Policy**

The policy of film and television production is mainly for script creation, film and television shooting and location, film and television post-production and technology research and development policy support [9]. For script creation policy, domestic key cities usually adopt three ways to support it: first, prior funding, script creation projects before film and television production. For example, in Xiamen, Fuzhou, and other cities, a certain amount of script creation funding is given to scripts that have been formally established or funded by the state or provinces; secondly, post-facto rewards are given to scripts after the film has been completed. Such as Haikou, Xiamen, Fuzhou and other cities, direct rewards for film and television drama scripts that have obtained film screening licenses or TV series distribution licenses, or rewards based on a certain percentage of the script transaction amount; third is the local theme script rewards. For example, cities such as Haikou, Fuzhou and Shenzhen offer additional rewards for screenplays reflecting local themes, reflecting the importance each city attaches to shaping the city's cultural image through film and television dramas.

#### **(2) Film and television investment and financing and film and television activity policy**

Film and television investment and financing policies are usually linked to cultural and financial policies, and film and television event policies are mainly support for film and television festivals and exhibitions, both of which are external conditions for the high-quality development of film and television industries [10]. Film and television investment and financing policies are currently focused on film and television project investment incentives, financing interest subsidies, and film and television industry fund incentives. Investment incentives for film and television projects are awarded according to a certain percentage of the actual investment amount, usually the proportion does not exceed 5%. Film and television enterprise financing interest subsidy refers to the film and television through bank loans or other

institutions of financing, according to a certain percentage of the financing interest to subsidize, usually the proportion of about 50% of the interest. Film and television industry fund rewards refers to film and television enterprises or other institutions to set up film and television industry funds, the government in accordance with a certain percentage to reward, usually the proportion of the total fund within 2%, and set a reward ceiling.

### (3) Film and television award-winning re-incentive policy

The re-incentive policy for film and television awards is mainly divided into two segments: domestic awards and international awards. The domestic awards section refers to winning the "Five Ones", i.e. the key awards such as the Huabiao Award, the Hundred Flowers Award, the Golden Rooster Award, the Flying Lotus Award, the Golden Eagle Award, the Hong Kong Golden Film Awards, etc., and rewards the award-winning film works or creators, and some cities also give rewards to the award-winning works of the Beijing International Film Festival and the Shanghai International Film Festival. The international award-winning segment refers to winning the Academy Awards and the major awards of the four major international film festivals, such as the Berlin, Cannes and Venice Film Festivals, and giving re-awards to the winning film works or the creative units [11]. Considering the above policies, the author believes that the existing policies focus excessively on awards, which leads some film and television creative teams to pursue a rare aesthetic culture or political culture in order to cater to the preferences of various awards, deviating from the mainstream ideology and the theme of people's aspiration for a better life, so it is recommended to dilute these awards. In addition, while awarding these prizes, it is also recommended to expand the number of outstanding film and television works selected or nominated, and to break the single evaluation standard of only the winner.

## **2.2. Principles for the construction of national policies to promote the film and television industry**

### (1) Market-driven based on free competition

Due to the industrial and economic nature of the film and television industry, it should follow the general laws of the market economy since. Respect for the laws of the market and the free market

economy is the prerequisite foundation for the development of the film and television industry. One of them is to take the state's respect for freedom of contract as the cornerstone. From the Contract Law (1999), the Property Law (2007), the General Provisions of the Civil Law (2017), and then to the consideration of the various sub-part (draft) of the Civil Code. Both the moral consensus of the nation and the awareness of the rule of law have been coalesced in the country's increasingly improved legislative process. The more positive side of the civil legislation is that through the establishment of market transaction rules and the protection of civil rights, it indirectly delineates the space of the role of public power and separates the "political state" and "civil society". The film and television industry is essentially in the category of "civil society", so under the prerequisites stipulated by law, film and television enterprises are free to choose their location and set up, and are free to choose the scope of business, transaction forms and objects of transactions. Second, freedom of contract is based on national legislation setting fair and reasonable competition rules, so that the film and television industry can compete fairly on the basis of the rule of law. For example, national legislation regulates unfair competition, protects intellectual property rights, and so on. Unlike the "night police state" era, the government has a clear comparative advantage in overcoming market defects, and can overcome the dilemma of free-riding, imperfect information and adverse selection in a pure market economy by providing public goods and establishing a social welfare system. Third, beyond freedom of contract and creation of rules, the state constructs a competitive environment with different relevance based on the characteristics of the supply and demand sides of different industries. As far as the supply side is concerned, the core of free competition lies in a sufficient number of suppliers offering goods, thus providing consumers with more opportunities for choice. Talent is the first resource, but in the film and television industry, due to the complexity and diversity of the industrial chain, the characteristics and factor contribution rates of talent in different industrial chains differ greatly, so there are both general rules and diversified and targeted requirements for the cultivation and promotion of talent in the film and television industry. From the demand side, the "people's growing need for a better life" includes the demand for cultural products, including film and television products. Therefore, fostering an overall

cultural atmosphere in society and a healthy cultural mentality among all citizens, guiding the promotion of consumer demand, and taking necessary measures to improve the matching of supply with demand are the cornerstones of the film and television industry's survival and development, which need to be reasonably guided by the government.

## (2) National promotion is complementary

The cultural and public nature of the film and television industry mainly lies in the following: first, it has the attributes of stimulating cultural and artistic creation, enhancing the development of national cultural undertakings and promoting cultural pluralism and other public interests; second, in the process of the in-depth development of world multipolarization, economic globalization, social informatization and cultural diversification, the film and television industry plays an important role in demonstrating cultural soft power. The state adopts necessary policy tools to promote its development, not only to realize the industrial connection of local culture to the country and even the world, but also to drive economic transformation and enhance international competitiveness through the development of the industry. On the one hand, the state has the responsibility to provide the basic services of the film and television industry that have the characteristics of public cultural services. Take China's Law on the Protection of Public Cultural Services (2016) as an example, which specifies that the state has fundamental responsibilities and obligations for the provision of cultural products based on the purpose of meeting citizens' basic cultural needs. In order to achieve the purpose of equalizing public cultural services, the law sets the basic framework and basic norms for standardization, achieving regional parity, urban and rural parity, and group parity.

### **2.3. SVM model building**

In this study, the SVM model is used to analyze the movie policy data of each file by using the "one-to-one" processing method, and K-fold cross-validation is chosen to test the data repeatedly in the process of SVM model. The principle is to cut the data samples into K subsets, select K-1 subsets for training, and use the remaining subsets for training model validation, repeat the operation K times, and use the grid search method to determine the optimal parameters of the model.

### 3. Prediction Accuracy of Film and TV Industry Policy Construction Based on SVM Model

In this paper, for the determination of model prediction accuracy, the average value of accuracy is predicted by taking the three policies with the highest degree of concern for film industry policies: financial subsidies, industry standards, and the release licensing system. The accuracy prediction values of film and television policies are shown in Table 1.

Under the model proposed in this paper, the predicted accuracy of financial subsidies is 0.7065, industry standards is 0.6581, and the release licensing system is 0.5891, and the average prediction accuracy of film and television industry policies is less than the predetermined value of 0.8. Among them, the k-value of the release permit system is 0.347, which is the first in the policy concern and is the key to the film industry in the pre-preparation and post-premiere. The current policy construction should continue to improve the issuance of film licenses according to the current industry development and forecast prospects, so that new directors with film talent can gain access to the film industry and break the status quo of "film masters" monopolizing the market. The industry standard k value is 0.442, ranking second in terms of concern. The industry standard is directly related to the subsequent development trend of the film industry, and the subsequent film policy should be constructed in a loose and tight combination, moderately relaxing the restrictions on the film industry in terms of themes and other aspects, and promoting the blossoming of films. However, in terms of the supervision of political opinions on movies, the requirements should be appropriately strict to avoid misleading audiences with improper comments in the name of movies. In terms of financial subsidies, it is recommended that appropriate subsidies be given to the film industry mainly to encourage the film industry to rebound under the epidemic.

**Table 1.** Prediction Value of Film and Television Policy Accuracy

	K	K-1	Accuracy average
Financial subsidies	0.451	0.9620	0.7065
Industry standards	0.442	0.8741	0.6581
Release permission system	0.347	0.8312	0.5891

## 4. CONCLUSION

This paper attempts to explore an effective way to construct a policy for China's film industry in the era of media convergence. The SVM model is used as an attempt to demonstrate the mean prediction accuracy of the model from three aspects: financial subsidies, industry standards, and theatrical licensing system. Empirically, the accuracy of the model is 0.7065 for financial subsidies, 0.6581 for industry standards, and 0.5891 for the release licensing system, all of which are smaller than the predicted value of 0.8, making the accuracy of the model credible. If China's broadcasting industry is to be developed effectively, it should formulate better industry standards, respond to the needs of the times and the actual needs of the people, continuously adjust the reform direction of the industry, and make innovative breakthroughs to expand the development space of the film industry.

## **ABSTRACT**

To solve the current problems of poor information fusion and long information fusion time in wireless sensor networks, this paper tries to propose a multi-channel information fusion method for wireless networks based on the Internet of Things. The methodology of infinite sensor network and IoT information fusion is adopted to model the research method, and the feasible matrix is established according to the algorithm to verify the multi-channel simulation results of wireless sensor network. The results show that the initial position of information fusion is 0.0021 and the end is 0.1218 by the calibration of information fusion system, and the fitting results are good. The proposed method in this paper has high effectiveness and feasibility in fusing information of wireless network multi-channels.

Internet of Things Technology; Wireless Sensors; Multi-channel information fusion; Simulation Analysis

## **1. INTRODUCTION**

The emergence of the Internet of Things (IoT) has improved the way humans live and work, and is of great significance to the development of modern society. In order to further enhance the application of the Internet of Things, it is necessary to strengthen the application of a variety of advanced science and technology, including wireless

sensor network technology, to achieve the purpose of comprehensive monitoring and management by improving the quality and efficiency of data collection. Wireless sensor networks enable monitoring of a specific area through a large number of sensor nodes with communication, sensing and computing capabilities deployed in a certain area [1]. The research of sensor networks started in the late 1990s, and after nearly two decades of vigorous development, they have been widely used in national defense and military, intelligent buildings, environmental monitoring, and other fields [2]. Following the rapid development of semiconductor technology, communication technology and computer technology, wireless sensor network technology was then born [3].

Technology often brings great change, and wireless sensor network technology is widely regarded as a gold mine that has not yet been fully exploited. According to analysts, the future development of IoT will go through four stages, widely used in logistics, retail and pharmaceutical fields before 2010, objects interconnected from 2010 to 2015, objects entering semi-intelligent stage from 2015 to 2020, and objects entering fully intelligent stage after 2020 [4]. By preliminary estimation, the development and application of China's IoT industry chain will likely create an output value of about 100 billion yuan. Some provinces and cities on the development of the Internet of Things during the 12th Five-Year Plan, has accelerated the formation of the basic framework of the Internet of Things industry and a series of "intelligent" action, indicating the determination to vigorously develop the Internet of Things [5]. As one of the key objects of IoT, the improvement and development of sensor network technology is bound to have a huge role in the development and application of IoT [6]. The IoT contains three levels: the perception layer, the network layer, and the application layer. At present, the most lacking product and technology in China is the perception layer, which is the capture and aggregation of information [7]. In the perception layer, the maturity and cost of sensor technology hinders the large-scale development and application of wireless sensor networks and IoT. Jianmei Yu pointed out that there are four factors that will ultimately determine the popularity of IoT, one is the further low power consumption of wireless sensors, the second is the development of wireless power supply or power harvesting

technology, the third is the ultra-miniaturization of energy sources, and the fourth is the miniaturization of wireless sensors themselves [8]. In addition to this, multi-channel information fusion technology for sensors is also an important aspect of wireless sensors that needs to be considered for improvement. Therefore, the main research work of the current sensor technology needs to focus on the above four factors, breakthroughs in these research hotspots, the level of development of the Internet of Things is bound to soar, the application will also be widely popular, and the market scale will be further expanded. At that time, the Internet of Things can truly realize the connection of things, and become a "talking", "thinking", and "acting" information exchange network [9].

In this paper, we try to propose a multichannel information fusion method with the methodology of wireless sensor network and IoT technology fusion, and establish a feasibility matrix to determine the feasibility of the methodology. Firstly, a brief introduction of IoT and wireless sensor networks is given to discover the importance of IoT technology in wireless sensor networks, and its methodological advantages in multi-channel information fusion technology are stated. Subsequently, a methodology for multi-channel information fusion in wireless sensor networks based on IoT technology is proposed and the results are simulated to verify the fitting results.

## **2. Internet of Things and Wireless Sensor Networks**

### **2.1. Overview of the Internet of Things**

The rapid development of Internet technology has given rise to the Internet of Things (IoT) technology, which is widely used in all aspects of society. The so-called Internet of Things (IoT) can be interpreted literally as the effective connection of things to things. The professional definition of IoT is to connect physical objects to the Internet using technologies and tools such as radio frequency identification, infrared sensors, and GPS systems, so as to facilitate the exchange and transmission of information between them and provide support for improving the monitoring and management effects of physical objects [10]. The Internet of Things (IoT) technology enables the connection between things, which ultimately relies on the sensors, processing devices and communication modules installed on the objects. Its main function is also to sense information and pass it

to the processing equipment, and finally, the information processed by the equipment can help us to monitor the target in real time and to master the status of the target being measured. It is the access of these sensors that makes the application of IoT more extensive compared to the Internet. Nowadays, the fifth generation of mobile communication technology is maturing, and the Internet of Things is coming into every aspect of our life, presenting a variety of applications.

## **2.2. Wireless Sensor Networks Overview**

Wireless sensor network refers to the deployment of a certain number and type of sensor elements in a certain area according to the actual needs, so as to build a network for comprehensive monitoring and scanning of the entire area. In this network, due to the large number of sensors and the different functions of these sensors, information on all aspects of the area can be collected comprehensively, and after transmitting this information to the control system, a more realistic and accurate conclusion can be obtained through the analysis of this data, which can help in the management of the area [11].

## **2.3. The importance of wireless sensor network technology in IoT applications**

In today's rapidly developing society, the community has put forward higher requirements for production and service work, and only by ensuring that production and service work meet the requirements can we promote the further development of modern society. In this context, the application of Internet of Things penetrates into various fields and has achieved good results and promoted the development of society. However, for the existing IOT technology, such as detection range is narrow, monitoring indicators are relatively single, etc., to a certain extent affect the application of IOT technology effect. The application of wireless sensor network technology can effectively improve this problem.

## **2.4. Advantages of IoT-based multi-channel information fusion method for wireless sensor networks**

### **(1) Formation Freedom**

The network builder can set up a fully functional wireless sensor network at any time, anywhere, easily and quickly, and can also

perform maintenance and management work within the network after set up. Therefore, in practical applications, a single person can carry part of the sensor nodes, according to the environment and terrain convenience to build and disassemble the sensor network.

### (2) High signal-to-noise ratio

Synthesizing multi-angle and multi-directional information in distributed nodes improves the signal-to-noise ratio.

### (3) Unattended

In a harsh external environment, where human behavioral activities are threatened, it will not be possible to keep watch over the sensors in real time, while wireless sensor networks do not require human guarding and can maintain themselves when problems arise. If a sensor node is in a state of power shortage, then the network can automatically find a replacement node for this sensor internally.

## **3. Methodology for information fusion of wireless sensor networks and IoT technologies**

In wireless sensor network information fusion systems, measurement errors (noise) are inevitably introduced throughout the measurement process due to the lack of a priori knowledge of the tracking environment and the constraints of the sensors' own performance. In addition, the exact number of targets is often unpredictable, and even if there is only one target, some measurements may be multiple due to clutter interference, which requires statistical methods to establish target-measurement correspondence. This is especially true in a multi-target environment. That is to say, the sensor observation process and the multi-target tracking environment have various uncertainties as well as randomness, which destroy the correspondence between echo measurements and the expected targets, so that the solution must be sought by using IoT technology.

For wireless network information sensor systems, after solving the correlation problem of data, the final results must be obtained with more accurate or readable by estimation fusion techniques. The so-called estimation fusion is the organic combination of traditional estimation theory and data fusion theory, or data fusion for estimation problems, i.e., the study of how to best utilize the useful information contained in multiple data machines in the process of estimating

unknown quantities. For the case where a quantity falls into the intersection region of a tracking gate, the implication is that the quantity may originate from multiple targets. The purpose of joint probabilistic data association is to calculate the probability that each measurement is associated with each of its possible original targets. Taking a tracking system with 2 targets and 3 echoes as an example, the meaning of the confirmation matrix is shown in Table 1. The confirmation matrix, which can be regarded as the set of all feasible matrices, is obtained directly from the measurement vector and the tracking gate, while the feasible matrix, on the other hand, needs to be obtained by splitting the confirmation matrix. The confirmation matrix splitting algorithm can be implemented by a recursive algorithm for the number of echoes.

**Table 1.** Definition of Confirmation Matrix

$\Omega$	Clutter t=0	Target t=1	Target t=2
Echo j =1	1	1	1
Echo j =2	1	1	0
Echo j =3	0	0	1

#### **4. Analysis of multi-channel simulation results for wireless network sensor networks**

To verify the accurate performance of multi-channel information fusion in wireless sensor networks, two sensors are taken for testing in this paper. The range variance of sensor 1 is 2 km and the angular variance is 0.5 degree; the range variance of sensor 2 is 4 km and the angular variance is 1 degree, and the filter uses N=6000 particles and 120 Monte Carlo simulations.

The results of the multi-information fusion fitting of the wireless sensor network are shown in Figure 1, which gives the comparison curves of the mean square error of the tracking position of the two sensors as well as the fusion system. Even the poorly performing sensor of the two sensors contributes to the fusion results, while the fusion system outperforms the better performing sensor. At the initial position, sensor 1 is 0 with an end of 0.2226, and sensor 2 has an initial position of 0.0046 with an end of 0.7899. After the information fusion system is calibrated, the information fusion between the two has an initial position of 0.0021 with an end of 0.1218, and the fusion system completes the start at about 15 points and maintains the

superior performance thereafter. In other words, using a sensor 1 with high range accuracy and low angular accuracy and a sensor 2 with low range accuracy and high angular accuracy for simultaneous detection while fusing using the method in this paper, we can obtain higher than accuracy single sensor tracking performance.

The proposed fusion system in this paper obtains tracking results that are closer to the real trajectory than any single sensor. In practical applications, the tracking performance of conventional filters is poor when the observation accuracy of a single sensor is low. Using multiple sensors, the tracking accuracy can be improved by fusing the measurement information. The multi-sensor fusion algorithm is based on the Kalman filter, but for strongly nonlinear problems, the Kalman filter tracking is poor or even divergent. In this chapter, a multi-sensor fusion algorithm based on particle filter is proposed to fuse the measurement information from multiple sensors by likelihood under the particle filter, which improves the information fusion accuracy. The algorithm fuses the information from multiple sensors from a probabilistic point of view, which is not limited by the type of information and is applicable to the information fusion of arbitrary nonlinear and non-Gaussian systems.

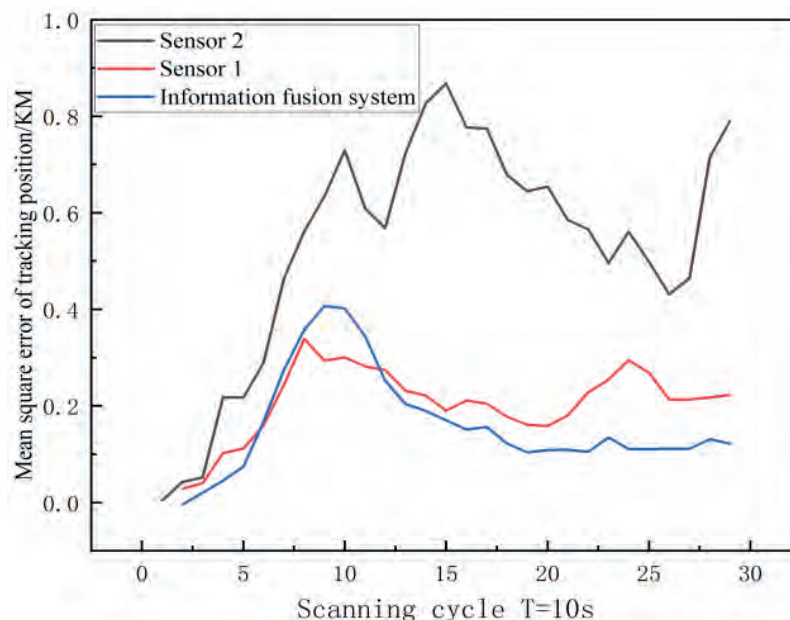

Figure 1. Multi information Fusion Fitting Results of Wireless Sensor Network

## 5. CONCLUSION

In order to study the wireless sensor network multi-channel information fusion method in depth, this paper proposes a methodology for the fusion of infinite sensor networks and IoT technologies, establishes the algorithm feasible matrix, and tests the multi-information fusion fitting effect of wireless sensor networks. The experimental results obtained that after the calibration of the information fusion system, the initial position of two sensor information fusion is 0.0021 and the end is 0.1218, and the multi-fusion system finishes the start at about 15 points and keeps superior performance than the high precision single sensor thereafter. That is to say, the proposed method in this paper has better fusion effect when fusing multi-channel information of wireless network, and the fusion delay is shorter and has better real-time performance.

## **ABSTRACT**

In this paper, we study the statistical inference of the Panel data model containing measurement errors with the aim of optimizing the existing Panel data model algorithm. First, the statistical inference theorems for the Panel data model with measurement errors are given, and the parameter estimation methods are determined, and the paper focuses on testing the correctness of the proposed data model with the parameter Bootstrap. Then the main conclusions of the corrected least squares estimation of the unknown parameter vector and the measurement error Panel data model are tested according to the full text. The results show that the corrected least squares estimates and constraint estimates of the unknown parameters are 0.0203, their asymptotic distributions are infinitely close to 0, the differences of the corrected residual sums of squares are less than or equal to 2.15, the mean value of  $U[-1,1]$  is less than 2.0, and the mean squared error is less than 0.9, so the constructed test statistic holds. This paper studies Panel data model has important theoretical significance and practical value.

## **KEYWORDS**

Panel Model; Measurement error; Least squares estimation; Statistical Inference

## 1. INTRODUCTION

Panel data models are a class of mixed-effects models with time series and cross-sectional data, which have been widely used in various fields such as market analysis, repeated measures, econometrics, and biomedicine [1]. The number of redundant parameters in Panel data models is usually more than the parameters of interest, which makes it difficult to solve practical problems by traditional statistical methods. The problem of statistical inference about this model has attracted a lot of attention from many statisticians, and at the same time, if different estimation methods are used for the unknown parameters in the model, it will lead to different statistics of the constructed hypothesis tests. Therefore, before exploring the statistical inference of the parameters of interest, the estimation methods of the regression coefficients and unknown variance components need to be analyzed [2].

For regression coefficients, numerous scholars have used estimation methods such as best linear unbiased estimation, least squares estimation, two-step estimation, generalized least squares estimation, Between Time estimation, Within estimation, and Between Individual estimation [3]. For unknown variance components, the estimation methods such as least squares unbiased estimation, analysis of variance estimation, spectral decomposition estimation, and minimum variance unbiased estimation are used [4]. In the statistical inference of Panel data models, hypothesis testing regarding regression coefficients is usually used for variable selection as well as to test the reasonableness of linear model assumptions, so it has attracted many scholars to explore. For example, some scholars have constructed the consistent most dominant test statistic under the condition that the variance components are known. However, in the process of practical statistical analysis and application, the variance components are often unknown, and the two-step test statistic for regression coefficients is given using the phase fit estimation of variance components [5]. Under two-stage sampling, a correction method for the F-statistic was proposed to reduce the effect of intra-cluster correlation coefficients; however, none of these methods is an exact test method [6]. In view of this, two exact F-tests have been established by linear transformation of the model, which in turn constructs a combined test with higher efficacy. In addition, exact

tests and confidence intervals for regression coefficients and variance components under different Panel data models were constructed based on the concept of generalized P-values and generalized confidence intervals [7]. The simulation results show that the generalized method constructed based on generalized P-values and generalized confidence intervals can control the test levels better [8]. However, existing studies also show that this method lacks stable test results under different sample sizes and parameter settings [9].

In this paper, we consider the problem of parameter estimation and testing of the Panel data model containing measurement errors under constraints. Firstly, the statistical inference theorem of the Panel data model with measurement error is given, followed by specifying the parameter estimation method of this paper with the parameter Bootstrap test. Then, for the hypothesis testing problem of the linear constraint, the difference between the sum of squared corrected residuals under the original and alternative hypotheses is used to construct a test statistic to test its mean and mean square error distribution, and the asymptotic distribution of this test statistic is proved. Finally, the validity of the proposed estimation and testing methods is verified by numerical simulation studies.

## 2. Statistical Inference of Measurement Error Panel Data Model

### 2.1. Parameter estimation

Among the theories and methods of parameter estimation for Panel data models, the most basic and commonly used is least squares estimation. Also, two-step estimation methods can be used to solve the parameter estimation. Therefore, in this subsection, the regression coefficients are estimated using least squares and two-step estimation methods, respectively.

Four least squares estimates for  $\beta$  :

$$\hat{\beta}_i = (X_i' X_i)^{-1} X_i' y_i, \quad i = 1, 2, 3, 4. \quad (1)$$

Here, it is assumed that  $(X_i' X_i)^{-1}$  exists, which is easily satisfied in the analysis of economic data. Then the covariance matrix of  $\hat{\beta}_i$  is

$\text{Cov}(\hat{\beta}_i) = \sigma_i^2 (X_i' X_i)^{-1}$ . In turn, using the residual estimate  $\hat{u}_i = y_i - X_i \hat{\beta}_i$ , the unbiased estimate of  $\sigma_i^2$  is obtained as:

$$\hat{\sigma}_i^2 = \frac{\hat{u}_i' \hat{u}_i}{\text{rank}(P_i) - k} = \frac{y_i' (I - X_i (X_i' X_i)^{-1} X_i') y_i}{n_i}, \quad i = 1, 2, 3, 4. \quad (2)$$

Where  $n_i = \text{rank}(P_i) - k$ , by the definition of  $\chi^2$  distribution,

$$V_i = \frac{n_i \hat{\sigma}_i^2}{\sigma_i^2} \sim \chi_{n_i}^2.$$

According to Rao's least squares unification theory, it is known that  $\hat{\beta}_i (i = 1, \dots, 4)$  is the best linear unbiased estimate of  $\beta$  in model (1), respectively, and in this paper, the four models are coupled to obtain the least squares estimate and the best linear unbiased estimate. The results are:

$$\hat{\beta}_{LS} = \left( \sum_{i=1}^4 X_i' X_i \right)^{-1} \left( \sum_{i=1}^4 X_i' y_i \right), \quad (3)$$

$$\hat{\beta}_{GLS} = \left( \sum_{i=1}^4 \frac{X_i' X_i}{\sigma_i^2} \right)^{-1} \left( \sum_{i=1}^4 \frac{X_i' y_i}{\sigma_i^2} \right). \quad (4)$$

This can be seen:

$$\hat{\beta}_{LS} \sim N\left(\beta, \Sigma_{LS}(\sigma_1^2, \sigma_2^2, \sigma_3^2, \sigma_4^2)\right), \Sigma_{LS}(\sigma_1^2, \sigma_2^2, \sigma_3^2, \sigma_4^2) = \left( \sum_{i=1}^4 X_i' X_i \right)^{-1},$$

$\left( \sum_{i=1}^4 \sigma_i^2 X_i' X_i \right) \left( \sum_{i=1}^4 X_i' X_i \right)^{-1}$ . However,  $\hat{\beta}_{GLS}$  in equation (4) contains

unknown variance components. Thus, the two-step estimation of  $\beta$  is obtained by replacing  $\sigma_i^2$  with  $\hat{\sigma}_i^2$ .

$$\hat{\beta}_{TS} = \left( \sum_{i=1}^4 \frac{X_i' X_i}{\hat{\sigma}_i^2} \right)^{-1} \left( \sum_{i=1}^4 \frac{X_i' y_i}{\hat{\sigma}_i^2} \right), \quad (5)$$

This can be seen:

$$\hat{\beta}_{TS} \mid \hat{\sigma}^2 \sim N\left(\beta, \Sigma_{TS}(\sigma_1^2, \sigma_2^2, \sigma_3^2, \sigma_4^2)\right), \hat{\sigma}^2 = (\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2),$$

$$\Sigma_{TS}(\sigma_1^2, \sigma_2^2, \sigma_3^2, \sigma_4^2) = \left(\sum_{i=1}^4 \frac{X_i' X_i}{\hat{\sigma}_i^2}\right)^{-1} \left(\sum_{i=1}^4 \frac{\sigma_i^2 X_i' X_i}{\hat{\sigma}_i^4}\right) \left(\sum_{i=1}^4 \frac{X_i' X_i}{\hat{\sigma}_i^2}\right)^{-1}$$

## 2.2. Regression coefficient test

Consider first the problem of non-singular linear hypothesis testing of the regression coefficients

$$H_0 : H\beta = d \quad \text{versus} \quad H_1 : H\beta \neq d. \quad (6)$$

Where  $H$  is a  $m \times k$  row full rank matrix and  $H\beta = d$  is compatible. In this paper, we will construct the test statistic for the hypothesis testing problem (6) based on  $\hat{\beta}_{LS}$  and  $\hat{\beta}_{TS}$ , using the parametric Bootstrap test.

### 2.2.1. Parameter Bootstrap test

Consider first the problem of non-singular linear hypothesis testing of the regression coefficients.

For the hypothesis testing problem (6), the parametric Bootstrap test statistic is constructed based on  $\hat{\beta}_{LS}$  and  $\hat{\beta}_{TS}$ , respectively. First define:

$$T_1 = (H\hat{\beta}_{LS} - d)' \left[ H\Sigma_{LS}(\sigma_1^2, \sigma_2^2, \sigma_3^2, \sigma_4^2) H' \right]^{-1} (H\hat{\beta}_{LS} - d), \quad (7)$$

$$T_2 = (H\hat{\beta}_{TS} - d)' \left[ H\Sigma_{TS}(\sigma_1^2, \sigma_2^2, \sigma_3^2, \sigma_4^2) H' \right]^{-1} (H\hat{\beta}_{TS} - d). \quad (8)$$

If  $\sigma_i^2 (i = 1, 2, 3, 4)$  is known, then  $T_1$  and  $T_2$  are the test statistics for the hypothesis testing problem (9). However, in practical applications  $\sigma_i^2$  is mostly an unknown parameter. Therefore, replacing  $\sigma_i^2$  with  $\hat{\sigma}_i^2$  is obtained.

$$T_1 = (H\hat{\beta}_{LS} - d)' \left[ H\Sigma_{LS}(\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2) H' \right]^{-1} (H\hat{\beta}_{LS} - d), \quad (9)$$

$$T_2 = (H\hat{\beta}_{TS} - d)' \left[ H\Sigma_{TS}(\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2) H' \right]^{-1} (H\hat{\beta}_{TS} - d). \quad (10)$$

Since the distributions of  $T_1$  and  $T_2$  are unknown, the Bootstrap method is used to generate the test statistic by sampling from the estimated model. Therefore, the Bootstrap test statistics based on  $T_1$  and  $T_2$  are respectively.

$$TB_1 = (H\hat{\beta}_{BLS} - d)' [H\Sigma_{LS}(S_{B1}^2, S_{B2}^2, S_{B3}^2, S_{B4}^2)H']^{-1} (H\hat{\beta}_{BLS} - d) -$$

$$= (H\hat{\beta}_{BLS} - d)' \left[ H \left( \sum_{i=1}^4 X_i' X_i \right)^{-1} \left( \sum_{i=1}^4 S_{Bi}^2 X_i' X_i \right) \left( \sum_{i=1}^4 X_i' X_i \right)^{-1} H' \right]^{-1} (H\hat{\beta}_{BLS} - d), \quad (11)$$

$$TB_2 = (H\hat{\beta}_{BTS} - d)' [H\Sigma_{TS}(S_{B1}^2, S_{B2}^2, S_{B3}^2, S_{B4}^2)H']^{-1} (H\hat{\beta}_{BTS} - d)$$

$$= (H\hat{\beta}_{BTS} - d)' \left[ H \left( \sum_{i=1}^4 \frac{X_i' X_i}{S_{Bi}^2} \right)^{-1} H' \right]^{-1} (H\hat{\beta}_{BTS} - d). \quad (12)$$

Which,  $(H\hat{\beta}_{BLS} - d) \sim N(0, H\Sigma_{LS}(\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2)H')$ ,  $S_{Bi}^2 \sim \frac{\hat{\sigma}_i^2}{n_i} \chi_{n_i}^2$  ( $i = 1, 2, 3, 4$ ),

$(H\hat{\beta}_{BTS} - d) \sim N(0, H\Sigma_{TS}(\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2)H')$ .

For the hypothesis testing problem (6), the following p-values can be given using  $TB_1$  and  $TB_2$ :

$$p_1 = p(TB_1 \geq t_1 | H_0), \quad p_2 = p(TB_2 \geq t_2 | H_0). \quad (13)$$

Where  $t_1 = (Hb_{LS} - d)' [H\Sigma_{LS}(s_1^2, s_2^2, s_3^2, s_4^2)HH']^{-1} (Hb_{LS} - d)$  denotes the observation of  $TB_1$ ,  $t_2 = (Hb_{TS} - d)' [H\Sigma_{TS}(s_1^2, s_2^2, s_3^2, s_4^2)H']^{-1} (Hb_{TS} - d)$  denotes the observation of  $TB_2$ ,  $b_{LS}$  and  $b_{TS}$  denotes the observation of  $\hat{\beta}_{LS}$  and  $\hat{\beta}_{TS}$ , respectively, and  $s_i^2$  denotes the observation of  $\hat{\sigma}_i^2$ ,  $i = 1, 2, 3, 4$ . In addition,  $p_i$  ( $i = 1, 2$ ) can be calculated using Monte Carlo method simulations.

Algorithm 2.1 Given  $a, b, c, \sigma_\mu^2, \sigma_\nu^2, \sigma_\gamma^2, \sigma_\xi^2, H, \beta_0, \beta$  and  $X, y$  is randomly generated according to equation (2) to calculate  $t_1$  and  $t_2$ .

For  $k = 1, 2, \dots, m$

$$\text{Let } (H\hat{\beta}_{BLS} - d) \sim N\left(0, H\Sigma_{LS}(\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2)H'\right), S_{Bi}^2 \sim \frac{\hat{\sigma}_i^2}{n_i} \chi_{n_i}^2, i=1,2,3,4, ,$$

$$(H\hat{\beta}_{BTS} - d) \sim N\left(0, H\Sigma_{TS}(\hat{\sigma}_1^2, \hat{\sigma}_2^2, \hat{\sigma}_3^2, \hat{\sigma}_4^2)H'\right);$$

Calculation  $TB_1$  and  $TB_2$ ;

If  $TB_1 \geq t_1$ , then  $q_1 = q_1 + 1$ ; Similarly, if  $TB_2 \geq t_2$ , then  $q_2 = q_2 + 1$ ;

end(k);

Then the hypothesis testing problem (6) with  $p_1 = q_1 / m, p_2 = q_2 / m$ .

### 3. The main conclusion of the Panel of measurement errors proves

On the tight support set  $[-1,1]$ , the kernel function  $K(\cdot)$  is a symmetric probability density function and is Lipschitz continuous with the mean and mean square error correlation results shown in Table 1.

In the case of covariates with measurement errors in the parametric part, the problem of estimating the parametric and nonparametric parts of the model is carried out in three broad steps. Firstly, under the assumption of model identifiability conditions, the data are averaged between groups, and secondly, the modified Profile least squares idea is used to obtain improved estimates of the parametric and nonparametric components of the semi-parametric Panel model with measurement errors. Finally, the asymptotic normality of the estimates given in this paper is further derived under some conventional canonical conditions. When numerical simulations are performed, the problem of correlation and endogeneity between the transformed model variables is considered, and there is a corresponding requirement for data generation. The comparison between the Naive estimation and the improved estimation in terms of the mean and mean square error of the estimated quantities shows that the estimates given in this paper are better than the Naive estimation. Three transformations of the model, using corrected least squares and Bootstrap test, yielded corrected least squares estimates and constrained estimates of 0.0203 for the unknown parameters, whose asymptotic distribution is infinitely close to 0. Secondly, the

difference between the corrected residual sum of squares under both the original and alternative hypotheses is less than or equal to 2.15, and the constructive test statistic holds. Finally, the validity of the proposed estimation and testing methods is verified after data simulation with limited samples.

**Table 1.** Mean value and mean square error

Error	N	T	$\delta$	$\theta(n)$		$\theta$	
				Mean	MSE	Mean	MSE
N(0,1)	50	100	0.1	1.9823	0.0065	2.0045	0.0073
			0.5	1.9053	0.0155	2.0458	0.0212
	100	100	0.1	1.9945	0.0055	2.0380	0.0213
			0.5	1.6850	0.0524	2.0163	0.0166
U[-1,1]	50	100	0.1	1.8765	0.0034	2.0014	0.0030
			0.5	1.6734	0.0678	2.1301	0.0121
	100	100	0.1	1.7114	0.0129	2.0171	0.0045
			0.5	1.5817	0.0375	2.0410	0.0124

#### 4. CONCLUSION

This paper studies the statistical inference methods for the Panel data model of measurement error under constraints. Firstly, the statistical inference formula and parameter estimation model of the Panel data model of measurement error are given, focusing on the parametric Bootstrap test, the corrected least squares estimation of the unknown parameter vector is given, and the asymptotic properties of the Panel data model under some conditions are tested. The results show that using the corrected least squares and Bootstrap test, the corrected least squares estimates and constrained estimates of the unknown parameters are 0.0203, and their asymptotic distribution is infinitely close to 0. The differences of the corrected residual sums of squares are all less than or equal to 2.15, which proves the asymptotic distribution of the test statistic. It is thus clear that the statistical inference of the algorithm in this paper holds for the Panel data model containing measurement errors.

## ABSTRACT

This paper aims to analyze the communication characteristics of agricultural-related self-publishing through case studies and BP neural network algorithm verification, and tries to explore the communication value of agricultural-related self-publishing and its optimal communication path in the context of rural revitalization. Under the proposed algorithm, the accuracy rate of the BP neural network training set is 82.40%. Among the platform disguised correlation values, 0.124 for Jitterbug Live and 0.116 for Xiaohongshu Live are higher than the predicted values. This indicates that the agricultural product value assessment model constructed by BP neural network has a high degree of reliability. In addition, with the development of society and the continuous emergence of new technologies, the countryside is bound to become a new territory for the spread and proliferation of new technologies, and rural revitalization will be greatly influenced by the impact brought by the Internet and new media technologies. Therefore, this study can also provide a study reference for future rural communication research.

## KEYWORDS

BP Neural Network; Agricultural products self-publishing; Rural revitalization; Rural Communication

## 1. INTRODUCTION

The rural revitalization strategy focuses on solving the key problems of rural development, aims to enhance the sustainable development capacity and competitiveness of rural systems, and promotes rural transformation and urban-rural integration through the "five major constructions" (industrial prosperity, ecological livability, civilized countryside, effective governance, and affluent living) [1]. The rural revitalization strategy places rural areas in the main role of national development, and changes the previous thinking of formulating agricultural policies from an urban perspective, so that rural areas can get rid of the dependence on cities and help them achieve sustainable and benign development through a series of policies [2]. The constant updating of digital technology has impacted the old model of mass media allocating social resources only to a few elite groups, and the development of technology has constantly impacted and changed the ecology of information production and communication, and ordinary people can also have a microphone in their hands to access social resources [3].

The emergence of new media technologies has reconfigured the shape of our society in all dimensions and has gradually spread to all aspects of life [4]. The penetration and influence of the Internet on rural areas are gradually expanding, and due to the potential business opportunities and academic research value in the policy context, the industry and academia have launched a lot of discussions and studies on this issue one after another. The industry has revealed the huge investment potential and opportunities for rural economic development under Internet technology by releasing several poverty alleviation projects, vigorously promoting the development of live streaming technology, and increasing capital investment in rural economy [5]. With the emergence of social media, which carries obvious characteristics of interactivity, immediacy, and interpersonal communication, each individual can have a voice, spatial and temporal boundaries are blurred, and the originally stable

communication relationship is broken. Individuals are no longer just receivers but also producers of information, and they transform from readers and audiences to consumers and users [6]. Short videos and live streaming provide the value of the scene, and the civilian culture, which has been marginalized for a long time, begins to rise, and social mobility is greatly enhanced. Ordinary people took control of the discourse, and everyone could become an opinion leader, and a new group of opinion leaders such as KOLs, vloggers, and netizens emerged [7-8].

This paper attempts to start from the development status of agricultural self media and its existing problems, proposes a BP neural network-based agricultural product value assessment model and validates its economic empowerment, in order to contribute to the healthy development of agricultural self media in the current stage of short video traffic era. In this process, according to the current problems, two major methods are proposed to optimize the communication of agricultural-related self media, namely, diversified realization-driven economic empowerment of agricultural products and improving media literacy.

## **2. The development of short video of agricultural products in the context of rural revitalization**

### **2.1. The generation of agricultural-related self-publishing**

The emergence of farming-related self-marketing can be traced back to 2013's "Killing Horse Meets Washing Haircut", which had a play volume of up to 5 million at that time, and it was because of the explosion of this video that farming-related self-marketing was first labeled as "rustic". 2015 saw the emergence of farming-related short videos and the formation of a relatively independent content area. Li Ziqi, a famous self-publisher, started to enter the public eye in 2016 by filming ancient-style rural food, and has been actively exploring overseas markets since 2017, with over 7.3 million fans on YouTube. Nowadays, short video platforms such as Racer and Today's Headlines are developing rapidly and actively penetrating into third and fourth-tier cities and rural areas.

## **2.2. Problems of Agricultural-related Self-Media Communication in the Context of Rural Revitalization**

(1) Pseudo "three agricultural" self-publishing emerges, conveying bad value guidance

The "coquette 9 sisters" annual income of 10 million, which is undoubtedly a huge temptation for other "three agricultural" self-media field. As a result, some of the self-publishers are doing content that has nothing to do with the "three rural areas" under the guise of "three rural areas". For example, "Rural Trio", three young men who just graduated from school are certified as "members of the Poverty Alleviation Group" and creators in the field of quality "three rural areas", but the videos they shoot are in It is hard to see the content related to "three rural areas", as the videos are about "eating and drinking" in the city or unpacking the express delivery from fans. This kind of video can easily convey the tendency of "greed for pleasure", and it is difficult to play the role of positive guidance.

(2) Production and marketing imbalance, lack of health supervision

Some "three agricultural" self-media see the business opportunities in the self-media, to do e-commerce, products from flour, vermicelli, to spicy cabbage, pancakes and other farm specialties, a wide variety of goods. It is undeniable that the development of "three agricultural" e-commerce has broadened the sales channels of agricultural products and promoted the development of rural economy, but we should also see that the stability of the quality of products cannot be guaranteed when the self-media sell their own handmade food. In addition, the lack of hygiene inspection and supervision of these homemade food products sold on the Internet has caused some hidden worries about food safety.

## **2.3. Building a BP neural network based agricultural product value assessment model**

(1) The basic principle of BP neural network

BP neural network is a learning algorithm that continuously mediates the value of the hidden layer by the sum of the squared difference between the output value and the actual value derived after the input. In this paper, we use the Z-Score normalization method to normalize

the training and test set data. The formula of Z-Score normalization method is:

$$Z = (\chi - \mu) / \sigma \quad (1)$$

In the formula  $z$  indicates the final result of normalization,  $x$  indicates the data value,  $\mu$  is the mean, and  $\sigma$  is the standard deviation. The specific quantity of  $z$  indicates the difference between the original value and the mean value, which may be negative.

## (2) Model construction and training

This paper uses Python software for neural network patent value assessment model construction. For parameter setting:

1) BP neural network structure contains input layer, implicit layer and output layer, the number of implicit layers may not be unique. The number of implicit layers is three, and the accuracy of this model is high when tested several times by Python. Therefore, this paper uses a three-layer neural network structure for training and learning, i.e., it contains three hidden layers.

2) In this paper, during the operation of constructing the patent value evaluation model based on BP neural network, 12 indexes are used after the rough set using Johnson's algorithm knowledge reduction.

3) In this paper, the patent value is evaluated, and thus the output layer neuron with only one output value is the patent value. Therefore, the number of neurons in the output layer is one and only one.

4) The number of neurons in the hidden layer is determined. The number of neurons in the hidden layer is tested by continuously modifying the number of neurons in each hidden layer, comparing the accuracy of the model under different conditions of the number of neurons, and keeping the relatively better and more stable parameters.

5) Carefully consider many factors, in order to ensure high accuracy and the highest operational efficiency under the same accuracy condition,  $10^{-4}$  is chosen as the target value of the model error here.

### 3. Analysis of the optimization of the communication path of agricultural products-related self-media

#### 3.1. Multiple realizations drive economic empowerment of rural agricultural products

In addition to the traditional entertainment function, with the development of e-commerce and shopping function into the major self-media platforms, self-media nowadays also has the function of bringing goods. The main ways of realizing cash by each platform are shown in Table 1.

**Table 1.** Main realization methods of each platform

Index	Code
Tiktok live broadcast	C5
Live broadcast of Little Red Book	C2
Tiktok Store	C14
Little Red Book Shopping Cart	C17
Paid courses	C8
Platform private message customization	C22
Kwai Shop	C7
Kwai live broadcast	C3
Video drainage realization	C10
Graphic and text drainage and realization	C21
Video+image text drainage	C1
Arrive with goods	C11

According to the realization methods of each platform, BP neural network was used to detect the importance of video elements in the process of agricultural self-media operation. The model obtained by training and learning for the training set is predicted on the training set itself, and the accuracy rate obtained is 82.40%. This indicates that the agricultural products patent value assessment model constructed by BP neural network has high confidence in patent value prediction, and the algorithm of this paper is established. The top four among the 12 platform cashing methods are: Jitterbug live 0.124, Xiaohongshu live 0.116, Jitterbug small store shopping 0.112, Xiaohongshu shopping cart 0.097. These four methods are also the mainstream short video platforms at present, with large user usage traffic and fast cashing, and the breakthrough of agricultural products self-media transformation can start from these four. Cut to find the characteristics of Xiaohongshu and Jitterbug users, according to the different user fan groups of the two platforms, separate the diversion,

and maximize the realization of agricultural products to cash and positive communication of rural values. In addition, for people who do not like to watch or do not have time to watch live, graphic, video, graphic + video and other diversion methods are the fastest and most convenient "grass" channels, to seize the rapid traffic brought by these three, optimize the video and graphic content, and strive to absorb powder and solid powder as soon as possible, to achieve the flow of cash.

Figure 1. Importance of agricultural products we media video element features

### 3.2. Improving media literacy

At present, the problems in the production of short videos on rural themes are largely related to the low media literacy of producers. As the main content producer of rural short videos, the producer should first actively pursue positive energy and establish bottom-line thinking in the main theme of short videos. On the basis of the clear boundary of their own free expression, try to expand the breadth and depth of content production, have their own correct values and expression, not to be a "slave" of traffic. Secondly, producers should actively get rid of inert thinking in the production process, continuously improve their cultural literacy level, enrich their perspective and level of view, actively seek innovation, and avoid borrowing or even plagiarism. As "opinion leaders", they should guide the network culture correctly and make themselves go farther on the road of self-media. In addition, rural short video producers should also focus on reflecting the actual

problems faced in rural life, such as rural education, medical care, the heritage of cultural skills and the "hollowing out" of the countryside in the process of urbanization. Rural short video producers are mostly from rural areas, so they can take advantage of their familiarity with the real life in rural areas, try their best to present the rural landscape comprehensively and accurately, learn to understand the requirements and connotations of the new rural construction, and become high-quality rural short video producers in combination with the rural revitalization strategy.

#### **4. CONCLUSION**

This paper takes BP neural network algorithm as the technical means to explore the effective path of short video dissemination of agricultural products under the background of rural revitalization, in order to explore the background of the generation of agricultural-related self media and the existing problems in an attempt to find out the direction of optimizing the future development of short videos of agricultural products, and build a BP neural network agricultural products value estimation model to verify the problems involved. The two major platforms for platform realization are Jieyin Live 0.124 and Xiaohongshu Live 0.116, which show deeper innovation possibility and development potential in the form of short video-based performance, which is conducive to promoting socialist rural construction and realizing rural development and comprehensive revitalization. However, to achieve the healthy and sustainable development of agriculture-related self media, this requires a good balance of the degree of constraints on agriculture-related self media by all parties. With the strategy of rural revitalization and core values as the guide, the government, society, capital platforms and participants from all parties need to work together to actively guide and regulate the agriculture-related self media in order to achieve the goal of building a new socialist countryside and gathering the sense of organic community in urban and rural areas.

## **ABSTRACT**

This paper is of great significance in exploring the growth of cross-border e-commerce (CBE) talents and enterprises driven by big data. Firstly, it elaborates the dilemma confronted by the CBE college talent cultivation mode, analyzes the deficiencies in enterprise operation, and puts forward a new strategy for CBE talent cultivation in colleges and universities. Through big data, we collect the demand of enterprise talents' ability and use it as a reference for talent cultivation. According to the big data analysis of CBE enterprise talent demand ability ratio, the top three are platform operation ability, accounting for 92%, English ability, accounting for 92%, and supply chain management ability, accounting for 85%. Cultivating talents of CBE in the new era through school-enterprise collaborative innovation and entrepreneurship education can greatly promote the growth of China's transnational e-commerce industry.

## **KEYWORDS**

Big Data Driven; Cross-border e-commerce; Talent Growth Model; School-Enterprise Cooperation

## 1. INTRODUCTION

With the increasing growth of the Internet economy and economic globalization, CBE and cross-border trade have become a new economic situation. It relies on the unique connectivity and convenience of the e-commerce economy to link the economies of various countries and generate huge economic benefits [1]. China's e-commerce economy has flourished in recent years, and CBE in various industries is doing well and occupies a large proportion of China's foreign trade. As the exercise base of CBE talents, universities are burdened with the important responsibility of delivering e-commerce talents to the country and enterprises. How to cultivate innovative and entrepreneurial talents of CBE in the new era is a problem faced by all universities [2]. At the similar time, enterprises, as the platform for CBE talents to show their talents, should also afford a moral environment for the survival of talents [3]. With the quick growth of the Internet and the new round of globalization of cross-border trade, consumption and services, CBE platforms as a novel mode of international skill are also facing opportunities and challenges [4].

The trade rules and regulatory approaches developed by governments for CBE retailing can have an important impact on the growth of CBE retailing. However, governments also face common challenges in regulation, such as the lack of efficient and low-cost management methods [5]. The Chinese government and industry attach great importance to the growth of CBE, considering it as a new engine for China's economic growth, a new mode of industrial transformation and a new window for opening up to the outside world in the new era [6]. Through continuous enhancement of policies and systems and revolution of business models, China has originally recognized a "systematic and all-round" CBE retail regulatory model in the course of more than a decade of growth, which has formed a good foundation for encouraging the growth of CBE in China [7]. However, as a new mode of international trade in China, CBE requires the Chinese government and industry to continuously improve their understanding and policy design to encourage the healthy and sustainable growth of the industry [8]. Meanwhile, the macro policy environment for technology growth is also improving, and big data is gradually rising as a national strategy. Starting from

2021, the State Council proposed to support the R&D and industrialization of software related to massive data storage and processing, and to encourage the R&D and industrialization of key products for information security. The Growth and Reform Commission and the General Administration of Customs have carried out the deployment of "China's cross-border sweater e-commerce service pilot" [9].

This paper firstly starts from two major directions, namely the dilemma of CBE talent exercise in universities and the problems of CBE enterprise operation, and clarifies the research direction of the whole paper. Then, we analyze the request for CBE enterprise talents according to the big data and propose an operative path to break the predicament of CBE innovation and entrepreneurship talents cultivation. That is, universities need to improve the cultivation mechanism of innovative and entrepreneurial aptitudes, strengthen the construction of CBE faculty, collaborate with platform data to improve services, and deal with cross-cultural issues under data-driven four initiatives.

## **2. The dilemma in CBE talent training in the context of big data drive**

### **2.1. The dilemma of training CBE talents in colleges and universities**

#### **(1) Faculty is not strong**

The education model of today's colleges and universities is generally dominated by teachers and counselors in charge of classwork and life, and students passively accepting learning. Teachers of professional courses have little experience in entrepreneurship due to the limitation of CBE platform, so they are more inclined to theoretical learning of CBE. But CBE requires a wide range of knowledge, including both professional knowledge theory and subject knowledge in sales, art, language, economy and other aspects. Teachers in colleges and universities do not have practical experience in CBE, so it is difficult for them to master all the knowledge required for CBE, which requires teachers to strengthen the learning of various knowledge in the field of CBE to meet the requirements of subject education. Since the CBE profession is partial to practicality, the

teaching as well as practical participation of CBE profession needs more high-quality professionals [10].

#### (2) Inadequate school-enterprise collaborative education

Innovation and entrepreneurship education and professional innovation education should be in line with contemporary values, and the two should complement each other in order to effectively encourage the growth of quality education. It is necessary to establish the sense of dialectical thinking that professional education is the foundation of innovation and entrepreneurship education and innovation and entrepreneurship education reacts to professional education.

#### (3) Imperfect teaching conditions and relative disconnection between practical training and vocational jobs

The training of CBE talents requires a high practical environment. At present, some colleges and universities have established CBE training rooms and equipped them with professional simulation software to simulate the real environment for students to practice and exercise, in an attempt to improve students' practical skills through various practical training modes and meet market demand and job requirements. However, with the rapid growth of "Internet+", it is difficult for the simulated system to catch up with the pace of system upgrade after all. In addition, there is a gap between the simulated environment and the real operating environment, and there is a big difference between the practical cases of students in school and the real projects in enterprises.

## **2.2. The main problems in the operation of CBE enterprises**

#### (1) Commodity homogenization is widespread

At present, some CBE business giants have already dominated the market. Comprehensive platforms, especially import platforms, cover beauty, mother and child, electronics and other commodities, and the problem of homogeneity prevails. Whether it is for new entrants or competitors who wish to continue to plow through and gain a leading position, differentiation and value for money are the goals that help companies break through. Whether online or offline, the collection of customers to attract traffic to enhance the transaction volume is the fundamental retail. The previous model of relying on price promotion

and taking the competition of price war not only examined the enterprise's own operation and cost management, but also tested the enterprise's ability to control the supply chain and occupy a favorable position.

## (2) Localization of operating strategies

CBE retailing faces the problem of cross-cultural differences and individualized needs. It needs to consider the differences in human environment, business environment and political environment from region to region more than traditional e-commerce at the operational level. In addition to the procurement, logistics and tariff issues in the supply chain, the customer-facing end of the shopping process involves differences in information access, value perception, end-use habits, payment methods, shopping scenarios and so on, all of which make it impossible to transfer the successful experience of e-commerce companies in one region to another. Users will also choose the best way to meet their preferences and habits with their own experience and feelings among many merchant choices. CBE enterprises how to deepen the local market environment to adjust their own operating model has become a need for continuous exploration of the problem.

## **3. Effective path for cultivating innovative and entrepreneurial talents in CBE in the context of big data drive**

In order to break the dilemma of CBE innovation and entrepreneurship talent cultivation, this paper uses big data to collect the current CBE enterprise talent demand ability situation according to the main existing dilemma of CBE talent cultivation mode above, and seeks to amend the talent cultivation mode of universities according to the enterprise talent demand ability situation. Strengthen the cooperation between schools and enterprises to cultivate elite talents who can adapt to the market demand.

The statistics of talent demand of CBE enterprises are shown in Table 1. The skills required higher in the demand of CBE talents in order are: having strong platform operation ability of 92%, English ability of 92%, supply chain management ability of 85%, crisis protection awareness of 82%, market decision-making power of 81%, and marketing ability of 80% inside and outside the station. These six competencies have the characteristics of strong integration and high

practical requirements, which means that universities should strengthen the cooperation between schools and enterprises in the process of talent training, and should not be detached from the emphasis on theory and light on practice. According to the statistical table of talent demand of CBE enterprises, this paper proposes a series of more detailed training initiatives, which are listed in the following.

**Table 1.** Statistics of talent demand of CBE enterprises

Number	Cross border e-commerce capacity demand	Statistics proportion
1	R&D capability	60%
2	Supply chain management capability	85%
3	Market decision-making power	81%
4	English ability	90%
5	Multilingual ability	65%
6	Strong platform operation ability	95%
7	Crisis protection awareness	82%
8	Marketing ability inside and outside the station	80%

### **3.1. Improve the mechanism of cultivating innovative and entrepreneurial talents in universities**

Integrate and improve educational and teaching resources, including and not limited to courses, projects and competitions. Based on the actual situation, higher vocational institutions actively encourage enterprises to participate in the process of cultivating innovative and entrepreneurial talents for CBE in schools. With the help of enterprises, they should set up teaching objectives based on the actual working needs of CBE, develop training courses and evaluation systems, and improve and enrich teaching contents. With the market needs and students' demands as the basic objectives, the curriculum of CBE is optimized and designed; the professional curriculum is the basis, the professional practical training courses are the skeleton, and the courses in multiple fields such as innovation and entrepreneurship and language learning are the auxiliary support to improve the cultivation mechanism of innovative and entrepreneurial talents in higher vocational institutions. At the same time, according to the local characteristics of the institutions, according to the needs of the countries along the "Belt and Road",

multilingual elective courses are set up to help students to engage in the language needs of the CBE industry. In order to meet the needs of CBE innovation and entrepreneurship talents, the curriculum should be set up, optimized and improved, and students with innovative and entrepreneurial ideas in the CBE industry should be properly supported and guided to a certain extent to expand their experience.

### **3.2. Strengthen the construction of CBE faculty**

The following strategies can be adopted: (1) higher education institutions, based on government policy requirements, set up research innovation and entrepreneurship topics with enterprises, which can add scientific research boost for enterprises and also enhance the ability of teachers to extend the implementation of CBE project research; (2) strengthen school-enterprise cooperation. The form of cooperation can be divided into two types, one is to implement the project of attracting enterprises to the school, and the other is to run a mixed ownership secondary college (department) model. Through these two models, attract high-quality teachers to join the enterprise mixed CBE teacher team, so that teachers can take up teaching tasks in both enterprises and schools, and allow teachers to check and fill in the gaps in the process of joint practice, joint practice and joint teaching in enterprises and schools, so as to improve teachers' professional ability in a shorter period of time; (3) encourage teachers to go to enterprises through policy establishment. It allows teachers to gain a deeper understanding of and participate in CBE start-ups and operations to enhance their real-world experience.

### **3.3. Collaborative Platform Data Enhancement Services**

China's e-commerce is in a period of rapid growth, and the geometric growth of user data is behind the spurt of e-commerce growth. E-commerce has the natural advantage of applying big data, and the collaborative sharing of data can better encourage the maximization of data asset value. The growth of Internet technology provides the possibility of handling massive amounts of data and extracting valuable information from complex fragmented data relationships. Within the enterprise, data operations of different system platforms need to establish mutual connections based on independent division of labor. Establishing an intelligent business data management

platform, quantifying strategies and methods, and evaluating results in an integrated manner will gradually improve the efficiency of data utilization and the quality of data application. The results of data collection and analysis from different channels and perspectives among different companies can contribute to the improvement of data in the user dimension. This requires unified storage of data, promotion of data integration, standardization of data processing, and finally data sharing to achieve the application of data correlation.

### **3.4. Dealing with cross-cultural issues in a data-driven manner**

People in different countries and regions have different expectations and preferences for the same product and the same shopping process. Through big data we can perceive these abstract and subtle differences, allowing differentiated services to be targeted in regionalized management and marketing. In the past, CBE services, especially in B2B, reduced cross-cultural friction in the transaction process through the process of dealing with people. The B2C field, which has huge growth space today, needs to pay more attention to the new and new user groups on the computer side of the Internet and mobile terminals. Combining Internet behavior to analyze cross-cultural differences can bring more humanized process optimization for CBE processes such as browsing, product selection, payment and delivery.

## **4. CONCLUSION**

This paper takes the study of CBE innovation and entrepreneurship talent cultivation mode in the context of big data-driven era as the entry point, analyzes the problems of CBE talent cultivation mode in colleges and universities at the present stage and the deficiencies in enterprise operation, and tries to find out the ways to crack the dilemma. According to the analysis of CBE enterprise talents' demand according to big data, the top three are platform operation ability (92%), English ability (92%) and supply chain management ability (85%). It shows that in the context of the new era, if we want to encourage the training of CBE innovation and entrepreneurship talents, we must fully understand the actual growth of the current market and do a good job of school-enterprise cooperation in combination with the growth characteristics of the CBE industry. The existing talent training program is improved, the practical training

ability of college students is improved from various aspects, and the in-depth interaction with enterprises and the market should be done.

## ABSTRACT

To solve the problem of rising workload of development and maintenance caused by frequent changes in requirements during the development and operation of MIS, this paper proposes a new method for building MIS software base modules. Based on BP neural network algorithm to generate or reconstruct the database of MIS software infrastructure module, we try to combine C/S and B/S, and verify its rationality through system performance test. The results show that the response speed in the application environment of report data loading and exporting client operation is 95 times/second, the response speed of batch operation performance is 90 times/second, the paged display list is 88 times/second, and the system home page loading mode is 75 times/second, and the response speed all exceed the predicted 70 times/second. This paper better solves the problem of rapid construction or reconstruction of MIS software base modules, and can better cope with the frequent changes of MIS in the development and operation process.

## **KEYWORDS**

BP Neural Network; MIS Module; C/S mode; B/S mode

## **1. INTRODUCTION**

MIS system platform models are broadly divided into four types, namely host terminal model, file server model, client server model and Web browser server model. The host terminal mode has been phased out due to limited hardware choices and unguaranteed hardware investment. And the file server mode is only applicable to small-scale LANs, which creates network bottlenecks for a large number of users and large data volume, and cannot meet user requirements especially on the Internet [1-2]. Therefore, the main modern enterprise MIS system platform models considered are C/S and B/S models [3]. Currently, large online applications used by enterprises have shared programs that allow multiple users to access a common database simultaneously [4]. This requires simple, uniform, efficient, and secure access control of data information, especially in shared databases [5]. Large systems contain many relatively independent application subsystems used by different departments. Each subsystem uses different databases, and a large number of tables and views are built in each subsystem, which makes the authorization management of database resources very complex [6].

Generally, each application subsystem is developed in parallel by different groups of software developers, and the development progress of each subsystem is different. If each subsystem is developed separately using its own permission management system, it will lead to duplicate development of software and make the permission management scattered, which is not conducive to unified management and reduces the security of the system [7]. In order to improve the development efficiency of the whole system and realize the unified control of access rights for the whole system, the system access rights management can be considered to be extracted from each subsystem to form a security management system independent of each application subsystem. The access rights of each subsystem are centrally managed in this security management system [8]. Due to the change of personnel in the enterprise, promotions are frequent,

especially the larger the enterprise and the more departments, the more complex it is for the maintenance of enterprise users and user access to subsystem permissions [9]. Generally, the personnel management mechanism in an enterprise is managed in a top-to-bottom hierarchical manner. To ensure a high level of security, the management of user identities and permissions for each subsystem should be delegated to the head of the department using that subsystem. However, on the one hand, users are unlikely to have a deep knowledge of the application and the library tables and views used in the program and cannot directly maintain access control to specific data objects related to the database [10]. On the other hand, since no new library tables are created after the developer commits the application for this subsystem, this makes it possible to implement access control at the application level.

In this paper, we first clarify the BP neural network and its algorithm model, determine the technical means of research, and then generate the MIS database for the next stage of research. Then, we propose the strategy of combining C/S and B/S according to the algorithm model and MIS database, and verify the strategy and the rationality of the proposed algorithm through system performance testing one by one. The algorithm set in this paper helps to realize the MIS base module construction.

## 2. BP Neural Network

BP neural network is a method of artificial neural network, based on automatic learning, back propagation error using gradient descent optimization algorithm to regulate the loss of weights and subsequently adjust the output. Also BP neural network is known as a supervised learning algorithm because the goal of any supervised learning algorithm is to find a function where the best input gets the most correct output. Whereas the back propagation of BP neural network is to train a multi-level neural network so that proper learning and adjustment can be done internally so that any input can be mapped to the output and finally the minimum error is obtained.

The formula for the BP neural network weights is:

$$W_{uv}(n_0 + 1) = W_{uv}(n_0) + W_{uv} \quad (1)$$

Where the correction quantity of the weights its expression is:

$$V\omega_{jk} = \eta\delta_k^0 y_j = \eta(d_k - o_k) o_k (1 - o_k) y_j \quad (2)$$

$$V_{v_{ij}} = \eta\delta_j^y x_i = \eta\left(\sum_{k=1}^1 \delta_j^y w_{jk}\right) y_j (1 - y_j) x_j \quad (3)$$

## 2.1. MIS database generation

The database of the MIS is generated based on the above-mentioned object information. The steps of the generation algorithm of the database table corresponding to each object are as follows.

(1) Find the current object. The attributes of the current object and the association information between it and other objects, and declare the SQL for building the table in the MIS database.

(2) Generate the table name of the table building SQL based on the object identification in the object base information. In the corresponding field name, generate the type and width of the corresponding field based on the type and width of the attribute; generate the association between the foreign key of the current table and the primary key of the associated table based on the association information between the current object and other objects.

(3) Execute the table building SQL to generate the table corresponding to the current object in the MIS database.

## 3. Combination strategy of C/S mode and B/S mode

First of all, the developer can decide which sub-functions are suitable for C/S and which are suitable for B/S based on certain principles. sub-functions suitable for C/S should have high security requirements, strong interactivity, small usage scope, fixed location, and large amount of data processing. For example, the function of inputting and modifying personnel and labor data, and the function of inputting vouchers in the financial system, etc. The sub-functions suitable for B/S should have the following characteristics: wide range of use, flexible location, able to change frequently, different security requirements, etc. For example: the internal information release function, the financial analysis table query function, the query function in the decision support system, etc.

Compared with C/S and B/S alone, the advantages of this solution are: to ensure the security of important and sensitive data, especially to strengthen the control of database modification and new records; to effectively use the resources of the enterprise internal computer, not only to ensure the interactivity of complex functions, but also to ensure the ease of use and unity of general functions; system maintenance simple bureau network is more efficient.

In the coding design stage, the system developer selects different coding methods for sub-functions using different modes (e.g.; C/S can use VB programming environment, while B/S uses ASP method), and then compiles and generates different customer applications and Web service programs. In the installation and debugging phase, the specific client application will be installed on the client of the specific user, and the Web service program needs to be installed on the Web server, meanwhile, the user of the application must receive certain training. In the software maintenance phase, different maintenance methods should be adopted for different modes of sub-functions.

#### 4. System Performance Testing

System testing is the most important part of the project before going live and is a reflection of the effectiveness of the research content of this paper. In this paper, we focus on the performance testing of the system to check the high performance and robustness of the system. The list of testing environment of the system is shown in Table 1, in which Jmeter is chosen as the performance testing tool.

Table 1. Analysis of Test Environment

Operating environment	Components	Specific parameters	Number
Server	Operating system	Win2019	1
	Database	SQL Servwr2020	2
Operating environment	Linguistic environment	.Net Franme Work5.0	3
	The server	IIS7.0	4
Client running environment	Operating system	Win10	5
	Application environment	Chrom	6

This paper tests the system performance in the following aspects:

- (1) System home page loading module (including login).

(2) The pagination display list of pages with large data volume such as demographic information and project information.

(3) Batch operation performance.

(4) Report data loading and exporting.

The system performance test is shown in Figure 1. Under the algorithm of this paper, the system home page loading module, population information, paging display list, batch operation performance, report data loading and export loading response speed are maintained at 75 and above, the system running rate is good. Among them, the application environment response rate of report data loading and exporting client operation reaches 95 times/sec, and the operation response performance is the most good, which can provide users with the fastest information access service. The response speed of batch operation performance is 90 times/second, which is the second fastest response speed and can provide quick service for users' operation. The pagination display list is 88 times/second, and the system home page loading mode is 75 times/second, the response speed is more than the predicted 70 times/second, and the system performance is good.

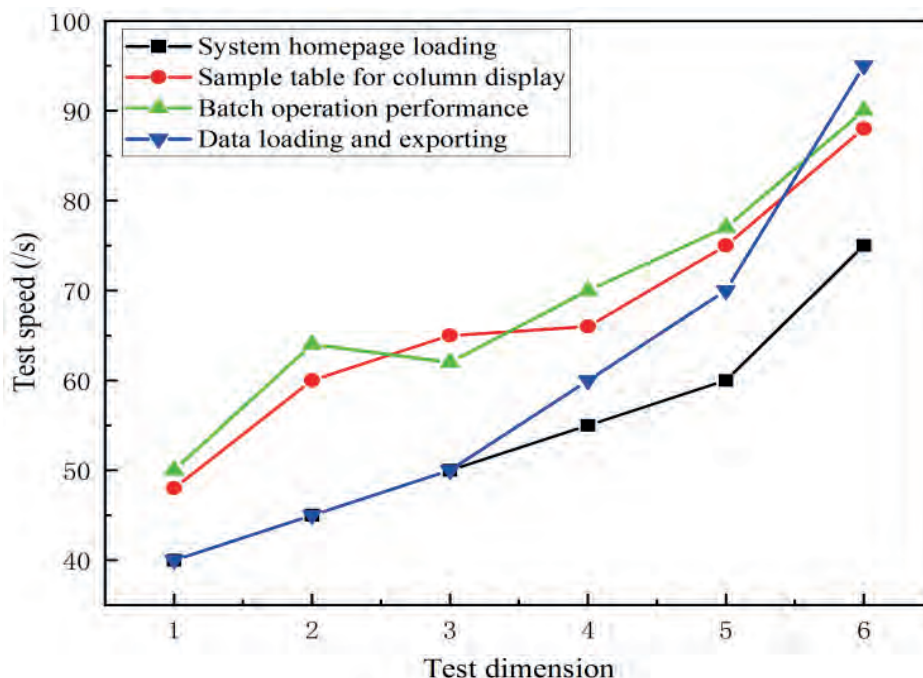

Figure 1. System Performance Test

## 5. CONCLUSION

In this paper, we construct the MIS algorithm model with BP neural network, by informatizing and managing the objects oriented by the basic information module in MIS and generating the corresponding database. At the same time, the interface layer, business logic layer and data access layer of MIS are decomposed into basic elements for management, and the corresponding software interaction interface, business logic and data access parts are generated by combining the object information. In the system performance test, the report data loading and exporting client-run application environment, the response speed reaches 95 times/second, and the batch operation performance response speed is 90 times/second, the system operation efficiency is good. The algorithm set up in this paper implements the MIS quick change database table, basic function module and software structure and version based on BP neural network.

## ABSTRACT

In order to improve the recognition accuracy of typical dance movements, this paper designs a folk dance movement recognition system based on SVM model. In the design process, the global optimization-seeking technique of genetic algorithm is used to simplify the search process of kernel function parameters and optimal penalty factors in order to optimize the dance recognition parameters. A multi-kernel learning method is used to achieve the mutual complementation of multi-class features to improve the dance recognition capability of the SVM classifier. The simulation results show that the average recognition time of the system is 0.7s, and the recognition rate reaches more than 95%. It can be seen that the SVM model can optimize the recognition process of typical movements of Chinese folk dances.

## KEYWORDS

Dance movement recognition; SVM model; Global Optimization Techniques; Kernel function parameters

## 1. INTRODUCTION

Dance movement recognition is a specific branch in the field of movement recognition [1]. With the increasing demand for dance analysis, training and teaching, dance movement recognition is gradually gaining attention from companies and universities at home

and abroad. Dance movement recognition technology can effectively identify dance movements and evaluate them objectively to give suggestions for modification, which is an advanced training aid [2-3].

Currently, there is a growing research on related technologies in the field of movement recognition. For example, in the literature [4], the EMG signal was preprocessed using the dual-tree complex wavelet transform and time-domain features were extracted from the preprocessed data to improve the discrimination of features. The results show that the naïve Bayesian classifier has an average classification accuracy of 88.89% and a response time of 0.058 ms for the recognition of 15 different actions. A modeling and separation method for real-time SEMG signals was developed in the literature [5] based on oscillation theory. Based on this, a feature extraction method for SEMG signals was constructed and combined with an integrated learning method to achieve the recognition of real-time action intent. The literature [6] proposes a new edge analysis-assisted monitoring solution for monitoring several physical activities of people to identify physical deficiencies in their daily life and presents an application scenario to validate the idea of the proposed system in a medical setting. In summary, the developed action recognition techniques are susceptible to the constraints of the target detection results, which affect the accuracy of the pose estimation and the low efficiency of the algorithms.

Based on this, a folk dance movement recognition system based on SVM model is designed in this paper. In the design process, firstly, the global optimization-seeking technique of genetic algorithm is used to increase the number of iterations and fitness values in order to simplify the search process of kernel function parameters and optimal penalty factors to optimize the dance recognition parameters. Secondly, a multicore learning method is used to fuse the directional gradient histogram features and audio features to extract features from the denoised action data in order to improve the dance recognition capability of the SVM classifier. Finally, the actual recognition effect of the system designed in this paper is tested by experiments. The results demonstrate that the SVM model-based folk dance movement recognition system can achieve accurate and efficient recognition of dance movements.

## **2. SVM dance movement recognition system**

### **2.1. Optimize dance recognition parameters**

Support vector machine SVM is a classification algorithm based on statistical learning theory, which has unique advantages in solving small-sample, nonlinear and high-dimensional classification and recognition problems and overcomes the problem of overlearning to a large extent [7-8]. The key to dance movement recognition based on SVM models is to find the appropriate kernel function parameters and the optimal penalty factor.

In this paper, we will use the global optimization seeking technique of genetic algorithm to simplify the search process of kernel function parameters and optimal penalty factors. The steps of efficient global search for optimal search of genetic algorithm are as follows.

(1) Initialize the kernel function parameters and the optimal penalty factor, and binary encode the kernel function parameters and the penalty factor with the institution causing the initial dance action population.

(2) Decode the kernel function parameters and the optimal penalty factor and substitute them into the SVM algorithm function, use the classification recognition rate obtained from the dance action training as the fitness value, and make the genetic probability judgment by the fitness.

(3) The individuals with high fitness are selected in each generation of evolution by the fitness value of action individuals, and the crossover operation is performed on the parameters to construct new individuals according to the crossover probability.

(4) Perform mutation operation on parameters to construct new individuals by changing the genes of a locus in the string of population individuals according to the mutation probability.

(5) Perform the decoding and fitness value calculation, and perform the update of the optimal action individual by comparing the classification recognition rate between the parent and the offspring.

(6) Based on the set termination value, determine whether the number of iterations and the fitness value meet the requirements, and

if they do not meet the requirements, repeat steps (3)-(5). If the requirement is met, then step (7) is executed.

(7) The genetic end, the kernel function parameters and the optimal penalty factor are obtained.

## **2.2. Improved action recognition algorithm**

In the process of action recognition of folk dance, action feature extraction will have a large impact on the final recognition effect [9]. The original data cannot be directly put into the classifier for classification after denoising, but feature extraction is needed for the denoised action data. After extracting the feature values that can represent the dance movements, the SVM model is then used to identify the different dance movements [10-11].

The directional gradient histogram features and audio features are fused using a multicore learning method in order to achieve mutual complementation of multiple classes of features and improve the recognition ability of the SVM classifier. The most favorable attributes for classification are selected as features from the original action data, and a set of kernel functions are set for each feature separately, each with corresponding weights. Multiple kernel functions are combined together in a linear weighted manner to form a new kernel function, and the SVM classifier is used to perform multi-class classification. At this point, the empirical risk and generalization ability of the dance moves are almost unchanged.

## **3. Analysis of experimental results of motion recognition system**

In this paper, we design a folk dance movement recognition system based on SVM model and conduct experiments on folk dance movement recognition of this system to verify its recognition effect. The hardware used in this experiment is a Huawei cell phone that collects three-axis acceleration signal data under Android system, and collects and saves each dance movement data in real time during the experiment. A total of 115 samples were collected from 5 movements of 23 people respectively. The cell phone was set directly in front of the movers, and the movers were allowed to perform the data collection of 5 movements: kick back, split, lower back, split jump and big kick. The feature values are extracted for these 115 samples, which constitute a 115×40-dimensional feature matrix. The system

designed in this paper was compared and analyzed with the traditional dance movement recognition classification system, and the resulting recognition results are shown in Table 1.

**Table 1. Action Recognition Results**

Movement Classification	Average Recognition Rate/%		Identification Time/s	
	Traditional	SVM	Traditional	SVM
Kick to the Back of the Leg	81.36	96.97	2.0	0.05
Splits	90.1	98.5	3.6	0.08
Lower Back	73.6	97.5	4.6	1.9
Split Jump	85.6	92.3	4.2	0.83
Big Kicks	73.49	90.5	3.1	0.65

In terms of the correct recognition rate of dance movements, the recognition rate of the traditional dance movement recognition classification system is 80.83% on average, which only reaches the passing requirement of recognition. In contrast, the recognition rate of the SVM model-based folk dance movement recognition system is significantly improved, and the overall level reaches more than 95%, which can almost reach complete recognition. In terms of recognition time, compared with the traditional dance movement recognition classification system, the average recognition time of the SVM model-based folk dance movement recognition system is 0.7, which is nearly 5 times higher, and the recognition performance has been significantly improved.

#### 4. CONCLUSION

Based on SVM model, this paper designs a folk dance action recognition system based on SVM model from optimizing dance recognition parameters and improving action recognition algorithm, and verifies the recognition effect of the system in the process of practical application. Compared with the traditional dance action recognition classification system, the average recognition time of the folk dance action recognition system based on SVM model is 0.7, and the average recognition rate reaches more than 95%, which can almost reach the standard of complete recognition. This fully proves the correctness and operability of the method designed in this paper for Chinese folk dance movement recognition.

## **ABSTRACT**

In order to study the financial management innovation strategy under Internet finance, this paper designs a financial management module for commercial banks based on Internet finance. Through the rapid development of the new form of Internet finance, the data of financial management in the operation of commercial banks are analyzed with commercial banks as the main research object of financial institutions, and corresponding innovative strategic measures are made. The simulation results show that the basic financial management parameter in this financial management module is 9.37, the comprehensive index parameter is 72.02%, and the evaluation index is increased by 5. It can be seen that the continuous innovation of financial management model is conducive to improving the management of commercial banks, reducing financial risks and promoting the continuous improvement of commercial banks' profits.

## **KEYWORDS**

Internet Finance; Innovative Strategies; Financial Management Parameters

## 1. INTRODUCTION

The development of commercial banks in the Internet financial era requires not only innovative service models, but also the improvement of their own management level and management professionalism [1-4]. First of all, traditional enterprise financial management is generally managed by financial personnel, so problems in financial management are generally the responsibility of financial managers. However, with the breakthrough of Internet technology, the connection between various departments in the enterprise has been strengthened, at which time the financial management responsibilities are apportioned to various departments. Second, the Internet has changed the specific methods of financial management, giving full play to the role of financial internal control, and after the financial management responsibilities are distributed to every corner of the enterprise, the corresponding financial management authority is also distributed to every department of the enterprise. In the previous financial management model, the output and feedback of financial information were slow, which did not bring the role of internal control of financial management into full play. Now the Internet-based financial management model has enhanced the rate of information transmission and feedback, which brings the internal control of financial management into full play. Finally, Internet technologies and devices have liberated the time and space for corporate financial management [5-8]. The development of the Internet has made the financial management of enterprises free from the constraints of time and space. Compared with the traditional way, in the Internet environment using Internet devices can work anywhere, no longer have to be limited to a certain time period and a certain area, breaking the restrictions of time and space.

The literature [9] emphasizes that the level of financial management has an important role in the enterprise, and it is an important reflection of the overall management quality of the enterprise in the development process. Among the influences on the level of financial management are also various, the main factors are: the inspection and supervision work carried out, the management system developed, and the management methods applied are imperfect. The above discussion enables to understand that the main purpose of financial management is to ensure the authenticity of the sources of

financial reporting information, the safety and profitability of funds, and the efficient and legal operation and production of the enterprise. The literature [10] suggests the key role of financial management, which is expressed as follows: first, to effectively monitor and evaluate the financial management of the enterprise, escort the enterprise to achieve the expected goals as soon as possible, and promote the healthy and rapid development of the enterprise operation. Second, to ensure that the enterprise can develop continuously and steadily in the course of operation. Absorb and increase the value of assets while carrying out daily business activities and various engineering projects. Third, to ensure the ownership of the enterprise. Accounting information should be true, complete, accurate and transparent, and financial data analysis should be objective, comprehensive and accurate.

In this paper, a financial management module for commercial banks based on the Internet context is designed. In the design process, through the new stage of rapid development of new forms of Internet finance, commercial banks as the main research object of financial institutions, analysis of financial management on the basis of the actual data of enterprises, the specific situation of financial management of banks was collected and studied. Theories of financial control, identification of financial risks, and financial management are understood in depth, respectively, and problems in financial management are studied based on the perspective of strategic development. In addition, five primary indicators and 15 secondary indicators are set to construct a judgment matrix for financial management evaluation, and the practical effect of this evaluation judgment matrix is confirmed by simulation results. It further illustrates that the financial management evaluation mechanism based on the Internet finance in the development process of commercial banks to promote the decision making business risks and financial risks in the financial operation and management, and effectively promote the scientific of commercial banks' decision making.

## **2. Financial Management Model**

### **2.1. Controlling financial management costs**

Actively change the management concept, the first need to do a good job of systematic control, both to focus on the importance of cost control, but also to strengthen the operating concept of cost control. On the basis of unified authority and responsibility, a more reliable cost control system must also be established, and the cost of material procurement and equipment maintenance must be controlled within the budget to ensure the operating objectives. Establish a financial evaluation system for major projects to prevent investment cost risks. A sound investment project evaluation system should be established, including a pre-assessment system in the early stage and an evaluation system in the later stage, so as to improve economic efficiency.

### **2.2. Innovative financial management model**

Optimize and improve the financial management model of commercial banks. The financial management of banks is related to the application of funds and the verification of assets. Banks should pay attention to financial management, change the traditional financial management concept, and optimize and improve the financial management model. Reform the traditional and backward financial management mode and discard the financial management mode that is not conducive to the development of banks. Improve the innovation ability of financial management mode, actively learn advanced financial management experience and methods, and create a new financial management model suitable for the development of banks.

Improve the organizational process system. In essence, the construction of the financial shared service center is to re-improve and adjust the organizational structure and financial processes. The repetitive and uniform operations in finance will end up in the shared center, converge to the shared center, and be handled by the shared center in a unified manner. This process requires setting up processes with unified standards and sound management systems to guarantee operation.

Construction of information system platform. The establishment of a financial shared service center and a centralized and perfect information system platform is a necessary condition. It provides a solid material guarantee for the construction of financial shared service center. To break through regional obstacles and provide more comprehensive services to its service recipients, the financial shared services realize organizational and process retransformation, and the establishment of a perfect information system is an objective requirement. Therefore, the Internet, cloud computing and other scientific technologies should be introduced into the financial management work, so as to improve the analysis and processing ability of financial data.

### **3. Financial Management Effectiveness Evaluation**

By calculating financial management control effectiveness evaluation indexes, internal management indexes, financial risk management indexes, and corporate business relationship indexes, and applying the judgment matrix of financial management evaluation, this paper designs a financial management module for commercial banks based on the Internet context. The method is deeply applied to the financial management work, as shown in Table 1.

**Table 1.** Judgment Matrix Of Financial Management Evaluation

Level Indicators	Secondary Indicators	Average
Basic Financial Management(A)	Effectiveness of post and organization setting (A1)	95.40
	Professional competence of financial personnel (A2)	86.67
	Participation of financial personnel in the enterprise decision-making process (A3)	53.33
	Accuracy and authenticity of accounting information (A4)	94.57
	Whether accounting materials are complete (A5)	96.1
Enterprise Business Relationship(B)	Relationship between enterprises and financial institutions (B6)	84.44
	Communication between enterprises and government (B7)	75.61
	Relationship between enterprises and other enterprises in the industry (B8)	79.45
Manage Financial Risk(C)	Effectiveness of managing financial risk (C9)	70
	Evaluate whether the financial risk system is scientific (C10)	71.23
Internal Management(D)	Whether the budget is reasonable and scientific (D11)	76.25
	Budget evaluation and implementation (D12)	64.62
	Implementation effect of internal control system (D13)	84.5
Effectiveness Of Financial Management(E)	Ability to manage funds (E14)	68
	Ability to allocate assets (E15)	56.17

In the above formula, Y represents the result of financial management evaluation score, which belongs to the first level of financial management evaluation indicators. n has the values of 1, 2, 3, 4, 5, b1 is the result of financial basic management indicators evaluation, b2 is the result of commercial bank business relationship indicators evaluation, b3 is the result of financial risk management indicators evaluation, b4 is the result of traditional financial control effectiveness indicators evaluation, and b5 is the result of financial control effectiveness indicators evaluation Results.

The financial management evaluation is calculated by combining the above formula. The evaluation of financial foundation management indicators is 9.37, the evaluation of commercial banking business relationship indicators is 15.64, the evaluation of financial risk

management indicators is 6.13, the evaluation of traditional financial control effectiveness indicators is 18.53, and the evaluation of financial control effectiveness indicators is 24.45. Combining the formulas, the financial management evaluation is synthesized as:  $Y=72.02$ .

From the specific scores of the above 10 indicators, we can see that the financial control effectiveness indicators in the financial management evaluation judgment matrix are 5.92% higher than the traditional financial management control effectiveness indicators. There are 5 financial control effectiveness indicators including primary indicators and 15 secondary indicators including evaluation and budget execution. Therefore, in financial management, allocation of assets is among the weakest links, and differences such as the ability to manage capital are relatively large. So they also belong to the weak links that should get attention in the financial management of commercial banks. For the above three links, commercial banks should pay more attention to them and clarify the key content of financial management work.

#### **4. CONCLUSION**

In this paper, from the perspective of financial management innovation strategy, a judgment matrix of financial management evaluation based on the background of Internet finance is designed, and the method is deeply applied to the financial management work of commercial banks. The evaluation of financial control effect index in the traditional financial management system is 18.53, and for the financial control effect index in the judgment matrix of financial management evaluation is 24.45, which improves the financial management system by 5.92%. Overall, the financial management innovation effect is still significant, indicating that the judgment matrix of financial management evaluation designed in this paper is conducive to the implementation of financial management innovation strategy in the context of Internet finance. The use of Internet technology changes the management mode of commercial banks, optimizes the management system, and further promotes the development and progress of commercial banks.

## **ABSTRACT**

In order to construct the mainstream ideology of colleges and universities in students' thinking and political education, this paper combines artificial intelligence technology and designs an artificial intelligence-based thinking and political discourse analysis and evaluation system. Using artificial intelligence technology to innovate the discourse text, the discourse system of university's Civic Education is constructed, and the value judgment of the operation process of Civic Education discourse system is made, and the discourse evaluation and feedback mechanism is established. The simulation results showed that the online discourse utilization index of school A reached 92.3% and the discourse communication power reached 96.84%. It can be seen that the artificial intelligence technology has improved the spatial discourse power of college Civic Education and opened up the discourse education space.

## **KEYWORDS**

Artificial Intelligence Technology; Thinking political discourse analysis; Discourse utilization indicators

## **1. INTRODUCTION**

Ideological and political education discourse is a specific stage of historical development with the dual properties of educational attributes and ideology [1]. Under a certain ideological and political

education discourse field, educators can shape value education behaviors by means of communication and instill and persuade discourse to educated people according to certain educational laws and discourse norms. This type of discourse is a systematic generalization and theoretical enhancement of the practical discourse of ideological and political education, which has a crucial position in the discourse system of ideological and political education, stipulates the development direction of the whole discourse system, and is a form of discourse with the characteristics of advance prediction and professional rationality [2-3].

For a long time, teaching the discourse of socialist education is an activity of conducting ideological and political education by grasping the dynamics of modern political developments. For example, the literature [4] explores the role of public discourse in the changing process at a college, clarifying the importance of socialist political education. And it also analyzes the personal motivations and experiences of a foreign lecturer to improve the insight of ideological communication in educational institutions. Using the correlation method, the literature [5] identified the main features of the discourse process. The impact of ideological and political education discourse in terms of developer's ideology was determined by means of a questionnaire, which revealed the trend of time lapse. The literature [6] advanced the study of the politics of nutrition policy by analyzing political discourse. In the course of the study, the role of political discourse was emphasized, including a strong ideological discourse and the strategic deployment of economic actors. Thus, it can be seen that the current research on ideological and political education discourse is biased towards the political science perspective, and the interpretation of the discourse is not deep enough to grasp the relationship between the inheritance and development of the discourse.

Based on this, this paper designs an artificial intelligence-based discourse analysis and evaluation system for thinking and politics to enhance the discourse power of colleges and universities in students' thinking and politics education. In the process of design, firstly, the discourse text is innovatively innovated by using artificial intelligence technology, and the discourse system of college thinking and political education is constructed from exploring the laws of thinking and

political discourse, formulating the rules of thinking and political discourse, and opening up the channels of discourse. Secondly, value judgment is made on the operation process of the discourse system of Civic and Political Education, and discourse evaluation procedure and feedback mechanism are established. Finally, the feasibility of the system is verified through the analysis of simulation results, which demonstrates its superiority in the exercise of discourse and discourse rights in cyberspace. The artificial intelligence-based discourse analysis and evaluation system of thinking and politics improves the discourse regulation of universities in thinking and politics education, and can meet the needs of students' school management.

## **2. Intelligent Civic Discourse Evaluation System**

### **2.1. Innovative intelligent discourse system**

#### **2.1.1. Exploring the laws of Civic Discourse**

At present, teachers and students in the field of ideological and political education can produce discourse differences or even aphasia because students are ahead of educators in the use of the Internet, and they have mastered and are familiar with using the Internet as a medium for learning, communication and work [7]. However, educators have not yet been able to get out of the traditional language mode of civic education and cannot fully adapt to and integrate into this emerging network context. For this reason, college and university civic education educators should break the inherent discourse barriers, use artificial intelligence technology to innovate the discourse text in the discourse work of college and university civic education, further integrate the online discourse content beneficial to civic education, and realize the conversion of discourse so as to effectively disseminate the educational content.

#### **2.1.2. Developing rules for thinking and political discourse**

The original discourse rules are mostly based on the educator speaking and the educated listening to achieve the effect of education. To a certain extent, this ignores the acceptability of the educated. This kind of textual discourse rules of ideological education is not quite applicable to the interactive nature of the new era of network development, so the original discourse of ideological education

should be innovated [8-9]. Educators should grasp the interactive state of college students in terms of ideology, use intelligent information retrieval function to investigate and study various phenomena appearing in students, and integrate the information and give feedback to students. The dialogue between teachers and students on ideological and political education events is promoted and scientific and reasonable rules of discourse are formed.

### **2.1.3. Open channels of discourse**

The traditional discourse channels of college ideology education are facing the impact of information network media [10]. For this reason colleges and universities need to use natural language processing technology to promote the teaching reform of college Civic and Political Science theory courses, enhance the frequency of interaction of discourse, and carry out propaganda and education on ideological issues in class. By grasping the leadership of the discourse, it enables the teaching of ideological education discourse to form a process of repetitive transmission and gradually build a college ideological education discourse system adapted to the reality.

## **2.2. Establishing a discourse feedback mechanism**

In the context of the new era, it is obvious that only one-way communication of the discourse operation process of civic education is not enough, and it is also necessary to establish a feedback and evaluation mechanism to take care of the interaction and interaction between the two subjects of communication activities and improve the effectiveness of the discourse. The feedback mechanism of discourse evaluation based on artificial intelligence is a process in which the evaluator uses artificial intelligence technology to make value judgments on the operation process of the discourse system of civic education and its results according to certain evaluation standards and procedures, and gives feedback to the relevant subjects.

The process of establishing a feedback mechanism for evaluating the discourse of Civic Education is as follows.

(1) Unify evaluation standards. Establish discourse evaluation procedures and feedback procedures through artificial intelligence technology, and integrate the evaluation laws of Civic Education in

the process of program operation, so as to carry out objective evaluation and feedback with purpose.

(2) Construct the discourse system of Civic Education. The discourse system of Civic Education is divided into two parts: the constituent elements and the operation process, which are explored and interpreted in depth to reflect the inner mechanism of Civic Education discourse in a comprehensive manner.

(3) Establish a diversified evaluation mechanism. Through artificial intelligence technology to improve the availability of educational evaluation information, establish relevant supporting mechanisms, focus on highlighting the requirements for the expression and dissemination of the discourse of Civics and Political Science, and realize discourse evaluation. The process of establishment should follow the law of combining quantitative evaluation and qualitative evaluation to make a comprehensive evaluation of the teaching quality of Civics and Political Science teachers. Adding the feedback link of discourse evaluation in the operation of the discourse system of Civics education can promote the discourse system of Civics education to become an interlocking and circular system.

### **3. Analysis of Simulation Results of Discourse Evaluation**

Based on artificial intelligence technology, this paper combines intelligent discourse system and discourse feedback mechanism to analyze and construct the discourse power of colleges and universities in students' civic education, and designs an artificial intelligence-based civic discourse analysis and evaluation system. In order to verify the practical effect of the system, this paper conducts an experiment of analyzing the discourse power of Civic Education in School A and School B, where School A is the experimental sample and School B is the control sample. The effect of discourse power analysis of the experimental samples was tested by the indexes of discourse utilization power, students' discourse discrimination power and discourse analysis power. The test results are shown in Table 1.

**Table 1. Results of Discourse Detection**

Intelligent discourse system	School A	School B	Difference
Internet Discourse Utilization Indicators	92.3%	68.61%	+23.69%
Students' Discernment of Discourse	91.65%	73.98%	+17.67%
Discourse Analysis Power	93.44%	71.65%	+21.79%
Discourse Communication Power	96.84%	71.32%	+25.52%
Discourse Moderating Power	87.65%	64.54%	+23.11%
Discourse Impact	89.68%	59.12%	+30.56%

In terms of the discourse power in the cyberspace of university civic education, the index of online discourse utilization in School A is 92.3%, which is about 23.69% higher compared with 68.61% in School B. The discourse analysis power and discourse regulation power are 93.44% and 87.65%, respectively. It indicates that the artificial intelligence-based discourse analysis and evaluation system of Civics creates good conditions for universities to conduct ideological and political discourse education, and ensures the implementation of discourse evaluation and the overall improvement of Civics education quality.

In the exercise of discourse right, the discernment power of students in school B is 73.98%, while the discernment power of students in school A is as high as 91.65%, which can carry out effective communication dialogue of ideological discourse and is conducive to finding effective influence materials of ideological education. the discourse dissemination power of school A is 96.84% and the discourse influence is 89.68%, which indicates that the analysis and evaluation system of ideological discourse based on artificial intelligence In the process of improving the discourse communication power, the timeliness of the ideological information is preserved, which is conducive to the formation of the discourse of mainstream ideology in colleges and universities.

#### **4. CONCLUSION**

Based on artificial intelligence technology, this paper designs an artificial intelligence-based discourse analysis and evaluation system for civic discourse from the perspective of innovating an intelligent discourse system and establishing a discourse feedback mechanism. The effect of the system's discourse analysis is verified through the

analysis of simulation results. The simulation results show that: in terms of cyberspace discourse rights, the index of cyber discourse utilization in School A reached 92.3%. In terms of discourse rights exercise, the discourse communication power of School A is 96.84%, and the discourse discrimination power of students in School A is as high as 91.65%, which allows effective communication dialogues of civic discourse. The discourse analysis and evaluation system based on artificial intelligence can enrich the discourse content of Civic Education and improve the discourse occupation space of Civic Education in colleges and universities.

## **ABSTRACT**

In order to reduce the energy consumption of mechanical engineering in the context of big data, this paper proposes a circulating water pump frequency conversion energy-saving control optimization method based on the frequency conversion regulation technology. First, according to the actual pump parameters requirements, set the energy-saving operation mode, adopted the way of pump unit consumption analysis, combined with the support of frequency conversion regulation technology to set the control parameters, and finally completed the control optimization study, and on this basis for the power consumption of the pump situation to carry out tests. The results show that: under the same flow rate, the control optimization method can make the pump frequency control save 34kw. In the mechanical engineering transformation, the energy-saving effect of frequency regulation technology is obvious and brings significant economic benefits.

## **KEYWORDS**

Big Data Background; Variable frequency regulation technology; Mechanical Engineering; Energy saving retrofit

## 1. INTRODUCTION

With the current situation of energy shortage and environmental pollution becoming more and more serious, the problem of high energy consumption and high emission of mechanical engineering is becoming more and more prominent, and the work of energy saving and emission reduction in mechanical engineering has become urgent [1-2]. At present, most of the products have generally adopted intelligent control, so that the performance of the products in terms of environmental adaptability and economy of use has been continuously improved [3-6]. Nowadays, more and more people are devoted to the energy-saving transformation of mechanical engineering, in which variable frequency regulation technology is being gradually applied to mechanical engineering transformation as an efficient mechanical drive technology [7-9].

Mechanical engineering, as the mainstay of the enterprise, has a very high daily consumption of resources, and its energy-saving renovation has been an inevitable trend of development. The literature [10] emphasizes that the amount of energy consumption generated during the operation of mechanical equipment continues to increase, exposing the enterprise to a large cost drain. From a long-term perspective, it is necessary to develop an energy-saving renovation program for mechanical engineering, and to adjust the working mode of mechanical equipment in order to drive the production efficiency. The literature [11] shows that with the rapid development of science and technology and the use of fully automated technology, the energy consumption of mechanical equipment increases greatly and the amount of wasted energy gradually increases. When machinery and equipment are in operation, only about 70% of the electrical energy is put into production, and the remaining 30% does not play a substantial role. There are still many problems related to energy saving work constraints, and the current and future development of industry cannot be targeted at mechanical engineering to transform into a new engineering discipline.

Therefore, in this paper, the circulating water pump frequency conversion method based on the background of big data is used to transform the electric motor of mechanical equipment, and the

automated frequency conversion speed regulation scheme is executed after starting the motor, which finally achieves the effect of controlling energy consumption. In order to verify that the method proposed in this paper has strong operability, simulation experiments are also designed. The results show that the speed control achieved by adding a frequency converter is more energy-efficient than the method of adjusting the flow by closing the valve. Based on the frequency conversion regulation technology can be effective for energy-saving transformation of mechanical engineering.

## **2. Energy-saving control optimization method after frequency conversion**

### **2.1. Set energy-saving operation mode**

The essence of variable frequency regulation technology is energy saving. When setting the pump frequency conversion energy-saving operation mode, a process similar to the rated value of the pump set is used to operate according to the actual pump parameter requirements. When the pump is in a lower load range, the actual operating process deviates from the rated operating value, resulting in a large amount of wasted energy. In this operation condition, the control turbine set is operated with smooth parameters in the low load interval to enhance the feed voltage of the pumps and control the pumps to divide the pressure to other parts to reduce the waste of energy. When the circulating water pump is in the high load interval, the hydraulic coupling in the pump set is linked with the motor to form a high speed operation state.

In order to ensure the operational safety of the process and maintain the normal operation of the motor, the control motor retains a certain margin, when the rated working condition within the circulating water pump is greater than the actual working condition. The coupler in the circulating water pump allocates to the motor capacity of the water pump group to become larger, driving the unused energy drive to other parts, forming a stable cycle process. Take the load rate of circulating water pump set at full load condition as the evaluation index, set a motor power factor, and reduce the power value of the pump set when the circulating water pump has a large output power margin, forming an energy-saving operation mode.

## 2.2. Control optimization in combination with frequency regulation technology

Take the obtained basic unit of single consumption as the control index and set the open-loop vector control mode to drive the pump operation mode. Turn on the control power, set the switch of the inverter bus of the pump to the side switch, set the control type of the control loop in the inverter control panel to the switch vector control. Set the speed ramp pump rotation rate to 20s, cut off the fast bypass, refer to the parameters of the motor nameplate, set the voltage value to 1.2 times of the rated voltage, and set the overspeed parameter to a fixed value. Under the control of the above parameters, combined with the theoretical support of big data, the parameters formed are shown in Table 1.

**Table 1.** Circulating water pump parameters

Serial number	Name	Set the value
1	Carrier frequency	520Hz
2	Time constant	0.024
3	Pulsation frequency	320Hz
4	Output calibration current	1.2A
5	Output calibration voltage	1.5V

Under the parameter control, for its actual optimization, after closing the power switch of the circulating water pump, set the output speed of the pump to 1/10 of the rated speed. after verifying the direction of the water circulation of the pump, check the energy consumption values of other switches, and gradually load the load to the rated, and finally complete the study of the optimization of energy-saving control.

## 3. Analysis of the effect of variable frequency regulation transformation

In order to verify the actual effect of the energy-saving control optimization method after the frequency conversion transformation of circulating water pumps based on big data, the power consumption of the 2 regulation methods of pump flow speed control and valve control were tested using frequency conversion regulation technology. The water pump uses a load specialized inverter, which is installed in the electrical control cabinet of each pump of the device transformer station and leads the control signal to the PLC control system in the central control room. The frequency regulation module of the pumps

is added to the PLC control system to realize the purpose of directly controlling and displaying the operation frequency of submersible pumps in the central control room.

The height difference from the regulating tank to the pretreatment tank is 10 m, and the height difference from the air flotation collector to the biofilter is 8 m. Considering the theoretical calculation results and the actual influencing factors, it was decided to adopt 2 energy-saving effect test programs. The 2 centrifugal pumps (P1A, P1B) in the regulating tank ensure that the sewage can be delivered to the 10m high pretreatment tank, and the speed range is set at 80%, 90% and 100% of the 3 control parameters, and the 2 pumps control parameters are the same. The speed range of 2 centrifugal pumps (P2A, P2B) in the air flotation basin was set at the 4 control parameters of 70%, 80%, 90%, and 100%, and the control parameters of the 2 pumps were the same. The test results are shown in Table 2.

**Table 2.** Pump frequency regulation test results

Test Items		Operating frequency			
		100%	90%	80%	70%
P1A	Current/A	81	69	53	-
	Power saving rate/%	0	14.8	34.6	-
P2A	Current/A	78	64	51	45
	Power saving rate/%	0	17.9	34.6	42.3
P1A+P1B	Flow/m <sup>3</sup>	996	906	750	-
P2A+P2B	Flow/m <sup>3</sup>	1015	983	830	74.2

The operation frequency of 2 circulating pumps (P1A, P1B) in the regulating tank is controlled at about 80%, and the flow rate can meet the conditions of use of the device, and the power saving rate is about 35%. Based on the full power of 42kw, the power saving is about 15kw. 2 centrifugal pumps (P2A, P2B) in the air floatation basin are controlled to run at about 70% frequency, and their flow rate can meet the conditions of use, the power saving rate is 42.3%. In the same flow rate, the frequency control saves 34kw compared with the valve control. 4 submersible circulating water pumps The four submersible circulating water pumps are more energy-saving than the previous method of adjusting the flow rate by closing the valve after adding the inverter and realizing the speed control. It can be seen that the transformation of mechanical engineering based on the

frequency conversion regulation technology in the context of big data in this paper has strong operability, which saves certain energy consumption and brings considerable economic benefits for mechanical engineering.

#### **4. CONCLUSION**

This paper proposes a circulating water pump frequency conversion energy-saving control optimization method from frequency conversion regulation technology in the context of big data, analyzes the circulating water pump energy-saving transformation effect, and compares the operation performance of multiple pumps running in parallel with different number of variable speed pumps. The results show that the frequency conversion control saves 34kw of power than the valve control, and its power saving rate is about 35%, and the energy saving effect is the most significant when all variable speed pumps are used in the full flow variation range. In the context of big data, the energy-saving control optimization method of frequency conversion proposed in this paper has a good energy-saving effect for mechanical engineering transformation, which reflects the economy of frequency regulation technology and plays a significant role in reducing energy consumption in mechanical engineering.

## ABSTRACT

Under the background of artificial intelligence (AI) technology, the college civic education should enhance the knowledge and humanity of the curriculum, and tap the ideological value in the AI civic education curriculum from multiple perspectives. In this paper, the advantages, disadvantages, opportunities and challenges of AI integration in college students' thinking and political science education are explained in a comprehensive manner through SWOT analysis. The independent sample t-test is conducted to evaluate the AI's college course Civic Education through five dimensions. Among them, the investigational and control classes presented a difference of 0.05 ( $t=2.897$ ) in the dimension of home country sentiment, 0.05 ( $t=2.719$ ) in the dimension of scientific spirit, 0.01 ( $t=4.168$ ) in the dimension of professionalism, and 0.01 ( $t=4.168$ ) in the dimension of personal development. In the dimension of personal development, the investigational class and the control class showed a difference of 0.01 (4.109); in the dimension of thinking and political attitude, the experimental class and the control class showed a difference of 0.01 ( $t=3.749$ ), by comparing the differences, the students in the investigational class were slightly higher than the control class in reaching their thinking and political goals.

## KEYWORDS

Artificial Intelligence; Civic education for college students; SWOT Analysis; T-test

## 1. INTRODUCTION

The so-called "curriculum thinking politics" refers to the conscious, planned and purposeful design of teaching links and creation of educational scenarios in the teaching procedure of ideological and political education (IPE) subjects in various courses. In an indirect and implicit way, the moral norms, ideological understanding and political views recognized and advocated by the teaching subject are organically integrated into the teaching process [1-2]. The educational and teaching concept of transmitting IPE to the taught subject so that he or she can become a qualified person who meets the requirements of national development [3]. The teaching of professional courses provides a broad background of development and a deep disciplinary foundation for curriculum thinking and politics, and gives IPE a firm scientific force. The knowledge of ideology and political science and professional knowledge go in the similar course and form a synergistic effect is the core concept of curriculum thinking and politics [4-6].

Based on the background of AI technology, the purpose of the new era of college curriculum thinking and politics structure is to promote the operation of the essential commission of moral education, characterized by collaborative education, and the core issue is to adhere to the value leadership of college students. Literature [7] argues that improving the effectiveness of ideological and political theory courses has developed a hot issue of concern for many higher education institutions. Literature [8] proposed that practical teaching of ideological and political theory courses is a significant part of the teaching system of ideology and politics in colleges and universities, and is an effective carrier for cultivating students engaged in ideological and political work in colleges and universities. Literature [9] combined with AI technology and built an intelligent management system of IPE in colleges and universities based on AI, which supervises the classroom through intelligent identification of students' identity. In the literature [10], it is believed that the structure of

"macro-IPE" is formed by changing from "ideological and political curriculum" to "IPE of curriculum" with the whole staff as the main body, and the structure of "macro IPE" is realized. This has become an important direction of higher education teaching reform.

Based on the technical background of AI, this paper firstly applies the SWOT analysis method to the process of daily IPE of college students. The advantages and disadvantages, opportunities and challenges of integrating AI into the IPE of college students are analyzed, so as to strengthen the value guidance for the development of college students and enhance the scientific and effective integration of AI into the IPE of college students. Secondly, a system of AI ideological and political elements is constructed, which is divided into four primary indicators, namely, family sentiment, scientific spirit, professionalism and personal development, and 16 secondary indicators, such as "international vision" and "love for the Party and the country", and the meanings of each indicator are explained. Finally, the independent sample t-test was made through five dimensions of national sentiment, scientific spirit, professionalism, personal development and political thinking attitude to evaluate and analyze the political thinking education of AI college courses.

## **2. AI-based Civic Education for College Curriculum**

### **2.1. Analysis of the conditions of integrating AI into the IPE of college students**

SWOT is used to analyze the internal advantages and disadvantages, external opportunities and challenges of the current integration of AI into daily IPE of college students, and a comprehensive, systematic and accurate study is conducted. Then, combining with the examples of daily student work, targeted solutions are proposed, so as to strengthen the value guidance for college students' growth and enhance the scientific and effective integration of AI into daily IPE of college students.

#### **2.1.1. Analysis of the advantages and disadvantages of integrating AI into the IPE of college students**

##### **(1) Advantage Analysis**

AI is applied to education industry, using big data analysis and algorithms to carve out a map of college students' learning preferences and study habits, so it can realize accurate teaching and counseling. Currently, college counselors are the core members of college students' thinking and political education, and they are the organizers, implementers and instructors of students' work in higher education. However, at present, college counselors generally become "clerks" of various departments because their responsibilities are not clear. It is a common phenomenon in many colleges and universities that counselors are inefficient and repetitive in handling various daily tasks that can be changed by AI, but they do not have the energy to do a good job in student work and their own career planning and development, which is not conducive to the stable development of IPE work in colleges and universities. This is a mutual phenomenon in many colleges and universities, which is not conducive to the stable development of IPE work in colleges and universities. The AI technology can help reduce the burden of counselors and give them more energy to do the work of IPE and value leadership, which will certainly significantly expand the effectiveness of IPE work of college students.

## (2) Disadvantage Analysis

Counselors are the backbone of college students' IPE. The work responsibilities of the counselors cover nine aspects, including ideological and theoretical education and value guidance, the structure of the Party and the League and the class, the structure of the style of study, the management of students' daily affairs, mental health education and consulting work, online IPE, campus crisis response, career planning and employment and entrepreneurship guidance, and theoretical and practical research. Each work needs different models and algorithms to construct. The development of AI technology is far faster than the reform and development in the field of education, which may lead to mismatches in the process of integrating AI into college students' IPE, and there will be many technical difficulties to overcome. AI has advantages in helping college students with repetitive and simple operations of IPE. Every student is an independent individual, and each student's IPE has its own characteristics. The complexity of IPE is reflected in that it is not a simple formula input. In many cases, it requires in-depth heart to

heart talk between ideological and political educators and educatees to generate emotional resonance.

### **2.1.2. Analysis of the Opportunities and Challenges of Integrating AI into the IPE of College Students**

#### **(1) Opportunity Analysis**

The opportunity of integrating AI into the IPE of college students is reflected in the strong support of national policies. The State Council issued and implemented the Notice on the Issuance of the Development Plan of a New Generation of AI on July 8, 2017, which provides a solid policy guarantee for the integration of AI into the IPE of college students. With the increasing maturity of computer technology, AI technology has mature technical guarantee, both in terms of hardware and software. Nowadays, AI has also been widely used in various fields of life, such as the online customer service on many websites is a primary AI, i.e. an automatic responder, which meets the needs of users. These mature AI technologies also provide stable technical support for the better integration of AI into the IPE of college students.

#### **(2) Challenge Analysis**

Dialectics tells us that there are two sides to everything, and AI, as a new thing, is a "double-edged sword" with certain disadvantages. In the report "AI in Education: Challenges and Opportunities for Sustainable Development" published by UNESCO, it is mentioned that the market for AI in education will grow rapidly and AI will have a direct impact on learning styles, students' abilities and teachers' development, while also posing new challenges for educational equity, educational decision-making, educational policies, privacy and ethics. China's National Professional Committee on Governance of New Generation AI released the Code of Ethics for New Generation AI on September 25, 2021, with the aim of integrating ethics into the whole life cycle of AI and providing relevant ethical guidelines for natural persons, legal entities and other related institutions, etc. engaged in AI-related activities. While we vigorously study how to integrate AI into the IPE of college students, we should also anticipate the potential challenges, make appropriate responses, not be afraid of them, and turn them into motivation for continuous improvement. The principle of the main body of IPE refers to the fact that ideological and

political educators should fully respect the main position of the education subjects and pay attention to mobilizing their self-education in order to achieve the IPE goals when carrying out education activities. Among them, the subjective initiative of the educated is an extremely important factor that affects the effect of IPE. The technology of AI may be detrimental to the subjective initiative of college students and lead them to rely on AI.

## 2.2. AI thinking element system structure

This study analyzes the frequency of keywords of college curriculum thinking education from the Internet based on AI big data technology. The frequencies in descending order are "values", "intelligence", "personalization", "science and technology", "creativity", "humanistic", "responsibility", "active", "active", "outlook on life", "worldview", "patriotic", "work ethic", "labor", "critical", "practical", "self-confidence". It can be seen that in addition to focusing on students' mastery of scientific knowledge, the Civic Education of college curriculum under AI should also focus on ideology and morality, and the cultivation of values. In order to make the system of thinking and political elements of AI more comprehensive and objective, this study combines literature and theoretical thinking, and tries to reflect the system of thinking and political elements of AI as comprehensively as possible. From the perspective of students, the system is initially divided into four primary indicators, such as national sentiment, scientific spirit, professionalism and personal development, and 16 secondary indicators, such as "international vision" and "love for the Party and the country". As shown in Table 1.

**Table 1.** A system of thinking elements under AI

Tier 1 indicators	Secondary indicators	Indicator Meaning
The feeling of family and country	International Perspectives	To pay attention to cutting-edge knowledge in the field of AI, actively participate in international exchanges and broaden their knowledge horizons; to have a proper international perspective, understand world history and respect the diversity of world cultures
	Love of Party and Country	Embrace the leadership of the Communist Party of China, love the motherland and uphold national unity; internalise the feelings of love for the Party, love for the

		country and love for socialism; develop the concept of national interests above all else.
	National Spirit	Respect ethnic differences, maintain ethnic unity and social stability.
	Cultural Identity	Respect the excellent traditional culture of the Chinese nation, enhance cultural confidence, actively promote excellent traditional culture and establish a concept of cultural self-awareness.
Scientific spirit	Innovative thinking	Open-minded, with a sense of autonomy and social innovation, insistence on innovation and courage to innovate.
	Critical questioning	Dare to question and inquire, seek truth and authenticity, learn to look at issues dialectically, learn to think independently, not follow the crowd, and build a strong sense of questioning.
	Responsibility	Enhance the heart of responsibility and be courageous as having the spirit of dedication.
	Creativity	Good hands-on practical skills, with the ability to conduct scientific research in AI and to innovate practical works from an engineering and technical perspective.
Professionalism	Physical and mental health	A love of life, a love of sport, a cheerful personality, a correct approach to frustration and difficulties in life and good interpersonal relationships.
	Quality of Will	Develop good character and moral habits, establish a correct outlook on the three concepts, enhance personal moral qualities, cherish the life you have and be grateful.
	Academic Integrity	Respect academic achievements, respect scientific research, abide by academic norms, improve academic personality, abandon academic misconduct, and strive to become practitioners of good academic ethics.
	Professional ethics	Form a good professional ethos, maintain excellent professional style, love their work and have the quality of cultivation to serve the public and dedicate themselves to society.
Personal	Emotion	Learn to stabilise your emotions and be

Development	Management	able to face life's difficulties with a positive mindset and be able to maintain a good emotional state.
	Communication	Good at communicating with people, learning to complement each other's strengths and having strong communication and cooperation skills.
	Reflection	The ability to be reflective and self-critical, learning to identify their own problems and to develop themselves continuously.
	Lifelong Learning	Establish the concept of lifelong learning, enjoy learning, constantly update the knowledge structure and take the initiative to study the knowledge in the field of AI.

### 3. Evaluation Analysis of Civic Education of AI College Curriculum

The implementation of a blended teaching model for AI Civics courses has a beneficial effect on the improvement of students' moral education skills. An independent sample t-test was conducted on the five dimensions of family and country sentiment, scientific spirit, professionalism, personal development, and thinking and political attitudes. From Table 2, it can be seen that: the experimental and control classes showed a difference of 0.05 ( $t=2.897$ ) in the dimension of family and country sentiment. Comparing the differences, it can be seen that the post-test mean of the family sentiment dimension in the control class was 19.46, which was slightly lower than the post-test mean of the experimental class of 21.96. In the scientific spirit dimension, the experimental and control classes showed a difference of 0.05 ( $t=2.719$ ). The difference between the experimental and control classes was 0.01 ( $t=4.168$ ) for the professionalism dimension. The difference between the experimental and control classes was 0.01 ( $t=4.109$ ) for the personal development dimension. Comparing the differences, it can be seen that the posttest mean of the personal development dimension was 30.24 in the control class, which was lower than the posttest mean of 33.49 in the experimental class. in the Civic Attitude dimension, the experimental and control classes showed a difference of 0.01 ( $t=3.749$ ). Comparing the differences, it can be seen that the posttest mean of the personal development dimension was 8.98 in the control

class, which was lower than the posttest mean of 10.94 in the experimental class.

**Table 2.** Five dimensional independent sample t-test

Dimensionality	Classes	Number of people	Average value	Standard deviation	Standard error of the mean	t
The feeling of family and country	Experimental Classes	45	21.96	0.942	0.145	2.897
	Control Classes	40	19.46	1.487	0.316	
Scientific spirit	Experimental Classes	45	25.99	1.648	0.249	2.719
	Control Classes	40	23.47	2.356	0.459	
Professionalism	Experimental Classes	45	34.96	1.356	0.269	4.168
	Control Classes	40	31.94	2.647	0.459	
Personal Development	Experimental Classes	45	33.49	1.465	0.249	4.109
	Control Classes	40	30.24	2.769	0.517	
Thinking attitude	Experimental Classes	45	10.94	0.579	0.155	3.749
	Control Classes	40	8.98	1.304	0.249	

#### 4. CONCLUSION

Civic education of college courses of AI should not only pay attention to the innovation of scientific and technological activities and inspire students' scientific thinking, but also to cultivate students' professional ethical awareness and the spirit of serving the people. Civic education of college courses based on AI needs to bring into play the characteristics and advantages of professional courses from the perspective of value leadership. Through the evaluation and analysis of the Civic and Political Education of college courses based on AI, from the dimension of family sentiment, the experimental class and the control class present a difference of 0.05 ( $t=2.897$ ), and the mean value of the post-test of the control class is slightly lower than the mean value of the post-test of the experimental class 2.5; in the dimension of scientific spirit, the experimental class and the control class present a difference of 0.05 ( $t=2.719$ ), and the mean value of

the post-test of the control class is slightly lower than the mean value of the In the dimension of professionalism, the experimental class and the control class showed a difference of 0.01 ( $t=4.168$ ), and the posttest mean of the control class was slightly lower than that of the experimental class 3.02; in the dimension of personal development, the experimental class and the control class showed a difference of 0.01 (4.109), and the posttest mean of the control class was slightly lower than that of the experimental class 3.25; in the dimension of thinking and political attitude, the experimental class and the control class showed a difference of 0.01. In the dimension of thinking and political attitude, the experimental class and the control class showed a difference of 0.01 ( $t=3.749$ ), and the posttest mean of the control class was slightly lower than that of the experimental class by 1.96. The comprehensive analysis shows that the students in the experimental class were slightly higher than the control class in reaching their thinking and political goals. In particular, the dimensions of professionalism, personal development and thinking and political attitudes showed higher significant levels, probably because these three dimensions are related to students' real life, more deeply experienced and more effective.

## **ABSTRACT**

In order to make the college construction funds play the most effective role, reduce the construction cost, and minimize the consumption of human and material resources to achieve high social benefits, we must pay attention to the control of construction cost in college construction projects. In this paper, the current problems of cost management in university construction are analyzed in depth. And on this basis, based on the big data technology, the fuzzy mathematical method is used to estimate the engineering cost control in the design stage and implementation stage of college engineering construction. The experiment collects a total of 10 characteristic factors and adopts 10 groups of college plant and storm playground with similar characteristics as examples for cost estimation. According to the 10 engineering characteristic factors, the highest cost estimation is 1310 Yuan/m<sup>2</sup> for the number of floors 2, eave height 9.8 meters, column distance 6.9 meters, span 11.7 meters, floor area 3140 square meters, shear wall structure form, aluminum alloy doors and windows, face brick decoration standard, block wall material, and brick strip base surface.

## **KEYWORDS**

Big Data Technology; Higher Education; Engineering Cost Management; Cost estimate

## **1. INTRODUCTION**

Cost control of college engineering construction projects is a very important task in college infrastructure management [1]. In the whole process of implementing college construction projects, the preliminary cost control has a great influence on the overall cost [2-3]. How to determine and control the project cost in project management, use construction funds reasonably and efficiently, avoid losses and wastes, and reduce the project operation cost has become an important task of the current engineering construction work in universities [4-6]. The literature [7] analyzed the problems in cost control based on the management of university infrastructure construction, from the actual engineering cases in each stage of project, design, bidding to construction. The literature [8] argued that

cost control runs through the whole process of university infrastructure projects, which is a dynamic management process. The literature [9] discussed the improvement strategies of engineering construction cost in colleges and universities from the aspects of basic management system, internal control system of decision-making, survey and design control system, management system of budget estimate and project cost control, supervision and accountability system, etc.

This paper firstly analyzes the current situation of cost management of college engineering construction, which is mainly manifested by too much administrative intervention, unreasonable institutional configuration, insufficient professional staffing and low management level; secondly, the implementation of the pricing model of college construction projects is not transparent enough and the information management of engineering cost is relatively backward. In view of this, based on the big data technology, the fuzzy mathematical method is used to describe the known similar projects, so as to estimate the cost of college engineering construction.

## **2. Analysis of the current situation of engineering construction cost management in colleges and universities**

### **2.1. Lower management level**

(1) The competent departments of colleges and universities and school leaders have little awareness of the economic benefits of engineering construction cost investment fund management. The focus of school management is teaching and scientific research, so the leaders are more concerned about the progress of the project, completion date and whether students can enroll on time, but neglect the control of the whole process of project cost, which affects the management input of project management personnel for cost control.

(2) Lack of communication and coordination among functional departments. Due to the lack of communication and mutual cooperation among departments of infrastructure construction, national capital, finance and faculties, there are often incomplete functions of construction projects, too many process changes and cost costs far exceeding contract costs.

(3) Due to the tight schedule and heavy tasks of the capital construction projects of colleges and universities, there are phenomena of one person working in multiple posts and overload. The instability of the managerial team also causes the lack of institutional constraints on their management behavior, and it is also difficult to effectively supervise the quality of engineering projects and the effect of investment. For example, on-site construction management personnel have to inspect the site, make on-site visas for concealed works, audit the project cost, and keep the relevant information of the project. In the case of personnel overload and unclear job responsibilities, job functions cross, infrastructure project management once the problem of which link, the management personnel are prone to tug of war between each other, the phenomenon of shifting the blame to each other, so that the work of cost control is difficult to continue. In addition, the lack of knowledge of engineering cost management, the lack of professional quality and the lack of legal awareness of the managers in the actual work will also cause the defects of cost management.

## **2.2. Lack of transparency in the implementation of pricing models for university construction projects**

Although the construction of Chinese laws and regulations on regulating the behavior of all parties in the construction market is being gradually strengthened, the reform is not yet in place due to certain defects in the current pricing model, and it is not in place in the process of cost management implementation. Under the current engineering pricing model, the engineering costing personnel mainly calculate the quantity of works according to the engineering drawings and derive the unit price and other data, so as to finally find out the project cost, but this pricing model is not conducive to the transformation of government functions and the competition of micro-entities. From the above government functions, if the government pricing color is too strong, then it will inevitably cause the government to control the engineering cost and interference. These factors can be reflected as the excessive use of government power under the market economy. From the perspective of competition of micro subjects, enterprises should be the main body of market competition. If the enterprise is not the main body of product pricing, the system related to the pricing of engineering cost according to the qualification level of

the enterprise and the average labor level of the society will seriously hinder the enterprise to participate in the real market competition environment. Enterprises thus lose their creativity and vitality, and eventually limit their development in the market economy. Under this pricing model, there are sometimes illegal behaviors such as corruption of university leaders, project bid-rigging, and unqualified project quality.

### **2.3. Engineering cost information management is backward**

With the application of information technology in various industries, the reform of engineering cost management continues to deepen. The systems and businesses of engineering cost are becoming more and more complex, and the traditional manual management can no longer meet the current needs, which greatly limits the development of engineering cost. In terms of engineering cost information management, the current engineering cost coding and classification are complicated due to the process, so engineering cost personnel have to repeat the paper operation every time, which is easy to cause errors in the data and cannot be improved in efficiency. In addition, if the needs of information system developers and related personnel cannot be communicated in a timely manner, the advantages of information resource sharing cannot be achieved in this environment, not to mention the efficiency of cost management. The development of the construction of engineering cost information network is also relatively slow. The current engineering cost is mainly for professional consulting companies to investigate the use of the menu of business is very limited, mainly company introduction, bidding documents, quotations, cost management system and other superficial information, but also the lack of collation and analysis of this information.

### **3. Estimation of engineering construction cost of universities based on big data technology**

It is difficult to estimate the cost of a project accurately, especially in the early stage of construction. In the office and teaching buildings of university buildings, most of them are high-rise buildings. Generally speaking, for investors need to accurately estimate how to save cost and reduce risk for such projects with large investment and long construction period. Therefore, we are considering to choose the

buildings such as internship plants and storm playgrounds of universities for example based on big data technology. The characteristic factors considered are: number of floors, eave height, column spacing, span, total building area, structural form, door and window type, decoration standard, wall material and floor type, total 10 characteristic factors, among which the first 5 are quantitative factors and the last 5 are qualitative factors.

The basic idea of the estimation method is that the fuzzy mathematical method based on big data technology describes the known similar projects, and the fuzzy known project feature values are used as the input values of the network after information diffusion processing according to the requirements. The cost per square meter of the known project is used as the target vector of the network, and then the network is trained to estimate the cost per square meter of the estimated project by inputting the characteristic values of the estimated project into the trained network. Using the square meter cost of the characteristic factors as the network output and the rest as the network input, 10 groups of college plants and stormy playgrounds with similar characteristics are collected as examples, and the final budget cost is derived based on the 10 engineering characteristics.

From Table 1, it can be seen that the highest cost is estimated to be RMB 1,310/m<sup>2</sup> for a 2-story building with an eave height of 9.8 m, a column spacing of 6.9 m, a span of 11.7 m, a floor area of 3,140 m<sup>2</sup>, a structural form of shear wall, a door and window type with mainly wooden doors and aluminum alloy, a decorative standard of face brick, a wall material of block, and a brick strip base surface. In addition, the lowest cost is estimated to be RMB 512/sq.m. for 1-story, eave height of 5.8m, column spacing of 5.5m, span of 11.7m, floor area of 1491 sq.m., structural form of brick and concrete, door and window type mainly of security door plastic, decoration standard of clear water wall, wall material is light partition wall, and reinforced alkaline pile floor.

**Table 1.** Estimated construction costs based on big data technology for 10 characteristic factors

Group	The layer number	Eaves high (m)	Column spacing (m)	Span (m)	Surface area (m <sup>2</sup> )	Structural forms	Window and door types	Fitting standards	Wall	Ground	Cost estimate (Yuan/m <sup>2</sup> )
Group 1	1	5.4	4.1	12.1	1004	Framework	Wooden door	Brushed stone	Hollow bricks	Brick bar base	704
Group 2	1	5.3	5.8	7.1	2349	Brick	Wooden door	Face tiles	Hollow bricks	Rebar	649
Group 3	1	4.3	4.8	14.6	1967	Masonry	Aluminium	Coatings	Blocks	Sheet raft	1047
Group 4	2	9.5	6.1	13.1	1264	Brick	Wooden door	Coatings	Blocks	Rebar	597
Group 5	3	14.1	7.3	10.1	4710	Masonry	Anti-theft doors	Coatings	Hollow bricks	Sheet raft	1197
Group 6	1	4.2	5.7	8.4	2619	Shearwalls	Wooden door	Clearwater Wall	Blocks	Sheet raft	906
Group 7	2	9.3	4.9	9.4	3487	Masonry	Anti-theft doors	Coatings	Blocks	Rebar	994
Group 8	1	5.8	5.5	11.7	1491	Brick	Anti-theft doors	Clearwater Wall	Blocks	Rebar	512
Group 9	1	4.9	5.7	12.7	2850	Framework	Aluminium	Brushed stone	Hollow bricks	Brick bar base	797
Group 10	2	9.8	6.9	11.7	3140	Shearwalls	Aluminium	Face tiles	Blocks	Brick bar base	1310

#### 4. CONCLUSION

The importance of construction project cost estimation in the construction of university engineering projects has been increasingly emphasized by all parties involved in construction activities. In this paper, based on big data technology to estimate the cost of college construction, engineering characteristics are used for the idea of estimation, and the final budget cost is derived based on 10

engineering characteristics factors. Namely, the highest cost is estimated at 2 storeys, eave height of 9.8 meters, column spacing of 6.9 meters, span of 11.7 meters, floor area of 3140 square meters, shear wall structure form, wooden doors and aluminum alloy doors and windows, face brick decoration, block wall material, and brick strip base surface of 1310 yuan/square meter. In addition, the lowest cost is estimated at 1 story, eave height of 5.8 m, column spacing of 5.5 m, span of 11.7 m, floor area of 1491 m<sup>2</sup>, brick and concrete structure, security doors and windows, clear water wall decoration, lightweight partition wall material, and reinforced alkaline pile floor at RMB 512/m<sup>2</sup>. The estimation method designed in this paper finally realizes the construction cost estimation of non-deterministic projects of universities based on big data technology.

## **ABSTRACT**

Under the influence of diversified music environment, the existing music teaching mode needs to be innovated urgently. This paper creatively proposes an intelligent music operation and maintenance system based on the big data cloud platform technology. In order to clarify the reform ideas, the classroom perception of college music majors is used as a research model to analyze the reform and innovation landing point. According to the teaching records of big data music cloud platform, the average score of teachers' perception is 7, and the average score of students' perception is 5.2. In terms of the percentage of difficulty distribution, vocal courses accounted for 35%, foreign music history for 20%, introduction to art for 18%, Chinese music history for 17%, and basic music theory for 10%. This shows that music teaching reform should focus on student-level access to improve students' music appreciation and evaluation skills.

Big Data Cloud Platform; Diverse musical environment; Music Cloud Platform; Music Class

## **1. INTRODUCTION**

Music, as an important part of quality education, is an important subject in compulsory education and college education, and permeates many multicultural concepts in teaching [1].

Multiculturalism started late in music teaching in Chinese colleges and universities, and although the concepts were permeated, the development of students' creativity and comprehensive literacy was neglected [2]. With the high development of society, music teaching in colleges and universities should also change its concept, carry out effective reforms, and focus on cultivating students' literacy. How to carry out music teaching in multiculturalism is a question that college teachers need to think deeply about [3]. Multiculturalism is the product of the intermingling of world cultures, and with the increasing world communication, people's national consciousness has been developed, and multiculturalism has received great attention in education [4]. From the literal interpretation, multiculturalism is the exchange and collision between different cultures. In the face of a complex and changing environment, national cultures seek development in the midst of impact, which in turn also generates new cultures. In such a social context, national cultures have proposed to build multiculturalism in order to adapt to the development of society, which is determined by national conditions and social environment. The concept of multiculturalism has promoted the development and progress of society and has become an important phenomenon in the intermingling of national cultures [5].

Music has its distinctive regular characteristics, and from this point of view music diversity education is undoubtedly smooth. Scholars and researchers concerned have conducted in-depth studies on multicultural music and have extended it to teaching with fruitful results [6]. In addition to its own regularity, music should also have a global character. Chinese music art has a long history of development and has very rich musical resources, and the continuous integration of these musical resources has enabled the formation of musical culture [7]. In the context of the current global integration development, the integration and exchange of various countries in various aspects are becoming closer and closer. One of the more important aspects is the exchange of musical cultures, which has led to the formation of a diverse and integrated musical culture [8]. In the context of the fusion of musical cultures, the musical arts can be made more colorful. It plays an important role in promoting students' understanding of their own culture, as well as maintaining respect for other cultures and a serious attitude of learning.

This paper analyzes the problems of music teaching at the present stage, and constructs a big data cloud platform music intelligent operation and maintenance system to guide teachers' music classroom education. At the same time, music students with profound music literacy in art colleges and universities are selected as the research samples, and the evaluation perceptions of teachers and students on the classroom are analyzed according to the teaching records of the Big Data Music Cloud Platform. The difficulties of music teaching in colleges and universities are further analyzed to find out the focus of reform, so as to propose strategies for music teaching innovation. This paper uses music students' teaching reform as a model to provide some reference for music and non-music teachers and students' music classroom teaching reform.

## **2. Music teaching mode reform ideas**

### **2.1. Analysis of the current situation of music teaching**

Teaching under the concept of multiculturalism provides equal opportunities to enjoy music education regardless of color, gender, or religious beliefs. In music teaching, although the progress of spiritual civilization has promoted the development of multiculturalism in colleges and universities, there are still many problems: first, neglecting multicultural teaching. In the actual music classroom, teachers focus more on teaching professional theoretical knowledge, but neglect the study of different ethnic cultures, which limits the scope of students' knowledge and creative talents [9]. Teaching under the concept of multicultural music education should be based on cultivating students' appreciation and aesthetic skills. The concept of teachers focusing only on teaching materials and taking grades as the standard will hinder the development of multicultural music teaching and is not conducive to the overall development of music. Second, the content of teaching materials needs to be improved. Throughout today's music teaching materials, there is a single system, a single teaching method, a lack of extra-curricular extension and multicultural supplementation, and no effective measures to carry out training for students [10]. China is a country composed of 56 ethnic groups, and numerous excellent works with great ethnic characteristics have emerged from ethnic development, such as Xinjiang's "By the Ili River" and Tibetan's "Dottalma". However, few

teachers really pay attention to the expression of ethnic music, which in turn inhibits the development of ethnic music. Third, the concept of global development is lacking. In the process of continuous integration of the world economy, the intermingling of cultures cannot be ignored. Music knows no boundaries, and good music can convey emotions and can resonate with people. However, the introduction of international music such as pop blues and jazz in Chinese music teaching has obvious shortcomings and cannot meet the needs of today's diversified music. In conclusion, music teaching must change the single teaching status quo and encourage the development of multicultural music in order to cultivate students' musical literacy.

## **2.2. Big data cloud platform music intelligent operation and maintenance system**

(1) Establishing a multi-source integrated data transmission mechanism

The intelligent operation and maintenance system is huge and complex, which is jointly operated by multiple systems of multiple majors (each major forms its own system to constitute independent data sources) and plays a strong supporting role for music teaching work. The intelligent operation and maintenance system is based on safe and reliable data collection and control standards and technologies, realizing the safe transmission and acquisition of multi-source data of each profession and transmitting to the big data cloud platform through the distributed data bus.

(2) Establishing an open, shared, secure and stable big data cloud platform

The platform adopts distributed computing architecture and relies on cloud storage, virtualization and big data technology to realize real-time processing and deep mining of massive data for music data collection and operation and maintenance. The platform makes comprehensive use of the existing hardware resources, which can effectively save hardware storage space and improve data processing efficiency. As the platform support of the intelligent music system operation and maintenance system, the big data cloud platform plays the role of bearing down and starting up. It receives a large amount of collected data from the equipment layer for integration and analysis, and provides computing, storage, network

resources and big data mining and analysis capability support for the upper layer, so that information resources can be fully shared and integrated.

### **2.3. Teaching content reform based on cultural diversity**

In the context of the new era, students' learning should have a new spiritual outlook. Music not only enables students to develop a healthy body and mind, but also serves as a bridge to the world of communication. Through the expression and learning of music, it can purify students' minds and form a new humanistic spirit. Music culture is attached to the whole process of students' music learning, and it not only brings students a new realm of musical thought, but also forms an important musical atmosphere in which they can feel the richness of teachers' teaching contents while conducting different musical and cultural forms and fusion learning process. The teacher's teaching mode should include the content of the world music curriculum, or the appreciation of African, classical, European and American music in the classroom, so that students can feel the difference between Chinese and foreign cultures and the different morals of musical expression.

### **2.4. Lifelike teaching model into the classroom**

Due to the regional influence of diverse music teaching, the content of Chinese teaching is infiltrated by Western culture, making students feel jumpy in their thinking when learning. In order to better adapt multicultural music education to the real development of students, music teaching should be integrated with culture according to students' actual lifestyles and habits, and incorporated into the music classroom using a lifelike teaching model. Teachers can incorporate teaching practices that allow students to learn music outdoors, for example, by taking students into natural settings to experience the comforts of the natural environment and the different contexts that music brings. Teachers can also play "Blue Sky" to allow students to experience the melodies and different musical connotations and express their own opinions to form new experiences of music learning.

### **3. Innovation of teaching mode based on big data cloud platform music intelligent operation and maintenance system**

#### **3.1. Analysis of the difficulties of teaching music in high schools**

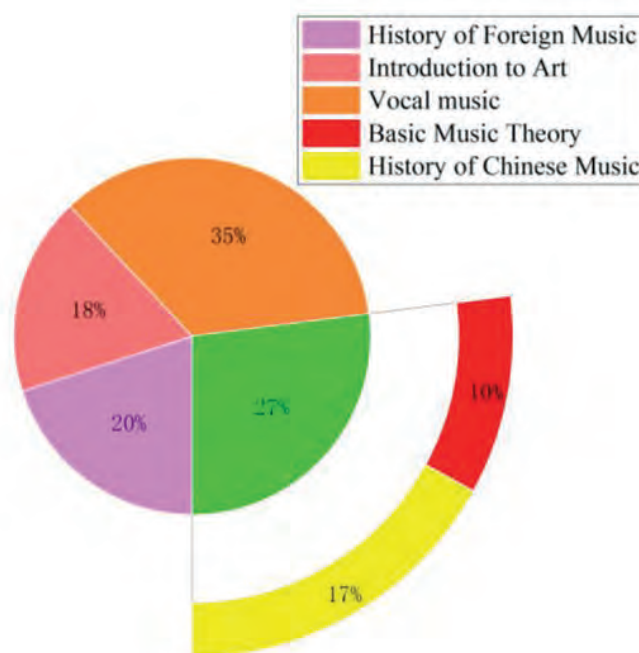

In order to study the method of music teaching reform in a diversified music environment, this section builds a big data cloud platform music intelligent operation and maintenance system. Using music majors and their teaching modes in art college institutions as a model, five college courses in basic music theory, vocal music, Chinese music history, foreign music history, and art introduction studies were retrieved in the big data music cloud platform as sub-samples, and the performance of teachers' teaching scores and teachers' and students' course evaluations were collected according to the cloud platform usage records for analysis to determine the focus of reform. The teacher and student perception level was assigned a score of 10.

The attitudes of teachers and students captured in the Big Data Music Cloud Platform are shown in Table 1. The average teacher perception score is 7 and the average student perception score is 5.2, which is in the middle of the range overall. Since art college students have already received systematic music theory training before art exams, their perception scores for courses such as basic music theory and introduction to art are 7, which are highly rated. In contrast, the perception ratings for courses such as foreign music history and vocal music courses were between 3 and 4, which were not high. This is due to the complexity of key words, large system, little practical training and insufficient training in these courses, for which the reform of music teaching mode should focus on the indicators with few ratings and optimize the teaching mode. At the teachers' level, because the academic level of college teachers is almost all at graduate and doctoral level, there is basically no difficulty for teaching contents like theory, such as basic music theory, Chinese music history and introduction to art, which have a rating range between 7 and 8, indicating that teachers have rich theoretical savings. For the more practical vocal courses, the perception rating is only 5, which indicates that the current music teaching is poor in practice, and both teachers and students are not trained in their abilities.

**Table1.** Attitude capture of teachers and students on big data music cloud platform

	Basic Music Theory	History of Chinese Music	History of Foreign Music	Introduction to Art	Vocal music
Teacher perception rating	7	8	7	8	5
Student perception rating	7	5	4	7	3
Summary of perceptual keywords	Basic and easy to understand	Complex and difficult	Complex, large system and obscure	Miscellaneous, abstract	Less practical training and insufficient training

The distribution of the perceived difficulty of music is shown in Figure 1. In basic agreement with the above table of big data music cloud platform teacher and student attitudes capture, students think that vocal music course is the most difficult to learn, accounting for 35%, foreign music history accounts for 20%, and general art theory accounts for 18%, further arguing that the current diversified music environment music teaching should focus on these three aspects, dedicated to improving students' sense of classroom access.

**Figure 1.** Distribution of difficulty in music perception

### **3.2. Innovative Strategies for Music Teaching**

Based on the background of diversified music environment, teachers should put students at the center of education in the process of changing the inherent teaching methods, and be able to apply innovative thinking to the music teaching mode and form important innovative strategies. Under the new teaching model, students' musical thinking is constructed, their musical emotions are inspired, and they are able to experience the musical expression situation, feel the charm of music and the shock brought by music in the musical atmosphere created by the teacher. Students gradually develop musical learning values and creative musical thinking under the guidance and evaluation of the teacher.

#### **(1) Contextualized teaching mode to develop students' music literacy**

Teachers can use technological equipment and information technology to gradually integrate modern teaching power into the classroom teaching model and create contextualized teaching models for students. Teachers can make music learning content and learning difficulties in the form of micro-lessons and involve students in the production of videos on their own initiative. Students should develop a process of musical and cultural exploration and appreciation of musical works, and through making videos they should constantly generate musical associations and musical creations, and be able to add their own musical and cultural connotations and understanding of musical knowledge. This process of forming innovative thinking adds more highlights to music video production, which leads to the pooling of knowledge and effective appreciation of works. Students can share and exchange learning through this multimedia context, thus developing their own musical literacy.

#### **(2) Construction of students' own musical connotations**

Reform in music is about changing students' learning habits and allowing them to actively explore the mysteries of the music field. Innovation in music is about getting students to think about diverse learning methods and improving their own practical skills and innovative thinking. Students' own understanding of music's unique perspective becomes the key to its development, and should be

combined with the innovative content of teachers' teaching models to continuously explore more ways of learning, increase the exploration of music culture, and strengthen their own musical learning initiatives so as to achieve the process of purifying the mind. Teachers should implement teaching methods for individual students while increasing the totality of learning, so that students can dare to express themselves and express music. Students can participate in music lectures and music interviews to communicate and learn about musical diversity. They can also participate in music theme exhibitions and lectures by famous musicians outside the classroom to achieve music culture penetration.

### (3) Emphasis on evaluation analysis

Popular music can be found everywhere in life, in schools, homes, and in various public places. However, we know that because of the different cultures, environments, and social contexts in which it is produced, the listenability and content of popular music varies, and some popular music may even influence the values of secondary school students. Therefore, it is important for teachers to teach students how to identify the best and worst works of popular music in the classroom, to respect each student's interest in different types of music, and to respect individual preferences while grasping overall taste. Teachers should actively encourage students to boldly analyze and evaluate new period works based on the various musical and cultural knowledge they have learned in the classroom, incorporating their own views on the works, and laying the foundation for students to enhance their music appreciation skills as a lifelong ability to learn music.

## **4. CONCLUSION**

In this paper, to investigate the reform method of music teaching mode in diversified music environment, a big data cloud platform music intelligent operation and maintenance system is built to record teachers' classroom. By selecting the classroom teaching of music majors in art colleges as the target of the study, the teacher and student evaluations of the classroom were analyzed based on the teaching use records of the big data music cloud platform, and then reform strategies were proposed. In the student-level ranking of the distribution of difficulty of different courses, the percentage of those

who considered vocal courses difficult was 35%, foreign music history was 20%, and introduction to art was 18%, and the perceived ratings of foreign music history and vocal courses, etc. were between 3 and 4. It can be seen that music teaching mode reform and innovation should be based on students' classroom acquisition, and we should continue to strengthen the depth and breadth of teaching research and focus on the combination of theory and practice. In order to effectively teach music culture in the context of diversified music environment, teachers should have rich knowledge reserve and be good at using different teaching methods to teach accurately, imaginatively and vividly in order to improve the quality and construct level of the classroom and increase the cultivation of students' music skill literacy.

# Cultivation of students' vocational ability based on innovative teaching of e-commerce in higher education in the context of big data

---

**Bo Li\***

School of E-commerce and Logistics, Changjiang Polytechnic.

Wuhan (China).

E-mail: [SvisonLee163@163.com](mailto:SvisonLee163@163.com)

---

## **ABSTRACT**

In order to comprehensively improve the vocational ability of e-commerce students in higher education institutions, this paper conducts an in-depth analysis and investigation on the innovation of teaching programs for vocational ability training of e-commerce students in higher education institutions under the background of big data. At the beginning of the study, the problems in the current teaching mode are analyzed, and then the scheme of this paper is proposed based on the employment-oriented approach by obtaining the vocational ability demand of talents in e-commerce enterprises according to big data. In the enterprise recruitment description, the high-frequency words in order are operation ability accounting for 43%, online store design and laying ability accounting for 30%, stress resistance ability accounting for 22%, and sociability ability accounting for 5%. This paper starts from the enterprise demand layer, which helps to locate students' career training ability more precisely, helps to improve students' competitiveness in the workplace, and helps to improve the teaching quality of e-commerce professional courses indirectly.

## **KEYWORDS**

Big Data; E-Commerce Major; Teaching Innovation; Student Vocational Competence

## 1. INTRODUCTION

In today's era, student employment is gradually developing into student entrepreneurship, but on this basis there is a lack of vocational competencies. Although higher education institutions focus on the quality of students' innovation and entrepreneurship spirit, there is a misunderstanding of vocational ability, which requires universities to pay attention to students' vocational ability first [1]. At the same time, there are some problems in the social environment, such as the lack of high-quality innovation and entrepreneurship training atmosphere, the lack of innovation and entrepreneurship practice conditions, the lack of support for students' innovation and entrepreneurship, and the lack of institutional guarantee and resource support for innovation education on-the-job culture [2]. E-commerce is a business model that provides products or services to customers and uses the Internet to benefit from them. Although this business model does not require finding a fixed office for traditional entrepreneurship and simply using a proven third-party entrepreneurial platform, this does not mean that there is no competence threshold for e-commerce entrepreneurship [3]. E-commerce entrepreneurship mainly uses virtual network domain Internet technology, so college students in higher education institutions need to learn e-commerce skills such as online store design, computer troubleshooting, network troubleshooting and other basic computer skills first in e-commerce entrepreneurship innovation [4]. At present, e-commerce is usually divided into web port and app port, and teachers should cultivate students' skills learning according to the actual needs in their lectures, so as to promote students' e-commerce entrepreneurship to get success, shrink the possibility of failure, and reduce the difficulties of entrepreneurship or employment.

As a form of online business, e-commerce requires both offline traditional companies to cooperate with stocking, and online marketing to operate. For individual online stores to operate elements such as products, logistics, financing, partners, and team members, careful organizational measures should be taken as needed [5]. In traditional entrepreneurship, it usually requires prior planning of the business, building organizational structure, directing employees, and regulating matters in various departments within the business. In contrast, in e-commerce entrepreneurship, students in higher

education institutions need to learn extra in management qualities [6]. E-commerce is closely related to information technology, so students in higher education institutions need to have the ability to be informed of information sources, and at the same time need to filter and purify, process and handle information, and then use it successfully [7]. Students in higher education institutions need to keep abreast of the store operations and functioning in their e-commerce ventures, so that they can deal with any accidents in the store in time.

This paper firstly analyzes the current problems in the teaching of e-commerce in higher vocational institutions, and finds that the current teaching mode generally has problems such as emphasis on theory rather than practice, lack of advanced teaching content, and professional curriculum to be improved. According to the characteristics of big data data capture, the demand for e-commerce talents is used as a keyword to obtain the demand for talents of enterprises, so as to position the training program of e-commerce majors. Finally, we propose four employment-oriented talent training teaching strategies, which are to teach students according to their talents, respect students' development characteristics, strengthen students' employment guidance by following good advice, establish systematic training system for teachers, and organize innovation competition for e-commerce majors to stimulate students' learning and inquiry.

## **2. Analysis of the problems in the teaching of e-commerce in current higher vocational institutions**

### **(1) Emphasis on theory, not practice**

At present, although most higher education institutions are aware of the importance of e-commerce profession, there is still room for improvement and perfection in the specific teaching methods. From the level of teaching concept, there is a very serious problem that emphasizes theory but not practice. Many institutions of higher education do not have a good understanding of the importance of practical teaching. As a higher vocational institution, especially a private one, one of its most important teaching tasks is to improve students' practical ability, because practice is the basis of innovation and improvement [8]. However, at present, there are many higher vocational institutions that habitually weaken the importance of

practical teaching work in the process of cultivating e-commerce professionals, and the time, energy, financial and material resources invested in practical teaching are very little in many aspects. This conceptual drawback of higher vocational institutions will certainly affect the practical application ability of college students, and then affect the employment success rate of college students. With the influence of big data, today's society has very high requirements for the practical ability of e-commerce students. If higher vocational colleges and universities still do not raise the importance of practical teaching, then the reform of e-commerce teaching in higher vocational colleges and universities is bound to be difficult.

### (2) Lack of advanced teaching content for e-commerce majors

Although many higher education institutions are aware of the many needs of the rapid development of e-commerce, they still retain the traditional teaching contents in the actual teaching. Teachers only focus on the teaching of traditional knowledge, but seldom add the current hot e-commerce issues and the cutting-edge issues of the profession into the teaching content, students still learn the traditional teaching content, but they do not know anything about the new knowledge and issues. With such teaching contents, students will not be able to keep up with the standards and demands of e-commerce enterprises for high quality professionals in the future, which will affect their employment in the field [9].

### (3) Professional curriculum needs to be improved

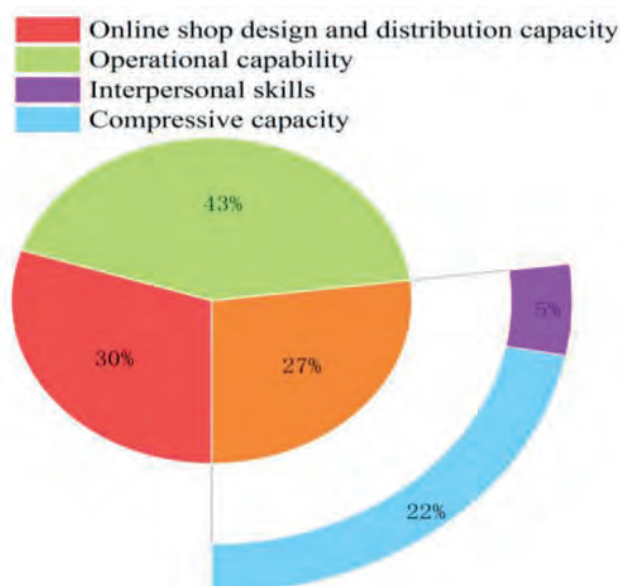

The positioning of e-commerce majors is still not accurate enough, and many higher vocational colleges and universities have great deviations from the positioning of e-commerce majors. Some colleges and universities include e-commerce majors into the College of Computer Science, some higher vocational colleges and universities include them into the College of Finance and Economics, and some higher vocational colleges and universities include them into the College of Management [10]. Therefore, in the curriculum design of e-commerce majors and the preparation of talent training programs, there are problems such as broad scope of curriculum setting and unconvincing talent training programs. Students need more skills and learn more chaotic courses, and the core skills are not exercised and compacted, which is not strong in the process of learning.

### 3. Cultivation of Vocational Ability of Higher Vocational E-Commerce Students

#### 3.1. E-commerce talent training orientation analysis

According to the characteristics of big data data acquisition, e-commerce talent demand as a keyword interception of e-commerce enterprise recruitment talent demand ability requirements, e-commerce enterprise talent demand high-frequency word distribution results are shown in Figure 1.

Under the big data screening, the high-frequency words in the recruitment description of e-commerce enterprises are 43% of operation ability, 30% of online store design and laying ability, 22% of stress resistance, and 5% of sociability in order. In detail, e-commerce enterprises seem to value the operational ability of job seekers, i.e. knowledge + practical comprehensive ability + business marketing thinking, for this reason, in the training of higher vocational talents, we should focus on the combination of theory and reality. Second is the online store design and store ability, this value is the worker aesthetic and computer operation ability, so in the training of higher-level e-commerce professionals, the students' PS, PR software training is particularly important, and also pay attention to the training of its business analysis ability. Furthermore, it is the ability to resist pressure. The e-commerce industry is fast-paced and has a large workload, so the workers' ability to resist pressure is extremely demanding. In the training of higher vocational talents, we should pay attention to the expansion of students' mental capacity.

**Figure 1.** Distribution of high-frequency words in the talent demand of e-commerce enterprises

### **3.2. Suggestions for employment-oriented teaching of e-commerce majors**

(1) Respecting students' developmental characteristics by tailoring education to their needs

Based on the learning characteristics and foundation of students in vocational colleges and universities, we focus on the comprehensive ability cultivation of students and look for teaching methods and modes that are suitable for students, and strive to achieve the overall development of students and professional specialization simultaneously.

(2) Strengthening students' career guidance by following good advice

Since the students enrolled, institutions should use multiple channels and ways to cultivate students' professional awareness and career consciousness. Students should be familiar with the future job environment and job content, cultivate their sense of professional identity and honor, guide them to fully understand the future direction of their majors, do a good job of career orientation assessment with special career guidance courses, let students establish a correct view of employment and career selection, and help them find a suitable career orientation and planning as soon as possible. At the same time, institutions should also strengthen the cultivation of non-professional quality, integrate the cultivation of non-professional quality into professional education, and make use of the actions arranged by the school such as Civic Education, cultural learning and after-school activities to cultivate students' non-professional quality.

(3) Establishing a systematic training system for teachers

Building a teacher training system featuring vocational education is an inevitable measure to ensure the continuous development and progress of vocational teachers. The construction of e-commerce teacher training system in higher vocational colleges should start from five aspects. First, pay attention to daily teaching and research activities. The teaching and research department of e-commerce

should make full use of the weekly teaching and research activities, carry out research and discussion on the problems existing in the actual teaching, and constantly optimize the teaching ability of teachers. Second, expand the channels of teacher training. The school may invite relevant education experts, entrepreneurs and e-commerce researchers to hold special lectures at the school to introduce the new trends, changes, new knowledge and new perspectives in the development of the e-commerce industry, guide teachers to update teaching ideas and methods, expand the content and form of teaching. Third, make full use of special training at all levels. Schools should mobilize the enthusiasm of teachers, create conditions for the development of teachers actively, set up e-commerce entrepreneurship workshops, and arrange for young key teachers to participate in various kinds of special training at all levels in a planned and step-by-step manner, we even support teachers to set up online stores on some e-commerce platforms and form student teams to conduct e-commerce live broadcast, short video shooting and daily operations without affecting teaching. Fourth, strengthen the intensity of teachers on-the-job training. E-commerce industry is different from the traditional industry, it develops fast, the application of new technology is rapid, knowledge update frequently. E-commerce teachers should not only go deep into the enterprise to carry out research, discussion and study, but also make greater efforts to make full use of winter and summer vacation, and even sign agreements with the enterprise during their daily work, carry out top-post exercise to improve practical skills. Fifth, through competition instead of training to improve the practical level of teachers. Teachers are encouraged to actively participate in skills competitions, skills textual research, skills spot checks and other work, in order to enhance the practical education level of the teaching staff.

(4) Organize innovation competitions for e-commerce majors to motivate students to learn and explore.

Attracting students' attention through the form of competition is an important way to stimulate students' innovation consciousness. Higher education institutions and teachers should improve the system of innovation competitions and form an assessment model with professional characteristics and innovative practical ability. Teachers should understand that the purpose of organizing innovation

competitions is to enhance students' learning motivation, promote learning through competitions, and encourage students to participate in such competitions more often to improve their comprehensive strength through the form of competitions. In addition, higher education institutions can also establish cooperative relationship with local e-commerce enterprises, and get more practical activities for students to participate in enterprises, so that students can get in touch with the operation mode and work content of actual e-commerce enterprises in advance, and lay a solid foundation for them to enter the society after graduation.

#### **4. CONCLUSION**

This paper explores the vocational ability cultivation program of e-commerce students in higher education institutions based on the background of big data development. Firstly, the current problems in e-commerce teaching in higher vocational colleges are analyzed and found to exist. The high-frequency vocabulary of talents in e-commerce enterprises is analyzed according to the big data platform to determine the general direction of enterprise talent demand, and then employment-oriented teaching suggestions for e-commerce majors are put forward. The high-frequency words in the recruitment descriptions of e-commerce enterprises are 43% for operation ability, 30% for online store design and laying ability, 22% for stress resistance and 5% for sociability. It can be seen that the current vocational ability cultivation of e-commerce students in higher vocational institutions should focus on the combination of students' workplace skills and book theory and on cultivating students' comprehensive quality.

## ABSTRACT

Researching the practical path of fostering innovative and entrepreneurial talents of college students can exercise students' entrepreneurial thinking ability and encourage the enhancement of students' entrepreneurial ability. This paper firstly analyzes the cultivation mode of college students' innovation and entrepreneurship talents, and clarifies the construction method and curriculum setting principle of talent cultivation mode. Secondly, we use big data as a means to obtain the data on the entrepreneurial intention of students' parameter works in college innovation and entrepreneurship (IE) competition and the employment and entrepreneurial intention of students enrolled in and graduated from the second level of college A. We determine the general direction of college students' IE talents cultivation and put forward the talent cultivation program of this paper. College students' entrepreneurship is based on personal preference and observation of daily life, and the forms of entrepreneurship and their percentages are: 97% for milk tea store, 96% for study room of examination, 92% for rental service, 90% for idle exchange, and 89% for online print store. In the current context of big data, higher education institutions should deepen the reform of education teaching

and talent cultivation mode to stimulate the IE enthusiasm of college students.

## **KEYWORDS**

Big Data; Innovation and Entrepreneurship for University Students; Talent Development; System construction

## **1. INTRODUCTION**

The tendency of colleges and universities to focus on the cultivation of innovative and entrepreneurial talents (IET) is not only the inevitable reform of higher education, but also the need to serve the civilization, transform the economic mode and promote the upgrading of industrial construction. This has significantly contributed to the enhancement and protection of people's livelihood, the structure of an innovative country, and the enhancement of national revolution and competitiveness [1]. In the critical period of building a temperately wealthy society in China, college students' IET are the reserve strength for social development. In the cultivation of talents, colleges and universities should focus on creating a group of high-quality college students with both advanced spirit and entrepreneurial ability to serve the structure of economy and promote the development of society [2]. To this end, universities should build a complete and effective exercise system for IET to implement the strategic goal of "improving independent innovation ability, building an innovative country and encouraging employment driven by entrepreneurship" proposed by the Party Central Committee.

The concept of education in colleges and universities requests to focus on the development of social enterprises, and the IET cultivated should meet the needs of the country and the growth of social enterprises. Only by facing the growth of social enterprises and focusing on foster innovative consciousness, ability and methods of college students that meet the needs of social enterprise growth can we improve their abilities in entrepreneurship and better motivate them to give full play to their strengths, ambitions and contribute to society in the growth of social enterprises [3]. The curriculum structure of the university should focus on public welfare-oriented and market-oriented social enterprises, cultivate the skills and abilities of

college students for the growth of these enterprises, and strive to explore the structure of a curriculum system that promotes the comprehensive improvement of college students. Gradually build up a system of IET training that integrates curriculum teaching, practical practice, employment guidance, career planning, independent learning, and joint enterprise and school for the growth of social enterprises, in order to cultivate various excellent talents suitable for the growth needs of social enterprises [4]. At the same time, it is also necessary to select college students' IE projects for the growth of social enterprises, and purposefully select and raise a number of IE projects that reflect the growth needs of social enterprises, can break through the bottlenecks of social enterprise growth and have greater social benefits. Through constructing a series of cultivation mode, IE system, integrated platform of industry-university-research, and achievement transformation mechanism oriented to the growth of social enterprises, we can guide college students in the university base to operate, manage, extend and simulate the projects, and promote the projects from structure to incubation and from incubation to growth, so as to truly realize the purpose of college students' IE education [5].

This paper firstly analyzes the IE talent cultivation mode of college students, and clarifies the structure method of talent cultivation mode and the principles of internal and external curriculum setting involved in school-enterprise cooperation. Secondly, we use big data as a means to obtain the entrepreneurial intention of students' entries in the college IE competition and the employment and entrepreneurial intention data of students enrolled in and graduated from the second-level colleges and universities of A. Based on the analysis of data information, we determine the general direction of college students' IE talent cultivation and propose a talent cultivation program based on the understanding of this paper. This paper starts from the level of students' intention, which is more likely to attract the attention of college students, which has practical significance for the improvement of entrepreneurial talent cultivation program in colleges and universities.

## **2. Analysis of Innovation and Entrepreneurial Talent Cultivation Model for University Students**

### **(1) Innovative entrepreneurial talent training model structure**

At present, the domestic IE education based on the social enterprise growth perspective includes "school-enterprise cooperation", "school-enterprise joint training", "school-enterprise docking", "school-enterprise linkage", "school-enterprise joint schooling", etc. [6]. For example, through holding "School-Enterprise Fair" and "School-Enterprise Cooperation Forum", implementing the school-enterprise matching and school-enterprise publicity of "Chain Group Matching and Cloud Negotiation", and through a series of activities such as live broadcast of enterprise HR with post, work-exchange cooperation, and joint growth of teaching materials by school-enterprise to reflect the talent training mode required by the growth of social enterprises. Through a series of activities such as the live broadcast of the HR of enterprises with jobs, the experience visit of school-enterprise cooperation, the cooperation of engineering alternation, and the joint growth of teaching materials between schools and enterprises, we can reflect the talent training mode required by the growth of social enterprises. From the above description, it can be seen that the talent cultivation of college students based on the vision of social enterprise growth is in line with the growth of the times and the trend of market demand [7]. In order to better meet the IE needs of college students and comprehensively improve their IE abilities, it is necessary to build a talent cultivation model for college students based on the social enterprise growth perspective. The IET cultivation model aims to face the demand of public welfare-oriented and market-spontaneous social enterprises and give full play to the role of enterprises leading the market in order to cultivate innovative and entrepreneurial applied and skilled talents suitable for the growth needs of today's society. By integrating many elements of social enterprise growth into the IE education of college students, we carry out in-class teaching and extra-curricular practice with the help of various resources, platforms and means. It enables college students to understand the knowledge, theory, spirit and value related to IE, continuously enhances their innovation and entrepreneurial consciousness, improves their innovation and entrepreneurial ability, and shapes their innovation and entrepreneurial spirit suitable for the growth of modern

enterprises, so as to promote better entrepreneurship among college students.

(2) In and out of class curriculum involved in school-enterprise cooperation model

The talent cultivation model oriented to the growth of social enterprises and market needs emphasizes the integration of elements and many favorable conditions of social enterprises into the whole process of in-class teaching and extracurricular practice of college students. By implementing a new type of IE education through school-enterprise linkage, cooperation, docking and interaction, it can comprehensively improve the IE ability of college students and prompt them to better start their own businesses [8]. When formulating the training plan for IET, colleges and universities should build a scientific curriculum system based on the social enterprise growth vision and integrate the concept, spirit, value, innovation, model and experience of social enterprises into the in-class teaching. Starting from the curriculum of basic, specialized, elective and general courses for college students, we focus on highlighting the educational contents and forms in IE for college students and strengthen the entrepreneurship curriculum. Through systematic and purposeful IE education, the ability of IE of college students can be improved comprehensively [9]. Colleges and universities can add basic courses such as basic entrepreneurship and basic skills courses according to the status of college students to consolidate the foundation of college students' IE. By increasing students' professional courses such as entrepreneurial thinking, training, and skills, they can cultivate their professionalism of IE. Enhance college students' understanding of corporate entrepreneurship by adding elective courses in business operation, management and business models. To cultivate the humanistic and entrepreneurial literacy required by college students in entrepreneurship by adding general courses in law, talent, culture, and art in entrepreneurship.

### **3. Practice in the cultivation of college students' IET**

#### **3.1. Analysis of the training direction of college students' IET**

In this paper, we use big data technology to obtain the entrepreneurial intention presented by students' entries in the college IE competition, and try to explore the innovation and entrepreneurial

aspirations of contemporary college students through this move. The results of the survey on the intention of some projects of college students' IE are shown in Table 1.

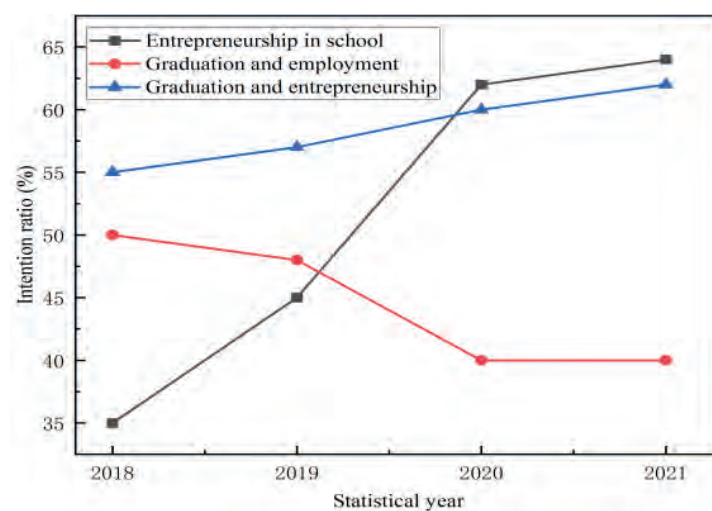

Student entries had the highest percentage of entrepreneurial intentions for milk tea stores and coffee shops, at 97%. Almost every group of 10 students had 4-5 entries in this category, which is also related to the contemporary students' preference for milk tea and coffee. It is worth noting that the percentages of entrepreneurial intentions for rental services and study rooms for examinations, idle exchange stores and online print stores are also relatively high, 92%, 96% and 89% respectively, and all three originate from the observations of college students in their daily campus life. College students will often engage in resource rental activities due to reasons such as low living expenses or simply not wanting to waste resources. For example, students with trams will consider renting their cars to fellow students for a fee when the cars are free, and students with elective courses will consider renting the textbooks of the students in their majors for a fee to attend classes. Based on the limited number of seats in the library and the difficulty for students to grab a seat, we will consider opening a paid study room for students with study needs. The intention of the print store is based on the final exams printing review materials and printing design works, found that the paper is too expensive, printing demand is large, good income and other reasons to have the idea of starting a business. This shows that the entrepreneurial direction of college students mostly comes from their personal preference needs and their observation of campus life. In the IE course, we can focus on strengthening the comprehensive training of students' business thinking and enterprise operation ability.

**Table 1.** Intention Results of College Students' IE Projects

Number	Entry name	Intention ratio
1	Hot pot shop	85%
2	Milk tea shop, coffee shop	97%
3	Barbecue shop	58%
4	Manicure shop	78%
5	Couture	60%
6	Rental services	92%
7	Online printing shop	89%
8	Idle exchange shop	90%
9	Postgraduate Examination Self study Room	96%

Based on the IE intention of college students, the data of employment and entrepreneurship of students and graduates in the second-level institutions under the jurisdiction of university A in the past four years were counted. The results of entrepreneurial intention of college students are shown in Figure 1.

The entrepreneurship rate of enrolled students and graduates shows an increasing trend, while in contrast, the employment rate of graduates shows a decreasing trend. In 2021, 65% of the students in a second-level college of university A have opened different kinds of campus specialty stores, and according to the students' feedback, their profits are quite substantial. Due to the continuous improvement of favorable policies for college students to start their own business, the number of college students' IE is increasing every year, and by 2021, more than 61% of students tend to start their own business after graduation, which leads to a certain downward trend of employment rate. Based on the emotional intention of college students' IE, it can be seen that the training direction of college students' IE talents mainly focuses on the cultivation of students' business thinking, business skills improvement and interpersonal negotiation ability.

**Figure 1.** College Students' Entrepreneurship Intention

### **3.2. Innovation of education system in the cultivation of college students' IET**

#### **3.2.1. Building a systematic curriculum system for IE education**

The training of IET requires a systematic educational curriculum and process. In terms of the socio-economic structure and its growth

situation on the requirements of IE education, IE education curriculum should be a multidisciplinary intersection and comprehensive discipline curriculum. It generally has some characteristics: first, the intersectionality and comprehensiveness of disciplines, second, the practicality and guidance of disciplines, and third, the creativity and characteristics of disciplines. First of all, the IE education curriculum needs to integrate and create design by integrating various disciplines. Based on students' professional courses, the curriculum should integrate the awareness, concepts, techniques and methods of IE, and also integrate the contents and concepts of other related courses, and form a theoretical and practical curriculum system through creative integration. Secondly, the structure of IE education curriculum should also have strong practicality and guidance. IE for college students is the process of practical application of knowledge and theories, so the education curriculum must focus on the guidance and effectiveness of specific practices, so that students have the necessary knowledge, theories, methods and skills for IE. Thirdly, the curriculum of IE education should be creative and characteristic, and should be built creatively with the advantages of university education resources and regional social and economic growth to form regional characteristic teaching materials. In this way, not only can the cultivation of IET benefit from the favorable conditions of regional growth, but also meet the actual needs of local society and add strength to the regional social and economic growth.

### **3.2.2. Establishing a correct view of entrepreneurship**

The establishment of entrepreneurship education system for college students should fully help college students establish a correct concept of entrepreneurship and focus on fostering entrepreneurial qualities. College students must change the traditional concept of employment and realize that IE is not a problem for a few college students with strong innovation ability and excellent academic performance, but everyone can start a business. Making full use of the "Internet + Entrepreneurship" application platform can accurately serve students' entrepreneurship and play a leading role in the structure of university students' entrepreneurship. The IE platform built with the efforts of all parties can provide an ideal stage for young entrepreneurs to integrate project display, capital matching, technology introduction

and marketing, and further stimulate young people's enthusiasm for entrepreneurship.

### **3.2.3. Build a perfect IE talent incubation system**

College student business incubation system is a kind of social and economic organization with special functions, and the role it plays in college students' IE is irreplaceable by any individual party of universities, enterprises or even the government. University entrepreneurship involves not only the employment of college students, but also the research and growth of science and technology and its promotion of industrial economic growth. Promoting the success of college students' entrepreneurship as much as possible and increasing the success rate of college students' entrepreneurship are the outstanding advantages of the incubation system. Due to the general lack of social practice experience of college students, the lack of the path of independent entrepreneurship, the lack of corresponding financial and material support, not to mention the strategy of physical operation, not to mention the difficulty of entrepreneurial success, it is also more difficult to find the ideal starting point for entrepreneurial start-up. Therefore, it is necessary to build a platform for college students to start their own business by constructing a perfect IE incubation system, and provide necessary business conditions, such as equipment places, business training, technical guidance, operation mechanism, legal consultation, management services, etc., in order to help startups avoid business risks and improve the survival rate. The entrepreneurship incubation system for college students includes entrepreneurship bases at provincial, municipal and county levels, community or school-run entrepreneurship incubation bases, etc. It can promote college students' IE by integrating resources from various industries, provide effective guidance and services for them, and enable college students' IE education to gain considerable social and economic benefits.

## **4. CONCLUSION**

This paper obtains the IE intention of college students based on the background of big data, and explores the practical path of college students' IE talents cultivation. Through the analysis of the cultivation mode of college students' IET, the principles of cultivation mode

structure and curriculum setting under enterprise mode are clarified. The big data technology is used to obtain the changes of college students' entrepreneurial intention and job-seeking intention, to determine the general direction of college students' IET cultivation, and then the scheme of this paper is proposed. College students' entrepreneurship is based on personal preference and observation of daily life, and the percentage of those who take milk tea store as their entrepreneurial intention is 97%, study room for examinations is 96%, rental service is 92%, idle exchange is 90%, and online printing store is 89%. Based on such characteristics, the cultivation of innovative entrepreneurial talents for college students should focus on the cultivation of students' business insight, and at the same time, for students who have already opened stores on campus should focus on the cultivation of their business operation and financial management skills.

## ABSTRACT

In order to further improve the accuracy of robot interaction recognition results and shorten the operation time, this paper proposes an interaction method of sensor multi-point control robot based on artificial intelligence technology. Firstly, five parts of the display layer are constructed, and then the speech recognition layer module is built. The system designed in this paper is compared with artificial neural network technology and inverse kinematic model, and the completion time and error accuracy of its interaction operation are tested. The test results show that the method designed in this paper saves 293 seconds than the artificial neural network technique and 340 seconds than the inverse kinematic model. The average accuracy of sensor automation was 94.3%, compared with 84.7% for the artificial neural network technique and 72.3% for the inverse kinematic model approach. The research in this paper improves the accuracy of robot interaction recognition and increases the efficiency of robot execution.

## KEYWORDS

Artificial Intelligence Technology; Robot interaction; Sensor; Multi-point control

## 1. INTRODUCTION

As a rapidly developing discipline, artificial intelligence has been widely applied in the field of sensors. The combination of artificial intelligence and sensor technology constitutes a new type of intelligent sensor, which improves the intelligence of sensors [1]. The importance of sensors in information systems cannot be overstated; its good or bad characteristics and reliability of output information are crucial for the quality of the whole system [2]. Nowadays, the rapid increase in automation in various industries, especially the increase in automation in industrial production, has put higher requirements on the performance of sensors. The traditional sensor technology is no longer able to meet the needs of the rapid development of automation technology due to the shortcomings of unstable performance, poor reliability, and low accuracy [3]. The progress made by human in artificial intelligence provides an opportunity for the combination of artificial intelligence and sensor technology, i.e., the emergence of new intelligent sensors [4]. The output characteristics of sensors are not only nonlinear and subject to various environmental factors, it is difficult to make comprehensive corrections for static sensor errors using traditional methods [5]. The literature [6] used artificial neural network technique to deal with the sensor static errors and the feasibility of this method was verified by experiments.

Human-computer interaction techniques have received a lot of attention from various research fields as well as experts. With the increasing improvement of HCI technology, various problems started to appear, such as redundant codes [7]. In order to better solve the above problems, some better research results are given by related experts. For example, a four-wheeled omnidirectional mobile robot is designed and Lyapunov function is constructed by deviating the position of the car body to obtain the inverse control law that conforms to the linear flight velocity of the car body. Using the traction wheel with directional velocity constraint, an inverse kinematic model was designed to obtain the optimal trajectory duration during tracking [8]. Some scholars have researched a wireless network-based automated control system for picking robots, where the Exyoos441 microprocessor was chosen for the hardware part and the DS3710 high-performance drive controller was used for the motion control module [9].

In this paper, we combine the sensed pose sensors and design a multi-point operating system for robot interaction based on artificial intelligence technology. The constructed torso candidate point detector includes five parts: multidimensional sensing posture recognition model in display layer, 3D video display module, 3D video acquisition module, virtual robot arm display module and robot arm control module. In the constructed built voice recognition layer module, the precise multi-point robot operation is realized by sensor and voice control. The system designed in this paper is compared with artificial neural network technology and inverse kinematic model to test its interactive operation completion time and error accuracy.

## **2. Artificial intelligence based sensor robot interaction operation method design**

### **2.1. Display layer module build preparation**

#### (1) Multidimensional sensing pose recognition model

Step 1: Using two types of sensors: posture sensors and acceleration sensors, the arm information of the human body is collected, while the angular velocity and acceleration information of the arm is obtained in real time.

Step 2: Solve the information obtained in step (1) to obtain the posture angle information.

Step 3: Combine the relevant theories to fuse all the information, then study the change law of each coordinate, and finally realize the human posture recognition.

(2) 3D video display module: through the virtual display of the main interface at the same time to display the movement of the two robotic arms, the operator can watch the theme interface to eventually achieve the purpose of robot interaction multi-point operation.

(3) 3D video acquisition module: read the mechanical and human posture change information in real time through the posture sensor, obtain the posture of the robot arm and object and the surrounding environment information, and transfer the acquired information to the system for processing in time.

(4) Virtual robotic arm display module: In order to further improve the accuracy and safety of remote operation, it is necessary to minimize

the transmission time delay of the system, while also being able to fully reflect the motion of the remote robot at any angle. The following is mainly to display the system interface by superimposing the virtual robot arm No. 1 and virtual robot arm No. 2, and to feedback the results to the server.

(5) Robotic arm control module: The robotic arm control module is mainly composed of three parts: control package, attitude recognition and robotic arm attitude calculation. It is responsible for calculating all the received attitude data to achieve the purpose of driving and controlling the robotic arm operation.

## **2.2. Speech recognition layer module building**

When the system automatically determines whether the action made by the virtual arm No.1 is the correct action, the completed "action command" is saved through the "control command" in the system and downloaded to the remote arm. If a person's posture changes, the system will automatically identify the posture information of the human body according to the posture recognition module. At the same time, the final posture information is transferred to the virtual arm No.1. If the "control commands" in the system are still transmitted autonomously by the human posture recognition module, the system may recognize the commands as wrong, which may lead to the wrong operation of the system. In order to avoid these problems, a speech recognition module is designed to send signals and instructions to each robot in various languages.

In order to better complete the interaction with both the virtual machine robot arm No.1, the speech recognition module in the system was designed mainly using the MFC degree. This is more convenient to call the isolated language recognition system in the system, and at the same time, the recognition result will be transmitted as a command to the API interface of the robot interactive multipoint operating system for voice recognition and result communication.

## **3. Experiment and Analysis**

To verify the interactive performance of the method designed in this paper, the artificial neural network technique, inverse kinematic model and the system designed in this paper are compared.

The results of the comparison of the completion time of the interactive multi-point operation robot of different systems are shown in Table 1. The completion time of the system designed in this paper is less than that of the artificial neural network technique and the inverse kinematic model.

The main reason why the system designed in this paper can complete the robot interaction multi-point operation in a shorter time is that the designed system incorporates the human posture recognition method in the practical application process, which effectively reduces the overall operation completion time.

**Table 1.** Comparison of completion time of interactive multi-point operation robots in different systems

Experiment No	Completion time of multi-point sensor robot interactive operation/(S)		
	Artificial Neural Network Technology	Inverse kinematics model	The system designed in this paper
1	164	160	150
2	170	172	148
3	180	184	134
4	171	177	150
5	168	169	141
6	176	185	137
7	186	190	144
8	178	185	142
9	154	164	138
10	160	168	130

The artificial neural network technique and inverse kinematic modeling method of this paper were used to implement 10 experiments on 100 data of sensors respectively to analyze the accuracy of artificial intelligence sensor multi-point automatic control.

The comparison results of the 3 types of HMI multi-point control are shown in Figure 1. The method in this paper has significant advantages over the other 2 methods. The average accuracy of automatic sensor control using this paper's method is 94.3%, which is higher than the control accuracy of artificial neural network technique (84.7%) and inverse kinematic model method (72.3%). This indicates that the design system in this paper effectively reduces the sensor multi-point human-computer interaction automatic control error, and this method obtains the ideal sensor human-computer interaction control effect.

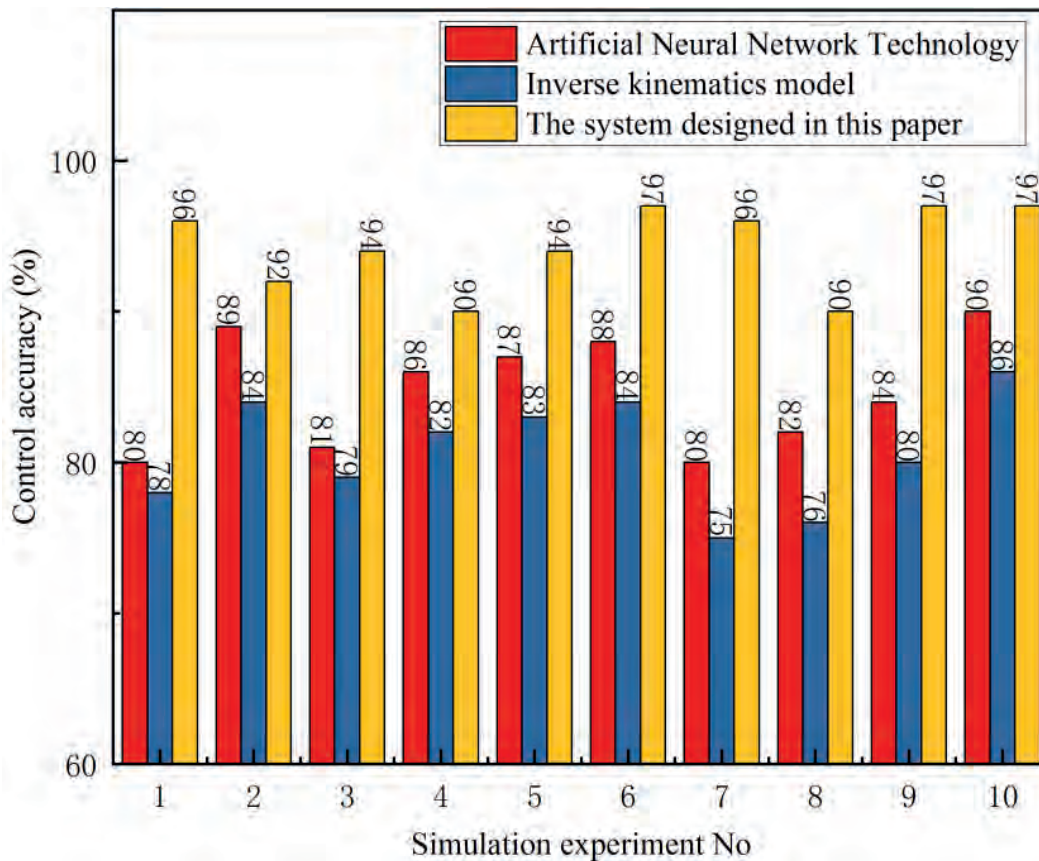

Figure 1. Comparison of three human-computer interaction systems for multi-point control

#### 4. CONCLUSION

In this paper, a multi-point control system for robot interaction based on artificial intelligence is designed by combining the sense posture sensors. The constructed torso is divided into a display layer module and a speech recognition layer. The system designed in this paper is compared with artificial neural network technique and inverse kinematic model to test its interaction operation completion time and error accuracy. The test results show that the method designed in this paper saves 293 seconds compared with the artificial neural network technique and 340 seconds compared with the inverse kinematic model, and the average accuracy of automatic control of sensors is 94.3%, while the average accuracy of the artificial neural network technique is 84.7% and the inverse kinematic model method is 72.3%. This shows that this design system can accurately recognize robot interaction commands with high recognition rate, and also can reduce the completion time and error of multi-point operation of robot interaction.

## **ABSTRACT**

Using big data to evaluate the development level of rural revitalization can identify the shortcomings in the implementation of policies in a timely manner. Based on the research needs, this paper proposes to use the assignment method and entropy value method to determine the index weights and measure the development level of rural revitalization through a comprehensive multi-index evaluation method. By constructing a method to obtain data for the evaluation of rural revitalization development level, five first-level indicators for the study were determined, and two rural villages were selected for algorithm verification. In villages A and B, the effective scores of governance in the two villages were 0.201 and 0.197, the scores of affluence in life were 0.196 and 0.166, and the scores of prosperous industry were 0.126 and 0.102, respectively, with an overall score of 0.800 in village A and 0.733 in village B. The algorithm results of this paper do not differ from the actual economic strength of the two villages. It can be seen that this paper has practical significance to

study the development level of rural revitalization based on big data technology.

## **KEYWORDS**

Big Data; Rural revitalization; Development Evaluation; Assignment method and entropy value method

## **1. INTRODUCTION**

The 19th National Congress of the Communist Party of China (CPC) put forward the strategy of rural revitalization, clearly defining the twenty-word policy of "prosperous industry, ecological livability, civilized countryside, effective governance, and prosperous living" [1]. In this context, how to measure and evaluate the development level of rural revitalization in different regions, discover the advantages and make up for the shortcomings, and then promote rural development according to the situation is the key to realize rural revitalization in China [2]. Currently, some studies have measured the development level of China's rural revitalization by constructing relevant index systems, and have used statistical yearbooks, agricultural census data, survey databases and research data for empirical analysis [3]. However, although statistical data have the advantage of high reliability, there is a lag period, and research data are rarely tracked. Due to the difficulty in obtaining more effective data, it is difficult for the government and academic institutions to comprehensively and scientifically evaluate the development level of China's rural revitalization.

With the promotion of national big data strategy, big data technology has become more mature and is accelerating to become a driving force for creating value and exploring potential, and its application is gradually penetrating into various micro units of economy and society [4]. In the field of agriculture and rural areas, big data technology is widely used in the fields of price monitoring of agricultural products, circulation of agricultural products, and early warning of agricultural disasters. However, there is no systematic research on the application of big data in rural development evaluation in both theory and practice. In fact, big data has great potential in the evaluation of rural revitalization development level, which is mainly due to the

precipitation of rural big data [5]. Big data technology can not only be used for data collection, but also play a unique advantage in analyzing, processing and presenting data, which can provide technical support for portraying rural development in an all-round, multi-dimensional and three-dimensional manner and evaluating the development level of rural revitalization, as well as providing new solutions for solving agricultural and rural problems [6].

This paper first clarifies the logic of rural revitalization development level evaluation under the whole life cycle perspective of big data technology, and then clarifies the theoretical basis of the whole paper. At the same time, it proposes the operation method of data acquisition for rural revitalization development level evaluation to carry out the model construction, and determines the construction of five index systems and labeling model construction. The study selects the assignment method and entropy value method to determine the index weights, and then measures the strength of rural revitalization development level through the comprehensive evaluation method of multiple indicators. Two villages A and B were taken as samples for the measurement and verification of the research algorithm of this paper, and finally, suggestions for the improvement of rural revitalization development level based on the understanding of this paper were proposed.

## **2. The Application of Big Data in the Evaluation of Development Level of Rural Revitalization**

### **2.1. Evaluation of the development level of rural revitalization from the perspective of the whole life cycle of big data technology**

Big data has the characteristics of "5 V", i.e., massive, high speed, diverse, real and low value density. In terms of the life cycle of big data, it is divided into four stages: acquisition, pre-processing, storage and analysis [7]. First, in the acquisition stage, big data technology can collect rural data from different sources, including administrative records, business records, Internet data, and electronic device sensing data. These data can be collectively referred to as nontraditional data, which are different from the traditional data collected by statistical departments. The use of non-traditional data for analysis can increase the data level and hierarchy, expand the

data dimension, enrich the data type, reduce the data lag and increase the data frequency [8]. Secondly, in the pre-processing stage, firstly, the missing data and abnormal data need to be processed, and they will be completed or eliminated according to certain methods. Then, we need to organize the multi-source heterogeneous countryside big data into a unified format data, and do quantitative processing for some text-based data, and convert them into numerical data. Thirdly, in the storage stage, the massive rural data should be stored in the database, and the storage must be safe, fast and efficient [9]. Fourth, in the analysis stage, the data are processed with the help of machine learning, deep learning and other big data analysis methods, and the data are displayed using visualization techniques.

## **2.2. Operation method of obtaining data for evaluation of rural revitalization development level**

### **(1) Model Construction**

At present, the main method of evaluating rural revitalization is to construct an indicator system. The indicator system is the most classic evaluation method, and this paper also uses the indicator system to evaluate the development level of rural revitalization [10]. Since the labeling model has the advantages of more freedom in framing and setting, and more diverse types of labeled data, this paper considers using the labeling technology of "data portrait" in the information field to expand the indicator system into a labeling system to visualize the development of rural revitalization.

### **(2) Indicator system construction**

In this paper, the year 2020 is selected as the evaluation year, and five index systems are constructed according to the research needs. According to the requirements of "twenty words" of rural revitalization strategy, the primary indicators are industrial prosperity, ecological livability, civilized countryside, effective governance and affluent living.

### **(3) Label model construction**

Tagging is a flexible, multidimensional and suitable model system for big data systems. In the field of information technology, tagging technology is usually used in the field of "user profiling", i.e., describing and portraying user characteristics by tagging things with

different labels. This paper innovatively applies the core of portrait technology, i.e. labeling technology, to the evaluation of rural revitalization, providing more technical tools and display methods for evaluating the development level of rural revitalization.

#### (4) Multi-indicator integrated measurement method

In this study, the relatively objective assignment method and entropy value method are selected to determine the index weights, and then the development level of rural revitalization is measured by the multi-indicator comprehensive evaluation method. In order to make the data of different dimensions comparable with each other, they need to be standardized. The formula is:

$$U = \sum_{j=1}^q W_j C_{ij} \quad (1)$$

$U$  represents the development level of rural revitalization.

### **3. Analysis of the evaluation results of the level of rural revitalization**

In order to verify the validity of the algorithm proposed in this paper, two villages of the same level in the same province, A and B, with almost no obvious differences, were randomly selected for the evaluation of five indicators to be measured. the comprehensive scores of the development level of rural revitalization of A and B are shown in Table 1.

Village A has an overall score of 0.800, while Village B has an overall score of 0.733. In terms of the overall score, Village A has a higher level of rural revitalization development than Village B. In terms of the five indicators, the scores of effective governance and affluent living are higher in both villages A and B, while the scores of ecological livability are in the middle, and the scores of prosperous industry and civilized countryside are lower. In the effective governance, village A scored 0.201 and village B scored 0.197, which means that the infrastructure of the two villages is more perfect and the residents are more satisfied with the rural governance. The industrial prosperity scores were 0.126 and 0.102 respectively, with a difference of 0.24 points. Comparing the measurement results with the actual economic development level of the two villages, the results show that the

measurement method of this paper is almost the same as the actual statistics, and the algorithm of this paper is valid.

**Table 1.** Comprehensive score of rural revitalization and development level of A and B

Indicator Dimension	Index name	Index score	
		Village A	Village B
Level I indicators	Industrial prosperity	0.126	0.102
	Ecological and livable	0.145	0.159
	Country style civilization	0.132	0.109
	Effective governance	0.201	0.197
	Live a prosperous life	0.196	0.166
Comprehensive score		0.800	0.733

The scores of the five indicators in villages A and B are shown in Figure 1. The highest scores are still effective governance and affluent living, and the scores of village A and B are 0.2 and 0.18 respectively.

**Figure 1.** Scores of 5 Indicators in Villages A and B

#### 4. Suggestions for enhancing the development of rural revitalization

(1) Formulate village development planning based on its own endowment. Explore suitable development models based on their own endowments and reasonably formulate development plans for villages. In this process, the principles of sustainability and comprehensiveness should be emphasized. Sustainability requires

that future development needs be fully considered and that current development should not seriously affect the space and resources needed for future development. Comprehensiveness requires development planning from multiple dimensions such as industry, culture, environment and spatial layout.

(2) Based on sustainable development, take the green development path. Establish and improve the centralized treatment mechanism and comprehensive utilization mechanism of domestic production waste according to local conditions, and store domestic waste at fixed points and collect and treat it in a unified manner. Establish a centralized collection system for domestic sewage, and adopt biological treatment method and physical treatment method for terminal treatment of domestic sewage. Actively realize the sustainable development of rural ecological tourism, make reasonable use of natural resources and protect the ecological environment in order to maximize the environmental, social and economic benefits.

(3) In terms of industrial development, promote the comprehensive development of various industries. The industrial prosperity required by rural revitalization is not the prosperity of a certain industry, but the overall prosperity of industries. Therefore, the government should comprehensively layout and integrate the development of one, two and three industries in the countryside.

(4) In the construction of rural civilization, the cultural construction of villages should be strengthened and the cultural infrastructure should be improved. The convenience of infrastructure largely determines whether residents are willing to participate in various cultural activities. Focus on promoting excellent traditional culture and enhancing the vitality and attractiveness of excellent traditional culture. We should also actively protect the local culture, preserve the original appearance, and reasonably develop and utilize the limited resources without destroying the original original appearance.

## **5. CONCLUSION**

This paper explores the credibility of the application of big data in the development level of rural revitalization, and constructs a method to obtain data for the evaluation of the development level of rural revitalization. The relatively objective assignment method and entropy

value method are used to determine the index weights, and then the multi-index comprehensive evaluation method is used to measure the development level of rural revitalization, and two rural villages A and B with almost no difference in economic development level are selected respectively for algorithm verification. Among them, the comprehensive score of village A is 0.800 and that of village B is 0.733. The results were compared with the actual economic development level of the two villages, and the results showed that the measurement method of this paper was almost the same as the actual statistics. Thus, it can be seen that the application of big data to the measurement of rural revitalization development level is error-free and the evaluation is real and meaningful.

## **ABSTRACT**

The level of basketball players' passing directly affects the overall level of the whole team and the performance of the game. This paper firstly explores the importance of basketball passing technique and passing awareness and the requirements of basketball passing technique quality. The deep learning target tracking algorithm is used to measure the accuracy of action capture, and the action decomposition system is built under the BP neural network algorithm, and then the two are verified separately. The combined value of BP neural network decomposition was verified as 2.282 and the combined value of basketball expert evaluation was 2.87. The accuracy of deep learning target tracking algorithm was 90% in chest passing action, 90% in ground passing and 98% in low hand passing. The design solution of this paper has high accuracy and is suitable for basketball movement breakdown design training and teaching.

## **KEYWORDS**

Deep Learning; Basketball; Passing action breakdown; BP Neural Network

## **1. INTRODUCTION**

In modern basketball, the use of passing and catching techniques in a basketball game reaches thousands of times. And in the game technical statistics, the successes and errors of passing and catching

have been used as an important factor in analyzing the winners and losers of the game [1]. It is also an important indicator for evaluating a good athlete for the merit of his passing assist ability [2]. In basketball, the passer's passing is the main method to organize the offense, achieve tactical cooperation and obtain shooting opportunities [3]. Currently, with the increasingly fierce confrontation between offense and defense and the increasing defensive ability, the requirements for the passing skillfulness and tacticality of the passer are getting higher and higher. In basketball teaching and training, only by comprehensively improving the quality and passing and catching ability of each player can the implementation of the team's tactical use be comprehensively improved, thus improving the overall strength of the team [4].

As a good passing player, one must master such a passing principle: from defense to attack. When making a full-court pass, observe and judge the ball from far and near; when entering the front court to pass the ball, one should first pass inside and then outside, and observe and judge the ball from near and far [5]. When passing the ball, the following three points should be achieved: First, according to the position of one's defender, choose a reasonable way to pass the ball, so that the ball is wide, hidden and versatile, and adaptable [6]. The more flexible the way of passing the ball, the more active it is. Second, master the flight speed of the ball according to the speed of the companion. If the ball is too fast, the player will not be in place to cause the ball to be lost, and if the ball is too slow, it will affect the movement of the companion and miss the opportunity [7]. Third, according to the defensive position of the companion to determine the ball's landing point, the general requirement is that the ball to the man, the ball's landing point is always on the far side of the defender. In the game, the reasonable use of different directions of the ball point, not subject to the restrictions of people, position and area conditions, fully embodies the concealment, versatility, flexibility and initiative of passing, reduce the blindness of passing, further improve the threat of passing, and enhance the efficiency of assisted passing [8].

This paper firstly explores the importance of basketball passing technique and passing awareness and basketball passing technique quality requirements to clarify the necessity of the study. By

constructing a basketball passing action decomposition design, we determine the use of deep learning target tracking algorithm to measure the accuracy of action capture. The BP neural network algorithm is used to build the motion decomposition system, and then the two are verified to prove the superiority of the design scheme of this paper. Finally, the design of basketball passing motion decomposition based on deep learning is proposed.

## **2. Basketball Passing Technique and Passing Awareness Development**

### **2.1. The importance of basketball passing technique and passing awareness**

(1) Passing is the main way to achieve the coaches' tactical intention and cooperation between players

The offensive tactics and cooperation laid out by coaches are essential in the process of passing implementation, and of course, the cooperation of players' blocking and running without the ball is also needed in this link [9]. In most of the play systems, most of the coordination is first through the cover without the ball, then run out of favorable position, and finally the player with the ball will pass the ball to the most favorable teammate's hands. Or maybe it's through one player's dribble break and then distribute the ball to a teammate in a favorable position. It is easy to see that only when the players have good passing awareness can they effectively complete the whole cooperation, so as to achieve the goal of scoring.

(2) Passing is an effective means for team offense and defense

In a basketball game, the players control the ball by dribbling, passing, holding and shooting. Passing has an active role in both offense and defense. In the team's offense by passing the ball can move and even disrupt the defender's position, making the defender lose effective position, thus creating favorable offensive opportunities for our team. In the fast break by passing the ball, the ball quickly gets into the frontcourt, creating the opportunity to score directly with more than one player or players on the basket. On defense, especially when the game is about to end and our team is leading, effective passing can prevent the opponent from making tactical fouls.

## **2.2. The basic quality requirements of basketball passing technique**

### **(1) Solid basic skills**

The passing fundamentals of the player must be quite solid and mature. In a high intensity confrontation with strong players, you can only pass with the strong side hand and not with the weak side hand, but such problems are common among basketball players in general. This not only lacks the line variation of passing, but also reduces the attacking surface of passing, and at the same time gives the defender half of the defensive pressure, making the attack less threatening and the chance of success less. Therefore, in basketball technical training, should strengthen the special practice of the weak side of the hand, pay attention to the equal number of strong and weak hand practice, balanced development of the ability of both sides of the hand. In the training can be used only the weak side of the hand to pass, catch the ball reinforcement exercises and special rules of the rivalry game or games. In this way to improve the weak-side hand's ability to pass and control the ball, and enhance the game fighting ability.

### **(2) Ability to pass the ball well while moving quickly**

Adopting a fast-moving style of play requires large and substantial frequent transfers of men and balls, striving to find attacking opportunities in the cover of peers and getting rid of defenders. In the game, even if an attacking opportunity is created, it is instantaneous. In order to pass the ball well in a tight defense that is fast, high and strong, it is necessary to strengthen the confrontation practice in the usual training, to exercise various passing abilities in a confrontation with fast movement, to improve the rhythm of movement and body coordination, to improve the accuracy of the sense of time and space position, and to improve the ability of tacit cooperation between players of the same team.

## **3. Design of basketball players' passing action decomposition in the context of deep learning**

### **3.1. Deep learning target detection algorithm**

Deep learning is a class of multilayer neural network algorithms capable of automatically learning and training the hidden internal structure in data through supervised, semi-supervised or

unsupervised training methods. Compared to manual extraction of low-level features, deep learning is able to transform the pixel data in the input image into higher-order, more abstracted layer-level features. Therefore, the features extracted by deep learning have stronger representational power and robustness than traditional methods. This advantage makes deep learning irreplaceably superior in research and applications in computer vision.

### 3.2. BP neural network basic steps

Step 1: Collect the initial sample data, determine the number of nodes in the input and output layers and the expected values.

Step 2: Set the parameters. The number of nodes in the input and output layers are determined by the actual problem, and there is no hard requirement for the selection of the implicit

There is no rigid requirement for the selection of the hidden layer. The number of nodes in the implicit layer is calculated using the empirical formula (1) and expressed as:

$$l = \sqrt{m + n} + a \quad (1)$$

Where  $m$  is the number of nodes in the input layer,  $n$  is the number of nodes in the output layer, and  $a$  is a regulation constant between 1 and 10. The activation function is selected as the default activation function used by the newff function in MATLAB, i.e., tansig (double S) type. The learning rate, the number of samples in the training set and the test set can determine the result by iterative attempts.

MATLAB software is applied to conduct simulation experiments, and the steps are as follows.

Step 1: Forward normalization of the data using Equation (2).

$$x'_{ij} = \frac{x_{ij} - x_{\min}}{x_{\max} - x_{\min}} \quad (2)$$

Step 2: Perform forward normalization on the data.

Step 3: Output the final prediction result.

### **3.3. Construction of basketball passing action breakdown system**

#### **(1) Basketball action index system determination**

Before constructing the basketball action decomposition model, it is necessary to clarify the decomposition action index system. Combining the principles of scientificity, precision, comprehensiveness and operability, the detailed analysis is carried out and fully considered according to the clear requirements of quality assurance for evaluation of higher education institutions.

#### **(2) Implementation of BP neural network structural model in basketball passing action decomposition**

The implementation of the BP neural network model requires the selection of numerical computing visualization MATLAB simulation software with very high performance. By constructing a 3-layer BP neural network, which contains 12 input layer neurons, 1 output layer neuron, and 8 hidden neurons, the number of training sessions must not be less than 1600, and the allowable error is 0.001, five test data with sample data are selected.

### **4. Simulation results of basketball passing breakdown action system**

#### **4.1. Results of basketball action decomposition under BP neural algorithm**

In order to verify the validity of the basketball passing action decomposition results, the basketball action decomposition results were compared and analyzed with the basketball expert evaluation results, and the results obtained by the simulation software were compared with the expert results.

The comparison status of basketball action decomposition results and basketball expert evaluation results is shown in Table 1. From the table, we can know that the integrated value of BP neural network decomposition is 2.282, and the integrated result of basketball expert evaluation value is 2.87, and the difference between them is 0.588. But the BP neural network decomposition result is close to the result of basketball expert evaluation, and there is almost no difference between the two equal.

**Table 1.** Comparison between basketball action decomposition results and expert evaluation results

Serial No	BP neural network decomposition value	Decomposition results of BP neural network	Basketball expert evaluation value	Basketball expert evaluation value
1	0.401	excellent	0.51	excellent
2	0.403	pass	0.51	pass
3	0.561	poor	0.72	poor
4	0.313	good	0.42	good
5	0.604	secondary	0.71	secondary

In addition, to confirm the experimental effect, five sets of data prepared in advance were compared with the results obtained using the simulation software and the results of basketball experts.

The comparison between the simulation software and the expert evaluation results is shown in Table 2. The total value of the evaluation by the simulation software was 3.2495 and the total value of the evaluation by the basketball expert was 3.38, with a difference of 0.1305. but in terms of the evaluation results, the simulation results were close to the evaluation results provided by the basketball expert. This indicates that BP neural network has high application value in basketball passing action decomposition evaluation, can replace manual evaluation, and achieves good basketball action analysis effect.

**Table 2.** Comparison of simulation software and expert evaluation results

Serial No	Evaluation value of simulation software	Simulation software evaluation results	Basketball expert evaluation value	Basketball expert evaluation results
1	0.5613	poor	0.72	poor
2	0.6524	pass	0.64	pass
3	0.6401	excellent	0.63	excellent
4	0.7240	good	0.76	good
5	0.6702	secondary	0.63	secondary

#### 4.2. Basketball motion capture results with deep learning

To verify the accuracy of the deep learning target detection algorithm for basketball passing action capture, the three actions of chest pass, ground pass and low hand pass in the basketball game video are

parameter locked and the deep learning capture results are compared with the basketball coach capture results.

The results of comparing the accuracy of deep learning algorithm with basketball coach action capture are shown in Figure 1. In the chest pass action the basketball coach capture accuracy is 70% and the deep learning target tracking algorithm capture accuracy is 90%. The ground pass basketball coach captures 80% accuracy and the deep learning target tracking algorithm captures 90% accuracy. The basketball coach captures 85% of the low-handed passes and the deep learning target tracking algorithm captures 98%. Obviously, the deep learning algorithm accuracy is higher than the basketball coach, and the method set up in this paper can provide technical support for basketball coaches to train basketball players.

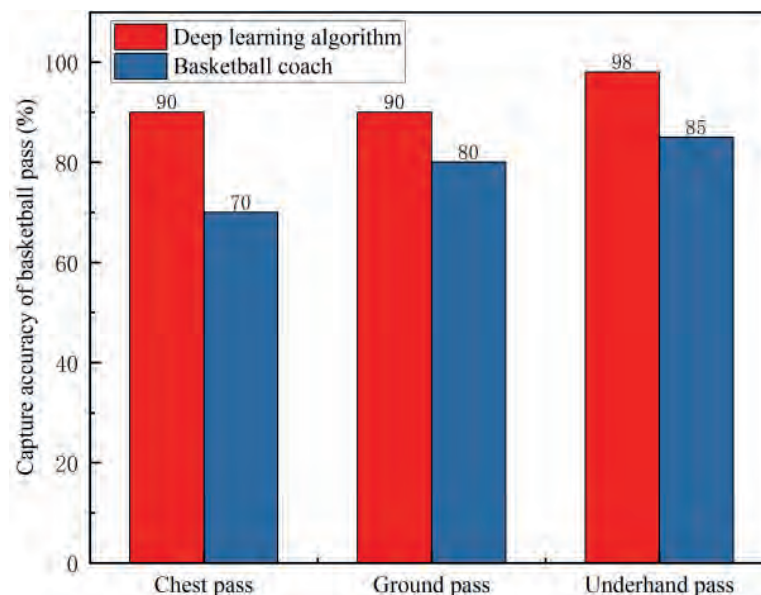

Figure 1. Comparison of depth learning algorithm and basketball coach's motion capture accuracy

### 4.3. Basketball movement breakdown design program

#### (1) Stance posture

a. Divided into parallel feet or front and back feet "small lunge" two standing method.

b. On the basis of "sitting chair", the back is slightly leaned forward into a "slope" position.

c. Align your feet to the basket as much as possible.

#### (2) In front of the chest or side of the torso, prepare to hold the ball

a. This state is for the following two situations: one is to catch the ball and shoot directly, the other is to catch the ball and then need to connect the "hidden ball" action. The common point is that the thumbs of the shooting hand and the ball protector are slightly in a "T-shape" on the basis of the stance, with the shooting hand's thumb being one of the vertical. The difference is that the chest is ready to hold the ball with the shooting hand pressed on the top of the ball, while the side of the torso "hidden ball" action, the shooting hand is directly above the ball.

b. The five fingers of both hands are separated. The shooting finger roots, finger belly are touching the ball, the palm of the hand is empty, and the ball protector touches the ball with the whole palm.

### (3) Holding the ball on the shoulder

a. On the basis of the second point of the articulation, place the ball directly above the shoulder joint and keep the throwing hand touching the ball correctly.

b. Maintain the "three right angles, two parallel" position. The back of the hand and the forearm, the forearm and the big arm, and the inside of the big arm and the front chest are the "three right angles". The big arm is parallel to the ground and both shoulders are parallel to an imaginary straight line in front from the preparation to the shot, which is "two parallel".

c. The hand protector is on the side of the ball, and the thumbs of both hands remain "T-shaped".

(4) The pitching arm is extended upward, the wrist is shaken and flexed, the fingers pluck the ball, and the ball protecting arm is fully extended at the same time

a. Pitch the ball with the palm of the hand facing upward, and then press the wrist when it is close to being fully extended, using the palm of the palm to be empty and the fingers to pluck the ball to make it rotate.

b. The arm of the ball protector follows the extension, keeping the ball on a positive flight path.

(5) Coordinate the upper and lower extremities together and press the wrist sufficiently

- a. Lower limbs stomp the ground, coherent and coordinated from bottom to top.
- b. Throw the ball with the wrist aligned to the basket, fingertips relaxed and slightly separated and pointing to the ground as much as possible.
- c. Soft rotation of the basketball, positive direction, try to enter the ball.

## **5. CONCLUSION**

In this paper, the design scheme of decomposition of basketball players' passing action is studied in the context of deep learning. Firstly, we analyze the importance of basketball passing technique and passing awareness and the quality requirements of passing technique, determine the use of deep learning target tracking algorithm and BP neural network algorithm as the technical means of the design scheme of this paper, and verify both of them respectively. In the chest passing action, the accuracy of deep learning target tracking algorithm was 90%, ground passing accuracy was 90%, and low hand passing accuracy was 98%. the integrated value of BP neural network decomposition was 2.282, the integrated result of basketball expert evaluation value was 2.87, the total value of simulation software evaluation was 3.2495, and the total value of basketball expert evaluation was 3.38, with a difference of 0.1305. The design scheme has high accuracy and is consistent with the basketball expert evaluation results, which has the value of promotion.

## **ABSTRACT**

In order to improve the scientific nature of youth sports training, this paper attempts to construct an optimization method for youth sports training with the help of VAR model. Firstly, the physiological basis of youth sports training is interpreted to ensure the characteristics of youth physical fitness. The common methods of youth sports training are dissected and their problematic areas are identified, the VAR prediction model and training optimization method are proposed, and the whole scheme is verified by co-integration. The ADF values for endurance duration of adolescents were -0.141520, for exercise impulse -2.55420, and for lactate concentration -1.415530, all of which were greater than the critical values of 1%, 5%, and 10%. The likelihood probability is 0.0133 for the "no cointegration" hypothesis and 0.3085 for the "at most one cointegration" hypothesis. the study protocol of this paper is smooth and cointegrating, and can be used as a reference for youth sports training.

## **KEYWORDS**

VAR model; Teenagers; Sports Training; Co-integration verification

## **1. INTRODUCTION**

Adolescents are the future of the country, and the training of adolescents should be aimed at diversified training. Along with learning textual knowledge, adolescents need to exercise a strong

body and healthy mind, sound personality development and comprehensive literacy [1]. The inclusion of humanism in sports training is the incorporation of sports training sentiments. Presenting a new perspective in shaping the value concept, emotional concept and moral literacy of adolescents can give them greater psychological satisfaction in sports and effectively promote the development of sports training [2].

The spirit of sports humanism is gradually formed in the continuous development of sports, and is the core quality of sports pursued by modern sports training, which is the requirement of national quality education [3]. Under the perspective of sports humanism, sports training is not only a requirement for physical quality, but also from the health of people themselves. Taking people as the fundamental starting point, it focuses on the physical health and psychological health of the training personnel, their adaptability in society, etc. [4]. The requirements for training personnel are not only to have a strong body and superb sports competition skills, but also to develop mentally, morally, and spiritually at the same time, which is the core of the development of sports humanism to this day [5]. Indispensable in sports training is the development and reform of sports rules, as well as the concept of sports competition, democracy and peaceful solidarity among peoples [6]. In the Olympic spirit, in addition to the pursuit of faster, higher and stronger, the Tokyo Olympics added unity. This is an advancement in the spirit of sports, an expansion of the humanistic spirit in sports training, reflecting the solidarity between people in sports and making sports competitions more humanistic. After each game, regardless of the results, there is no national boundary, and each athlete will hug and encourage each other, which is the best interpretation of the humanistic spirit of modern sports. The athletes can understand each other's hardship in training, and every sportsman deserves to be recognized.

This paper firstly deconstructs the basis of the whole sports training for adolescents one by one. The physiological basis of training is deconstructed from three aspects: motor system, cardiovascular system, and respiratory system, and the common methods used in youth training are analyzed and their current training problems are identified. Then, the VAR model prediction method and the optimized training method designed in this paper were proposed, and the male

1500m long-distance running performance of A high school physical training students was extracted to serve as a research model for unit characteristic root and co-integration tests. The research proposal of this paper is useful for youth sports training improvement.

## **2. Youth Sports Training System**

### **2.1. Physiological basis of youth sports training**

#### **(1) Movement System**

The proportion of organic and inorganic material in the bones in the human body varies at different ages. For adolescents, there is significantly more organic material than inorganic material, so the bones are tougher and more flexible. However, it is poorer in terms of hardness and strength, and requires proper exercise to promote bone growth. In addition, adolescents have more water in their muscles and have less inorganic salt and protein, and their muscles are more elastic. However, the muscles are not strong enough and are prone to fatigue.

#### **(2) Cardiovascular System**

The heart of adolescents is not well developed, and the heart is smaller in volume and total volume than that of adults, and the heart muscle fibers are thinner, but adolescents have a high metabolism, so they need to compensate by heart rate during exercise. With the onset of puberty, the heart begins to develop, although the development of blood vessels is slower, coupled with more gonadal and thyroid secretion, which can easily lead to higher blood pressure.

#### **(3) Respiratory System**

Adolescents have a small thorax and weak respiratory muscles, which usually manifest as shallow, fast breathing and low lung capacity. Compared with adult trachea and bronchi, the lumen of adolescents is narrower, the mucosa of trachea is weaker, and the cilia of ciliated epithelial cells in the trachea are less mobile, which makes them vulnerable to microorganisms and dust.

### **2.2. Main methods of youth sports training**

#### **(1) Competition training method**

The competition training method is good for motivating young people's desire to win, and it helps them to enhance their own sports in competition practice. For example, basketball, badminton and aerobics competitions can effectively motivate youth to train and maintain good training intensity, and also help to improve the actual combat effect.

## (2) Decomposition training method

The decomposition training method is to divide the whole set of movements into different links, the method can reduce the difficulty of the movement, easy for young people to master. Especially for the more difficult sports movements, it is more appropriate to take the decomposition training method, in the process can enhance the confidence of youth learning. The disadvantage is that the overall action is difficult to form in the minds of young people, so in the process of training need to be used in this training method for more complex, decomposable action training to go. Therefore, the current segmental training method, as well as the sequential decomposition training method, are more applied decomposition training methods [7].

## (3) Continuous training method

This method is to allow adolescents to train continuously and persistently over a longer period of time, which includes the following three main approaches: one, short duration training. This method does not have qualitative requirements for movements and the combination of movements, and can be adjusted with the actual training requirements. It can effectively enhance the endurance of adolescents in quality training and achieve a combination of aerobic and anaerobic exercise [8]. Second, the medium-time continuous training method. This method can play a significant role in the process of endurance training. It is mainly based on aerobic exercise to enhance the sport-specific endurance of adolescents and improve the stability of movements, which is more common in middle-distance running training. Third, the long duration training method. In addition to the above training methods, long duration training is also an effective method for endurance enhancement, and adolescents mainly use uniform speed, variable speed and Fatalek for long duration training [9].

### **2.3. Problems with youth sports training**

#### **(1) Bias in the perception of training intensity**

From the current situation of Chinese youth sports, there is a tendency for some coaches to blindly increase and decrease the intensity of training. The main purpose of increasing the intensity of training is to avoid the training quality not meeting the standard or not reaching the training level of other countries. Under this concept, high-intensity training tends to lead to high physical and mental stress among youths, while low-intensity training mainly takes into account the physical and mental characteristics of youths, although it is not effective in improving their sports skills.

#### **(2) There are differences in the physical fitness of adolescents**

Adolescents have certain requirements for their physical strength and endurance in the process of sports training. Some of the adolescents with poor physical fitness and those with better physical fitness will have significant differences in completing the same training tasks. This tends to damage the training motivation of adolescents, and the difference in physical fitness will also affect the strategy development of coaches to some extent.

#### **(3) Bias in the understanding of competition instead of practice**

The number of current sports competitions is increasing, so there are more and more opportunities for youth to participate in competitions in addition to training. Many coaches will let youth participate in different types and levels of competitions in order to improve the level of youth sports, and keep youth in competition condition by using competition as training. However, due to the lack of experience in training, it may not be possible to adjust the problems in the training, and the long-term use of the method of competition will also increase the probability of youth sports injuries.

### **2.4. Biased understanding of competition rather than practice**

VAR models are commonly used for forecasting 2 or more correlated time series. VAR models can generally be expressed as restricted vector autoregressive models by the following equation.

$$y_t = A_1 y_{t-1} + A_2 y_{t-2} + \dots A_p y_{t-p} + Bx_t + \varepsilon_t \quad (1)$$

Where  $y_t$  is the  $n$ -dimensional endogenous vector;  $x_t$  is the  $m$ -dimensional exogenous vector;  $\varepsilon_t$  is the  $n$ -dimensional random perturbation vector;  $A_i (i=1,2,\dots,p)$  and  $B$  are the coefficient matrices. In particular, when the exogenous vector is a constant matrix  $C$ , the VAR model becomes the following equation (2), called the unrestricted vector autoregressive model.

$$y_t = C + A_1 y_{t-1} + A_2 y_{t-2} + \dots A_p y_{t-p} + \varepsilon_t \quad (2)$$

This paper applies the method to predict the indicators in youth sports training.

### **3. Optimization of youth sports training methods**

#### **3.1. Youth sports training optimization methods**

##### (1) Establishing a youth-oriented mindset

In the process of innovative youth sports training methods, coaches should take youth as the main subject. Especially in the process of sports training at the early stage of adolescents, their sports expertise is poor, so coaches should not bring too much negativity into the training or make training plans according to the changing situation. Rather, they should fully follow the physical and mental characteristics of the youth, accept their opinions, and then innovate training methods and approaches so as to steadily improve the training effect.

##### (2) Doing good training prep activities

To achieve good training results, youth need to adjust their bodies to the best condition through warm-up and preparation activities in the pre-training period. In recent years, the innovation of youth sports training pre-preparation activities has also become the focus of attention. Traditional training methods mainly include slow walking, stretching exercises, but now some of the pre-training program can be aerobics exercise or the use of small games to achieve the warm-up effect.

(3) Building a grassroots amateur training system and giving full play to the role of single associations

Increase the construction of youth associations, innovate and reform the management mode of associations, and fully mobilize the enthusiasm of single associations. Projects with a good mass base are carried out using the market model, such as the establishment of clubs. At the same time, the assessment system and funding policy of club assessment are formulated with the youth training attainment to motivate them to give full play to the characteristics of each project. Strengthen the cooperation with educational institutions to carry out sports activities in schools. Promote in schools, provide coaching training venues for schools, organize various training camps to attract more young people to participate in various sports, continuously train sports talents, and gradually form a youth training system.

### **3.2. VAR model prediction results**

The purpose of unit root test is to determine whether the series is a smooth series or not, otherwise it may easily lead to pseudo-regression. In this paper, the endurance tolerance duration, exercise impulse, lactate concentration, and heart rate variability of male long-distance running 1500m of physical training students in A high school were used as variables to verify the smooth series of the training program in this paper. The results of unit root test of male long-distance running 1500m training in A high school are shown in Table 1.

The ADF value of endurance tolerance time for long-distance running 1500m for male physical training students in high school A was -0.141520, which was greater than the critical values of 1%, 5%, and 10%. The ADF value for exercise impulse was -2.55420, which was greater than the critical values of 1%, 5%, and 10%. The ADF value for lactate concentration was -1.415530, which is greater than the 1%, 5%, and 10% thresholds. This indicates that endurance tolerance duration, exercise impulse, and lactate concentration are smooth sequences. The ADF value of heart rate variability was -3.660007, which was less than the 5% and 10% critical values, and the heart rate variability was a non-stationary time series. Thus, the youth sports training program designed in this paper basically performed smoothly, and the general direction of the program was error-free, but

there were areas that needed to be adjusted. Heart rate variability corresponds to the shallow level of exercise intensity, and students' endurance should be moderately observed during training, and the training volume should be increased gradually.

**Table 1.** A Root Test of 1500m Long distance Running Training Unit for High School Boys

variable	ADFvalue	1% critical value	5% critical value	10% critical value	conclusion
Endurance	-0.141520	-4.130886	-3.132870	-2.613752	stable
Exercise impulse	-2.55420	-4.100037	-3.182410	-2.628450	stable
Lactic Acid concentration	-1.415530	-2.760875	-1.780650	-1.60574	stable
Heart rate variability	-3.660007	-4.058750	-3.117021	-2.574103	Unsteadiness

This paper conducts a cointegration test with the level of physiological adaptation of adolescents on the basis of the youth sports training optimization program. The cointegration test is mainly to examine whether there is a long-term equilibrium relationship between the groups of variables under study, and it is only meaningful to study them jointly if there is a certain association.

The results of the cointegration test of the VAR youth sports training model constructed are shown in Table 2. For the hypothesis of "no co-integration", the likelihood probability is 0.0133, which is less than the 5% confidence level, so the original hypothesis is rejected. For the hypothesis of "at most one cointegration", the likelihood probability is 0.3085, which is greater than the 5% confidence level, so the original hypothesis is accepted. This also indicates that there is a co-integration relationship between the two, that is, there is a long-term equilibrium relationship between youth sports training program and youth physiological adaptation level. It is meaningful to study them together, and the training program designed under the VAR model in this paper is valid.

**Table 2.** Cointegration test results of VAR youth sports training model

Original hypothesis (number of co integration variables)	characteristic value	Trace statistic	5% critical value	Likelihood probability	conclusion
nothing	0.789875	19.342786	15.503768	0.0133	refuse
Up to one	0.85378	1.093840	3.841765	0.3085	accept

#### 4. CONCLUSION

In this paper, the VAR model is used as the main technical principle to study the possibility of applying the model to youth sports training and to explore the best training optimization methods applicable to youth groups. The problems are identified by analyzing the physiological basis of youth training and the main training methods one by one. A VAR prediction model for youth sports training is proposed based on the current state of the problem. In this paper, for the hypothesis of "no cointegration", the likelihood probability is 0.0133, which is less than 5% confidence level, and the original hypothesis is rejected. For the hypothesis of "at most one cointegration", the likelihood probability is 0.3085, which is greater than 5% confidence level, and the original hypothesis is accepted. It can be seen that there is a co-integration relationship and a long-term equilibrium relationship between youth sports training program and youth physiological adaptation level.

## **ABSTRACT**

In order to improve the marketing effect of rural tourism enterprises and expand the awareness of rural tourism destinations, this paper uses big data technology as a means to study the ways of optimizing the marketing strategies of tourism enterprises in the context of the new media era. Taking ShakeYin APP, which currently has the largest number of user fans, as the research object, big data technology is used to obtain users' travel tendencies. Among them, 40% of users tend to be recommended by famous travel bloggers when choosing travel destinations; 25% are recommended by netizens; 15% are vegetarian tourists' experiences, 10% are recommendations of official tourism videos, and the remaining 10% are live tourism broadcasts. In the context of the new media era, the combination of integrated marketing with the self-media platform can promote the maximum marketing effect.

## KEYWORDS

New Media Age; Big Data Technology; Rural Tourism; Corporate Marketing

## 1. INTRODUCTION

The era of big data is the main trend of today's society, where abstract information will be delivered in the form of data. People use the technical means of big data to sort, analyze and process and refine the information that is really useful for them in a huge amount of information [1]. Modern tourism enterprises are industries that carry out service business based on information and face great market opportunities and challenges in the context of the big data era. The popularity of informational networks has led to convenient and fast solutions to people's travel needs, which directly affects their consumption habits [2]. Tourism enterprises should change their traditional marketing methods on the basis of big data, keep pace with the times, combine modern information technology, innovate marketing methods comprehensively, ensure scientific management and efficient operation, and continuously improve the competitiveness of tourism enterprises in the market [3].

On the one hand, in the network era, people can obtain tourism information without the limitation of time and space, and tourism-related information can be accessed through the Internet. Accommodation, transportation, and tickets can be booked in advance online, which gives travelers more choices [4]. The advent of the big data era has led to the autonomy of people's travel consciousness. People can flexibly arrange their travel itineraries according to their own preferences, and meet their personalized choices in terms of travel food, accommodation, travel, purchase and entertainment [5]. In travel forums, postings and other communication platforms, tourists can share real travel experiences, have more intuitive feelings about travel itineraries and hotel and attraction evaluations, and the information becomes more real and accurate, which makes the interactive communication among travel consumers enhanced. On the other hand, with the development of tourism, people's travel needs are no longer simply visiting, but more in the pursuit of spiritual satisfaction. Tourism demand becomes more and

more "advanced" and "deep", people are more eager to obtain intangible spiritual value in the process of tourism [6]. At the same time, tourists are more aware of their travel needs, and information technology can not only provide people with timely, convenient and up-to-date information about the tourism market, but also motivate tourists to plan and arrange with their own thematic needs. Information becomes a catalyst for tourists' tourism, and tourists' tourism consciousness shows the characteristics of overtaking [7].

This article first analyzes the current situation of rural enterprise marketing in the context of the new media era and dissects the dilemma of tourism enterprises in marketing. The article uses the travel browsing preferences of users on the Jitterbug APP as a big data correlation and investigates the travel attention of users to serve as the basis for the proposed suggestions. At the same time, it also proposes to market-oriented and new media technology as the main grasp of rural tourism enterprises marketing strategy, and according to the needs of consumers to develop a targeted marketing strategy plan. Tourism enterprises need to innovate marketing service means to accurately track tourism consumers and provide quality services, and also use information technology means to enrich marketing methods and achieve cross-platform big data sharing and interoperability.

## **2. The current situation and problems of rural tourism enterprise marketing under new media**

### **(1) Single marketing channel**

More rural tourism enterprises publicity channels, one is through the government propaganda. Government promotion is region-specific, creating a macro environment that does not target specific enterprises for marketing and promotion. Enterprises can "piggyback", but the effect is limited [8]. The second is through commercial enterprises and platform cooperation. More rural tourism enterprises cooperate with travel agencies, outdoor development companies, training companies, and conference companies. However, there is some competition between rural tourism enterprises and branded resorts and urban business hotels, resulting in limited clientele and obvious cycles.

### **(2) Weak marketing products**

Rural tourism enterprises product design and development capabilities are relatively weak. Food and beverage products of a single variety, "a chicken a few eat + play mahjong" popular for a while, "one trick" can no longer win. Accommodation products often ignore the characteristics of the times, is no longer just "bed + sleep", the comfort of the accommodation experience and functional configuration is particularly important. The natural environment of rural tourism enterprises is not left to grow naturally, and requires planning and design. In general, the current rural tourism enterprises' products are homogenized and not updated in time, failing to combine the new era of consumer characteristics and needs for product development, and failing to make full use of tourism resources for the integration of primary, secondary and tertiary industry products [9].

### (3) Lack of marketing talent

Talent is always a source of motivation for business development. Rural tourism enterprises, from owners to employees, often lack marketing professional learning experience and knowledge skills. Rural tourism enterprises have certain limitations in attracting professional talents due to the fact that they are located in areas basically in the suburbs or mountainous areas, which are relatively remote, coupled with the lack of clarity in various aspects such as the culture and values of the enterprise. In particular, professional marketing talents are scarce. Since rural tourism is a comprehensive industry, integrating one, two and three industries, the requirements for marketing talents are different from other industries, therefore, talents meeting the marketing requirements of rural tourism are even more scarce.

### (4) Backward marketing concept

Rural tourism enterprises are mostly upgraded by agricultural enterprises, farmhouses, etc.. Enterprises are mostly owner-operated and managed independently, confined to the cultural quality of the owners and other aspects, most with traditional concepts, waiting for customers to come to the door is a strong idea, there are most enterprises to the government and other departments of marketing work. If the government to promote the transformation and upgrading of agriculture, it is necessary to vigorously develop rural tourism, and constantly increase investment and publicity, increasing financial

expenditures. The enterprise initiative to promote the way is also relatively simple, "stopping the road to pull customers", "hiring people to shout", "set up a large signboard", "fake flowers and flags " and other sales methods, which lacks the understanding of marketing, moreover, the understanding of new media [10].

### **3. Marketing innovation strategy of rural tourism enterprises in the era of new media background**

#### **3.1. Market-oriented marketing strategies for rural tourism enterprises**

##### **(1) Development of differentiated special tourism products**

Rural tourism products should be based on regional characteristics, and must develop original tourism products. Only tourism products with originality and innovation can attract tourists in the long term. The aim is to further develop local tourism resources, develop tourism and cultural products, and classify different tourism products according to tourism market customers. The fast-paced and high-intensity life in the city makes many city dwellers wish to get away from the city and find an idyllic life. Rural tourism enterprises can design unique tourism and leisure products based on local tourism resources.

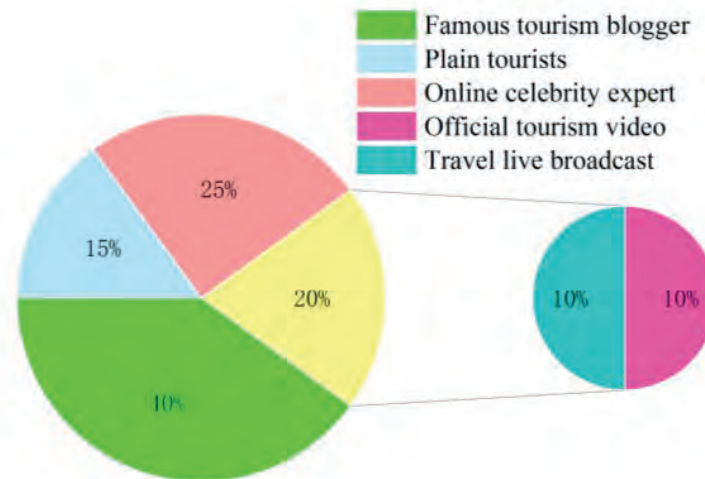

##### **(2) Reasonable pricing to increase the competitiveness of tourism products**

Adopt reasonable pricing to improve the competitiveness of tourism products and enhance the price sensitivity of rural tourism customer groups. When determining the price of rural tourism products, the consumption capacity and consumption habits of the consumer group should be fully considered. Given that rural tourism is a special product category, the prices of tourism products should be based on market supply and demand, and more flexible pricing methods should be adopted according to the differences between off-season and turbulent periods, and different pricing methods can also be adopted according to the target groups.

### **3.2. Marketing strategy of rural tourism enterprises based on new media technology**

In the era of new media, with the continuous development of self-media short videos, the mass tourism method is obviously different from traditional tourism. The tourism methods recommended by travel bloggers and "red" by net stars are impacting the traditional enterprise marketing and promotion methods. Next, we will use big data technology to obtain tourism browsing data of short video platform users, and use it to analyze the repositioning of the focus of rural tourism enterprises' publicity.

The situation of big data to obtain Jitterbug APP tourism data is shown in Figure 1. Users prefer well-known travel bloggers' recommendations when choosing tourism destinations, accounting for 40%; netizen experts' recommendations account for 25%; vegetarian tourists' experience recommendations account for 15%; official tourism video recommendations account for 10%; and live tourism recommendations account for 10%. Among them, well-known tourism bloggers such as Fan Qi, who has 21.764 million fans, has almost a stable amount of 250,000 shake video plays per release, and the fan effect is very considerable. Rural tourism as a popular tourist destination in recent years, tourism enterprises may wish to consider working with tourism bloggers together, as a way to open up corporate awareness. It is worth noting that the percentage of vegetarian tourists who recommend after experience also reached 15%, which reflects that in addition to the net red "grass", users also pursue the real sense of travel experience. Therefore, in tourism services, enterprises should first improve their own conditions, improve the comfort of tourists travel.

**Figure 1.** Big Data Obtaining Tiktok APP Tourism Data

According to the big data of travel preference and combined with the development trend of new media, this paper gives the following suggestions:

(1) Actively change the marketing concept and strengthen the application of new media research

First of all, leisure enterprise managers should change their marketing concepts and keep up with the times, and put business operation and marketing management in the current context. Secondly, compared with the four traditional media of newspaper, outdoor, radio and TV, the new media is imaginatively called the "fifth media". New media is a new technical support system for the emergence of media forms, such as digital magazines, digital newspapers, digital radio, cell phone SMS, mobile TV, live webcasting, desktop windows, digital TV, digital movies, touch media, cell phone network, etc.. Enterprises should fully study the impact of new media on the market and successful cases, find the combination of rural tourism and new media, develop new media marketing strategies and implementation steps, and use new media to help enterprises build new marketing systems.

(2) Combine various platforms of new media and build new marketing channels

Rural tourism enterprises should classify new media and different platforms to create different marketing channels. At the same time, it

is also possible to organically combine mainstream new media platform columns and boards with the characteristics of rural tourism enterprises to establish a new new new media channel system. Second, the management and maintenance of new media channels should be strengthened. The diversification of channel sources has put forward higher requirements on the management of enterprises. Tourism enterprises should carry out relative management and service according to the customers of different channels, especially those of new media channels, to form word-of-mouth and positive effects.

(3) Combine with the speed of new media communication to strengthen marketing and promotion

New media, as a new communication medium, has the characteristics of fast communication speed and wide communication range. Combining the characteristics of the new media's fast communication speed means that information is updated quickly. This requires that the speed and quality of content updates provided by rural tourism enterprises need to be synchronized with the new media platform, and the relevant information content should be maintained and updated frequently. In addition, combined with the wide range of new media communication, rural tourism enterprises are required to focus on the breadth and depth of promotional content to accommodate a wider range of communication. In particular, in the work of self-built new media publicity, it is more important to correspond to the needs of consumers and provide effective publicity information in order to improve the publicity effect in order to promote customer conversion.

#### **4. CONCLUSION**

This article studies more possibilities of marketing for rural tourism enterprises in the new media era based on the full-featured characteristics of big data technology. Starting from analyzing the current characteristics of rural tourism enterprises' marketing in the context of new media, the article analyzes the challenges faced by rural tourism enterprises in marketing and proposes marketing strategies for rural tourism enterprises that are market-oriented and based on new media technology. According to the survey data of Jitterbit APP, users are more inclined to be recommended by famous travel bloggers when choosing tourism destinations, accounting for

40%; by netizens, 25%; by vegetarian tourists' experience, 15%; by official tourism videos, 10%; and by live tourism, 10%. In the context of the new media era, cooperation with short video platforms will be more helpful to rural tourism enterprises to open their awareness.

## ABSTRACT

To explore an effective method for predicting the peak electric load, this paper proposes a prediction study using LSTM based on Bayesian networks. A time series foretelling model based on long and short-term memory neural network (NN) and dynamic Bayesian network is proposed. An electric load forecasting scheme based on the leaf Bayesian network is established, and the forecasting accuracy of the leaf Bayesian network is compared with that of the BP NN. The prediction consequences confirm that the Bayesian network prediction accuracy reaches 98.81%% and 97.60%, and the BP NN reaches 95.42% and 97.41%, respectively, with a difference of 3.39 and 0.19. The peak load time prediction error is 2.82 h for the Bayesian network and 4.01 h for the BP NN. the model can improve the sequence forecast accuracy and speed while reducing the complexity of the algorithm.

## KEYWORDS

Bayesian Network; Short and long-term memory; Peak electric load; Prediction accuracy

## 1. INTRODUCTION

The basic task of electric power system is to provide uninterrupted, high-quality and stable electric energy to meet the electricity demand of various users [1]. In current years, with the quick growth of the general economy and the unceasing enhancement of the alive typical of the inhabitants, the proportion of electric energy in the end energy consumption has become higher and higher. The overall electric load shows a high growth rate, especially the growth rate of peak load is higher than the growth rate of electric load [2]. Currently, China's load peaks are constantly refreshed and the imbalance between supply and demand during peak periods is deepening [3]. Scientific and accurate load peak prediction could afford a position origin for the daily operation of power grids and the formulation of power dispatching schemes. Based on the forecast results, the power plant capacity can be reasonably arranged, and the balance of power supply and demand can be reasonably purchased to achieve safe, reliable and economic operation of the power grid [4].

Time series prediction is a hot problem in the field of pattern recognition and artificial intelligence, which has a wide range of application prospects and has received the attention of scholars and researchers [5]. At the same time, sequence prediction will encounter great challenges due to the development and popularity of computer technology. Multi-step prediction often uses some straightforward approaches, such as iterative and straight approaches. In the strategy based on the iterative method, the one-step ahead calculation is first calculated and then the other data are predicted through one-step process calculation value [6]. Another hand, in the straight method-based approach, one-step process or multi-step ahead values could be assessed based on the equal prediction model. Usually, the collective error is a significant feature disturbing the prediction accuracy in the iterative method, while the computational cost is an important factor to be considered in the direct method. Besides, some procedures such as DirRec strategy and multiple-input multiple-output method, as well as multiple-input multiple-output prediction models are proposed [7]. In the MIMO and MISMO procedures, the chief idea is to obtain higher prediction accuracy, and at the same time, all these approaches have high computational cost. In MISMO procedures, the original forecast commission is generally converted

into subtasks, which in turn use the optimal solution to compute the output, where algorithmic complexity is a key issue [8].

In the paper, a time sequence forecasting model through the principles of LSTM and Bayesian theory is proposed for recursive operational structure long and short-term memory NNs and dynamic Bayesian networks. Firstly, the theory of Bayesian network and its algorithm are elaborated, and then its parameter index prediction criteria are constructed to clarify the LSTM model and its application principle. By comparing the algorithm of this paper with BP NN, an optimal estimation theory is studied and proved, and on this basis, the optimal prediction estimate is obtained, which is used to establish that the model can decrease the intricacy of the algorithm while improving the accuracy and speed of sequence prediction.

## **2. Bayesian network-based peak power load model**

### **2.1. Bayesian Network Theory**

A Bayesian network is a focused acyclic graph whose bulges signify random variables and the variable values can be either discrete or continuous. The edges among the bulges signify straight additions between the variables, and each node has a possibility circulation attached to it [9]. The conditional probability distribution of the root protuberance is an edge possibility circulation  $P(X)$ , and the possibility circulation of the non-root node is a conditional probability distribution  $P(X|\pi(X))$ .

Bayesian network model building generally consists of two parts.

#### **(1) Network Architecture Learning**

The construction learning of Bayesian networks is mainly through learning the network construction that turns greatest with the data according to some quantity, and the approaches are chiefly confidential as a hybrid search algorithm through dependent arithmetical study, scoring search methods, and a combination of both. In this paper, the scoring-based search method is used to select the forbidden search algorithm, and the Bayesian information criterion (BIC) is selected for the scoring function. The BIC is quantified as follows:

The variables  $X$  and  $Y$  that obey the Gaussian circulation, then the

Gaussian probability density function of  $X$  conditional on the variable  $Y$  is:

$$f(X|Y) = \frac{1}{(2\pi)^{N/2} |S|^{1/2}} \exp\left\{-\frac{1}{2}(X - WY - U)\right\} \quad (1)$$

$$W = S_{XY} S_{XX}^{-1}, S = \begin{bmatrix} S_{XX} & S_{XY} \\ S_{XY} & S_{YY} \end{bmatrix}, U = [U_X - WU_Y] \quad (2)$$

Suppose there are  $m$  independent identically distributed exercise trials  $D$  and the log-likelihood function  $L$  is:

$$L = \log \prod_{i=1}^m f(X|Y, D) \quad (3)$$

Then the formula for calculating the BIC score  $S$  is:

$$S = L - M \ln(P) / 2 \quad (4)$$

Where:  $M$  is the number of bulges related to the probability density function;  $P$  is the number of bulges of the created Bayesian network.

## 2.2. Parameter Learning

Parameter learning of Bayesian networks is the problematic of decisive the limits of the possibility circulation of the network bulges, given the recognized network. Parameter learning approaches include the great likelihood estimation approach and Bayesian estimation approach. In this paper, the excessive likelihood valuation approach is used to guess the network parameters. It is known that  $p$  meta-normally distributed overall  $X \sim N_p(\mu, \Sigma)$ , let  $X_{(i)} = (x_{i1}, \dots, x_{ip})', i = 1, 2, \dots, n$ , is a  $n$  simple accidental model strained from  $p$  meta-normally distributed overall  $X$ , i.e.,  $X(i), \dots, X(n)$  is autonomously and identically dispersed with general  $X$ , and the unkind  $X$  covariance  $A$  and likelihood occupation  $L(\mu, \Sigma)$  are respectively:

$$\left\{ \begin{array}{l} \bar{X} = \frac{1}{n} \sum_{i=1}^n X_{(i)} \\ A = \frac{1}{2} \sum_{i=1}^n (X_{(i)} - \bar{X})(X_{(i)} - \bar{X})' \\ L(\mu, \Sigma) = \prod_{i=1}^n \frac{1}{(2\pi)^{\frac{p}{2}} |\Sigma|^{\frac{1}{2}}} \exp \left[ -\frac{1}{2} (x_{(i)} - \mu) \Sigma^{-1} (x_{(i)} - \mu)' \right] \end{array} \right. \quad (5)$$

### 2.3. Construction of peak power load forecasting model

The specific steps of model structure are as follows:

- (1) Input data and do processing.
- (2) Through the two-stage approach, select the greatest mixture of conforming model features from the different model variables.
- (3) Association the consequences of model factor assortment to construct a Bayesian network load peak forecast model by:
  - 1) Setting the parameters of the search procedure and the original network solution.
  - 2) Calculating the current network construction score according to the Bayesian scoring criterion.
  - 3) determining whether the conjunction standard is pleased, and if so, outputting the present optimal network construction, and vice versa, continuing to the next step.
  - 4) Determining the current network construction neighborhood.
  - 5) Regulate whether the searched applicant network construction solution pleases the contempt criterion.
  - 6) Repeat steps 3), 4) and 5) until the convergence criterion is satisfied, then end the search.
- (4) Perform peak load prediction using the constructed Bayesian network model.
- (5) Output the peak load forecast value and the corresponding peak time.

### 2.4. LSTM model

Long and short-term memory NN is a special kind of convolutional NN that can perform well in sequential information processing and is

broadly used in fields such as handwriting recognition and music classification [10]. LSTM models are specifically used in recognition or retrieval fields to deal with long term dependency problems. Remembering long-time information is the inherent behavior of LSTM. When the LSTM model works, the first step is to decide which information desires to be dropped from the cell. This conclusion is done using a component in the model called the "forgetting gate", which is an S-shaped layer. The "forget gate" first receives the input signal and then calculates a number between 0 and 1, where 1 means "keep all previous information" and 0 means "drop all previous information ". Through the traditional LSTM model, some scholars have planned a number of enhanced models, such as the gated cyclic unit. This model combines forgetting gates and input gates to form a new update gate, and also mixes cell states and hidden states to finally obtain a simpler and improved LSTM model called GRU.

### **3. Results of LSTM through Bayesian network for power load peak prediction**

Through the historical 98-point load data from February 15, 2020 to December 30, 2021 in City B of City A, the historical load peaks from the 42nd moment point to the 80th moment point of each day were extracted, and a load peak prediction model was constructed for each category for classification and prediction. Applying the above Bayesian network load peak prediction approach, modeling prediction for each category of load and comparing with BP NN, the load prediction accuracy comparison results are shown in Table 1.

The highest grid load magnitudes are for category 2 and category 5 loads. The Bayesian network has very high prediction accuracy, reaching 98.81%% and 97.60%, respectively, while the corresponding BP NN is 95.42% and 97.41%, with a difference value of 3.39 and 0.19, respectively. the rest of the peak predictions also have high accuracy. The average prediction accuracy of Bayesian network is 95.645%, while the BP NN maintains a relatively stable prediction accuracy, with an average prediction accuracy of 95.28%. Thus, the feasibility of Bayesian in power load peak prediction is further verified.

**Table 1.** Load Peak Prediction Accuracy

Load category		Category 1	Category 2	Category 3	Category 4	Category 5	Category 6
forecat Precision (%)	Bayesian network	94.50	98.81	96.62	95.80	97.60	90.54
	BP NN	94.79	95.42	95.14	95.95	97.41	92.97

Through the above Bayesian network model, the peak load is predicted and compared with the BP NN for analysis. The prediction pairs of peak load magnitude and occurrence moment are shown in Figure 1. The lowest point of peak load prediction of Bayesian network is 3024.65 MW and the highest point is 5480.98 MW, and the prediction accuracy is 94.40%. The lowest point of peak load prediction of BP NN is 2168.31 MW and the highest point is 5618.29 MW, and the prediction accuracy is 94.12%. The peak load time prediction error of Bayesian network is 2.82 h; the peak load time prediction error of BP NN is 4.01 h. The peak load prediction through Bayesian network has higher magnitude prediction accuracy compared with BP NN prediction, but the peak time prediction error of Bayesian network is smaller. This indicates that the peak load prediction through Bayesian network has high credibility and feasibility, and the prediction approach in this paper is effective.

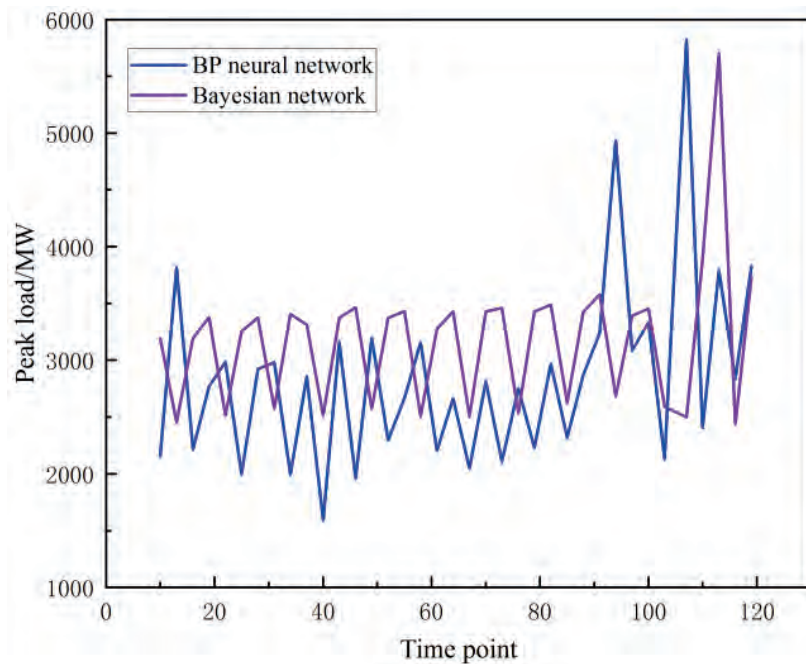

Figure 1. Prediction of peak amplitude of power load

## 4. CONCLUSION

In this paper, recursive operation construction is proposed through the principles of LSTM and Bayesian theory to obtain better prediction performance. The prediction progress of Bayesian network and BP NN is compared and verified, according to the prediction results, the average prediction accuracy of Bayesian network is 95.645%, and the average prediction accuracy of BP NN reaches 95.28%. The time prediction error of peak load of Bayesian network is 2.82 h, and the time prediction error of peak load of BP NN is 4.01 h. Thus, it can be seen that the construction of this paper has good prediction performance and verifies that the LSTM time series prediction of Bayesian network is effective, and the algorithm is scalable and popular in related fields.

### **ABSTRACT**

In order to overcome the realistic difficulties of dangerous experiments without facilitating practical operation and deepen the practical application degree of instrument analysis experiments, this paper analyzes experimental teaching resources based on virtual simulation of modern hybrid instruments with artificial intelligence system. From the current realistic dilemma of instrument analysis experimental teaching, breaking the realistic operation barrier with artificial intelligence technology, specific conceptual ideas and implementation plan are proposed, and the lesson plan is submitted to the expert group for preliminary estimation to carry out the acceptance of students' operation results. Out of 100 points, the final score of the lesson plan proposed in this paper was 79 points. Among them, 20% of the students thought that the experiment had a strong sense of learning acquisition and 19% of both simulation as well as knowledge acquisition. The scheme constructed in this paper has a high degree of reproduction and is suitable for the promotion of instrumental analysis experimental teaching.

## KEYWORDS

Artificial Intelligence; Instrumental analysis experiments; Teaching Model; Expert Assessment

## 1. INTRODUCTION

Modern instrumental analysis involves the intersection of many disciplines and has been progressing and improving with the continuous development of science and technology, becoming a powerful tool for solving key problems in the field of natural sciences and is widely used in various fields such as pharmaceuticals, life sciences, environmental sciences, agricultural sciences, animal sciences and food sciences. Therefore, instrumental analysis theory and laboratory courses are considered as one of the important basic courses for both undergraduate and graduate students of chemistry and non-chemistry majors in higher education institutions [1]. Specifically in the field of chemistry, laboratory courses serve the function of bridging classroom theory and production practice, and are an indispensable part of the process of integrating theory with practice. However, the content of the theory and experimental courses of instrumental analysis is numerous and abstract, and the correlation between the knowledge points of each chapter is small, which causes students to have difficulties in learning and gradually become intimidated in the learning process until they eventually lose interest, which greatly reduces the teaching effect [2]. In recent years, with the continuous innovation of teaching methods, advanced teaching modes such as virtual simulation and online and offline hybrid teaching have emerged, and the application value of virtual simulation experiments in the field of teaching and research has been gradually recognized by education and research workers, and rapidly accepted by major universities, while welcomed by the majority of teachers and students [3]. Many domestic universities have established virtual simulation laboratories according to their own needs. However, how to effectively combine the above-mentioned model with modern instrumentation analysis experimental courses and break the teaching bottleneck of traditional modern instrumentation analysis experiments is an urgent problem for every worker engaged in teaching this course [4].

In this paper, a virtual simulation experimental teaching mode based on artificial intelligence system is constructed based on the existing problems of the current hybrid instrumental analysis experimental teaching. The main research idea is to comprehensively collect students' experimental process data, analyze the state of the experimental process and the behavioral data of the experimental group, etc. The virtual simulation software exercises and offline experimental operations are carried out as the main program implementation methods. Finally, the practical performance of the program is fully evaluated through the evaluation of the teaching program by a 4-member expert group and the first batch of students' experimental operation experience.

## **2. Modern hybrid instrumental analysis laboratory teaching dilemma**

(1) Instrumental analysis experimental content is numerous and abstract and difficult to understand

The experimental content of instrumental analysis mainly includes optics, electricity, chromatography and mass spectrometry, etc. The contents of each chapter are many and little correlated with each other, which undoubtedly increases the difficulty of students' learning [5]. Traditionally, the teaching methods of modern instrumental analysis laboratory classes are generally board books, PPT and instrument operation, which make it difficult for teachers to explain the principles of various analytical methods to students in an in-depth, clear and thorough manner. Students with weak foundation usually only have a preliminary understanding of some basic concepts, and cannot really grasp the structure and working principle of the instruments, and students gradually lose interest in the learning process, which makes it difficult to ensure the teaching effect.

(2) Insufficient sets of instruments and equipment

With the popularization of higher education, the scale of laboratory construction often lags behind the actual needs of the rapidly growing number of students, which is mainly manifested in the insufficient number of modern instruments and equipment per capita. In addition, large instruments are expensive, so it is not possible to achieve one per capita, so experiments are generally conducted in groups. In group experiments, usually only the students who are better learners

operate the experiments, and those who are weak and do not know the relevant knowledge points are automatically turned into spectators due to lack of confidence. The latter need to think and understand in the process of experimental operation to improve their ability.

### (3) High-risk experiments are difficult to offer

Due to the concern of experimental safety, universities usually do not offer experiments with high risk, which makes the teaching content incomplete, restricts the construction of students' complete knowledge system and restricts the teaching effect [6].

### (4) Late update of instruments

With the continuous development of science and technology, the development of modern instruments is also changing rapidly. Colleges and universities are often limited by the site, funding, the slow update of large instruments, high-end instruments can not afford to buy. In the actual teaching can only offer content related to the existing instruments in the laboratory, which causes the teaching content to be obsolete, and students cannot understand and master the latest cutting-edge science and technology [7].

### (5) Some large modern instruments and equipment cannot be opened to undergraduate students

Some large precision instruments and equipment used in modern instrumentation and analysis experimental courses are often very costly to maintain, and the operators need to have professional knowledge and experience in using them [8]. Due to the limitation of course hours, such experiments cannot be offered to undergraduate students.

### (6) Students have different foundations and should be taught according to their abilities

With the expansion of colleges and universities, some students with weak foundation have the opportunity to enter colleges and universities. The theoretical content of modern instrumental analysis experiments is boring and difficult, so that the above-mentioned students are unable to learn and eventually lose confidence or even give up, leading to an unpromising teaching effect.

### **3. Construction of virtual simulation experimental teaching mode based on artificial intelligence**

#### **3.1. Building Ideas**

(1) Comprehensive collection of student experimental process data and analysis of experimental process status. Based on the online experimental platform, real-time collection and storage of student experimental process data is realized for analyzing students' circuit design, experimental operation, and circuit status monitoring, which provides original information for behavioral analysis system and teaching feedback mechanism [9].

(2) Research on hierarchical guidance and experimental circuit fault analysis methods for online experiments using artificial intelligence-related technologies. Based on the behavioral data and circuit states in student experiments, intelligent techniques are used to analyze the correctness of student experimental states and experimental circuits. Selectively and conditionally provide from simple and detailed hierarchical experimental task analysis, problem guidance and operation guidance according to student behavior to personalize online help for students.

(3) Study the connotation of teaching evaluation and design personalized experimental assessment programs. According to different experimental tasks, determine the experimental objectives and develop experimental assessment criteria. Schools should combine the analysis of students' experimental behavior and the use of online help to comprehensively evaluate the completeness, completion, standardization, accuracy, autonomy and other indicators of students' experiments, and study a reasonable teaching evaluation system.

(4) Analyze the behavioral data of experimental groups and give feedback on teaching results. Using artificial intelligence-related technology, we analyze the teaching methods and teaching effects as a whole, provide the effectiveness analysis data of online experimental teaching, and provide the reference basis for improvement for teaching designers.

#### **3.2. Program Implementation Methodology**

(1) Multimedia classroom to explain the theory

Classroom theoretical lectures are an important part of traditional instrumental analysis experiments. Teachers explain the theoretical parts of the involved instrumental analysis experiments according to the requirements of teaching objectives, focusing on instrument construction, operation principles, usage, data processing, etc. The original classroom is textbook-based and PPT-based, which is abstract and difficult for students to understand. At this stage, we have to combine the characteristics of multimedia classroom and network video resources to make the theoretical knowledge vivid, fully mobilize students' learning enthusiasm and actively integrate into the lecture process. Cultivate students' active learning ability, strengthen teacher-student interaction, and improve the overall effect of classroom theory teaching of instrumental analysis experiments.

### (2) Virtual simulation software exercises

Large precision instruments with high technical content and complex structure, it is difficult to observe the inside of the instrument, and students cannot clearly understand the instrument structure and working principle. The virtual simulation experiment can solve these problems well. The simulation animation experiment of instrument disassembly can show the working principle graphically, with the virtual simulation software operation video, and the key links to strengthen the practice, improve the students' learning interest and teaching effect. Students' ability to analyze and solve problems can be improved comprehensively, which is conducive to the cultivation of highly skilled and innovative talents.

### (3) Offline experimental operation

Through multimedia classroom theory lectures, students have a clearer understanding of the experimental projects to be carried out. After that, students enter the virtual simulation experiment platform by themselves, they can repeatedly rehearse and simulate the experiment operation process to fully digest the classroom knowledge. After the virtual simulation platform rehearsal, students have a clear and complete understanding of the experiments to be carried out. After entering the lab, the teacher will give a live lecture for the instruments, after which the students will conduct experiments in groups.

### **3.3. Acceptance of experimental teaching results of mixed instrument analysis**

In the evaluation of teaching mode, it first needs to be accepted and evaluated by the expert group to determine its teaching value before it can be initially tried out. In this paper, the construction of teaching resources and the sharing of teaching resources are the two secondary indicators, and the virtual simulation instrument analysis experimental teaching program is submitted to the 4-member expert group for evaluation, and the results of the expert evaluation of the virtual simulation experimental teaching mode are shown in Table 1.

In the teaching assessment with a score out of 100, the final score of the lesson plan proposed in this paper is 79. In the assessment of the construction of experimental teaching resources where real experiments cannot be carried out or are highly dangerous and polluted, it scored 19 points out of a total score of 20 points or was highly supported by the expert group. The necessity, applicability, innovation and richness of experimental items of teaching resources scored 18 points and ranked second. The rest of the indicators were also close to full scores. It can be seen that educational research, due to its strong specialization, itself contains a large amount of domain knowledge, and the behavioral data generated in the teaching process has become diverse and complex in the era of artificial intelligence. Comprehensive analysis of the above, the combination of knowledge reasoning and AI machine learning is bound to be an effective way of teaching behavioral research problems.

**Table 1.** Expert Evaluation Results of Virtual Simulation Experiment Teaching Mode

Evaluation indicators		Observation index	Score	Expert rating	
Level I indicators	Secondary indicators				
Virtual Simulation Experiment Teaching Resources	Construction of teaching resources	Starting time of experimental project	10	6	
		Necessity, applicability, innovation of teaching resources and richness of experimental projects	20	18	
		Experimental teaching resources that can not be carried out or are highly dangerous, and seriously polluted	20	19

According to the expert evaluation opinions, the program of this paper carried out the actual measurement of students' experimental session, in which we should focus on collecting students' gaining sense as a reference of teaching program and improving the preliminary program. The distribution of the first batch of experimental students' gaining sense is shown in Figure 1. Students were most positive in the outcome evaluation, with 30% believing that the experimental system could obtain good learning outcomes in

conducting the experiments. Student efficacy evaluations were the next most positive, with 20% believing that the pilot system was conducting experimental learning with a strong sense of acquisition. The simulation degree and knowledge gaining feeling were 19%, which proved that the experiment system simulated realistic and the experiment was highly reproduced. 12% thought that the experiment system was not strong in operation and the subsequent modification in this area should be focused.

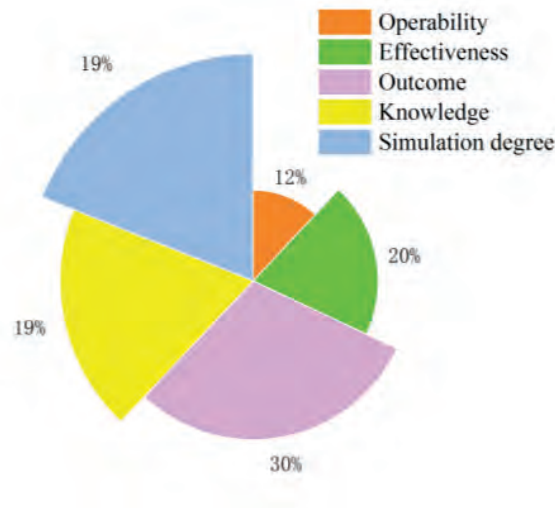

Figure 1. Distribution of sense of gain of the first batch of experimental students

#### 4. CONCLUSION

This paper proposes the construction of virtual simulation instrument analysis laboratory based on artificial intelligence from the teaching dilemma of modern hybrid instrument analysis laboratory teaching, and clarifies the construction ideas and program implementation methods one by one, and finally the program results are accepted through the initial evaluation of the teaching expert group program and the first batch of students' practical operation learning acquisition. The final score of the proposed lesson plan in this paper is 79. In the evaluation of the construction of experimental teaching resources that cannot be carried out by real experiments or are highly dangerous and polluted, it scored 19 points, which was highly supported by the expert group. In addition, 30% of the students thought that the experimental system could obtain good learning results by conducting experiments, and 20% of the students thought that the experimental system had a strong sense of gaining experimental learning. The

teaching model constructed in this paper has practical promotion value.

## ABSTRACT

In order to improve the overall quality of students, this paper tries to propose an analysis of the feasibility of enhancing students' quality education with the ability to appreciate piano works in the context of big data. By discussing the current situation of piano appreciation and students' quality education and evaluating the significance of this project, this paper proposes a teaching plan for piano appreciation and students' quality education based on big data analysis. In order to verify the scientificity of the lesson plan, it was handed over to the expert group for evaluation, and the final evaluation result was obtained as 21 points, and in the teaching test session, the students' satisfaction reached 90%. The program of this paper was unanimously approved by the expert group and the students, and has important educational and teaching value.

## KEYWORDS

Big Data; Piano Appreciation; Quality education for students; Satisfaction

## 1. INTRODUCTION

The Ministry of Education of the People's Republic of China advocates the development of cultural quality education for students in China, proposes to emphasize and strengthen aesthetic education

and art education in schools, and takes art education as one of the important contents of "quality education", placing art education in a rather important position [1]. This is undoubtedly a very wise and far-reaching initiative. Secondary vocational education has become an important part of education, and the quality and ability of secondary school students are directly related to the healthy development of China's socialist modernization [2]. Quality education is a purposeful and planned activity to develop, shape and improve people's body and mind by using different educational means. In the quality education which requires the all-round development of morality, intellect, physique, aesthetics and labor, the role played by music education as one of the basic contents of quality education has gradually gained recognition and attention. Sukhomlinsky once said: "There is no education without aesthetic education". Aesthetic education plays an important role in cultivating students' healthy aesthetic concepts and aesthetic abilities, and cultivating noble moral sentiments [3]. However, how to teach a good music appreciation class is still confusing to many teachers. Currently, there are many problems in music appreciation teaching, which are highlighted by the fact that music appreciation teaching is too specialized or non-musical. How to change the status quo of music appreciation teaching? According to Aldrich, a contemporary American philosopher, "The content of a musical work is both audible and visible. To be precise, both the audible and the visible are not mutually exclusive in musical works [4]." Musical aesthetics also affirms Aldrich's view from an aesthetic point of view that the content of music consists of two types of expression; one is the intuitive, non-imaginative musical content, i.e., the audible content, which is the objective content element in music. The other is non-intuitive, imaginative, and can be called non-musical content, i.e., visual and thinkable content [5].

In this paper, we analyze the problems of the current music appreciation curriculum in colleges and universities through big data to find out the current situation of music appreciation training in colleges and universities and to figure out the research trends. And then the significance of piano music appreciation and students' quality education is linked to form the theoretical basis of this paper. Based on the theoretical definition, the implementation plan of piano

music appreciation in students' quality education is proposed in this paper, and the plan is handed over to a group of experts for teaching quality assessment. After the evaluation was approved, a semester-long teaching test was conducted for this purpose, which finally verified the scientific validity of the lesson plan designed in this paper.

## **2. Students' ability to appreciate piano works in the perspective of big data**

### **2.1. The current situation of cultivating music appreciation in colleges and universities**

At present, the importance of cultivating music appreciation in college piano education is not high, and the following problems mainly exist. First, the importance of theoretical teaching of piano is not high, and some teachers only pay attention to the exercise of students' playing skills in teaching, ignoring the actual needs of students, which leads to the phenomenon of mechanical and rigid playing of students. Secondly, the infectious power of piano teaching is not high enough to stimulate students' strong interest in piano. Teachers' piano teaching is slightly boring and dull in content and manner, which eventually makes it difficult to improve the quality of teaching. Third, the teacher's ability to cultivate music appreciation needs to be improved. With the development and progress of society and the changing needs of people, teachers need to keep up with the times and improve their own ability to play a model role for their students.

### **2.2. The significance of piano music appreciation in students' quality education**

#### **(1) Develop students' perceptual and imaginative skills**

In the process of music appreciation, people may have different understanding of the works even if they have the same feelings about the rhythm and timbre of the music due to the differences in life experiences, cultural qualities, and stylistic interests. Therefore, secondary institutions should cultivate students' music appreciation ability, reflect the aesthetic value, and cultivate their perception and imagination so as to break the shackles of thinking [6]. The cultivation of perceptive ability can start from classical music, for example, when enjoying "High Mountain Flowing Water", the teacher guides students to feel the scene of high mountain flowing water simulated by the

sound of guqin and the sympathetic feelings contained in it, so that students can experience the aesthetics in the ancient piece and touch the heartstrings. The cultivation of students' imagination can spill over into any excellent piece; imagination itself is what connects the hazy sense of music to life experience. The imagery in excellent works is in turn derived from the reality of life. When appreciating the music, it is only necessary to follow the free thinking of the music to trace the imagery in the melody. For example, when appreciating "The Tempest", the teacher can ask students to imagine the natural landscape of muffled thunder rolling and lightning flashing according to the change of strength, so as to achieve the aesthetic expectation. This experience accumulated to a certain extent can help students soon also understand the mood of the music and resonate with the author in their appreciation.

### (2) Feel the aesthetics of music through emotional experience

The emotional experience in the aesthetic process is an important basis for integrating into the aesthetic world of music, and only with the ability to experience deeply the connotations of music can one touch the world of emotions in the work. Teachers should pay attention to cultivating students' mental emotions during teaching activities, so that they can learn to deal with different emotional factors according to different rhythms of the repertoire. At the same time, it is necessary to broaden students' knowledge, to have a deep understanding of the spirit of the times and national consciousness of each period in art history, and to be familiar with the characteristics of various musical styles, which is also a basic skill necessary for music appreciation. When studying Beethoven's Symphony of Destiny, the teacher can start from life experience, linking the triplet to the knocking sound and then to destiny, thus opening the chapter of this piece, allowing students to understand the idea of struggle in the work, to experience the spirit of fearlessness, and to achieve the desired effect of emotional experience. Cultivating a higher level of music appreciation from practice is conducive to enhancing the aesthetic meaning of students [7].

### (3) Develop interest in learning and enhance thinking skills

Music appreciation is the process of developing students' awareness of a work from cognition to understanding to internalization. Guiding

students in piano education begins with an understanding of the context in which the work was composed and the author's life background, which helps students to understand the motivation of the piece from an emotional point of view. Compared to teaching students piano skills in a rigid way, cultivating students' music appreciation is more likely to stimulate students' interest in learning piano, and it also exercises students' thinking skills, prompting them to think in learning, improve in thinking, and internalize in improving. Interest is an important prerequisite for learning an instrument and should motivate students to actively explore and practice relentlessly. In conclusion, the cultivation of music appreciation is of profound significance for piano education [8].

### **3. Appreciation of piano works in the quality education of students' initiatives and effectiveness**

#### **3.1. Music Appreciation Method**

Music appreciation is divided into three ways: perceptual appreciation, emotional appreciation and rational appreciation. The famous music educator Huang Zi once said, "In terms of perceptual appreciation, we should be able to discern the rhythm, tune, harmony and timbre of beauty [9]. In terms of emotional appreciation, we should first know the method of these musical expressions and the life and character of the composer, and then use our meditation to experience the emotions it expresses. In terms of rational appreciation, we should first know the differences between the various schools of these music and the characteristics of each school, and be able to examine the precise structure resulting from the various variations of 'gladness' tracing this 'gladness'." This quote from Huang Zi shows that when appreciating music, we should not only grasp the musical content, but also the non-musical content. In music appreciation teaching, we should handle the relationship between musical and non-musical contents according to the students' knowledge structure, learning ability and psychological characteristics. Only by grasping the musical and non-musical contents at the same time can we fully mobilize students' enthusiasm and make the classroom "alive". For example, when students enjoy "Yellow River Cantata", in order to let students understand the musical characteristics of the Yellow River and shorten the distance from the music, we can use multimedia to show

the majestic picture of the Yellow River. With the changing speed, intensity and mood of the music, the students' emotions are naturally integrated into the music.

### **3.2. Music appreciation skills development**

(1) Pay attention to the actual situation of students, scientific classification teaching

Each student has different levels of music appreciation ability, and teachers in colleges and universities should fully understand the actual situation of each student when conducting education guidance, and teach differently according to students' different comprehension and appreciation of music, i.e. teaching at different levels. Both high and low level students should be taught in a gradual manner, respecting the law of student development. For students with weaker foundations, it is important to start with basic music appreciation material and gradually move to more difficult pieces. For the more capable students, teachers should recommend relevant books to students on the one hand, and at the same time, they should make sure that these students should not be overly ambitious and should strengthen their training in general, and should carry out deep and connotative studies to gradually improve their music appreciation ability and piano level. Piano teachers in higher education should play a leading role, pay attention to grasp the actual situation of students, timely understand the needs of students, carry out scientific classification teaching, enrich themselves, and constantly meet the piano learning needs of students.

(2) Create a warm atmosphere and increase the difficulty appropriately

A harmonious and warm teaching atmosphere is helpful for students to learn piano, which can both stimulate students' interest in learning and promote teachers' piano teaching progress. In the piano teaching, the difficulty of learning is increased appropriately, and the music is appreciated from a higher level, which is very beneficial to the cultivation and improvement of students' music appreciation ability. Therefore, the piano teaching in colleges and universities can encourage students to study actively by organizing some piano concerts and recitals. The piano teaching facilities in schools can be further improved to cultivate students' interest in piano learning, so

that students can have sufficient time to appreciate, perceive and compose music. In terms of teaching difficulty, a progressive approach can be adopted, from easy to difficult, from shallow to deep, from the content of the work to the background of the author, to the era of composition and emotional thrust, step by step, to enhance students' music appreciation ability and improve the quality of piano teaching.

### **3.3. Expert evaluation results and student satisfaction**

To explore the scientific nature of the lesson plan designed in this paper, the lesson plan was first submitted to a panel of experts for evaluation where it was implemented. The evaluation items were divided into two parts: teacher quality and students' aesthetic emotion, and the sum of the two parts was added up to 30 points, with more than 15 considered as passing and 15 and above as good. The results of the expert evaluation are shown in Table 1.

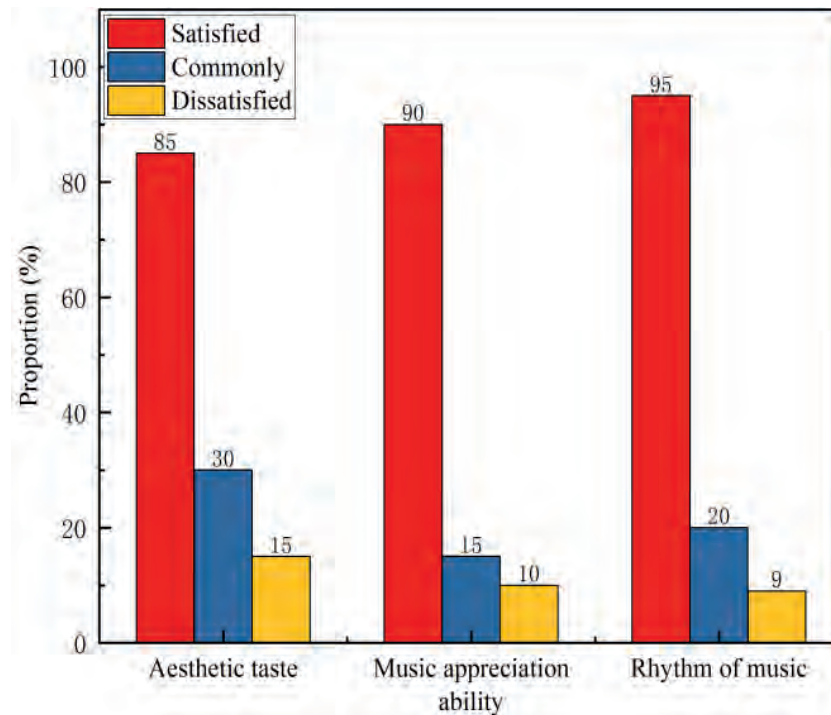

The total sum of teacher literacy and students' aesthetic emotion of the proposed program was 21, and the program was rated as excellent, which proved that the program set up in this paper was unanimously approved by the expert group, and had pedagogical scientificity and scalability.

**Table 1. Expert Evaluation Results**

Evaluation items	Evaluation content	score	Evaluation grade
Teacher basic accomplishment (16 points)	1. Prepare to use audio resources and teaching tools (piano, electronic organ, percussion instrument, etc.) in teaching. (4 points)	4	Excellent
	2. Professional skills are proficient and standardized, and basic teaching skills can be used organically in classroom teaching. (4 points)		
	3. The creation of a situation is aesthetic. He can devote himself to the music he hears, and has the power to tap the inner appeal of the music. (4 points)	3	Excellent
	4. Proper use of evaluation, effective methods, can stimulate emotional concern about students' personality development. (4 points)	4	Excellent
Students' aesthetic feelings (14 points)	1. He has a strong interest in learning music, obtaining the ability to feel, create and appreciate beauty and healthy aesthetic taste. (6 points)	5	Excellent
	2. Actively participate in various music practice activities, and have independent feelings and opinions on the music you listen to. (8 points)	5	Excellent

After the expert group assessment and approval, the program will be subjected to a preliminary test of student-teaching level instruction. The experimental time setting was based on one semester, and two administrative classes were used as experimental subjects. The student satisfaction survey is shown in Figure 1.

The overall satisfaction of students with the format and content of piano appreciation lectures was 90%, and the content of the lectures was liked by students. Among them, students' satisfaction reached the highest value, i.e. 95%, in the belief that music rhythm has a good cultivation effect. This was followed by the improvement of music appreciation with a satisfaction level of 90%. Students believe that piano appreciation lessons can improve their music appreciation intuition and appreciation skills, which are beneficial to their daily lives.

**Figure 1.** Survey of students' satisfaction with teaching

#### 4. CONCLUSION

Music appreciation skills are far-reaching in stimulating students' interest in learning piano, deepening their understanding of piano knowledge, and refining their musicianship. This paper attempts to combine piano with the cultivation of students' quality by proposing a piano appreciation curriculum program based on the perspective of big data, and submitting the designed program to a panel of experts for evaluation, followed by a student-level teaching quality test. The results of the test showed that the students were 90% satisfied with the format and content of the piano appreciation lessons, 95% satisfied with the rhythm of the music, and 90% satisfied with the music appreciation ability. Thus, the program of this paper was not only approved by the expert group, but also loved by the students. In the actual teaching, it is still necessary to focus on the combination of piano music theoretical knowledge and specific practice, to understand the actual situation of each student, to improve the teaching methods, and to strive to create a warm and harmonious teaching atmosphere to achieve the common progress of teachers and students.

## **ABSTRACT**

The study of town boundary planning helps to improve the science of urban planning and development. In this paper, a linear regression model-based town development boundary planning scheme is proposed. The framework of town development boundary delineation method is clarified first, and a linear regression model of town development boundary is proposed based on the research foundation. The VIF values of the three independent variables of land intensity, boundary elasticity and indicator rigidity are less than 5. The regression results of the multiple linear regression model of town development boundary designed in this paper are satisfactory and can improve the effectiveness of town boundary development.

## **KEYWORDS**

Linear regression; Urban Development Boundary; Town Planning; Significance

## **1. INTRODUCTION**

The current research on urban development boundary delineation focuses too much on innovative technical methods, but fails to propose ways to determine the spatial scale at the institutional level. In fact, the key to the application of relevant spatial models is to determine the relationship between the urban development boundary and the scale of construction land. China's administrative

establishment is a multi-level management model, which cannot implement all the contents of spatial planning through planning at one level, but can only implement and deepen spatial planning at each level by corresponding to the planning authority at each level [1]. With the preparation of territorial spatial planning, the delineation and management of urban development boundaries, which is the core content of planning preparation and implementation, is in urgent need of more in-depth research and exploration. Urbanization is an important source of power and result of China's economic and social development since the reform and opening up, which is mainly manifested in geographic space as the rapid expansion of urban and rural construction land, especially the growth of urban built-up area [2]. As an organic organizer of various production and living factors, the spatial demand generated by the development of cities will lead to the growth and spread of urban geographical space [3]. However, urban growth also brings consequences such as encroachment of agricultural land, environmental damage, traffic congestion, growth of commuting distance and time, air pollution, and more rapid spread of diseases. There is a relatively sloppy urban construction land in China, and the growth rate has been faster than the urban population growth rate for a long time [4]. Therefore, urban growth management policies and tools have been conceived in the scientific and effective planning and management of urban spatial expansion. Concepts such as urban development boundaries have been more researched and practically applied, resulting in various approaches to boundary delineation including geographic simulation methods [5]. The delineation of three control lines, such as urban development boundary, is a key task of current territorial spatial planning work, but the current delineation practice lacks consideration from the perspective of process evolution and spatial optimization, and its scientificity and systematization still have more deficiencies [6]. In the context of national ecological civilization and spatial planning system construction, a systematic scientific and automated delineation method should be proposed for towns. The spatial pattern of intensive and compact towns and cities should be delineated on the basis of ecological and agricultural bottom-line constraints to assist planning managers in using town boundary growth management tools to make it an effective measure to promote new town development and an important tool to modernize the national spatial governance capacity.

Based on the background of urban planning and town development boundary validity, this study proposes a set of fine delineation methods of town development boundary based on linear regression with the principle of bottom-line control thinking and town development boundary delineation methods. The linear regression model constructed in this paper is divided into three parts. The first part is to analyze the correlation and clarify the significance range values of the explanatory variables and the explained variables. The second part is to determine the regression model, based on the coefficient of determination to measure the linear regression effect and the fit of the model. The third part is the regression test, which is mainly to conduct the significance test of the regression coefficients of the multiple linear regression equations to prove whether the regression model prediction results are satisfactory and can provide effective reference for the natural resources department to promote the urban development boundary delineation and control of similar cities in the future.

## **2. Principles of urban development boundary delineation methods**

The methods of town development boundary delineation are mainly divided into "positive planning" method, "anti-planning" method and comprehensive method according to the planning concept. The "anti-planning" method first analyzes the constraints of town development in the planning area, such as ecological sensitivity or ecological suitability, and delineates the future boundaries of town development on the basis of clearly prohibited development areas [7]. The "positive planning" method is based on the law of town development, and the future development pattern of the city is determined by the suitability method or predicted by the model. The forecasting method mainly uses town growth models, especially the meta-automata CA model, which uses geographic simulation methods to simulate and predict the spatial pattern of town growth in the future planning period and to assist in the delineation of development boundaries [8]. The integrated method combines the characteristics of the above two methods, firstly, the "inverse planning" method is used to obtain the constraints of town development, and then the "positive planning" method is used to predict the future urban pattern in order to obtain more accurate delineation results. This is the ideal method of

development boundary delineation at present. There have been many studies on urban development boundary delineation based on geographic simulation methods. For example, the CA-based CLUE model, CA-Markov model and SA-Patch-CA model have been introduced for boundary delineation. The FLUS-UGB, based on the FLUS land use change simulation model, has applied the results of "dual evaluation" to the planning practice in Chongqing and other places. Some researchers have also adopted spatial optimization and multi-intelligence system modeling approaches for delineation.

In general, the subjective judgment of the planning decision makers may lead to a lack of scientificity in the current delineation practice, and it is difficult to obtain an optimal spatial pattern for ecology, agriculture and towns. At the same time, many delineation methods do not support refined spatial selection, which is not conducive to the formation of more accurate policy control boundaries, especially the current methods take less account of the spatial optimization of urban development boundary delineation and simulation of composite problem characteristics. These are the advantages of GeoSOS, so GeoSOS can be used to define the eco-agricultural bottom line space and forecast the future town growth, and to delineate the town development boundary.

### **3. Multiple linear regression model of urban development boundary**

#### **3.1. Correlation Analysis**

Correlation analysis is a statistical method that measures the closeness of correlation between multiple explanatory variables and the explanatory variable. Under the condition that the significance level is set at 0.01 or 0.05, if the P-value of the significance test of the correlation coefficient is less than 0.01 or 0.05, it means that the explanatory variables are significantly correlated with the explanatory variables. If the P value is greater than 0.01 or 0.05, it means that there is no significant correlation between the explanatory variables and the explained variables, and the corresponding explanatory variables should be excluded at this time.

### **3.2. Determine the regression model**

In order to further investigate the relationship and degree of influence of the respective variables on the dependent variable, the stepwise regression method is usually used to select the independent variables that have a significant influence on the dependent variable one by one. The basic idea of stepwise regression method is to introduce independent variables one by one and perform F-test for each entered independent variable. If the original introduced independent variables are no longer significant due to the later introduced independent variables, the original introduced independent variables are removed and the process is repeated until no significant independent variables are introduced and no insignificant independent variables are removed from the regression equation. After the regression equation is obtained based on the stepwise regression method, the linear regression effect of the model is usually measured based on the coefficient of determination. The coefficient of determination is the ratio of the sum of squared regressions to the sum of squared deviations. The greater the proportion of the sum of squares of the regression, the better the fit of the regression line to the sample data and the better the model regression.

### **3.3. Regression test**

Regression coefficient significance test: In order to establish a simpler regression equation and eliminate a certain independent variable that does not contribute significantly to the dependent variable, the regression coefficient significance test of the multiple linear regression equation is required. Under the null hypothesis, the t-test is applied. If the observed value of the calculated t-statistic is greater than the given significance level, the null hypothesis should be accepted, i.e., the independent variable has no significant contribution to the dependent variable and should be eliminated. Multicollinearity test: the variance inflation factor VIF is used to test for multicollinearity. When  $VIF < 5$ , it means that there is no multicollinearity between the respective variables. Analysis of residuals: The analysis of normality with the mean value of residuals being 0 can be performed by drawing a residual plot. If the mean value of residuals is 0, the points in the residual plot should be scattered randomly above and below the horizontal line with the

vertical coordinate being 0, indicating that the model basically conforms to the assumptions.

#### 4. Analysis of results

The t-test significant levels are shown in Table 1. The corresponding t-test significance levels in the table are all greater than 0.05, indicating that the boxed total and limited capacity cannot have a significant effect on the town development boundary complex variable function, indicating that there is no significant linear relationship and cannot be introduced into the linear regression equation, which needs to be eliminated. The main factors affecting the complex variable function are the construction land intensity, boundary elasticity and index rigidity.

**Table 1.** Significant level of t test

Model		Sum of squares	Freedom	Mean square	F	Significance
1	Regression	6250.098	1	6352.097	60.432	Remarkable
	Residual	10457.841	107	104.307		
	Total	18720.910	110			
2	Regression	7534.123	2	3760.541	38.421	Remarkable
	Residual	10279.123	104	94.420		
	Total	18720.910	110			
3	Regression	8029.754	3	2809.942	28.945	Remarkable
	Residual	9687.078	105	90.510		
	Total	18720.910	110			

Based on the significance test results, the regression coefficients of the boundary development were then tested. The regression coefficients are shown in Table 2. The VIF values of all three independent variables are less than 5, so there is no multicollinearity among the variables. The regression standardized residuals fluctuate randomly around  $e=0$  within a certain range of variation, indicating that the residuals of this regression model obey a normal distribution, and the model conforms to the basic assumption that there is no autocorrelation. The regression of the boundary development effectiveness model in this paper is relatively ideal.

**Table 2.** Regression coefficient estimation table

Coefficient a							
Model	Non standardized coefficient		Standardization coefficient	t	Significance tolerance	Collinearity statistics	
	standard error	Beta				VIF	
constant	-16.523	9.437		-1.654	0.074		
Constant micro equation	0.450	0.127	0.315	3.416	0.002	0.483	1.761
Intensive degree of construction land	0.330	0.106	0.246	3.045	0.004	0.642	1.542
Boundary elasticity	0.352	0.138	0.212	2.615	0.21	0.651	1.496

## 5. CONCLUSION

This paper predicts the effectiveness of town boundary development based on linear regression models. By first determining the town boundary delineation method to qualify the scheme of this paper, and then constructing a multiple linear regression model based on the framework of town boundary delineation scheme, and carrying out algorithm and process validation one by one, finally locking the regression algorithm model of this paper. The results of the significance t-test showed that the t-level of significance was greater than 0.05, and was significantly correlated with construction land intensity, boundary elasticity and index rigidity, and the VIF values of the three independent variables were less than 5. The regression model set up in this paper obeyed normal distribution, and there was no autocorrelation, which proved the validity of the town boundary development model.

---

## ABSTRACT

The current requirements of business English majors are increasing, and the diversification of teaching resources is conducive to the all-round expansion of students' English ability. Based on this, this paper designs a WeChat-based business English online teaching platform by integrating WeChat platform with artificial intelligence technology, and compares the platform with traditional teaching platforms, so as to discover the teaching advantages of the platform designed. Students' satisfaction with the learning effect of the designed platform reached 84% on average. The remaining satisfaction percentages from high to low are: 92% for interactive communication, 88% for learning content, 86% for independent learning, 84% for learning atmosphere, 82% for knowledge expansion, and 73% for ease of use. The design platform of this paper is highly recognized by students that the online business English education platform based on artificial intelligence technology is valuable for teaching use.

## KEYWORDS

Artificial Intelligence; Online Education Platform; College Business English; Big Data

## 1. INTRODUCTION

In recent years, China's import and export trade, foreign investment and other international business activities have become more and more frequent, and the demand for business English talents has been

expanding as a result of economic and social development. In addition, the Action Plan for Study Abroad 2015-2017 calls for increasing the cultivation of cutting-edge talents, talents for international organizations, and talents for regional country studies, etc., which puts forward higher requirements for colleges and universities to cultivate high-level internationalized foreign language professionals [1]. Cultivating qualified senior professionals in business English to meet the needs of China's economic internationalization is an important mission of higher education, and the cultivation of business English talents is urgent. The British Standard for Business English sets out clear objectives for the training of business English majors: Business English aims to cultivate students with solid basic skills in English, international perspective and humanistic culture, mastery of linguistics, economics, management, law (international business law) and other related basic theories and knowledge, familiar with the common rules and practices of international business, with the ability to apply English, business practice, cross-cultural communication, thinking and they are able to apply English, business practice, cross-cultural communication, thinking and innovation, and independent learning ability, and are able to engage in international business. The above training objectives highlight the three characteristics of internationalization, compound and application of business English talents [2-3]. The quality of training business English majors will become one of the important factors affecting and restricting China's economic development, and to cultivate high-quality international composite talents that meet the needs of the country, it is necessary to have a team of teachers who are proficient in foreign languages and well versed in professional knowledge [4].

Teachers can record relevant courses with the help of online teaching platform, and students can ask questions about AI application technology through the online Q&A platform, and teachers can answer one-on-one, which improves the teaching effect of the course [5]. Artificial intelligence technology is a comprehensive technology that is developing more rapidly and involves more fields [6]. The proper use of artificial intelligence application technology can solve many difficult problems that people cannot solve and has an important impact on improving work efficiency. Artificial intelligence

application technology can integrate various resources, analyze and decompose complex information so as to transform it into several simple information, and can also train talents in combination with curriculum teaching [7].

In this paper, a new online teaching platform for business English in colleges and universities is designed based on artificial intelligence technology. Firstly, the hardware equipment of the online teaching platform is constructed to lay a good foundation for the platform creation. Secondly, the online teaching platform software is created from three aspects: online teaching platform operation mode, online teaching course database, and platform encryption calculation based on OBE concept. Thirdly, integrate business English teaching with WeChat and build the interface design of WeChat online platform in order to complete the preparation of teaching platform in this paper. Finally, the platform was tested experimentally with the traditional education platform, and the results of the correct rate and students' satisfaction evaluation of the platform designed in this paper were obtained.

## **2. Design of an online business English teaching platform based on artificial intelligence technology**

### **2.1. Business English Online Teaching Platform Hardware Design**

The online teaching platform is developed based on the OBE concept of the AI applied technology course and uses Symfony2 Web Framework as the framework [8]. The online teaching platform uses Symfony2 Web Framework template tags to implement PHP code functions, converts templates into platform hardware modules through Symfony2 Web Framework's template engine, and improves access efficiency through a caching mechanism. The access control layer is implemented by loading filters, and the dispatch controller that distinguishes different modules through the module mechanism and namespace. The data access layer is implemented using Symfony2 Web Framework's ORM mechanism, which enhances development efficiency. When the server receives a request from each module, it loads the global configuration file and initializes the loading filter. According to the route dispatch controller and action configured by yml, the business logic layer and data layer are requested to load

data and render the data to html page, so that the whole process of request operation is completed, and finally the data is rendered and output to the web server.

## **2.2. Business English Online Teaching Platform Software Design**

### **(1) Online teaching platform operation mode**

The operational functions of teaching mainly include four functional modes: course participant management, teaching material management, online assignment process management, and teaching progress management [9]. The participants of course participant management are mainly teaching administrators, and firstly, it is determined that the course opening audit has been passed and the course space has been generated, which indicates that the teaching administrator has logged in. After the course space is generated, the instructional manager selects to import course participants according to the course teaching object. Teachers upload corresponding teaching videos according to the directory structure of teaching materials, edit the description text corresponding to the materials, and submit them for uploading. The teachers and course leaders are the core of teaching progress management. After the course leader logs into the course management page, he or she clicks the link of teaching operation control to enter the progress control page, and teachers can click teaching material access control, assignment access control and online test control to enter the corresponding pages respectively. The online test control can control whether the test can be initiated or not.

### **(2) Generate online teaching course database**

The database design mainly includes 3 parts: conceptual model design, logical model design and physical implementation scheme design. Firstly, the conceptual model of the system database is constructed using E-R model as a graphical tool. Secondly, some kind of logical model is selected according to the conceptual model, and the conceptual model is transformed. Finally, the database design is implemented using database management system. The platform design uses Power Designer CASE to construct the database model, and the knowledge system of the online teaching platform can be obtained according to the constructed database,

which has a great influence on the design of the realized online teaching platform.

### (3) Platform encryption computing based on OBE concept

In the MD5 algorithm calculation, the message is firstly refined so that the length of the message is an integer multiple of 461 and the differences between different messages are ensured. After a series of processing, the length of the message is compressed to a 103-bit value, and this process is called message dispersion. The password entered during login also needs to be encrypted by MD5. If the result is the same as that of the registered encryption, the verification is successful and the user enters the verification code input link, and after completing the matching, the user successfully logs into the corresponding function page. If the verification fails, the user has to re-enter the password. The MD5 algorithm solves the transmission and storage problems in the form of common codes and other security issues in traditional passwords.

### **2.3. Business English WeChat Teaching Platform WeChat Interface Design**

This paper integrates the teaching platform with social media and uses the WeChat platform as an entry point for business English in colleges and universities. The information interaction process of WeChat platform is divided into four modules. Terminal layer users send messages to the official WeChat server through the Http transfer protocol, and the information is processed by the server and then sent to other WeChat terminal users to complete a message interaction. The interface layer is the adapter for information interaction between terminals, which is used to receive, read, analyze and process data, and then respond to ensure the security of data transmission. The third-party messaging interface needs to be equipped with a server to program and process the interacting messages. Common technologies used to implement third-party messaging interfaces include PHP, J2EE technologies, NET technologies, and other network programming technologies, while tomcat, nginx, apache, and iis can be used as common servers. Through the third-party messaging interface, different functional components between the terminal layer and the application layer can interact with each other in real-time information. Users can fully utilize

the various functions of WeChat to develop a variety of applications to adapt to changing teaching needs, achieve aggregation of network resources, and maximize the role of mobile technology in teaching.

### 3. Teaching platform test experiment analysis

The test in this chapter uses the backup system of DELLR852 server and Quark Stor server. the configuration of DELLR852 server is as follows: Intel(R) octa-core M5531 Xeon(R) CPU, 3.92GHz, 8MB cache, QPI up to 6.40GT/s, 10GB of memory, and 800GB of hard disk capacity. in order to ensure the teaching platform's stability, the functions of the running platform are now tested, and the above test control factors are compared and analyzed with the traditional online teaching platform and the online teaching platform designed in this paper, respectively. The experimental results of the two platforms are shown in Table 1. The online education platform designed in this paper all executes the commands correctly, while the traditional platform has error commands in both viewing courses and homework submission, so the online teaching platform designed in this paper is better than the traditional platform.

**Table 1.** Experimental results of the two platforms

input	conditions for execution	Traditional platform	This article platform
View course	Whether the course is displayed or not	Error	Correct
Video playback	Whether it can be played normally	Correct	Correct
Search courses	Whether to search correctly	Correct	Correct
Job submission	Whether to submit normally	Error	Correct

The effect of the WeChat platform-based business English model is shown in Figure 1. The online platform designed in this paper was evaluated by an expert group and then tested in a semester-long student teaching experiment based on the evaluation comments. After a semester of business English learning model reform, the WeChat platform greatly increased the learning interaction between teachers and students and between students, and obtained good feedback on the learning use effect. The average satisfaction with the learning effect reached about 84%. The remaining items in descending order are: interactive communication (92%), learning content (88%), independent learning (86%), learning atmosphere (84%), knowledge expansion (82%), and ease of operation (73%).

Most of the students think that the WeChat platform-based business English learning mode in colleges and universities is more helpful to their English proficiency and believe that this approach can create a better language learning atmosphere. WeChat online learning increases the opportunities for language practice, and students can communicate with their teachers and classmates anytime they encounter problems in the learning process, which can solve the difficult problems of teaching and learning in a timely manner.

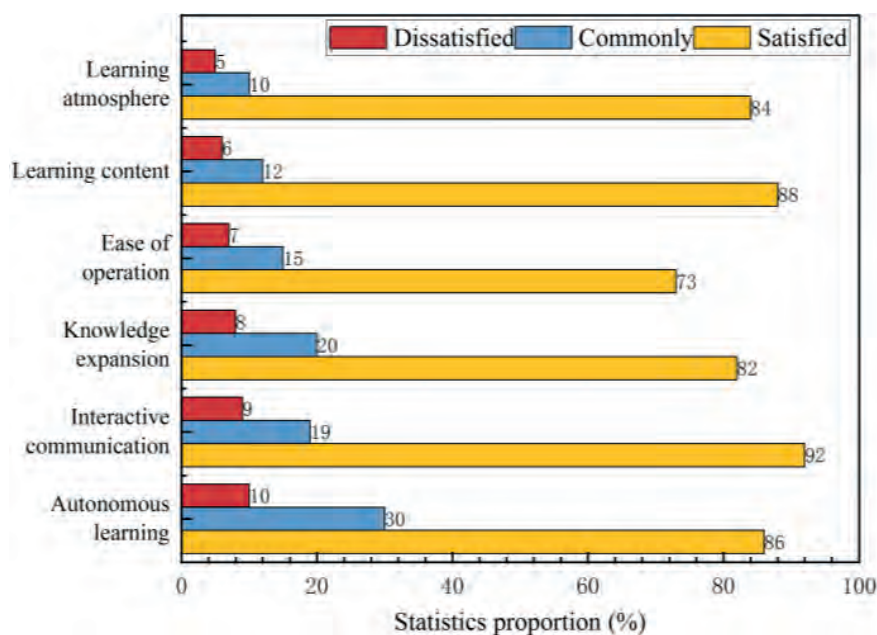

Figure 1. Effect of Business English Teaching Mode Based on WeChat Platform

#### 4. CONCLUSION

This paper designs an online teaching platform for the artificial intelligence applied technology course, and tries to integrate and apply this teaching platform with social media to create a WeChat-based online business English teaching platform for artificial intelligence. Through the experimental comparison and analysis between the online platform designed in this paper and the traditional teaching platform, the online education platform designed in this paper all executes the instructions correctly, and the students' satisfaction with the learning effect reaches about 84% on average. This proves that the online teaching platform is better than the traditional teaching platform in that it can solve students' problems in learning in a timely manner, and the security and data encryption of the platform are better.

## ABSTRACT

The quality of talent cultivation of music majors in colleges and universities is an integral part of the quality assurance system of higher education. This study clarifies the existing dilemmas of music majors in colleges and universities through the investigation of their talent cultivation quality. The current employment direction of music majors in colleges and universities after graduation and their skill needs are analyzed by means of big data to further discuss the trial scheme to promote the reform of music education in colleges and universities and optimize the construction of talent cultivation mode. Among the employment situation of music majors, 20.6% are engaged in non-music related jobs after graduation, 6.9% are engaged behind the scenes of theater orchestras, 5.9% choose to continue their education, and only 2.9% are engaged in theater orchestra performers. The current employment mismatch of college music graduates is serious, and it is of practical significance to study the reform and optimization methods of college music talents training in this paper.

## KEYWORDS

Big Data; Music Education in High Schools; Talent Development; Teaching Reform

## 1. INTRODUCTION

Music education resources in colleges and universities are responsible for the prosperous development of music education in society, as well as an important part of the harmonious and stable development of social culture [1]. The training of music professionals in colleges and universities must be able to meet the needs of social culture in terms of quality, continuously deliver outstanding talents to society, be able to point out the direction for the future development of music education, and recreate and innovate the presentation of music resources [2]. The innovation of musical works is a powerful driving force for the development of social culture. Colleges and universities have abundant talent resources, facility resources, and information resources, and the concentration of these resource advantages is conducive to the uninterrupted development of new music programs in schools, allowing students to have more ample time to perform and demonstrate the connotation of music culture [3]. Music education has the role of leading and developing the lives and intellect of college students, and benefits students in four main ways: social success, school success, intellectual development success, and life success. The inclusion of music in the school curriculum can help students develop their physical and mental health, and such advantages can enhance their later life needs [4].

The talent development model is guided by the achievement of talent development goals as a way of behavior and activity structure of education. For the study of the model, the description and analysis in the face of complex research objects is carried out in a parsimonious, abstract and structured way, grasping the essential features of the main forms, characteristics, structures and laws of movement of the existence of things as a whole [5]. Therefore, the talent training mode covers many elements such as training objectives, contents, ways and conditions, including training objectives and specifications, professional setting and construction, curriculum system and teaching contents, teaching methods and teaching means, teaching evaluation and quality control, etc. The talent training mode of music majors mainly focuses on improving the comprehensive quality and innovative ability of music majors, systematically integrating the trinity of teaching, scientific research and artistic practice, and giving full play to the mutual roles of the three [6].

In order to provide the experience of transforming the quality of college music majors' talent cultivation to a modern governance model and to better improve and perfect the management mechanism and management style, this study explores the existing problems of the current college music majors' talent cultivation model. Using big data technology, we collected the current job market flow of college music graduates after entering the recruitment market and analyzed the reasons behind causing job market diversion, which in turn enabled us to clearly locate the direction of the current college music talent cultivation reform dilemma and propose a trial scheme to optimize talent cultivation.

## **2. Existing Problems of Music Education and Talent Cultivation Model in Universities under the Perspective of Big Data**

(1) The facilities and equipment of music education are a bit backward

At present, the music education equipment and facilities in most colleges and universities are relatively backward, not updated in time, and no longer meet the music learning needs of contemporary college students. The enrollment of art students in most colleges and universities is expanding, but the corresponding educational resources are not matched, and the teaching situation is increasingly "contradictory". This is reflected in the relative lack of music education equipment and facilities, both in terms of quality and quantity. If music teachers are unable to play a key role in the music teaching curriculum, then music education in colleges and universities is bound to be ineffective. At present, however, most colleges and universities have a shortage of professional music teachers, leading to a surge in pressure on existing music teachers. Due to the traditional education concept, some leaders of colleges and universities do not really implement the education concept of "educating people with moral character", which leads to the lack of professional music teachers' resources in schools [7]. In the actual music teaching, the phenomenon of "part-time teaching" generally exists. For example, some university music teachers are not only responsible for teaching music majors, but also for teaching hundreds of students in other majors in public music classes with basic theory. Even though the curriculum at the university level has been relatively easy compared

to the previous level, the teaching energy of music teachers is after all limited, and the large number of courses will only make music teachers feel exhausted, which will then affect the teaching of music courses and is not conducive to music education improvement and innovation.

(2) The quality of music learning among college students at the overall level has declined

On the whole, the quality of music learning among college students has declined, and even for those who are admitted to music art majors, their own interest in learning music knowledge is not high, and it is more like a kind of lumpy and copious learning. In other words, college students today lack understanding and perception of music knowledge, and their learning goals are not clear. In the context of the new curriculum reform, many universities have liberalized the enrollment ratio of art students, and the enrollment scale of music majors has been expanding. However, with the increasing number of students enrolled, the actual level of students enrolled varies, and music teaching activities are affected and the overall level gradually declines. In this way, some of the music education work in colleges and universities is affected by the traditional teaching mode, and college students cannot recognize the importance and necessity of music learning for their lifelong learning development, and they are "dispensable" to music theory learning and music practice participation, which directly increases the teaching burden of music teachers [8]. If music teachers fail to establish an effective and harmonious communication relationship with college students when conducting music teaching activities, they will feel that they have "more than enough energy". Over time, music teachers are unable to devote more time and energy to the students they teach, which seriously hinders the teaching progress.

(3) Music teachers' teaching methods are solidified and single

In the traditional teaching mode, most music teachers carry out music teaching activities by incorporating some novel teaching methods, but due to their own teaching level and limited experience, some music teachers' application of advanced teaching methods are only superficial and not effective enough. For example, some young music teachers in colleges and universities do not have the ability to control

the rhythm of classroom teaching skillfully, and they lack in using information and game-based teaching methods, resulting in poor innovation of music teaching methods and poor learning effect of students. In addition, one of the obvious teaching problems in most young music teachers' classrooms is that they are not too far removed from the age of their students because they are new to education. If the distance between themselves and their students is not reasonably well managed at the beginning of the lesson, students will have a casual, scattered attitude toward learning and lack respect for the music teacher during the formal music lesson. In order to prevent students from "making mistakes" and to inspire them to deepen their knowledge of music, to learn independently, and to use innovative learning methods to master music knowledge. Music teachers must establish a good teacher image, grasp the scale of teacher-student interaction, innovate and apply feasible music teaching methods, continuously introduce novel teaching methods, create interesting and efficient music classes, and help students improve their music learning efficiency.

### **3. The path of music education reform and talent training mode optimization in colleges and universities**

#### **3.1. The employment of college music graduates in the perspective of big data**

In this paper, we use big data technology to capture the employment situation of music students graduating from colleges and universities at the present stage, in order to understand the current employment-oriented direction of teaching improvement of music majors in colleges and universities. The summary of the graduation employment direction of music students in colleges and universities is shown in Table 1.

**Table 1.** Summary of Graduation and Employment Directions of College Musicians

Number	Project	Content involved
M1	Non music related work	New Media Editor/We Media
M2	Other work in music industry	Music Producer/Editor/Personal Music Room/Recording Studio
M3	Music industry practitioners	Performance/copyright/music platform/record company
M4	Behind the Theatre Orchestra	Administration/publicity/production
M5	Theatre Orchestra Performers	Full time/part-time
M6	Music training institutions, music teachers in primary and secondary schools	Art examination training, music interest institutions/music and dance teachers in primary and secondary schools
M7	Continue to study	Postgraduate study of music related majors at home and abroad

The employment situation of music students graduating from colleges and universities is shown in Figure 1. In terms of employment choices, for jobs related to the music industry chain, such as performance, copyright, music platform and record company, unsurprisingly became the most popular choice. The respective percentages of industry directions chosen by graduates were 21.6% for other jobs in the music industry and 28.4% for music industry practitioners. Music-related jobs were 20.6%, music training institutions and primary and secondary school music teachers were 13.7%, behind the scenes of theater orchestras were 6.9%, continuing education were 5.9%, and theater orchestra performers were 2.9%. It is worth mentioning that, during the data acquisition process, it was found that 20.3% of the 200 graduates of music majors in college A graduated from music performance majors such as voice and song, piano, orchestra and national music, but only 2% are currently working as professional actors. Even more surprising is that 21% of them are working in jobs completely unrelated to music after graduation. The employment situation of music graduates is not optimistic, and the main problem is still the mismatch between the professional knowledge learned and the skills required for music positions in the market, the inability of music students to get inside-out opportunities, the difficulty of perfect articulation between education and career, and the inability to ensure professionalism and practicality at the same time. Therefore, it is necessary to strengthen the cultivation of students' professional skills

and enhance the comprehensive quality of music students in college music education.

Figure 1. Graduation and employment of music majors in colleges and universities

### 3.2. Trial scheme of music education reform and talent cultivation mode in colleges and universities

#### (1) Reinforcing students' sense of professional identity

The more elegant and deeper the accumulation, the more advanced one's appreciation and creation will be. When this appreciation and creation reach a very high attainment, it is possible to become a specialized music talent in higher music education talent training mode, and it is also possible to become a top talent in science and technology or social aspects by virtue of their unique music art quality. Therefore, university music majors should constantly strengthen students' professional identity in the process of talent training, and this identity is a manifestation of inner self-confidence. It has been found that when the ideal of sameness is established between students and the profession, it is possible to jointly achieve the goals to be achieved in terms of the quality of music professional training.

#### (2) Create a good learning atmosphere

The school must be good at creating an environment that is appropriate, and the stimulation of the external environment can also mobilize students' learning motivation. To achieve the goal of talent

cultivation, higher education conservatories must be good at creating a good learning environment. In the interviews, the researcher concluded that all college music schools are actively creating a better learning environment for students, and that a good atmosphere can lead to academic progress, while a poor learning atmosphere can reduce students' professional identity.

### (3) Strengthen the teaching of music practice

The learning of music knowledge should eventually be applied to music practice activities, using the knowledge learned to analyze music works, sing songs and play instruments in order to improve students' core literacy in music subjects. The key to achieving this goal is to organize diversified music practice activities to increase students' rational understanding of theoretical knowledge and to promote a more solid foundation of music theory, so that they can truly apply what they have learned. Take the song "Alamu Khan" as an example, the song mainly praises the lively and passionate Uyghur girls, with a bright rhythm and beautiful melody, creating a scene of singing and dancing. In music teaching, teachers can show related videos, use group discussion to guide students to express their feelings, teach tambourine playing skills, and carry out practical training of song singing, so that students can deepen their experience of music emotion and ignite their enthusiasm for learning. In the long run, students' thinking ability, expression ability, comprehension ability and core literacy of music subjects will be significantly improved.

Given the wide variety of musical instruments, and the wide variation in ease of operation, it is difficult for students to understand the articulation and playing techniques of various instruments in just a few music lessons. Therefore, teachers can use new media to show the appearance, rhythm, and playing methods of musical instruments, and use virtual reality technology to create a simulation practice platform for students to practice with musical instruments on that platform. After a full understanding of the instrument, students are fully able to pick the instrument according to their own preferences and abilities. Teachers urge students to strengthen their training and test their musical instruments at the end of the semester, which not only enriches students' life after school, but also cultivates students'

elegant interests and hobbies. Music teaching based on students' interest is more attractive and affinity, students' enthusiasm to participate in practical teaching activities is higher than ever, theory and practice are developed synergistically, and the effectiveness of music education teaching reform in colleges and universities is ensured.

#### (4) Reforming the way music is evaluated

Establish a sound music teaching evaluation system, adopt diversified subject evaluation, combine process evaluation and result evaluation, and achieve objectivity and comprehensiveness, so as to provide correct guidance to music education and teaching reform, and promote the modernization, scientific and long-term development of music education in colleges and universities. On the one hand, students can evaluate each other, based on their understanding of their classmates who spend time together, students will give a more pertinent score, and usually encourage each other and grow together, students will be more harmonious and friendly with each other. Teachers evaluate students based on their pre-course prep, classroom performance, learning attitudes, values and the results of the analysis of learning information on the MU platform, which can help students understand themselves correctly, correct their shortcomings and gain continuous progress. On the other hand, college music teachers should establish student files, record detailed information of each student's learning situation, judge whether students have progressed or not, as an effective basis for process evaluation, and should adjust music teaching plans in a timely manner to strengthen teaching effects. The final exam should be designed separately for theoretical knowledge and practical operation items, such as selecting a musical instrument to play music repertoire, which can achieve accurate evaluation of students. Closely integrate music education in colleges and universities with students' professional development, which will have a positive effect on the healthy growth of college students.

## **4. CONCLUSION**

This study explores the optimization path of music education reform and talent training in colleges and universities under the perspective of big data. By capturing the employment situation of music graduates

in colleges and universities through big data and combining the existing problems of current music education and talent training mode in colleges and universities, this study proposes an optimized teaching plan for curriculum education reform and music talent training mode. The study found that in terms of employment options, only 2% of those who graduated with music performance majors are currently working as professional actors, and 21% of those who graduated are engaged in jobs completely unrelated to music. The main reason for this is the mismatch between the professional knowledge acquired and the skills required for music positions in the market. The pilot program of music education reform in colleges and universities proposed in this paper has improved the overall quality of students' music by optimizing the learning atmosphere and strengthening the practice of music majors in all aspects.

## **ABSTRACT**

In order to optimize the current college students' thinking and teaching management, this paper tries to apply the big data technology to the college thinking and teaching innovation management. Based on this, the SWOT analysis method is incorporated into it together to explore more possibilities brought by it to the innovation of college Civics. According to the SWOT analysis table, we can get: the total weighted mean score of advantage is 4.47, the total weighted mean score of disadvantage is 3.96, the total weighted mean score of opportunity is 4.24, the total weighted mean score of opportunity is 4.33. Thus, it can be seen that the current thinking and politics innovation has good advantage support and reform and development opportunity, and the innovation optimization method proposed in this paper from the internal and external advantages and disadvantages of thinking and politics work has practical significance.

## **KEYWORDS**

Big Data Technology; SWTO Analysis; College Civics; Management Innovation

## **1. INTRODUCTION**

The development of college Civics education in the information era is facing opportunities and threats, and the construction of an

informative and intelligent Civics education model based on digital information technology has become one of the important topics in the current research of college Civics education [1]. As an important element in the teaching structure of Civics and Political Science class, the teaching power of teachers and the learning power of students directly determine the efficiency of teaching activities. Teaching power refers to the individual psychological characteristics and professionalism of teachers who organize and carry out teaching based on their own knowledge structure and professional skills to achieve teaching goals and complete teaching tasks. Learning ability refers to the comprehensive ability of students to master knowledge, improve their ability, complete learning tasks and internalize textbook knowledge into their own knowledge and literacy [2].

In the teaching of Civics in colleges and universities, education provides educational services to students with ideological concepts, political views and moral norms as educational products. At the same time, borrowing from the theory related to the balance of supply and demand in the field of economics, making a balance between the supply and demand of educational products is the basic condition to realize the efficiency of teaching and learning in both directions. Therefore, the balanced development between the two is the center of gravity of the teaching structure adjustment of Civics and Political Science class [3]. The integration of information technology helps to promote a dynamic balance between the elements of Civics education at multiple levels, such as curriculum objectives, teaching content, teaching organization, and teaching evaluation, and the spiritual value needs of students' healthy growth, easing the contradiction between teaching supply and students' needs [4]. For example, with the introduction of big data technology, teachers can understand the overall teaching situation in a more comprehensive and diversified way by data mining and analysis, so that they can reasonably allocate and integrate the elements of teaching supply according to students' actual needs to improve the adaptability and flexibility of teaching supply structure [5]. In addition, teachers can rely on the information-based learning platform to instantly follow up on students' ideological behavior, discover their intrinsic learning needs, and find the crux and center of ideological problems, so as to improve the personalization and precision of the teaching of Civics.

This paper builds a big data and thought politics innovation management method from three aspects. Firstly, the concept of big data and its data characteristics are clarified, and the ways and means of its technical support are elaborated. Finally, big data technology is integrated with SWOT analysis method to analyze the advantages, disadvantages, opportunities and threats of the current teaching and learning of Civic Education and other aspects from internal and external factors. Through the SWOT analysis table, the strategy of constructing the innovative management method of college thinking and administration is proposed in a focused and comprehensive way.

## **2. Integration of Big Data Technology and Resource Management of Civics Teaching**

### **2.1. Big Data**

Big Data refers to large, fast updating, fragmented, and valuable information that is often displayed in multiple ways. In a narrow sense, Big Data uses different processing methods to increase the space, speed, and diversity of information material with greater resolution, decisiveness, and process optimization. In general, this concept of big data should be judged by the essence of the concept [6]. Big data has four characteristics as: Volume, Variety, Velocity, and Veracity, which we generally call the 4Vs.

### **2.2. Big data provides technical support for the reform and innovation of ideological and political education in colleges and universities**

(1) Big data technology can effectively integrate educational resources

Big data in education offers educators unprecedented opportunities to reach and instruct students in new ways. It will give teachers greater insight into their students' educational experiences, which will help them assess the state of the education system. With big data in education, student behavior can be monitored. For example, monitoring how long it takes students to answer questions, what materials they use to prepare for tests, etc. These similar questions can be answered automatically and instantly, giving instant feedback to each student and providing an accurate teaching resource [7].

(2) Big data can promote ideological and political education model innovation and upgrade

First, through monitoring and analyzing students' behaviors, big data technology can find the related thoughts and behaviors, and then decompose macroscopic thoughts into microscopic behaviors, and turn "big and comprehensive" theoretical lectures into "small and precise" daily behavioral development [8]. Secondly, big data technology can explore deeper regularity issues by exploring the law of thought development and correlating data from different periods and stages with it. Finally, big data technology can accurately carry out carrier integration by monitoring online and offline teaching data. Through big data technology positioning and analysis, it makes the connection with the education object occurring becomes readily, anywhere, accurate and integrated, so that the individualized differences of the student group can truly be taught according to their needs.

### **2.3. SWOT analysis method**

SWOT analysis model is a method of situation analysis proposed by Wyrick, a professor of management at the University of San Francisco, and its most prominent features and advantages are structured and systematized. The SWOT matrix is an interactive and hierarchical analysis based on the significance of each dimension and level, which overcomes the limitations of other analysis methods that isolate one of the above aspects, and then systematically analyzes the overall situation of the analyzed object and scientifically formulates an integrated development strategy of "WT, WO, ST, SO" [9].

### **3. SWOT analysis of the innovation of college Civics teaching under the background of big data**

In order to improve the accuracy and scientificity of SWOT analysis, we determined the main influencing factors of the SWOT matrix of precise thinking and government work in colleges and universities through data research and expert interviews, and calculated the distribution data of the evaluation matrix. The evaluation matrix of internal factors and external factors of the innovation of college thinking and teaching in the context of big data is shown in Table 1. The data show that the "advantage" score, "disadvantage" score,

"opportunity" score and "threat" score of precision thinking and government work in colleges and universities are all greater than 1. "This indicates that the internal advantages of precise thinking and government work in colleges and universities are greater than the disadvantages, and the external opportunities are greater than the threats, and the overall conditions and development environment are better.

**Table 1.** Evaluation Matrix of Internal and External Factors of Ideological and Political Teaching Innovation in Colleges and Universities

Dimension	Influence factor	Importance evaluation		
		Mean value	Weight	Weighted average
Strength	Comprehensive information collection	4.40	39.04%	1.54
	Visualization of problem presentation	4.78	34.59%	1.61
	Content push customization	3.92	30.51%	1.32
	Total weighted mean score			4.47
Weakness	The concept of precise education has not been widely established	3.72	35.19%	1.24
	Lack of coordination mechanism for precise ideological and political work	4.46	34.28%	1.37
	Lack of professional talents	4.23	33.77%	1.35
	Total weighted mean score			3.96
Opportunity	Policy guarantee	4.35	30.43%	1.64
	Technology enabling	4.83	35.19%	1.53
	Capital addition	3.65	33.38%	1.07
	Total weighted mean score			4.24
Threats	The educational object's information attention is diluted	4.15	35.73%	1.50
	Educators' "digital dependence"	4.64	34.48%	1.73
	Educational information security and ethical crisis	3.58	30.38%	1.10
	Total weighted mean score			4.33
Note: The assignment range of "importance evaluation" is 1-5 points. The higher the score, the higher the priority.				

## (1) SW analysis: internal strengths and weaknesses analysis

With the support of new technologies such as big data, the precision thinking and government work in colleges and universities can be organized and carried out precisely, and its characteristics and advantages are.

One of them is the comprehensive information collection. With the educational application of big data, artificial intelligence and other cutting-edge technologies, the Civic and Political Science workers can use campus network, electronic monitoring, information detection system and multi-media capture means to realize the whole process of all-round information collection online. The data of classroom learning data, assessment data, Internet data, consumption data, book borrowing data, social practice data, campus activity data and other aspects of data are comprehensively collected, accurately identified, dynamically captured and individually analyzed, realizing the capture of data trajectories of the thoughts and behaviors of education subjects in their unconscious state and effectively improving data fidelity.

Second, visualization of problem presentation. With the support of data, educators can visualize educational problems in the form of graphics and images to present them in a multi-dimensional manner, providing an intuitive basis for problem solving.

Third, content pushing customization. Based on big data analysis, educators can accurately identify the information preferences and value orientation of education subjects based on the relevant data such as the number of visits, click rate, length of stay and bounce rate of education subjects to the network information, and place the education information that meets the personal preferences of education subjects in the priority position of information pushing in order to improve the matching degree between education information and education subjects.

In terms of disadvantages, the internal construction of accurate thinking work in colleges and universities is inevitably in need of improvement because it is in the initial stage.

One of them is the concept to be established: the concept of precise education has not been widely established. The problem of unclear

and poor understanding of "big data" and "accurate thinking work" exists among college thinking workers in general. Some of them lack big data thinking and precise thinking, and they are hesitant about the precise thinking work supported by big data, and even reject it because of "technical skills panic".

Secondly, the mechanism is lacking: the level of collaboration of accurate thinking and politics work needs to be improved. At present, the level of coordination of accurate thinking and politics work in universities is not high in terms of information flow, organization and coordination, effectiveness analysis, problem solving and program development, etc. The phenomenon of "single-armed combat" is still common, and a set of systematic and effective working mechanism has not yet been formed.

Thirdly, there is a lack of talents: the professional talents team of accurate thinking and government work needs to be cultivated. The key to promote accurate thinking and politics work in colleges and universities is to improve the ability and level of leaders and organizers of thinking and politics work in colleges and universities.

## (2) OT analysis: external opportunity and threat analysis

In terms of external opportunities, the overall precision thinking work in colleges and universities has a good development environment and opportunities.

Firstly, policy guarantee: policy incentive promotes the steady development of accurate thinking work.

Secondly, technology empowerment: technological innovation promotes the iteration and upgrading of accurate thinking and politics work. Emerging technology empowerment is the fundamental support and important opportunity for accurate thinking and government work in universities.

Thirdly, capital support: market entry injects new opportunities for accurate thinking and politics work. Along with the promotion of precise thinking and politics work in colleges and universities, its market value has deeply attracted the entry of capital in 5G, big data, information and communication, cloud computing, artificial intelligence and other fields, which provides capital support for good precise thinking and politics work in colleges and universities.

In terms of threats, the real-life issues that must be responded to strongly by the accurate thinking and government work in colleges and universities are.

First, information flooding: the fragmentation of information attention blurs the "digital portrait" of education objects. In the era of big data, in the face of a huge amount of information of different colors and flavors, college students unconsciously become "omnivores", and the unprecedented flood of information leads to the splitting and dilution of college students' information attention.

Second, the digital trap: the application of big data leads to educators suffering from "digital dependence". The main symptom is that the thinking and political science workers are lost in the advantages of the comprehensiveness, science and intuitiveness of big data, and unconsciously form a "cult of numbers". The organization of all thinking and political work is data-driven, gradually losing the ability to think and judge independently, becoming a "puppet" under the manipulation of data.

Third, the ethical dilemma: undifferentiated access to information violates the data privacy of educational subjects. This will further lead to the confrontation between data sharing and data privacy, and involves the legitimacy and legality of data acquisition and application in the precise thinking work of universities.

#### **4. The construction of strategy for the innovation of college Civics teaching in the background of big data**

Based on the SWOT analysis model in Chapter 3, this paper puts forward the development strategies of precise thinking and government work in colleges and universities. The innovation strategy matrix of college Civics teaching in the context of big data is shown in Table 2.

**Table 2.** Innovation Strategy Matrix of College Ideological and Political Education under the Background of Big Data

Internal factors	
Strength	Weakness
1.Comprehensive information collection 2.Visualization of problem presentation 3.Content Push Customization	1. The concept of precise education has not been widely established 2. Lack of coordination mechanism for precise ideological and political work 3. Lack of professional talents
SO strategy	WO strategy
Seize the opportunity of development Stimulate internal vitality	Establish rules and regulations: promote scientific and standardized precision ideological and political work
ST strategy	WT strategy
Active action: based on advantages Solve the problem with kindness	Targeted treatment: focus on outstanding problems and make efforts accurately
External factors	
Opportunity	Threats
1. Policy guarantee 2. Technology enabling 3. Capital addition	1. Educational objects' attention is diluted 2. Educators' "digital dependence" 3. Education information security and ethical crisis

Specific strategy details are as follows.

Firstly, take advantage of the situation: clarify the development goals and the direction of advancement, coordinate the advantages and opportunities, and take advantage of the situation to achieve new action. First, seize the opportunity of national policy and do a good job in the overall planning of accurate thinking and government work. Second, vigorously promote the deep integration of new technologies such as big data with the thinking and government work of colleges and universities, innovate the big data application mechanism of precise thinking and government work, strengthen the technology drive, and plant the inherent technical advantages of precise thinking and government work. Third, actively explore the cooperation mechanism and mode between universities and new technology enterprises, fully explore external market resources and absorb market financial support to create good development conditions and environment.

Secondly, we take the initiative: to break the problem based on our advantages with good planning. First, in response to the ethical crisis

of information leakage of education objects, the privacy level of information of education objects can be set. Secondly, we can make full use of the advantages of comprehensive information collection, analyze the information preferences of education subjects, and build a database of moral education information resources with rich contents, various forms, complete types and timely updates to enhance the attractiveness of education information.

Thirdly, build rules and regulations: promote the scientific and standardization of precise thinking and government work. Make good use of external opportunities, make efforts to make up for internal deficiencies, pay attention to the top-level design of precise thinking and government work in colleges and universities, work on building rules and regulations, and regulate development with the rigidity of system to guarantee the quality and level of precise thinking and government work.

Fourthly, targeting policy: focus on the outstanding problems to make precise efforts and policies. One, with system thinking as a guide, to the real problems gathered researchers, educators and managers, cohesive governance synergy. Second, seize the main contradiction, target the outstanding problems and make precise efforts. Take the main contradictions and key issues affecting the whole situation as breakthroughs to win the opening battle. Third, clarify the timetable and roadmap for promoting precise thinking and governance. Each university should make a timetable and roadmap for promoting accurate thinking and government work according to local conditions to ensure that construction initiatives and problem solutions are put in place and applied effectively.

## **5. CONCLUSION**

Based on big data technology, this paper explores the effective method of innovative management of college Civics, integrates big data technology with SWOT analysis method, analyzes the opportunities and threats of Civics innovation teaching from internal and external factors one by one, and then proposes optimized management strategies based on the analysis results. From the SWOT analysis, the total weighted mean score of advantages is 4.47 and the total weighted mean score of threats is 4.33, which means that the current management optimization of Civics and Political

Science innovation in colleges and universities has great advantages. Colleges and universities should timely seize the opportunity to innovate before it is too late, and pay attention to the threats faced by the thinking and administration work in the current big data background, and timely resolve the risks in order to help maximize the effect of thinking and administration management.

## **ABSTRACT**

In order to improve the effect of Civic Education for college students on Eban platform, this paper proposes Civic Information Teaching Model based on artificial neural network technology. The research direction is determined by analyzing the advantages and disadvantages of Civic Education on Eban platform. The feasibility analysis of the information of Civic Education for college students based on artificial neural network is proposed, and the scientificity of the conception of this paper is comprehensively verified. The sensitivity of mining Civic and Political elements of Eban courses tested by using artificial neural value-added evaluation model is 90% in general, and the sensitivity of news material mining is up to 95%. The recognition rate of the ideological and political courses of each university on Eban APP is 94%, and the sensitivity of documentary information mining is 92%, which is a good test performance and meets the new national requirements for ideological and political education work. The research on the effectiveness of ideological and political education in this paper is of reference and practical significance.

## **KEYWORDS**

Artificial Neural Networks; College Student Civics; Easy Class; Informative Education

## **1. INTRODUCTION**

The ideological and political courses for college students must adhere to educating students and helping them to establish correct moral concepts. As a carrier of ideological and political education, Eban should focus on the needs and demands of college students in practical work, and make use of the unique functions of Eban itself for ideological and political education [1]. To a large extent, Eban is a carrier innovation for college students' ideological and political education, which can carry out targeted college students' online ideological and political education and effectively enhance the effectiveness of students' online ideological and political education [2]. At the same time, it helps college students to establish positive and healthy concepts and cultivate qualified talents for socialism with Chinese characteristics in the new era.

"Eban" is a real-name comprehensive student online interactive community integrating ideological education, teaching and learning, life services and cultural entertainment [3]. In recent years, the national "Eban" co-construction system has been deepened, which provides a convenient way to share the resources of online ideological education in colleges and universities. Each "Eban" co-constructed university gives full play to its regional characteristics and specialties, and produces high-quality online thinking and politics education courses on the "Eban" platform. Among them, the excellent course platform of Eban has gathered more than 8,000 high-quality video courses with 31.4 million contents, and opened many columns for learning the 19th National Congress of the Party, college Civic Education, situation and policy, Civic Theory Course, Party Member Education and Youth League Education. This provides a strong supply of resources for the online Civic Education of colleges and universities and greatly expands the width of online Civic Education for college students [4].

In this paper, firstly, we start from the advantages and disadvantages of Eban platform to carry out college students' civic education, comprehensively analyze the advantages and disadvantages of Eban platform, and determine its research significance. It is followed by the analysis of the feasibility of the information-based teaching of college students' Civic Education on Eban based on artificial neural network, the adaptability of artificial neural network and value-added evaluation of Civic Education to determine the feasibility of its application to the practice of value-added evaluation. The analysis of Civic Education elements based on artificial neural network yields the sensitivity of its information mining. The effect of public opinion monitoring on the Eban platform fills the research gap of previous studies on the orientation of public opinion on the platform. Based on the results of the full-text study, this paper proposes countermeasures to enhance the effectiveness of online political education for college students.

## **2. Analysis of the advantages and disadvantages of carrying out the political education of college students on Eban platform**

### **2.1. The advantages of carrying out college students' thinking and political education on Eban platform**

(1) Provincial and school co-construction, increasing the intensity of online political education for college students

Under the active promotion of the Central Internet Information Office and the Ministry of Education, up to now, "Eban" has covered 32 provinces, autonomous regions and municipalities nationwide, and more than 1,000 colleges and universities have carried out the joint construction work of "Eban", and the number of registered users of "Eban" has exceeded 10 million. "The number of registered users exceeds 10 million. The continuous promotion of the provincial-school co-construction work of "Eban" has increased the intensity of college students' online thinking and government education [5]. The perfect provincial-school co-construction mechanism enables each university to closely focus on the fundamental task of establishing moral education, unify ideas and develop their own strengths, and carry out online ideological education work in an orderly manner.

(2) Platform integration increases the depth of online ideological education of college students

Platform integration is one of the characteristics of "E-Class" co-construction system, which effectively increases the depth of online ideological education for college students [6]. The platform integration feature of "Eban" makes it possible to carry out online political thinking education work in multiple channels and directions, and it can penetrate into college students' groups. As the main position of online political thinking in colleges and universities, "Eban" provides students with a full range of campus services such as customized education and teaching, life services and cultural entertainment. At the same time, "Eban" can give full play to the advantages of its open platform, providing secondary development functions for many users and functional interfaces for other platforms. For example, the topics of "Eban" can be easily posted to friends, WeChat groups and QQ groups, and its platform can be co-constructed with popular applications such as Campus Today to achieve platform integration and data sharing.

## **2.2. The disadvantages of carrying out the Civic and Political Education of college students on Eban platform**

(1) The network literacy of education grantors and the information needs of education recipients are not synchronized

Civics teachers and counselors are the teaching body of online ideological and political education in colleges and universities, and they mainly undertake the teaching task of leading college students' online ideology. However, many teachers and counselors of Civics and Political Science courses focus on offline education and theoretical teaching, and they know less about the law of network information dissemination and cannot grasp the network behavior habits of college students, and their use of network tools only stays in the forwarding of teaching and management information, lacking the ability of secondary processing of key information such as hot events on the network [7]. On the other hand, contemporary college students, as education recipients, are more and more interested in network information under the influence of the rapid development of various network industries. It can be seen that the unsynchronized network literacy of the education grantor and the information needs of the education recipient are the difficulties faced by the current network Civic Education in colleges and universities.

(2) Inconsistency of content output form with the aesthetic demand of college students

At present, many colleges and universities still adopt traditional working methods for online ideological and political education, such as using school official microblogs, WeChat public numbers and class QQ groups to produce rigid ideological and political education articles, or simply forwarding documents and notices from higher departments, lacking two-way communication and network interaction with students. The output form of this kind of ideological education is inconsistent with the aesthetic needs of contemporary college student groups, unable to attract the attention of youth groups, and the content is poorly readable, unable to arouse the emotional resonance of college students [8]. College students who are accustomed to the free and open network information environment can no longer accept this one-way information transmission form, and even get tired of this kind of didactic education mode, thus seriously reducing the effectiveness of online political education.

### **3. Feasibility Analysis of Information Education Mode of College Students' Civics and Politics Eban Based on Artificial Neural Network**

#### **3.1. The Adaptability of Artificial Neural Network Technology and Value-Added Evaluation of Civic Education**

Value-added scores in value-added evaluation in Civics not only measure the results of student progress, but also reflect the role of the teaching system when multiple factors interact [9]. Compared with traditional evaluation, value-added evaluation poses more specific requirements in terms of philosophy, data structure, and handling of complex data. The degree of adaptation of artificial neural networks to these requirements can solve the technical problems of traditional evaluation models to most extent, which determines the feasibility of applying artificial neural networks to the practice of value-added evaluation. For ease of presentation, the various types of value-added evaluation models can be summarized as the following mathematical models:

$$y = f(x_1, x_2, \dots, x_n) \quad (1)$$

Where  $y$  denotes the value-added outcome or exit score of the assessment object,  $f(x)$  denotes the value-added evaluation function, and  $(x_1, x_2, \dots, x_n)$  denotes the correlated influencing factors of the value-added score, including indicators such as pretest scores, student background, and teacher characteristics. Therefore, the goal of the value-added evaluation model construction and comparison is to explore the evaluation function that can explain the relationship between  $y$  and  $x$  to the greatest extent.

### **3.2. Artificial Neural Network Based Civic Elements Discovery**

Based on the adaptability of artificial neural network and value-added evaluation of Civic Education, this paper uses the artificial neural data value-added evaluation model method to mine some Civic elements from the E-Class Civic Education course dataset for the sensitivity test of this paper's algorithm model.

The mined elements of ECB Civic Education are shown in Table 1. The overall sensitivity of the mined Civic and Political elements of Eban course using the artificial neural value-added evaluation model is 90%, and the test performance is good. Among them, the highest sensitivity for news material mining is 95%, and almost all the Civic and Political information is completely identified. The next one is the recognition rate of 94% for the Civics courses of each college on Eban APP, which can greatly reduce the complexity of teachers' screening of teaching contents by using it in college Civics education.

**Table 1.** The "E-Class" Civic Science and Politics Element Mining

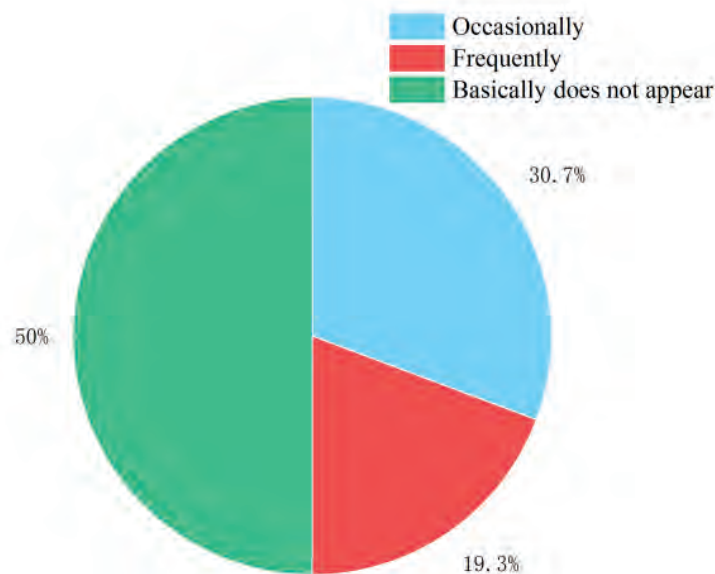

Ideological and political basis	The core values of Chinese socialism	Sensitivity
Excavation approach	1. Explore patriotism, national pride, four self-confidence, self-worth, sense of responsibility, outlook on adversity, craftsmanship, dedication culture, innovation spirit, harmony and unity between man and nature, sustainable development, etc. from electronic textbooks	80%
	2. Discover from news video materials	95%
	3. Great country style: classic Chinese classics such as "The Story of China's Reform and Opening up", "The 70 Years of New China", and current political hot spots of "National Treasure": national policies, government work reports, current affairs news at home and abroad, and other value guides: spirit of hard work, sound personality, etc	92%
	4. Digging in the ideological and political course of Yiban	94%
Material source identification	Audio and video resources (dynamic), text resources (static), pictures (static) and other multi-modal	89%

### 3.3. Public Opinion Monitoring on Eban Platform under Artificial Neural Network

Eban is an innovative product in the context of network. While the practice of online ideological and political education for college students based on Eban plays its role as a carrier of ideological and political education, it also faces the problem of network opinion safety.

The frequency of negative comments on Eban is shown in Figure 1. 19.3% of the teachers and students said that negative comments would appear frequently on Eban, 30.7% said that negative comments would appear occasionally, and 50% said that negative comments basically did not appear. Although there are fewer

negative comments on Eban compared with other online platforms, the survey results show that neither the Eban platform itself nor the universities have established a good mechanism to monitor the comments and articles made by teachers and students on Eban platform, which leads to the failure to detect students' problems in time and no way to conduct targeted education. Based on this, in the information education of Eban, special attention should be paid to the monitoring of the public opinion orientation of Eban platform, so as to timely kill the poisonous tumor of ideology such as division and wrong political tendency.

**Figure 1.** Frequency of Negative Comments in Yi's Class

#### **4. Measures to Enhance the Effectiveness of Online Ideological and Political Education for College Students Based on Eban**

(1) Enhance college students' active awareness of participating in online ideological and political education

The ideological education carried out on E-class is mainly targeted at students. Students are the main force, and they can educate themselves, strengthen self-management and discipline themselves in practical activities as the target of ideological education, and this main consciousness determines whether the development of ideological education can achieve practical effects. When using E-class to carry out the Civic Education, we must be aware of this problem and pay attention to the personalities and needs of college students, so that we can better realize the effect of Civic Education.

## (2) Improving the network literacy of education subjects

In order to enhance the effectiveness of the online Civic Education of college students based on Eban, ideological and political educators should take the initiative to open Eban, learn the features, functions and contents of Eban, be proficient in searching information, publishing articles and managing students on the platform of Eban, and play a leading role in the Eban class. Teachers can write and publish positive articles on the website that can promote students' growth, and students can find resonance in the articles. To carry out Civic Education for college students, teachers are required to have excellent quality and ability in order to be able to use E-Class to carry out Civic Education with ease and enhance the effect of education.

## (3) Strengthening guidance and developing innovation

Using the platform of Eban's excellent courses, we create online study groups such as "studying for the fourth and sixth grades" and "final exams". Relying on the "Topic Discussion" column of the class group, carry out online student exchange meetings and thematic class meetings. The "Class Curriculum" section of the classroom group is used to plant online courses on topics such as mental health education, career planning education, and college culture education. Based on the "Online Exam" section of the class group, online exams are organized to further strengthen the learning effect through tests and promote students to complete their learning tasks consciously and actively.

## **5. CONCLUSION**

This paper proposes the information education model of college students' ideological and political Eban based on artificial neural network technology, and uses artificial neural network technology to explore its adaptability to value-added evaluation of Civic and Political Education, as well as to explore its sensitivity of mining Civic and Political information and the effect of public opinion supervision, so as to evaluate the feasibility of the model. The artificial neural value-added evaluation model tested that the overall sensitivity of mining Civic and Political elements of Eban courses was 90%, and the sensitivity of mining news materials was up to 95%, and the recognition rate of Civic and Political courses of colleges and universities on Eban APP was 94%, so the test performance was

good. The purpose of carrying out online ideological and political education for college students based on Eban platform is to solve a series of practical problems such as "how to innovate ideological and political education mode" and "enhance the effectiveness of online ideological and political education", which is also an important measure to promote the innovative development of online ideological and political education for college students. This is also an important measure to promote the innovative development of college students' online ideological and political education, and play a certain role in promoting the development of ideological and political education in colleges and universities.

## **6. FUNDING**

(1) This research was supported by effect Analysis and Countermeasure Research of Network Ideological and Political Education Mode Based on School-based Construction of "Yiban" (Funded by Humanities and Social Science Research Project of Heilongjiang Provincial Education Department in 2019)

Fund number: 2019-KYYWF-1268

(2) This research was supported by research on the Construction of Social Psychological Service System Supported by Mental Health Education Resources in Colleges and Universities (Qiqihar Philosophy and Social Science Research Planning Project)

Fund number: QSX2022-43JL

## **ABSTRACT**

Applying big data technology to Eban network ideological and political education is conducive to improving teaching management efficiency and enhancing the quality of network ideological and political education. This paper firstly compares the emergence and development of Eban network ideological and political education and explores its educational characteristics, and then builds a big data college network ideological and political education effectiveness assessment platform to demonstrate students' access and platform participation by means of big data technology. At the level of students' sense of acquisition, the significance level of E-ban ideological network political education ranged from -3.25 to -4.42, and the p-values were all less than 0.05. Online ideological and political education made students feel that they had learned something and had positive significance. At the level of platform activity, the average value of student activity index is 12.5 and the average value of class co-construction index is 7.5, with a high overall activity level. The big data ideological education effectiveness assessment platform built by this research has important teaching practice value.

## **KEYWORDS**

Big Data; Easy Class; Web Civics; Effectiveness Assessment

## 1. INTRODUCTION

As a new online media platform for colleges and universities, Eban can give full play to its function of online ideological and political education, which is an important response to further strengthen the work of online ideological and political education in colleges and universities and an inevitable requirement for the development of online ideological and political education in colleges and universities [1]. The periodization wave of full media and big data symbiosis has provided fresh means for the ideological and political education work in colleges and universities, and the network ideological and political education is thus advanced. The lifestyles, learning styles and thinking styles of college students in higher education have also changed as a result. Facing such an objective situation, improving timeliness and effectiveness objectively requires big data platform and technology to be fully connected with ideological and political education work [2].

Online ideological and political education is an important part of ideological and political education, an important direction for exploring ideological and political education in colleges and universities in the new media era, an important way to improve the efficiency and effectiveness of ideological and political education, and an inevitable requirement for developing and improving the ideological and political education system [3]. Under the premise of following the law of political work, the law of teaching and educating people and the law of students' growth, network ideological and political education takes network education and quality improvement as the goal, strengthens the network construction and management of colleges and universities as the main line, innovates network ideological and political education as the focus, fully uses new media and new technology, constantly innovates working ideas and methods, strives to make ideological and political work live and forms a vivid online and offline linkage education of people The situation [4]. In recent years, colleges and universities have been increasing the network ideological and political education, actively improving the management of network positions, guiding students to abide by network norms, guiding correct opinion guidance, constantly narrowing and eliminating the discourse difference between teachers and students, deeply promoting micro network education platform,

pushing students' favorite campus culture "micro products", and devoting to create a good campus network cultural atmosphere [5]. This paper explores the relationship between big data technology and e-culture.

This paper explores the effectiveness of combining big data technology with Eban's online ideological and political education, and is divided into three parts. The first part explores the current situation of the emergence and development of Eban and online ideological education and their development characteristics, and tries to sort out the future direction of Eban's development from the source. The second part studies the teaching effectiveness of combining big data technology with Eban Civic Education, builds a big data college network Civic Education effectiveness assessment platform, and verifies the teaching results from students' sense of acquiring online Civic Education and the activity of Eban platform, proving that the big data Civic Online Teaching Platform designed in this paper can improve students' passion for Civic Learning.

## **2. Easy Class and Online Civic Education**

### **2.1. The Emergence and Development of Eban**

The "Eban" student interactive community platform is a comprehensive interactive online community that provides teaching, living services and cultural entertainment for university teachers and students [6]. In August 2007, the online class "E-class" appeared in some colleges and universities in Shanghai, and in September 2009, the Shanghai Education System Network Culture Development Research Center was commissioned by the Shanghai Municipal Party Committee of Education and Health and the Municipal Education Commission to develop an upgraded version of E-class based on the "E-class" system. The upgraded E-class system is based on "E-class". The system integrated the functions of BBS, web disk and photo album, and was launched in Shanghai Jiaotong University, Donghua University, Shanghai International Studies University and Shanghai Ocean University. In September 2012, Eban achieved full coverage in public and private colleges and universities in Shanghai. at the end of 2012, colleges and universities in Fujian, Guangxi, Tianjin, Hainan, Jiangsu, Hubei, Sichuan and other provinces and cities began to gradually promote Eban on a pilot basis. in 2013, the

Ministry of Education and the State Information Office issued the "Opinions on Further Strengthening the Network Construction and Management of Higher Education Institutions In 2013, the Opinions on Further Strengthening Network Construction and Management of Higher Education Institutions issued by the Ministry of Education and the State Information Office called for the implementation of "Eban" promotion plan and the gradual construction of "Eban" into an interactive demonstration community for college students integrating ideological education, education and teaching, life services and cultural entertainment.

## **2.2. Features of the ideological and political education of Eban Network**

### **(1) Non-profit**

Under the leadership of government departments, "Eban" has broken the structure model of commercial interactive community websites, and its nonprofit nature is different from that of profitable commercial application platforms such as microblogs and weibo [7]. The advantages of non-profit nature, such as the relative simplicity of online information and the absence of advertising interference, have made "Eban" the main forum for college students to access the Internet, an important platform for students' communication, the main channel for college students to express their opinions, and an important window for the development of college students' thoughts today.

### **(2) Resource sharing**

"It has integrated mainstream Web2.0 applications such as forums, social networks, blogs, microblogs, emails, network hard disk, cell phone applications, etc., and supports various access forms such as web pages and cell phone clients. It has typical college life applications such as clubs, interests, address book, open classes, Eban College, Eban Notes and topics. The powerful resource sharing of Eban locks the user group firmly in the "class" [8].

## **3. The effectiveness of big data technology in the application of ideological and political education in Eban network**

### **3.1. Build a big data university network ideological and political education effectiveness assessment platform**

First, build a data acquisition platform. Data acquisition is the foundation of the whole effectiveness assessment platform. The main body of data collection consists of education management workers in the field of network ideological and political education in colleges and universities and professional technical team familiar with knowledge related to big data collection and management. The data collection objects mainly include workers, working objects and management departments of network ideological and political education. The data mainly comes from the input data information of network ideological and political education workers and working objects in the major network platforms inside and outside the university for network ideological and political education content dissemination, interactive communication, forwarding and sharing. The data from the network informatization office, academic affairs system, logistics security office and other related departments within the university will also be used as the support of the evaluation data sources. The step of data acquisition is to import the collected data into the database and let the database play the role of dynamic monitoring, while ensuring that the acquired data reflects both the accuracy and targeting characteristics, and is integrated with the index system of effectiveness assessment.

Second, establish a data analysis platform. Data analysis is the key to effectiveness assessment, and it is through deep data mining and analysis that we can bring the value of data use into play. This process needs to use a series of intelligent functions of big data, after intelligent screening, integration, clustering, analysis and statistical processing of the collected massive data, and through the association between data to understand the audience base, compare the audience groups, analyze the behavior trajectory, and analyze the dissemination situation and education effect of college network ideological and political education among students in real time.

Finally, the data feedback platform is formed. Through the data feedback platform, the explicit and implicit data are analyzed in depth, thus presenting the effectiveness assessment report and visual data analysis report of college network ideological and political education, which provides objective reference for the index system of

effectiveness assessment and dynamic adjustment of the implementation process, and ensures the scientific and long-term effectiveness assessment work. The platform of college network ideological and political education in the era of big data consists of data acquisition platform, data analysis platform and data feedback platform, etc., which form an interlocking structure system and will ensure that the effectiveness assessment is comprehensive, coordinated, objective and reasonable.

### **3.2. Analysis of Eban Network Civics Students' Access**

In order to investigate the students' learning acquisition sense after the application of big data technology to the online ideological and political education of Eban, students from the School of Economics and Management of University A were used as the research subjects. A total of 200 students participated in the pre-intervention test, of which 115 were in the research group and 85 in the control group, and the comparison between the control group and the research group in terms of the sense of access to online ideological and political education after the intervention is shown in Table 1.

The results of the study show that the significance level is between -3.25 and -4.42, which means that ideological and political education using the Eban platform can have a significant impact on students' sense of access to online ideological and political education and can significantly improve their learning experience. p-values are less than 0.05, indicating that after one semester of online ideological and political education learning intervention, the study group and the control group have a statistically significant difference in the sense of access to online ideological and political education. The differences in each dimension were statistically significant. The students in the study group showed significant improvement in gaining experience, environment, content, means, sharing, personal growth, and behavior, indicating that throughout the intervention process, the students' subjective experience of the content, process, and means of education was positive and positive as recipients of online ideological and political education through the Eban platform.

**Table 1.** Comparison of sense of gain in online ideological and political education

Variable	control group (n=115)	Research Group (n=85)	t	p
Get content	5.40±1.28	6.04±0.35	-4.423	0.000**
Get shared	5.41±1.30	5.90±0.30	-3.746	0.000**
Get experience	5.45±1.47	6.18±0.45	-3.756	0.000**
Behavioral acquisition	5.42±1.45	6.06±0.33	-4.412	0.001**
Sense of personal gain	5.43±1.32	5.92±0.45	-3.250	0.002**

### 3.3. Students' learning activeness under the ideological and political education of E-class network

According to the data summary of students' learning on Eban, the statistical items include active index out of 15 points and co-construction index out of 15 points. the statistics of students' Eban activity from March to June are shown in Figure 1.

The average value of student activity index is 12.5, and the average value of class co-construction index is 7.5. In general, the activity of Eban network ideological education is high, and the highest value of individual activity index in which students have active willingness to study Civics courses on Eban is 14 points, which proves that Eban has the place to attract students to stay. Schools should seize this opportunity to develop more learning categories on Eban that attract students.

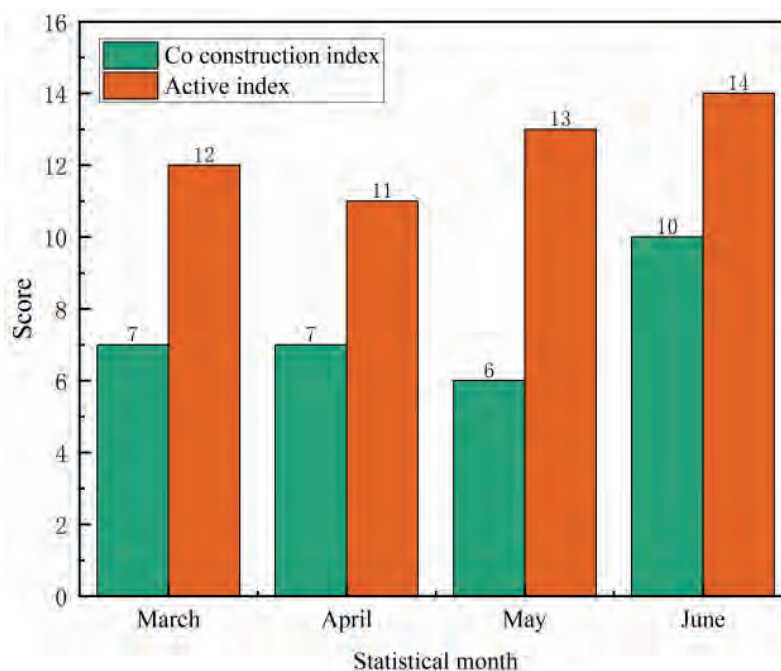

Figure 1. Statistics of students' activity in changing classes from March to June

#### **4. Exploring the construction of the path of easy class thinking and political education**

(1) Strengthen "Eban + party and group building" and open up new positions for party building and group building

In the era of new media, youth and the Internet have a natural connection, where the youth are, the Party and League should be built and work should be done. All levels of society should closely integrate with the needs of youth, constantly provide them with services and assistance in learning and success, employment and entrepreneurship, social integration, etc., and expand the coverage of the work of the Party and the League. Eban is an interactive communication platform mainly for college students and a gathering place for young students, so it should become a new position of "Internet + Party and League Construction". Party and group organizations can make full use of Eban platform to establish party branches and group branches, carry out online party and group activities such as theoretical study, thematic discussion, democratic evaluation and opinion collection, record the daily performance of branch members and grasp the dynamics of students' thoughts. At the same time, it can also carry out micro-course collection and display with the help of Eban You Class, complete the education and training assessment of party members and league members, realize the effective connection of party and league construction in Eban platform, and promote the organization construction to deepen development.

(2) Focus on the research and development of Eban's entertaining applications to enhance the fun of ideological and political education

The positioning of Eban is "a network interactive community integrating education and teaching, life services and cultural entertainment". However, in actual application, Eban is still dominated by serious notices and ideological tweets, and most of the activities are still focused on theme education, lacking in fun and entertainment, and lacking in attractiveness to students. In the process of construction, colleges and universities can add entertainment sections and enrich entertainment functions through application

design competitions and other means, and at the same time combine the ideological education with it, so that students can immerse their hearts in a relaxed and pleasant atmosphere and enhance their satisfaction with the platform.

### (3) Establishing a perfect evaluation mechanism

By incorporating the work of "E-Class" into the year-end assessment index of students' work in each second-level college, we can further promote the development of "E-Class". The student work of E-Class can be evaluated through regular reports and included in the comprehensive quality assessment of students, so as to promote the further development of each student workstation. The establishment of a perfect assessment system and the orientation of assessment can make the teachers and students of "E-Class" have a clearer direction of their work.

## **5. CONCLUSION**

The purpose of this paper is to explore the possibilities brought by the integration of big data technology and Eban platform for online ideological and political education, to sort out the current situation and development needs of Eban with the rise and development of online ideological politics, and to build an evaluation platform for the effectiveness of online ideological and political education in big data universities. The conclusions are verified in terms of students' sense of access and the activity of Eban, and the future construction path of Eban is proposed based on the conclusions, such as strengthening the construction of "Eban + party and group construction" and establishing a perfect evaluation system. The significance level of e-Ban ideological network political education ranged from -3.25 to -4.42, with p-values less than 0.05. This indicates that using the e-Ban platform for ideological education is meaningful and can enhance students' activeness in learning ideology and politics and shape positive ideological and political views.

## ABSTRACT

The innovation of physical education in colleges and universities is conducive to improving students' enthusiasm for sports training and teachers' teaching quality. In this paper, under the background of big data development, big data technology is combined with the reform and innovation of college physical education mode. By analyzing the dilemma of college physical education innovation, the application strategy of combining big data technology with college physical education is proposed for the difficulties of innovation, and the program is evaluated according to the teaching results of students. The big data analysis shows that in the attendance rate of college students' physical education elective courses, the average attendance rate of freshmen is 97%, sophomores is 97.3% and juniors is 92.7%. In the distribution of grades, 35% of the grades are excellent, 40% are good, and only 5% are failing. It shows that the innovation of big data applied to college physical education teaching mode can get better feedback of students' performance.

## KEYWORDS

Big Data; College physical education; Teaching Innovation; Attendance rate

## 1. INTRODUCTION

In the university education system, physical education is used as an instrumental presence to serve other subject areas. Since entering the 21st century, the overall health level of college students has shown a decreasing trend, and most of them are on the verge of subhealth [1]. As a result, physical education in colleges and universities must be innovatively reformed with the cultivation and development of students' physical literacy as an important goal in order to motivate college students to develop physical exercise habits and healthy lifestyles. By improving the physical condition of contemporary college students, thus realizing the basic requirements for high-quality talents in the new era [2].

Since the reform and opening up, with the strong support and encouragement of the national education department, the physical education of colleges and universities has made great progress and development. At present, under the guidance of humanistic education theory, the reform and construction of the curriculum of physical education in colleges and universities have made rapid development, and the concepts of happy sports and lifelong sports have gradually played an active role in the reform and construction of school sports and become the universal value pursuit of teachers and students in colleges and universities [3]. With the professional development of physical education teachers, the updating of their ideology and the development of their education and teaching ability, college students also change from the previous passive learning state of liking sports but not liking physical education classes to gradually eliminating their resistance to physical education courses and taking the initiative to evaluate the vivid image of physical education classes and the humor of physical education teachers. This fully proves the great progress of physical education in colleges and universities [4]. In addition, physical education in colleges and universities has also accumulated valuable experience in sports competition activities inside and outside the university. In conclusion, the current college sports management

has made relatively fruitful achievements in both theory and practice, which has laid a solid foundation for the overall development of education. However, there are limitations in the management of physical education in colleges and universities in practice due to the characteristics of physical education, teachers' professional ability and level, and managers' consciousness and prejudice. Physical education needs to keep abreast of the times, be active, and take the initiative to carry out management innovation in strict accordance with the Party's policy and educational action requirements in order to properly and effectively achieve the overall development and progress of physical education in colleges and universities [5].

In this paper, starting from the current dilemma faced by the innovation and reform of college physical education, we propose an attempt of the innovation path of college physical education based on big data, starting from the difficulties in sports management methods and talent training. Chapter 3 of the paper introduces in detail the application strategies of big data technology and college physical education innovation teaching, and proposes cracking solutions to the previous dilemmas one by one from three aspects: teaching contents and methods, physical education teaching resources sharing and teaching communication and evaluation construction, and finally carries out the acceptance of teaching results to prove where the empirical value of this paper's research lies.

## **2. The dilemma facing the innovative reform of physical education in colleges and universities**

### **.1. Sports management methods are slightly outdated**

The traditional management model of physical education in higher education relies excessively on the unified orders of educational administration, and usually one model engages in a one-size-fits-all approach, where the manager, leader, and decision maker are usually served by one person, which has greater power and space to dominate the management affairs of physical education [6]. In this context, the management method is bound to be single and arbitrary, resulting in the excessive use of power by the manager to give orders and control the behavior of the affairs and related objects, which is not conducive to the healthy development of the management affairs and the performance of the work enthusiasm of the related objects,

as well as to the achievement and realization of the sports participation and the established goals of physical and mental health in the process of students' group sports activities. For this reason, universities should put the power into the prison of system, adjust the thinking consciousness and habits of leading decision makers and management executors, change the management concept from management to service and governance, and firmly establish the service consciousness of managers instead of rigidly ruling, controlling and giving orders [7]. In the actual management process, various factors should be fully mobilized and various practical management methods should be used to promote the motivation and initiative of the management objects and to promote the achievement and realization of management goals.

## **2.2. Talent training singularity, lack of short- and medium-term goals**

In the process of talent training, many colleges and universities lack effective grips for students' subject concept guidance, professional cognitive ability and learning attitude. Students start to receive a fixed single training from the beginning of their freshman year, and in reality, sometimes the best career development is instead those students who perform less well in class or even in exams. Physical education majors are supposed to cultivate talents who learn and teach at the same time, but some students cannot express the characteristics and requirements of some sports well, so they cannot design their teaching well, and finally the situation that students trained by colleges and universities have strong skills but poor culture. In addition, most of the talents training in colleges and universities are also long-term goals, lacking short and medium-term stage goals, so students may not be able to reach their training goals in 3-4 years of study life.

### **. Big Data Technology and Innovative Teaching Strategies for College Sports Applications**

First, with the help of big data, enrich the content and methods of college sports teaching. Traditional college sports teaching class

The teacher is usually the main body to teach theory and skills, and students are passive recipients. In many colleges and universities, the teaching mode is single and lacks sufficient changes and

innovations. Through big data technology, physical education teachers can obtain a large number of new teaching methods and learn from excellent teaching experience, so as to enrich teaching contents and improve teaching quality. In addition, relying on big data technology, physical education teachers can explain more physical education knowledge and teach more physical exercise methods in microclasses, catechisms and other online classes, so that students can receive diversified physical education, enhance their learning interests and acquire comprehensive physical education knowledge [8].

Secondly, with the help of big data, sharing and exchange of physical education resources among colleges and universities are realized. The data analysis function can provide timely feedback of effective information and suitable resources according to the demand. With the development of big data technology, colleges and universities can better present their educational activities while implementing information-based education, and provide information basis for cooperation as well as communication between colleges and universities. Big data technology can realize the sharing of resources among colleges and universities, promote the exchange of physical education teaching and teachers and students among colleges and universities, and create conditions for improving the quality of physical education teaching in colleges and universities.

Thirdly, "scientific and rigorous" physical education evaluation in the era of big data needs to be constructed. In the era of big data, it is possible to collect and record all kinds of data in physical education, which can effectively enhance the objectivity of evaluation, get rid of the reliance on experience and make the evaluation of physical education more diversified. Using big data technology to reconstruct the evaluation system of physical education can not only improve students' knowledge and skills, but also discrete data such as students' fitness status, sports behaviors and habits can be collected. Technical analysis is used to reflect the quality of each student in terms of thought, emotion, form and behavior, and this can be used as a standard for scientific and rigorous evaluation of students.

## **4. Acceptance of Innovative Teaching Achievements in College Physical Education under Big Data**

### **4.1. Attendance statistics of college students' physical education elective courses**

In order to investigate the results of physical education teaching in colleges and universities from the perspective of big data, the attendance information of teachers on the university's academic affairs information network was used as a specimen to verify the attendance rates of physical education elective classes for freshmen to juniors from April to June using the data analysis platform, and compared with the paper attendance sheets to check the gaps.

The attendance rates of students in physical education elective classes are shown in Figure 1. The average attendance rate of freshman students from April to June was 97%, the average attendance rate of sophomore students from April to June was 97.3%, and the average attendance rate of junior students from April to June was 92.7%, and the overall attendance rate of students in physical education elective was high. Comparing the data on paper student attendance sheets and teachers' class attendance rolls, the number of students taking leave of absence and sick leave is slowly decreasing, and the situation of students avoiding physical education classes has improved. This indicates that the innovative form of physical education has been well received by students and that students are responding well. The highest attendance rates were achieved in June in all three years: 100% in freshman year, 99% in sophomore year, and 96% in junior year. Students believe that the innovative physical education program adds more fun to physical activities, and the integration of big data technology with physical education makes it possible to detect the data in the learning process one by one and practice the weak items in a targeted way.

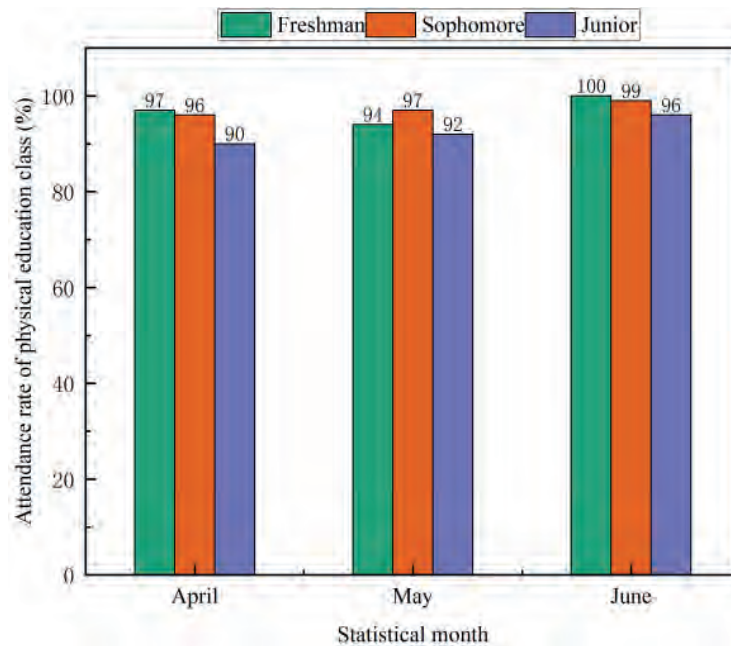

Figure 1. Attendance rate of students in sports elective courses

#### 4.2. Physical education performance acceptance

In the teaching process, college physical education teachers use big data technology to track students' sports at any time, summarize students' training data in time, develop differentiated teaching and training programs for different groups, and use the final student examination results as the final result test after a semester of student physical education course teaching. The big data differentiated teaching student training results are shown in Figure 2.

The students' training performance reached 35% excellent, 40% good, 20% passing and only 5% failing, and the students' performance was good overall. This proves that the use of big data technology for student training data tracking can differentiate training according to individual student differences, thus obtaining good teaching results. Students' excellent and good rates can be improved most quickly, helping to reduce the rate of college students failing final exams. The training data precisely locates students' vulnerable training items, while accurate teaching also helps to reduce injuries caused by improper exercise or over-exercise and protects students' personal safety in sports training.

Figure 2. Student Training Results of Big Data Differentiation Teaching

## 5. CONCLUSION

Big data permeates all aspects of life, and combining big data with physical education courses for physical education teaching innovation is one of the highlights of this paper. By analyzing the current challenges of physical education innovation reform in colleges and universities, this paper investigates the data screening of physical education elective courses from freshmen to juniors in colleges and universities under the integration of big data technology and physical education, using the efficient and accurate characteristics of big data information acquisition, mainly examining the student performance in colleges and universities after the application of innovative teaching methods, student attendance and differentiated teaching. According to the results of big data analysis, the average attendance rate of freshman students is 97%, the average attendance rate of sophomore students is 97.3%, and the average attendance rate of junior students is 92.7%, and the overall attendance rate of students in physical education classes is high. In terms of the distribution of students' grades, excellent rate accounts for 35%, good rate accounts for 40%, passing rate accounts for 20%, and failing rate accounts for 5%, which is maintained at a high level overall. Thus, it can be seen that college physical education innovation is conducive to stimulating

students' enthusiasm for physical education, and actively using cutting-edge technology in teaching can help students improve their performance.

## ABSTRACT

Studying the expression path of Internet music culture in college music education is beneficial to the expansion of college music teaching resources. In this paper, the integration of college music teaching and Internet music is studied under the perspective of big data. Firstly, the reasons for the development of college music education are analyzed, and then the main paths of Internet music culture dissemination in college music education are studied, and the reasons at the teacher and student levels are analyzed through big data. The results show that based on the college student level, the main sources of Internet music dissemination are: music platforms accounted for 38%, short video dissemination accounted for 32%, and the use of the Internet is an important path for Internet music culture to be fully expressed. Based on the college music teacher level, the frequency of college teachers using Internet music teaching reached 60% in 2018 and increased to 80% by 2021, thus, Internet music penetrated all aspects of college music in a large scale.

## KEYWORDS

Big Data; Music Teaching in High Schools; Internet Music; Expression path

## 1. INTRODUCTION

Internet music is an important part of Chinese music culture, and the emergence of Internet music has gradually changed the concept of

music education, causing people's musical aesthetic orientation to change and having a deep impact on the pursuit of musical values [1]. Internet music not only enriches the content of music education, but also promotes its diversified development, and is also influencing the intrinsic relationship of music education, giving it new vitality [2].

The intrinsic value of Internet music is unlimited, but the prerequisite for Internet music to become an educational resource is that it needs to reflect the educational value of Internet music, so colleges and universities need to give full play to and tap the value of Internet music educational resources [3]. Teachers in colleges and universities need to correctly understand the essential value of Internet music, develop its true educational value, and use Internet music scientifically and rationally for music education, so as to effectively improve the quality of music education [4]. The use of Internet music for music education can be understood, to some extent, as the establishment of a music education aid mechanism through the Internet. Internet music is an educational medium in the process of conducting music education, which requires music educators and learners to correctly see the advantages and disadvantages of Internet music. Teachers should combine the inherent needs of current music education and attributes, reasonably develop the advantages of Internet music resources, and use it as the main teaching object to give full play to its music education function [5].

Based on the development status of college music education under the perspective of big data, this paper analyzes the reasons for the emergence of college music education in order to clarify the needs of college music education. The whole paper is divided into three parts; the first part explores the reasons for the development of music in colleges and universities and clarifies its development prospects from the development of big data and the Internet and the favorable national policies on music education. The second part analyzes the main paths of music dissemination in colleges and universities at the student level and teacher level, and explores the reasons why Internet music has been able to spread widely in colleges and universities. The third part redefines the application value of Internet music in college music education based on the full-text study, and

explains the necessity of integrating college music education with Internet music culture.

## **2. Reasons for the Emergence of Music Education in Universities in the Perspective of Big Data**

### **2.1. The continuous progress of big data and Internet technology**

With the continuous development of information technology, we have stepped into the era of big data, the rapid development of the Internet and the rapid popularization of mobile terminal devices such as cell phones and tablet computers, which make it increasingly convenient for people to receive knowledge. The effective use of technologies such as big data and artificial intelligence for teaching innovation is the trend of the times and has shown a more significant impact on the educational work of Chinese universities [6]. The supporting audio and video capture and transmission technologies, artificial intelligence and big data technologies in online music education in colleges and universities have also been further developed, with the emergence of large-scale online open courses that truly teach, learn, do, and evaluate through online. During the epidemic, live classes have also become the main mode of music learning in colleges and universities, where both sides of teaching can interact instantly online, without the restriction of time and geography, effectively promoting the development of music education in colleges and universities.

### **2.2. The continuous favorable national policies**

In order to comprehensively strengthen and cooperate with the aesthetic education of colleges and universities in the new era and improve the artistic literacy of college students, according to the "Opinions of the Ministry of Education on Effectively Strengthening the Aesthetic Education of Higher Education in the New Era Mutual" requirements, colleges and universities should incorporate public art courses and art practice into their teaching plans, and each student must take the public art courses specified by the school and complete the credits before graduating. The opinion requirements also mentioned that the Ministry of Education should revise the National Public Art Curriculum Guidance Program for General Higher Education Schools in the next step, and continuously strengthen the standardization, institutionalization and scientificization of higher public art curriculum construction in the new era [7]. With the

formulation and introduction of a series of educational policies such as the Opinions on Popularizing Art Education in General Higher Education Schools, music education in general colleges and universities has been standardized to some extent. The policy of online education in the era of "Internet+" has also received more attention, as eleven departments, including the Ministry of Education, jointly issued the "Guidance on Promoting the Healthy Development of Online Education", striving to build a learning society in which "everyone can learn, everywhere can learn, and all the time can learn". Online music education in colleges and universities is also more suitable to use modern information technology such as the Internet and artificial intelligence to teach and learn, so that modern information technology and education can achieve deep integration and continuously improve the quality of online music teaching in colleges and universities [8].

### **3. The path of expression of Internet music culture in music education in colleges and universities**

#### **3.1. Internet Music Culture**

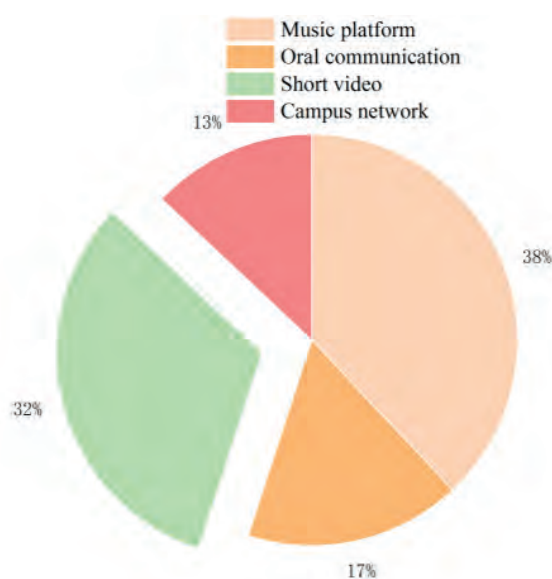

Internet music is, as the name implies, popular music that is distributed on the Internet, and these musical works are closer to life and easily accepted by listeners. Simple, easy to understand and widely circulated, Internet music is mainly based on songs. The Internet is a convenient and fast medium, spreading quite fast, as long as the songs are uploaded on the Internet, within a short time, people in the north and south of the world can hear the songs. With the advanced Internet technology and the latest music content, Internet music has attracted many Internet users, especially the majority of teenagers. Internet music is a new form of music produced and disseminated through the Internet, an extension of popular music culture in the digital era, an important way for people to entertain themselves and send their emotions, with a strong sense of life and personal color [9].

## 3.2. The path of conveying Internet music culture in music education in colleges and universities

### 3.2.1. How Internet music is distributed among college students

In this study, we mainly use big data to analyze the Internet music culture in the current college music education, in order to figure out the dissemination path of Internet music. The main paths of Internet music dissemination are shown in Figure 1.

The distribution of the main sources of Internet music from high to low is 38% for music platforms, 32% for short videos, 17% for oral communication among classmates, and 13% for campus network, which shows that the spread of Internet music is mainly the daily recommendation of music platforms to form the exposure rate, and then to obtain the fan base to expand the music audience one by one. The spread of short videos is mainly based on Jieyin and Xiaohongshu, which often become the wind vane of popular music. The characteristics of contemporary college students are heavy Internet users, and their life association is highly related to Internet use, so it is practical to identify the expression of Internet music culture in college music based on Internet use data. In the college music classroom, teachers communicate with students about Internet music, and Internet music is presented in various ways in students' assignments. College music and Internet music intermingle with each other to form college music education with the characteristics of the new era of the Internet.

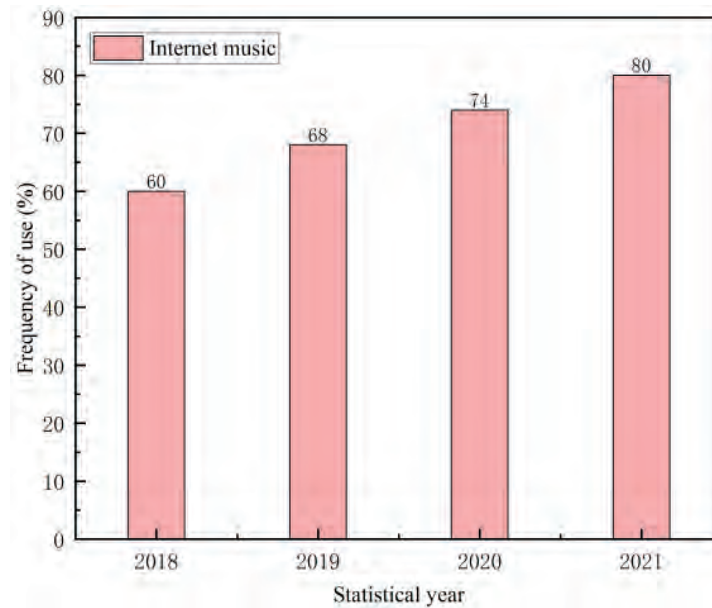

**Figure 1.** Main Path of Internet Music Transmission

### **3.2.2. Application of Internet music teaching frequency by teachers in higher education**

Internet music has shown its own characteristics in its unique form since its creation. With the rapid development and continuous popularity of the Internet, Internet music culture has broken the inherited system, and its inheritance and innovation on traditional music have begun to develop towards diversification. In terms of music creation, Internet music has the characteristics of openness, freedom and democracy, and its creation subjects are no longer limited to music professionals, showing a popular trend of mass. In terms of music dissemination, Internet music is not restricted by time, space, or geography, making it possible for different groups to share it anytime and anywhere. In terms of genres of music, Internet music shows diverse characteristics and reveals different themes and styles.

After the study based on the student level, a survey was then conducted to investigate the frequency of actual application of Internet music in the teaching cases of college teachers. Statistics on the application of Internet music case teaching by college teachers are shown in Figure 2. In the new era, teachers' teaching materials are expanding and music teaching resources are not only limited to classical music, but Internet music is also slowly integrated into college music teaching. the frequency of college teachers using Internet music teaching cases is 60% in 2018 and increases to 80% by 2021, which is sufficient to prove that college teachers are sure about Internet music. Excellent Internet music is growing among colleges and universities with the process of teachers' teaching, and Internet music culture is spreading.

**Figure 2.** Statistics of case teaching of college teachers using Internet music

#### **4. The Value of Internet Music in College Music Education**

##### **(1) Increase students' interest in learning music**

For college students, because of their psychological freedom, they pursue individuality and traditional music cannot make them interested. Internet music has a personalized style and can reflect the different atmosphere of the times, so that the original boring music teaching can meet the interest of students, which can greatly improve the teaching effect of college music education. Colleges and universities should strengthen the communication between students and teachers, so that teachers and students can actively participate in music teaching, which can make the original music classroom activities more harmonious atmosphere.

##### **(2) Highlighting the contemporary nature of music education in colleges and universities**

Compared with traditional music education, Internet music can enrich the music culture nowadays, and most of them are created to adapt to the development of the times. With the development of music education in colleges and universities, both traditional music and Internet music are used as teaching materials for music education, and the two are integrated and innovated so that music education can reflect the characteristics of the new era. The characteristics of the era of Internet music are very clear, and many music works can

reflect the characteristics of the times and the current situation of society. Therefore, in the process of teaching music on the Internet, teachers need to have the ability to use not only music equipment but also a variety of Internet media. Teachers use advanced Internet technology to carry out music teaching so that the characteristics and connotations of Internet music can be fully expressed.

### (3) Enriching music learning styles

Internet music learning can be conducted not only in the classroom, but also at home or in other venues, which is a great reform to traditional music classroom learning. Music education in colleges and universities is not only taught by teachers using teaching books, but also through a variety of other teaching media. Students can find music resources on the Internet and study them independently, or they can use group discussions to learn, which enables students to enrich their learning styles and their access to music knowledge is expanded. Rich ways of learning Internet music can deepen students' understanding of Internet music and enable them to better learn the connotations of Internet music. Teachers can guide students to carry out learning activities and practices on the Internet to make students learn music in more diverse ways and make music teaching more imaginative and vivid by improving the conditions of music classroom teaching.

## **5. CONCLUSION**

In this paper, we study the integration of college music teaching with the communication path of Internet music culture under the perspective of big data, and explore the possibility of integrating Internet music with it by analyzing the reasons for the rise of college music education. Big data is used to obtain the main role of college teachers and students in the communication of Internet music and to redefine its value. The results show that: based on the college student level, the main sources of Internet music dissemination are music platforms accounting for 38% and short video dissemination accounting for 32%, and the use of the Internet is an important path for Internet music culture to be fully expressed. Based on the level of college music teachers, teachers' continuous application of excellent Internet music cases in music teaching is the main result of prompting the spread of Internet music. The research in this paper takes college

music education and Internet music culture communication as the entry point, which can fill the research gap in the field of Internet music and enrich the research results of college music teaching.

## **ABSTRACT**

This paper analyzes a series of industries such as cultivation, R&D and culture of Guanxiang in Liaobu Town, Dalingshan and Qingxi Town, which are typical representative areas of Dongguan's incense culture industry, and also analyzes the dilemma of Dongguan City's Guanxiang industry development by using big data technology. The primary industry of Dongguan City Guanxiang only accounts for 16.0%, while the secondary and tertiary industries are 52.5% and 41.5% respectively, with obvious problems of unreasonable industrial structure. Compared with the fast-developing Zhongshan City, the industrial value-added of Dongguan Guanxiang industry in the past five years is about 3% lower, and the value-added speed is slower. In the intelligent background with the help of big data technology can clearly see the pain points of the development of Dongguan incense culture industry.

## **KEYWORDS**

Big Data Technology; Dongguan Incense Culture; Industry Structure; Value-added speed

## **1. INTRODUCTION**

Guanxiang has a long history of development, and its high level of production technology and superior quality have made it famous all

over the world. As a product of Dongguan's long history and culture, Guanxiang contains rich cultural connotation and spiritual wealth [1-2]. As a special cultural industry, the development of guanxiang not only has important economic significance, but also has important significance for the inheritance and development of traditional culture [3-4]. In today's rapid economic development, the revival of cultural industry should be combined with local special industries, so that economic benefits and cultural inheritance can be developed together [5]. Based on this, it is necessary to explore the culture of guanxi and its industrial revival.

For the study of spice industry, the literature [6] pointed out that 80%-90% of bulk spices in the spice oil and oleoresin industry would be left as residues, and also suggested that the residues from the spice industry could be applied to the development of dietary fiber foods. The literature [7] assessed the trends in Indian spice exports and their export competitiveness in a global framework and used Simpson's Diversity Index to measure their export diversity. The paper [8] studied the development of the incense industry in Zhongshan City, using the proven technology roadmap of "Research and Development Market Needs, Objectives, Technical Barriers, Requirements" as a blueprint. The literature [9] studied the route and travel distance of traditional organized spice retailing from agricultural locations to consumers, and noted an increase in food miles of spices in integrated supermarkets.

This paper first explores the development history of Guanxiang culture industry in typical Dongguan towns by analyzing the main layout of Guanxiang industry in recent years with Liao Bu town, Dalingshan and Qingxi town as examples. Then, based on the big data technology, the life cycle of Dongguan's incense culture industry is judged, and the big data of its guanxi industry structure and industry development are analyzed to find out its problems.

## **2. The current situation of the development of Guanxiang cultural industry - a typical region as an example**

### **2.1. Guanxiang Industry in Liaobu Town**

The town of Chabu in Dongguan has developed a lot of commercial activities, and incense was distributed here during the Ming and Qing dynasties. The culture of Guanxiang is one of the characteristics of

the town. Since 2009, Chabu Town has implemented the "Eight-One" project of Guanxiang culture and actively explored the characteristics of Guanxiang culture on the basis of developing "culture + tourism + industry", thus embarking on the road of integrating the development of culture and tourism. Relying on Guanxiang culture, Chabu town has built two 4A-level scenic spots, namely Xiangcheng Cultural Tourism Zone and Xiangcheng Zoo, as well as the national 3A-level scenic spot - Ya Xiang Street Cultural Tourism Resort. With the market as its guide, Chabu Town holds a series of festivals and cultural activities such as China (Dongguan) Incense Cultural Industry Expo, Guanxiang Flower Festival and International Automobile Festival every year. The town of Chabu has established China's first incense culture theme museum - China Incense Culture Museum, Tooth Incense Street, Incense City Park and other projects, and introduced a large number of high-quality enterprises, such as the Incense City Group, Burton Group, etc., to provide strong support for the implementation of the Incense City Cultural Industrial Park, Incense Expo Park and other projects. Due to the rapid development of cultural tourism industry, Chabu Town has become a demonstration area of cultural tourism integration development in Guangdong Province, a demonstration area of global tourism in Guangdong Province, and a tourism style town in Guangdong Province.

## **2.2. Guanxiang Industry in Dalingshan**

Dalingshan is a place with a long history and cultural tradition. The area is the birthplace of the Guanxiang production techniques, and its Guanxiang production techniques have been successfully selected as a representative list of national intangible cultural heritage items, while there is one representative inheritor of national intangible cultural heritage items. In recent years, Dalingshan has paid great attention to the protection, research and promotion of guanxiang cultivation technology. At present, Dalingshan has become a very famous traditional production area of guanxiang in China, and Dalingshan guanxiang has also become a national geographical indication protected product. There are more than 1,000 mother trees of guanxiang, more than 60,000 old guanxiang trees producing high quality guanxiang, and more than 100,000 other guanxiang trees in the guanxiang intangible cultural heritage protection park in

Dalingshan. Every year, celebration performances, incense picking days and incense performance activities are held at the time of Snow Festival in the lunar calendar to interact with visitors to taste incense, which further deepens the connotation of guanxiang culture and promotes the healthy development of guanxiang industry. In addition, based on the characteristics of Guanxiang culture and relying on the culture of Guanxiang, Dalingshan Town carries out the cultural tourism festival of "Cultural Tourism-Dalingshan Guanxiang Season" through cultural inheritance, literary creation, cultural activities and online and offline experience activities to further excavate and show the culture of Guanxiang and form the Dalingshan. At the same time, the festival will create a "hit" attraction and promote Dalingshan Guanxiang, making it one of the most popular tourist attractions online.

### **2.3. Guanxiang Industry in Qingxi Town**

With 1,260 mu of Guanxiang Garden in Qingxi Town and a total of about 10,000 Guanxiang trees planted, Guanxiang Garden has a greater advantage in developing the Guanxiang industry. In order to grow and develop the guanxiang industry, the guanxiang garden has formed a professional research team and conducted in-depth cooperative research with universities and scientific research institutions such as Nanchang University, Guangzhou University of Traditional Chinese Medicine, Hunan Agricultural University and South China Botanical Garden of Chinese Academy of Sciences to solve the technical problems of guanxiang cultivation. Liu Dongxiao, the representative inheritor of Dongguan intangible cultural heritage project, started the cultivation of guanxiang in 1998. He is good at opening incense doors and processing incense products, and established Dongguan Guanxiang Horticultural Technology Co., Ltd. He invests a lot of research and development funds every year to research the main technical problems of guanxiang products, and has successfully applied for seven invention patents. He led the research and development of biological knotting technology, which increased the knotting rate of guanxiang by 30 times and successfully passed the test of National Food and Drug Administration. At the same time, he also introduced and developed high value-added products such as guanxiang tea, guanxiang flower tea, guanxiang wine and guanxiang pillow through deep processing of guanxiang, which not only

developed guanxiang derivative products but also injected new vitality into the ancient guanxiang.

### 3. Exploring the problems of Dongguan incense industry based on big data

#### 3.1. Judgment method of industry life cycle under big data

The index of industry life cycle should be formed by considering the proportion and growth rate of the industry in the whole market as the stage industry. The industry will have different forms depending on the industry, but it shows uniform characteristics, that is, the industry occupies a small share of the market. After entering the growth stage, the industry's share in the market gradually increases, and its growth rate is much higher than the average growth rate of all industries in the market. In the maturity stage, the development of the industry tends to level off and no major fluctuations occur, so the slope of the life cycle curve becomes smaller. It is important to note that the maturity phase occupies the majority of the industry system. In the decline stage, the lifecycle curve has a decreasing trend and its slope is generally negative. The industry life cycle calculation method based on big data is:

$$y_t = \frac{k}{1 + ae^{-bt}} \quad (1)$$

Where  $y_t$  represents the industry development index,  $t$  is the time, and  $a, b, k$  is the variable. At this point, if  $a > 0, b > 0$  is kept,  $k$  is the current saturation value of the industry. So it can be seen that  $a$  represents the base period coefficient and  $b$  represents the potential coefficient.

In the formation stage, the industry's growth rate is slow, after a certain period of accumulation, the industry will enter into the growth period. Then enter the maturity when the development of flat without fluctuations, and finally the industry is saturated, marking has entered the recessionary period, when the third-order derivative of the formula (1) is obtained as follows:

$$y_t''' = \frac{ab^3ke^{-bt} - 4a^2b^3ke^{-2bt} + a^3b^2ke^{-3bt}}{(1 + ae^{-bt})^4} \quad (2)$$

The dividing point between the industry formation period and the growth period is  $t_1$ , and the dividing point between the growth period and the maturity period is  $t_2$ . Both are the points that make the equation (2) zero.

For the special culture and economy fusion industry of Guanxi industry, its process realizes the fusion of tourism, production, market and cultural resources. The development of cultural industry is also generally divided into four stages of industrial life cycle. Unlike general industry types, the life cycle of Guanxiang industry, a culture and economy fusion industry, is longer and most difficult to enter the mature stage, the reason for which is that its industrial development is closely related to policies.

### **3.2. Analysis of the development dilemma of guanxi industry based on big data**

#### **3.2.1. Dongguan City Guanxiang industry structure is not reasonable**

With the analysis of big data technology, the distribution of Dongguan Guanxiang industry in Dongguan is shown in Figure 1. The distribution of the industry tends to be in the secondary industry (42.5%) and tertiary industry (41.5%), and lacks attention to the root of Guanxiang industry - planting (16%). Moreover, there are only a few leading enterprises in Dongguan's guanxiang industry, such as "Shangzhengtang, Tang's and Huang Ou". Throughout the development mode of the advanced guanxiang industry, only a single point of development has been accomplished, and there is no standard industrial development guideline has been formed. Although there have been "Shangzhengtang, Tang's, Huang Ou" and other enterprises aiming at supply-side reform, but the industrial distribution in Dongguan is still not ideal.

Figure 1. Dongguan City Guanxiang industry distribution

### 3.2.2. Dongguan's Guanxiang industry is developing slowly

In comparison with other regions in China where guanxi (incense) is grown, the development rate of the guanxi industry in Dongguan is not satisfactory even though it is in the growth period. A comparison of the development of the guanxiang industry in each region from 2014-2019 is shown in Table 1. Based on the analysis of big data, Dongguan City guanxiang industry value-added in the past few years is about 10%, and the annual value-added from 2016 to 2020 is planned to reach 12%. In contrast, Zhongshan City and Yunnan Province, which are in a period of rapid development, are expected to reach an industry value-added of about 15%, and Hainan Province and Maoming City, which occupy a larger share of the market, have already left Dongguan City behind due to their large prior base, and their current annual output value has reached the level of billions of yuan.

**Table 1.** Comparison of the development of Guanxiang industry in different regions

Region	Dongguan	Zhongshan	Maoming	Xishuangbanna	Haikou
Growth rate of industrial value	9.60%	17.7%	14.8%	15.5%	14.0%

In addition, in terms of market demand and industrial technology development, the development of guanxi industry technology does not match the demand of the rapidly growing market. At present, although Dongguan guanxiang industry has been trying to expand the number of guanxiang planting and planting area as much as possible, the total amount of guanxiang tree planting can hardly maintain the development demand of local guanxiang industry in Guangzhou. In

order to break the shackles of Dongguan incense development, it is necessary to seek to borrow manpower to accomplish this, one is to develop artificial planting, and the other is to develop artificial incense-bearing technology.

#### **4. CONCLUSION**

This paper analyzes the typical town of Dongguan Guanxiang cultural industry and uses big data technology to analyze the problems in the development of Dongguan's incense cultural industry. Dongguan's Guanxiang industry has experienced two development histories, the first from the Tang Dynasty to the pre-reform and opening-up period, through the formation stage, growth stage, maturity stage, decline stage and extinction stage. The second time is from the reform and opening up to the present. Based on the analysis of big data, it is predicted that Dongguan Guanxiang industry is currently in the growth stage of the industry, and it is predicted that the industry will reach maturity in 2025. Dongguan Guanxiang industry has problems such as weak industrial competitiveness, unreasonable industrial structure, slow industrial development and unsatisfactory industrial efficiency. The reasons for these problems are mainly due to the mismatch between government policy support and the industrial cycle of Guanxiang, insufficient preliminary planning of Guanxiang industry, low aggregation of Guanxiang industry-related enterprises, and unclear profit model of Guanxiang industry for incense farmers.

In order to solve the problems of Guanxiang industry development in Dongguan, it is necessary for the government to take the lead, clarify the positioning of the industry life cycle, give full play to the government's standardized guidance, formulate a comprehensive plan for the development of Guanxiang industry, optimize the industrial layout, create leading enterprises, vigorously explore the profit model of Guanxiang industry, and finally realize the development of Guanxiang industry in a diversified way with the integration of three industries.

#### **5. FUNDING**

(1) This research was supported by philosophy and social science planning of Dongguan in 2021 (2021CG52).

# Reform of diversified art design professional teaching mode based on big data cloud platform

---

**Chuan Xue\***

Yiwu Industrial & commercial College. Yiwu (China).

E-mail: [X15868921878@126.com](mailto:X15868921878@126.com)

---

## **ABSTRACT**

In order to understand the reform direction of diversified art design professional teaching mode, this paper starts from the big data cloud platform and analyzes the different functions of big data and cloud platform. At the same time, it analyzes the diversification of art design and gives the reform direction of the teaching mode of diversified art design majors, namely the comprehensive teaching mode. Based on this model to analyze the teaching organization form and teaching objectives with the big data cloud platform. From the viewpoint of teaching objectives, cultivating students' ability to complete design is the ultimate goal of comprehensive teaching, accounting for 17.47%. In addition, the hands-on practical ability accounts for 15.49% and the communication and expression ability accounts for 12.78%. Thus, when teaching diversified art and design majors, the main goal should be to cultivate students' comprehensive ability.

## **KEYWORDS**

Big Data; Cloud Platform; Diversification; Artistic Design

## **1. INTRODUCTION**

Since entering the 21st century, the development of art and design has opened a new chapter. With the accelerated pace of social development such as knowledge economy, information society, green revolution, creative industry, "picture-reading era" and low-carbon life, it has prompted the upgrading of design ideas and design methods in

the overall cultural form [1-2]. Art and design are constantly adapting to become a driving force in society [3]. Art and design majors also continue to explore the reform direction of teaching mode in the advancement, so as to better meet the demand for design talents in the diversified development of society [4-5].

The reform of the teaching and learning model for diverse art and design courses is a research direction for many scholars. The literature [6] investigates the ways in which drawing is taught and assessed in UK schools with a particular focus on A level art and design courses. Its historical survey of the development of syllabuses and assessment methods traces how the role of drawing has changed in the curriculum over the last sixty years. Using the methodological tools of visual design grammar, the paper [7] develops a pedagogical proposal based on the Art Thinking Project at Harvard University and proposes a new type of approach to teaching artworks in the Socratic era. The literature [8] reveals the mechanisms of formation of professional competences and artistic values of students of architectural art. It argues that modern interactive teaching is of great interest, which requires teachers to provide quality education, especially in the area of creative disciplines. The literature [9] considers the limitations of traditional methods of education and teaching in the training of professionals, and proposes innovative new media interactive teaching concepts and models. It analyzes the current situation and problems of using new media environment education in college teaching and proposes the innovation of new media interactive teaching concepts and models in the process of practice.

This paper first briefly analyzes big data and describes its characteristics, illustrating the various data mining means and deep learning techniques involved in big data analysis techniques. Secondly, by decomposing the architecture of the cloud platform, it explains the specific functions that constitute each part of the cloud platform. Then, the factors affecting the diversified development of art design are introduced, and the teaching mode of art design majors is analyzed according to the influencing factors, while the reform of the teaching mode of art design is proposed with the integrated teaching mode. Finally, the teaching organization form and teaching objectives

are analyzed for the integrated teaching mode of art design majors, so as to illustrate the feasibility of the integrated teaching mode.

## **2. Big Data Cloud Platform Technology**

### **2.1. Big Data**

Big data is characterized by its wide range, fast dissemination and large capacity, which is an inevitable product of the extremely rapid development of modern network technology. Large capacity refers to the fact that Big Data is generally a data collection of data volume level, which is higher than several exponential levels compared with other data collections, and the data inside is cumbersome and complex, unlike the general data collection of a single type. Diversity refers to the variety of information in the data collection, and the variety of data formats, such as images, text, sound, etc. Speed refers to the fact that the technology of Big Data is growing particularly fast and developing rapidly. This requires that the processing of big data should also be as fast as possible, otherwise it will result in data accumulation. The value of big data is characterized by its own huge data contains certain laws and value trends, and this characteristic is also the driving force that motivates us to study big data.

### **2.2. Architecture Analysis of Big Data Cloud Platform**

From the perspective of user experience, the overall system architecture of the data visualization project is designed by combining visualization technology and web technology. The data visualization project is divided into the following parts: application layer, user authentication layer, business layer, data layer, and physical layer.

The application layer is responsible for presenting all the functions of the data visualization project to the users. The data visualization project adopts a B/S structure, where the browser receives user input and requests a response from the server.

The user authentication layer is responsible for providing users with authentication. The data visualization project is divided into several modules according to the functions, and users can access between all modules by logging into one module.

The business layer is the core module of the data visualization project, which involves several functions such as canvas editing, record management, and project deployment.

The data layer is used to store the relevant resources used by users in the visualization project and to do data persistence for these resources.

The physical layer is used to provide the underlying hardware support, including the relevant network resources, storage resources, etc.

### **3. Analysis of the teaching mode of diversified art and design majors**

#### **3.1. Factors affecting the development of art and design diversity**

##### **3.1.1. Diversity in the field of modern design**

Art design in the information age has been subdivided into various fields, in addition to the most common clothing, interior, architecture, garden, advertising, industry, packaging, etc., there are also some new design fields such as the comprehensive design of corporate culture system. Some modern large-scale designs focus more on group cooperation and the synthesis of various design fields to obtain a broader design idea to achieve better design results.

##### **3.1.2. Diversification of design elements**

The development of the whole design is in the direction of diversification, in addition to the overall development of diversification, in the design of specific materials, technology, shape, color, function, concept and style are in a diversified development.

Designers' grasp of materials, selection and preferences are different. The development of science and technology has brought more new materials, and different materials have different expressive power. When modern designers create designs, they have more choices in materials due to the diversity of materials, and they can be more open to their own design thinking, and more creative and individual designs can be finally implemented, which is complementary to the development of design diversity.

### **3.2. Analysis of the teaching mode of diversified art and design majors**

In the atmosphere of the market economy, if a designer is bent on catering to the market and the technical conditions of production, it is easy to lose his own unique design concept, which is not conducive to the development of design. Design is for people's lives, but also the expression of the designer's own ideas, as a designer should keep a clear head, in addition to design for people's lives, but also to maintain the artistry of design.

#### **3.2.1. Thinking about the teaching mode of art and design majors**

Compared with traditional single-subject instructional design, integrated instructional design not only includes the first two items, but also promotes analysis and integration skills through multidisciplinary perspective analysis and interdisciplinary integration, so that students can conduct integrated interdisciplinary research and practice more effectively.

The process of integration-oriented instructional design refers to the integration of students' knowledge from multiple disciplines based on the professional practice of design disciplines under the guidance of teachers. Through the interaction between different disciplines, students are able to deepen their study of the subject matter by applying basic principles, design ideas, methods and tools from other disciplines, reflecting an integrated interdisciplinary understanding.

#### **3.2.2. Analysis of the organization form of the teaching mode of art design majors**

In terms of micro-level instructional organization, it includes three basic forms of instructional organization: synchronous learning, group learning, and individual learning. In comprehensive design education, based on different types of courses and teaching objectives, different teaching objects, research and practice projects, a variety of teaching organization forms are flexibly adopted. Based on the big data cloud platform to investigate and analyze the art design students, so as to clarify the organization form of art design professional teaching mode, the results are shown in Figure 1.

In terms of students' opinions on the organization of diversified art and design teaching modes, 41.26% of students prefer the organization of individual learning. This is because individual learning is embodied in the whole process of integrated teaching and learning activities, which is an interdisciplinary learning based on students' comprehensive analysis and judgment of problems and for solving them, which is conducive to cultivating students' interdisciplinary thinking and deep thinking. Group learning came in second with 25.32%. In addition to individual learning, some students also prefer to study art and design in groups because it not only gives full play to students' autonomy and initiative in learning, but also develops students' ability to communicate and coordinate, analyze and synthesize, and express and elaborate.

Figure 1. Analysis of the organization of the teaching model

### 3.3. Analysis of the training objectives of the integrated teaching model

In order to better stimulate students' creative thinking, this paper proposes an integrated teaching model based on both themes and problems. Through the integrated teaching model for diversified art and design majors, we focus on cultivating several core competencies of students. Student learning data is collected and analyzed through the big data cloud platform, and its analysis results are shown in Figure 2.

By analyzing the data from the big data cloud platform and teaching diversified art and design majors in an integrated teaching mode, we

can effectively integrate course teaching and team writing. In this way, students can be equipped with eight core competencies, such as cognitive ambiguity, ability to learn from others, ability to synthesize information, ability to experiment quickly, ability to think systematically, ability to construct methods, ability to practice with hands, ability to communicate and express, and ability to complete design. Among them, developing students' ability to complete design is the ultimate goal of integrated teaching, accounting for 17.47%, followed by hands-on practice ability, accounting for 15.49%, and the third is communication and expression ability, accounting for 12.78%. The integrated teaching mode can effectively help students to carry out art design and better exercise their practical art design skills. Students can improve their communication and expression skills through group learning and teamwork, and then they can effectively express their own opinions or actively present their design solutions.

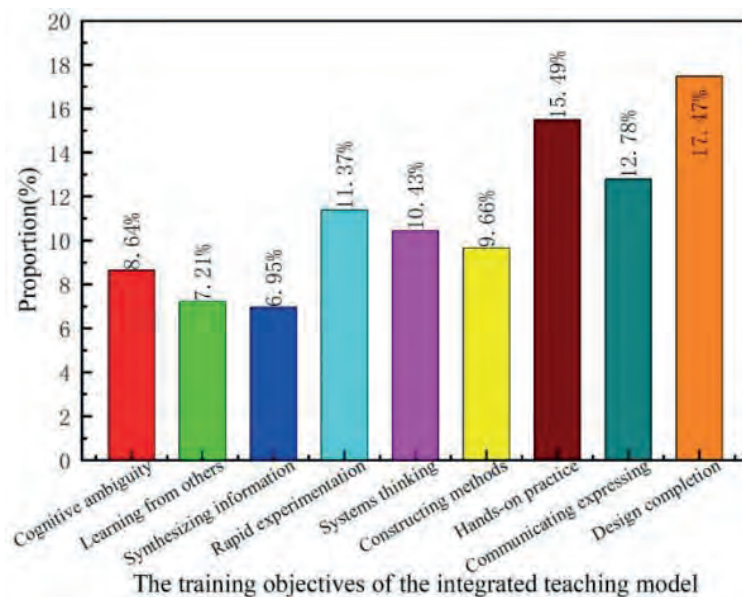

Figure 2. Analysis of integrated teaching models

#### 4. CONCLUSION

In this paper, the teaching mode of diversified art design majors is analyzed and studied under the technology of big data cloud platform. From diversified art design to the comprehensive teaching mode of art design majors, the data analysis of the organization form and teaching objectives of this teaching mode was conducted with the big data cloud platform, and the results of its analysis are as follows:

(1) As for the organization form of the integrated teaching mode, 41.26% of students prefer the organization form of individual learning because it is conducive to cultivating students' interdisciplinary thinking and deep thinking.

(2) In terms of the teaching objectives, the core competencies such as cognitive ambiguity, ability to learn from others, ability to synthesize information, ability to experiment quickly, ability to think systematically, ability to construct methods, ability to practice, ability to communicate and express, and ability to complete design can be achieved.

## ABSTRACT

The rise of big data is of great significance to the preservation and transmission of traditional minority literary arts. This paper examines the role played by big data technology in the inheritance and development of traditional minority literary arts, and analyzes the big data of Tatar theater art works and audience viewing experience on the Internet platform. From 2006 to 2020, the number of Tatar theater art works added on average about 41 new works per year, and the percentage of viewers who expressed interest also increased year by year. Big data technology can help Tatar theater art get out of the dissemination dilemma and burst into new vitality.

## KEYWORDS

Big Data; Tatar Theatre Art; Number of works; Audience Attitude

## 1. INTRODUCTION

Xinjiang, known as the "homeland of songs and dances", has a theatrical art as glorious as that of songs and dances. According to the records of Chinese historical books, as well as a large number of local cultural relics and archaeological research in Xinjiang, the Tatar drama art has a long history and a long history [1-2]. It is easy to see from the Guzi Grottoes murals the progressive scenes of theatrical performances, the male and female musicians playing various instruments, the dramatic figures with different shapes and forms, the artists wearing various ornaments and masks, and the men, women

and children watching the performances. This shows that since ancient times, the art-loving Tatar forefathers made the art of singing and dancing into the hall [3-4]. Wherever the Tatar people live, there must be singing and dancing art, and wherever there is singing and dancing art, there must be theater art as well. The Tatar people were not only intoxicated by singing, dancing, and maixilev, but also theater was an important part of their social and cultural life, as evidenced by many historical documents and excavated cultural relics [5].

In the new century, people pay more and more attention to the culture and art of ethnic minorities. Wei et al. took Fishing City as an example to study the development dilemma of traditional drama of ethnic minorities in the present time and put forward the basic ideas of innovation in terms of ideology, spectacle and artistry [6]. Sun et al. argued that traditional ethnic minority motifs contain the minority's love for beauty, happiness, and the pursuit of a better life, and have a strong national flavor and manifest their aesthetic concepts. They tried to apply traditional ethnic patterns to visual communication design and designed works that meet the cultural and psychological structure of the public [7]. Gand et al. found that the traditional patterns of ethnic minorities in Gansu Province are ethnic arts with strong ethnic characteristics and used the Surf feature point recognition algorithm to extract feature points of ethnic patterns based on the feature point extractor in OpenCV [8]. Based on previous studies, this paper studies the role of big data technology in the inheritance and development of minority theater arts from three aspects: data processing, big data dissemination patterns and precise analysis, especially the origin and development of the Tatar minority theater arts in Xinjiang, and analyzes the changes in the dissemination of Tatar theater arts on the Internet platform from 2006 to 2020 with the help of big data technology, the and the attitude change of the viewing audience.

## **2. Big Data and the Preservation and Transmission of Traditional Ethnic Minority Literary Resources**

"Big Data" is the sum of data resources generated in the process of informatization, with the characteristics of large volume, miscellaneous types, fast speed and low value density. Among them,

mixed types and low value density are the biggest differences between Big Data and traditional data, which means that Big Data originates from multiple data sources and is a kind of comprehensive data, including not only traditional structured data, but also semi-structured and unstructured data such as audio, video, web pages and text. Therefore, Big Data can show multifaceted information connotation, which can make people notice the multifaceted correlation of different things, discover new knowledge and create new value. Due to the above-mentioned characteristics of big data, it is of great significance for the preservation of traditional minority literature.

## **2.1. Data processing**

Data mainly consists of structured data, semi-structured data and unstructured data. Traditional databases are mainly for structured data collection, storage and correlation analysis. The most common database query language is structured query language, which shows the neat arrangement of data. With the popularity of the Internet, semi-structured data and unstructured data in the form of text, audio, video and images have sprung up, accounting for about 85% of the global network data volume, among which unstructured data introducing ethnic traditional literature and arts are also increasing in large quantities. The number of websites and web pages dedicated to the history, customs, music, songs and dances of ethnic minorities in China is increasing. For example, "China Tibetan Netcom", which introduces traditional Tibetan culture, supports dynamic video on demand and online distribution of video files in Chinese, Tibetan and English. There are more than 100 websites introducing Mongolian culture and tradition, such as "Mongolian Culture" and "Grassland Eagle". The websites showcasing traditional Uyghur culture include "Avanti", "Nafu" and others. Comprehensive websites introducing the traditional literature and arts of southwestern minority groups include "Qian southeast ethnic culture network" and "Yunnan minority network". These websites are published every day.

Since the traditional data retrieval and analysis technologies mainly focus on structured data, they cannot handle complicated unstructured or semi-structured data, making the use of these massive data resources on the Internet greatly restricted. Now,

Hadoop, an open source distributed processing technology that can run on general-purpose servers, has been created to process large-scale unstructured data quickly and obtain a general outline and developmental context. This technology can help people grasp the current situation of something, social repercussions and future trends in a short period of time.

## **2.2. Big data communication model**

According to the "Integration of Chinese Folk Dances" (Yunnan Volume), there are about 6,718 types of traditional folk dance routines in Yunnan, and only the "playing song" of the Yi ethnic group has nearly 30 to 40 types of dance routines, which are difficult to record and pass down in written pictures. For the literary heritage of non-written ethnic groups, this mode of protection is even less applicable. For example, the traditional folk song "Zaendal" of the Daur ethnic group has no lyrics and is sung with insubstantial words, but the emotions in the song can be expressed by the singer. With the emergence of digital recording methods such as audio and video, the carrier of literary resources is transferred from people to new media such as databases, which can prevent the phenomenon of "people dying and art dying" and help protect a large number of unwritten ethnic literary resources. Yunnan University and the Yunnan Provincial Electronic Computing Center have taken the lead in a demonstration study on the preservation and transmission of minority cultural heritage through the use of interactive multimedia software for cultural presentation and interpretation, relying on the Dongba cultural data, to recreate the extinct Naxi "rituals". For the general public, although we can rarely hear those ancient folk songs in our daily lives, we can learn them through modern media and through the Internet.

## **2.3. Big data precision analysis**

Since a large amount of user identity information and broadcast behavior information is recorded in the background, online video platforms have built big data analysis websites for both online video and keyword search. These sites currently provide video big data analysis with a maximum period of 5 years, including daily, weekly, monthly, and annual search index and broadcast index of a certain video program, broadcast devices, broadcast sites, episode analysis, user broadcast behavior, and core user characteristics. Through the

analysis of these unstructured data, researchers can grasp the social demand for a certain minority traditional culture and promote its industrialization process. At the same time, to better understand the audience's attitude and preference, to make precise judgment on the audience of a certain minority traditional literature and art video, and to carry out targeted cultural promotion and marketing. Through the analysis of viewer comment data, the shortcomings of traditional minority culture and arts in terms of performance and dissemination forms can be identified and improved, thus enhancing its appeal to the audience. In addition, the analysis of the site's search index and broadcast index can also promptly identify the trend of marginalization of certain traditional minority cultures and arts, and then rescue and support them to enhance their vitality.

### **3. The development and inheritance of Tatar drama art**

#### **3.1. The Origin and Development of Tatar Theatre Art**

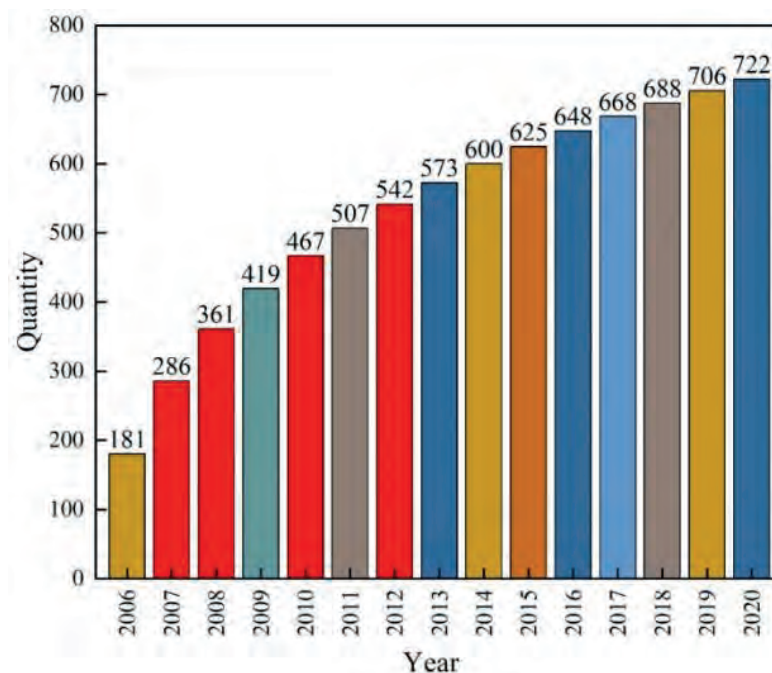

Historically, Persian and Indian primitive drama was imported into the West one after another with the religions of Central and West Asia as cultural carriers. In recent years, a large number of Zoroastrian, Nestorian, and Manichean sermon texts have been excavated in Xi'an, Dunhuang, and Turpan. Dunhuang Buddhist drama and Persian primitive drama had a gradual process of being recognized in the 20th century. The book "Blessed Wisdom" compiled by the famous falcon poet Yusuf Hass Hajiff of the Western Kara Khan Dynasty between 1069 and 1070 is considered by many scholars in China and abroad to be an exhortatory poetic drama.

The most popular folk drama derived from ancient games and entertainment gradually developed into mini-drama, from fragment to whole, and from one-act to multi-act, and then became a fully-fledged drama in the real sense. Arif-Senem is a long classical oriental poem with different plots widely circulated among the Tatar, Uzbek and Tajik tribes of Xinjiang and Central Asia. This folklore was widely spread around the Caucasus in the middle of the 19th century, and the great Russian poet Lermontov composed a long poem "Arif the Lover" based on this legend when he was in exile there, but "Arif-Senem" was widely spread among the Tatar folklore in the 15th and 16th centuries. According to scholars' research, "Arif-Sainaim" was composed in Tatar folklore after the Islamization of Tatar. During the

evolution of legends, songs and long poems, it was repeatedly refined and adapted by folk artists, and was intertwined with the spiritual life of the people, and its dramatic characteristics became increasingly distinctive and socially influential. In the 16th century, "Arif-Senem" became a regular play of the court troupe of Yarkand Khanate.

### 3.2. Big data-based results and analysis

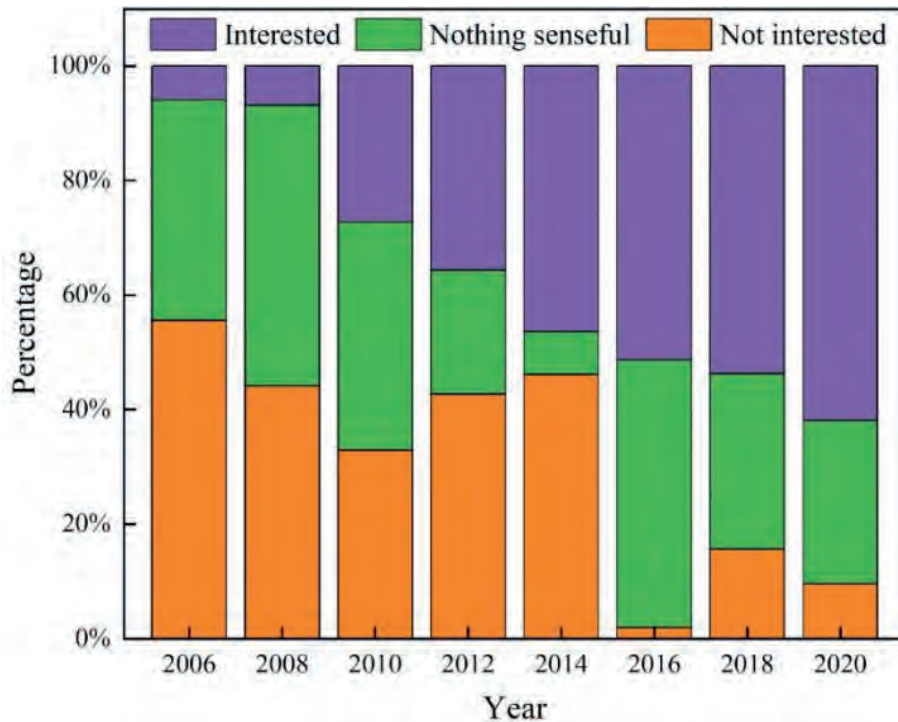

Using big data technology to mine and analyze the development of the Tatar minority theater art in Xinjiang in recent years, the growth of the number of works related to Tatar theater art from 2006 to 2020 is shown in Figure 1. From 2006 to 2020, the number of works related to Tatar theater art grew from 181 to 722, with an average increase of about 41 works per year. It can be seen that with the increase of national attention to minority arts, Tatar drama art is getting more and more attention and recognition from creators, and more creators will take the initiative to find and explore Tatar drama culture and its extension.

**Figure 1.** The number of works related to the Tatar theatre arts has increased

By analyzing the big data of the audience's attitude towards watching Tatar drama art, the attitude change of Tatar drama art audience is shown in Figure 2. Overall, in 2006, 55.58% of the audience were not interested in Tatar drama art at all, 38.48% of the audience had indifferent attitude, and only 5.94% of the audience expressed

interest. And in 2020, the audience's attitude toward Tatar theater art has changed, with only 9.59% of those who are not interested at all, 28.51% of those who do not care, and 61.90% of those who express interest, which is more than half of the audience. It can be seen that in the past ten years or so, with the help of Internet platform and technologies such as big data, Tatar theater art has been more widely disseminated and has a wider audience base.

**Figure 2.** Changes in attitudes of the audience of the Tatar theatre arts

#### 4. CONCLUSION

This paper studies the origin and development of the Tatar theater art of Xinjiang minority in the context of big data, and the changes in the number of Tatar theater art works and the change of audience's attitude in the new era with the help of big data technology. The inheritance and development of Tatar theater art under the background of big data can be started from the following aspects.

- (1) Technically, Tatar theater art should strengthen data resourcefulness and cooperation with digital media.
- (2) In terms of methods, Tatar drama art should break through the traditional mode of literary inheritance.

(3) In terms of social benefits, organizations at all levels should back big data to provide precise support for Tatar drama art and give appropriate support to individuals and groups who create.

(4) On the process, the ways of public participation in the inheritance and protection of traditional minority literature and arts should be actively broadened.

(5) At the academic level, the academic community should expand the depth and breadth of research on traditional minority literary arts.

## ABSTRACT

This paper analyzes the training methods and strategies of piano fingering, and proposes a piano fingering feature analysis algorithm based on the judgment Hidden Markov Model in piano fingering. Combining the a priori knowledge of fingering rules, two judgment functions are first introduced in the judgment HMM, which effectively overcomes the drawback that the traditional HMM cannot combine the note key sequence information, and removes the wrong through-span fingering and the fingering beyond the playable span. Through the algorithm analysis, the number of combinations of four-note chords and five-note chords accounted for 86.7% of the total number of combinations. In the output probability parameter matrix consisting of single notes and two- and three-finger chords, two- and three-finger chords accounted for 96.1%. There are various fingerings for piano, and players can choose the fingerings that are suitable for them scientifically and reasonably according to their own finger characteristics, which can help improve their playing level.

## KEYWORDS

Cryptomarkov; Piano Fingering; Feature Extraction; Note key sequence

## 1. INTRODUCTION

Fingering is the most important part of the piano learning process, as it directly affects the progress of piano learning [1-2]. Piano fingering,

in general, is how a player uses his fingers to move on the piano keyboard and strike the keys to produce each note of a piece of music, thus forming a musical sound [3-4]. The most important aspect of fingering is how to use the right fingers in the right place on the keyboard to play the right keys for each note of a melody, which is the key to piano performance [5].

In [6], a feature matching method based on "dynamic closed-value adjustment" is proposed, and a feature matching strategy using both pitch and pitch length as musical features is proposed, with rough selection first and then fine selection later. In [7], pitch and rhythm are used as matching musical features, and a linear alignment matching method is proposed to approximate melody matching. The literature [8] proposed a music feature recognition method based on Blockboard structure, which can realize music recognition from the perspective of human auditory discrimination mechanism. The contour line algorithm proposed in the literature [9] is widely used, and this method only takes the highest pitch note part when processing music to achieve the extraction of the main melody with a high pitch melody line. However, it failed to pay attention to the duration of the notes, but only took the highest notes.

For piano fingering feature extraction, a Hidden Markov based extraction method is proposed in this paper. The method parses the note feature matrix, screens the piano track blocks and separates them to extract the note key sequences separately. The track-separated key features take into account the specific key information corresponding to the fingers in the actual piano playing process, as well as different hands corresponding to different voices and tracks, which is beneficial to the establishment of fingering generation models.

## **2. Fingering of the piano**

The scientific method of piano playing requires not only the correct sitting of the body, but also the sensitive and reasonable use of the fingers, and the science of law enforcement plays an important role in the performance of the piano. Therefore, in the process of piano playing, the correct fingering should be chosen in a reasonable and scientific way, which will greatly improve the performance effect and technique. Choosing the correct fingering will improve the efficiency

and effectiveness of the performance, and it will help to interpret the music in a more concrete way, which will help to understand the work correctly, and it will also help to combine one's strengths with one's own characteristics in the process of playing, and to form one's own style and technique. The use of the fingers and piano playing is a part of the whole process of piano playing, which requires a high degree of cooperation and perfect unity between the fingers and the piano keys. In the process of playing the piano one should choose the fingering according to the style of each work, which will help to understand the content of the work. In piano performance fingering training, the use of fingering must be mastered, accurate and rapid, taking the movement of the fingers as a prerequisite, using the fingers to dominate all parts of the body, unifying their memory, thinking and cognitive abilities effectively, unifying all the senses of the body into a whole, gradually accumulating playing experience and fingering in the long-term practice of piano performance. In the long practice of piano playing, we gradually accumulate experience in playing and fingering, which provides a good reference for the performance of the piano and the expression of the content of the work.

## **2.1. The importance of fingering in piano training**

In the process of piano playing, the use of each finger is related to the expression of the content of the score and the unity of the score as a whole. Playing the role of each finger well has an important role in promoting the expression of the score. In piano fingering practice, a reasonable and correct fingering is the organic coordination of each rhythm and note. Fingering practice in piano training is an important step in piano teaching and a fundamental step in piano teaching. A scientific and reasonable choice of piano training fingering helps the player to master the music better and to understand the music better, which is essential to improve the efficiency and smoothness of the performance.

## **2.2. Piano fingering training methods and strategies**

### **2.2.1. Make the most of your fingers and strengthen your training**

Fingers are irreplaceable in piano playing. Therefore, in piano performance training, it is important to pay attention to the effective use of finger strength and playing speed for the piano sound, which is important for the overall effect of the music. The length of the fingers

also has an impact on the strength of the piano playing. According to the characteristics of the fingers themselves, the length of the thumb is very different from the other fingers, and the strength and direction it holds is also very different. Therefore, it is difficult to harmonize the strength of the thumb with the other fingers in the playing process. The index finger is considered to be the most inert finger, so it is difficult to coordinate the repetition of movements, but it has its own advantages in terms of speed, which cannot be replaced by other fingers. The middle finger is the longest of the fingers and it has a good control of the tone of the piano playing and its role in controlling the keyboard. The ring finger, on the other hand, lacks independence and has no unique personality of its own, so it is important to strengthen the training of the ring finger in piano training. The little finger, although not dominant among several other fingers, is the most powerful support in the octave of piano playing and is the main force of the octave playing. In the piano training process, it is necessary to make full use of the characteristics of each finger itself, to conduct targeted training for their own fingers, to strengthen training for the fingers that play weaker, and to develop corresponding training methods and techniques according to the characteristics of different fingers.

### **2.2.2. Reasonable distribution of various fingerings**

In the process of creating a score, musicians and composers of scores make the score according to certain playing rules and methods, so in piano performance training, special attention should be paid to the reasonable matching and use of fingerings. There are certain rules between the notes and phrases in the score, so it is necessary to allocate and use the ten fingers in a reasonable way. In the piano training process, the player must be clear about the characteristics and connotations of the music played, and use different fingerings according to the content of the piano score. In the process of playing, the player must be flexible in the use of various fingerings and use the fingerings that are suitable for him or her according to his or her own characteristics. When playing a score, you should be clear about the content and emotional characteristics of the work, train strictly according to the fingering specified in the score, and make reasonable adjustments to the actual situation where appropriate.

### 3. Piano fingering analysis based on artificial intelligence technology

#### 3.1. Judgment Hidden Markov Model

Based on the existing first-order HMM and the relevant prior knowledge of fingering, this paper proposes an improved judgment HMM, detailed as follows in the first-order HMM. Let the input note sequence be  $o_1, o_2, \dots, o_{N-1}, o_N \in O$  and the corresponding fingering sequence be  $s_1, s_2, \dots, s_{N-1}, s_N \in S$ . The prediction objective is to maximize the conditional probability of the fingering sequence given the note sequence.

$$s_1, \dots, s_N = \arg \max_{s \in S} P(s_1, \dots, s_N | o_1, \dots, o_N) = \arg \max_{s \in S} \frac{P(s_1, \dots, s_N, o_1, \dots, o_N)}{P(o_1, \dots, o_N)} \quad (1)$$

From the chi-square Markov assumption and the observation independence assumption of the first-order HMM, it follows that:

$$P(s_1, \dots, s_N, o_1, \dots, o_N) = \prod_{t=2}^N P(s_t | s_{t-1}) P(o_t | s_t) \quad (2)$$

#### 3.2. Predicting the optimal fingering sequence

When the interval distance between  $t-1$  and  $t$  (here all refer to the single note interval) exceeds the maximum interfingering range  $\varepsilon$  of 1.5, the fingering at the moment of  $t$  cannot be transferred to any fingering state in the natural hand position to achieve the note transition, and the fingering correlation is interrupted at the moment of  $t$ . The judgement transfer probability can be expressed as:

$$\prod_{t=2}^N P(s_t | s_{t-1}, |o_t - o_{t-1}| > \varepsilon) = 0 \quad (3)$$

At this point the fingering path is searched for the entire sequence of notes. It will result in:

$$\prod_{t=2}^N P(s_t | s_{t-1}, o_t, o_{t-1}) \cdot P(o_t | s_t) = 0 \quad (4)$$

Therefore, in the set  $U = \{I_1^*, I_2^*, I_3^*, I_4^*, \dots, I_a^*\}$  of the maximum probability paths ending in different states obtained using local information, the penetration index  $l$  in path  $I_j^* = s_1, \dots, s_{\tau-1}, s_\tau$  under the corresponding note sequence  $O = o_1, \dots, o_{\tau-1}, o_\tau$  is calculated, and the path with the smallest  $l$  is selected as the optimal path with the highest performance efficiency  $l$  is calculated as

$$l(I_j^*, O) = \begin{cases} \sum_{t=2}^{\tau} -\frac{1}{2} (\text{sgn}[o_t - o_{o-1}(s_t - s_{t-1})] + 1) & \text{Right Hand} \\ \sum_{t=2}^{\tau} \frac{1}{2} (\text{sgn}[o_t - o_{o-1}(s_t - s_{t-1})] + 1) & \text{Left Hand} \end{cases} \quad (5)$$

Then the optimal path  $I_{all}^* = \arg \min_{1 \leq j \leq a} (I_j^*, Q)$ , the optimal path of all small segments are stitched together to get the optimal fingering sequence of a note sequence.

### 3.3. Characteristics of Fingerprint Data

The number of combinations of 88 notes output is very large, and the parameters in the output probability matrix will reach 64881, of which the number of combinations of four-note chords and five-note chords accounts for 86.7%. The number of notes and fingering in the data set is extremely low, approximately 0. Therefore, the output probability matrix is reduced to 15347 by deleting the four-note and five-note chord notes and fingering in the output probability matrix and the transfer probability matrix, and the conditional state transfer matrix is 764. In the output probability parameter matrix composed of single notes and two- and three-finger chords, the two- and three-finger chords account for 96.1%. The right-hand fingering frequencies are shown in Figure 1. In the self-built dataset, the multi-finger chords are very low-frequency and many positions have a frequency of 0. The reason is that the model effect is more concerned with the monophonic sequence of scores that require more finger transitions, so there is not much chord coverage in the training set, and more datasets with chords need to be added subsequently. Theoretically, the output matrix is spread over all notes. The right hand note frequencies are shown in Figure 2. The range of note Midi numbers (21-108) covered by the right hand is mainly concentrated in the right

half of the region, and the left hand is concentrated in the left half of the region, with very few appearing in the other half of the region. Therefore the output probability matrix of the left- and right-handed model to be trained parameters is again reduced by half.

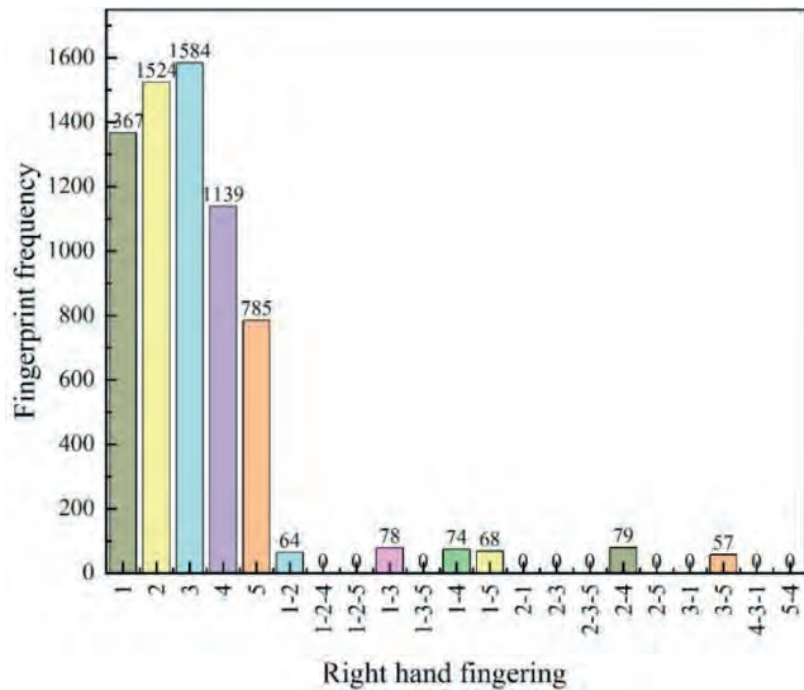

Figure 1. Right hand fingering frequency distribution

Figure 2. Frequency distribution of right-hand notes

## 4. CONCLUSION

Piano performance and finger usage are throughout the whole process of piano performance, which requires a high degree of cooperation and perfect unity between fingers and piano keys. The fingering characteristics of the piano were analyzed by predicting the optimal fingering sequence based on the verdict hidden Markov model in this paper. The number of combinations of four-note chords and five-note chords accounted for 86.7% of the total number of combinations. In the output probability parameter matrix consisting of single notes and two- and three-finger chords, the two- and three-finger chords accounted for 96.1% of the output probability.

The output probability matrix of the left and right hand models to be trained parameters was reduced by half.

The ability of fingers includes the flexibility, sensitivity and strength of fingers, which is the basic ability of finger training. It requires the player to use each ability of fingers flexibly and strengthen these aspects in piano training and adapt to the playing skills and fingerings in order to have good results in piano playing.

### ABSTRACT

With the increase of national attention to the field of preschool education, the society's requirements for preschool education talents are getting higher and higher. This paper firstly analyzes the multimedia technology ability that kindergarten teachers must master in the current situation from the actual demand of applying multimedia technology ability in the daily work of kindergarten teachers, and optimizes the cultivation path of preschool education professionals. The evaluation indexes are constructed according to the training objectives of preschool education talents, and the data are collected through survey and analysis. After analyzing the data, we found that the scores for the three indicators of "attitude and behavior toward children", "attitude and behavior toward child care and education", and "personal development and behavior" ranged from 4.45 to 4.5. The scores for these three indicators ranged from 4.45 to 4.57, indicating that the early childhood teachers rated their own professional ethics as high. This study should not only focus on the teaching mode and teaching methods, but also on the professionalism and professional ability of preschool educators, so as to further optimize the cultivation path of preschool education talents.

### KEYWORDS

Multimedia; Preschool Education; Cultivation Path; Evaluation Indicators

## 1. INTRODUCTION

In recent years, people's quality of life has been significantly improved, and many parents pay high attention to their children's education. Preschool education, as a basic educational link, is related to the cultivation of learning habits of young children [1-2]. Looking at the current mode of cultivating talents in preschool education, early childhood knowledge education is the focus of its education and teaching, but there is a deficiency in cultivating other abilities of students, which makes the comprehensive quality of preschool education talents unsatisfactory [3-4]. As the main site for cultivating preschool education professionals, colleges and universities should promote the further optimization and improvement of the personnel cultivation mode of preschool education professionals to effectively enhance the comprehensive ability of students [5-6].

The literature [7] analyzed the current situation and trends of internationalized talents cultivation of preschool education majors at home and abroad, and on this basis explored the feasible paths to improve the quality of internationalized talents cultivation of preschool education majors in colleges and universities from three dimensions: the connotation of goal interpretation, optimization of process system and improvement of evaluation mechanism. The literature [8] adopts practical strategies to achieve the precision of talent cultivation objectives, scientific and rationalization of curriculum setting, diversification of teaching methods and diversification of evaluation system, in order to optimize the undergraduate talent cultivation mode of preschool education majors to cultivate talents who can adapt to the new era.

This paper firstly combines multimedia technology, the concept of talent training program, key elements and the own characteristics of applied bachelor's degree, and determines the research content mainly for the theoretical exploration of four aspects: talent training objectives, talent training planning, curriculum structure exploration and practical link arrangement of applied undergraduate preschool education majors. Then, on the premise of determining the cultivation objectives, the competencies that applied preschool education talents need to achieve are decomposed, which is the concretization of the talent cultivation objectives. Finally, the evaluation index system is

formulated according to the training plan of applied preschool education talents, and the evaluation analysis of preschool education talents is carried out from three aspects: professional philosophy and teacher morality, professional knowledge and professional ability.

## **2. Multimedia measures to promote the optimization of talent cultivation mode of preschool education majors in colleges and universities**

### **2.1. Restructuring the teaching format of preschool education**

With the development of early childhood education, how to promote the all-round development of young children has become the focus of education. In preschool education majors in colleges and universities, teachers in charge of classes should focus on cultivating students' teaching ability and adjusting and innovating their teaching methods. By adopting various teaching methods, such as group cooperation methods and role plays, students are guided to analyze and think about problems based on the perspective of young children, so that they can further understand the psychological state and inner needs of young children and lay the foundation for improving their teaching ability. Young children are young, have relatively limited cognitive ability, and are curious about new things, so they often ask questions that are embarrassing or difficult for adults to answer. In the teaching of preschool education, teachers should make this clear to students and conduct situation simulations so that students can respond to different situations in order to enhance their resilience and solve various young children's problems flexibly and effectively, thus promoting the healthy physical and mental development of young children.

### **2.2. Stimulate interest in learning**

For early childhood teachers at this stage, the scientific and rational use of information technology during education and teaching can create a very high-quality learning atmosphere for early childhood students. For early childhood students, the main motivation for learning is interest, without which the whole educational activity will lose its own meaning. Therefore, early childhood teachers can make use of multimedia courseware to show the abstract knowledge in a more concrete way during the design and implementation of educational activities. For some of the content that needs to be

expressed in words, the early childhood teacher can rely on the projector or computer to express the images depicted in words more graphically. Overall, the use of multimedia technology in preschool education is very extensive, not only to promote the efficiency of preschool teaching activities, but also to further promote the effective development of all aspects of early childhood students' abilities. Early childhood teachers must pay more attention to the screening of educational information in multimedia technology during the actual use of multimedia technology.

### **2.3. Create an excellent game situation**

Multimedia technology is the best means to create teaching situations. When creating game situations, teachers should take into account students' understanding and acceptance ability to make the situations more relevant to students' actual situation. Especially in indoor learning, teachers should make the game context more colorful through audio, music, video and other resources. The core of the game context teaching mode is "teaching for fun", so that students can learn to cooperate and feel friendship in the game, and cultivate a good sense of rules and correct three views while participating in the game activities. For example, music games combined with dance can help strengthen students' sense of rhythm and increase their activity level to ensure their physical fitness. And number games can help students develop creative thinking, logical ability and so on, making students' thinking more active and deepening their understanding of numbers. In addition, attention should also be paid to setting up a reward system for students to increase their participation in the game by rewarding small gifts and giving small medals to help them master the relevant knowledge points in the game.

### **2.4. Build awareness of teacher-student interaction**

In multimedia teaching, teachers need to give students sufficient free discussion time, pay attention to and participate in students' discussions in a timely manner, observe each student's discussion status, and thus establish a good friendship relationship with students. In addition, teachers can also form an interactive response relationship with students in the classroom to avoid indoctrination. With the role of multimedia, teachers need to get rid of the traditional teaching concept and participate in classroom learning with students,

which not only increases the communication between teachers and students, but also enables teachers to learn about students' problems and learning situation in the communication. With the help of the Internet, teachers and students have more opportunities to communicate online anytime and anywhere, which quickly brings the distance between teachers and students closer.

### **3. Analysis of talent cultivation based on multimedia preschool education**

Table 1 shows the evaluation index system. This part was based on the Professional Standards (Trial), and the Early Childhood Teachers' Questionnaire and the Kindergarten Directors' Questionnaire were prepared. A total of 390 questionnaires were collected, excluding invalid questionnaires, and the remaining valid questionnaires were 385. The questions in both questionnaires corresponded to the secondary indicators in the Professional Standards (for Trial Implementation). The Early Childhood Teacher Questionnaire invited the early childhood teachers to choose the degree that matched their personal situation. The questionnaire was scored on a 5-point scale, ranging from "not at all" to "fully", with 15 points each. The higher the mean score of each dimension, the higher the level of professionalism of the teachers in that dimension. Question 2 was scored inversely to question 1. In the Kindergarten Director Questionnaire, the directors were asked to rate the importance of the professionalism of qualified kindergarten teachers on a scale from "very important" to "not important", with the higher the mean score of each dimension indicating the more important the professionalism of the kindergarten teachers in that dimension. The higher the mean score of each dimension, the more important the professionalism of the teachers in that dimension.

**Table 1.** Evaluation index system

Level I indicators	Secondary indicators	subject
Professional concept and ethics	Professional understanding and understanding	1-2 questions
	Attitude and behavior towards children	3-4 questions
	Attitudes and behaviors towards childcare and education	5-6 questions
	Personal accomplishment and behavior	7-8 questions
professional knowledge	Early childhood development knowledge	9-10 questions
	Knowledge of ECCE	11-12 questions
	General knowledge	13-14 Question
Professional competence	Ability to create and utilize environment	15-16 questions
	One day life organization and conservation capacity	17-18 Questions
	Ability to support and guide game activities	19-20 questions
	Ability to plan and implement educational activities	21-22 Questions
	Incentive and evaluation ability	23-24 Questions
	Communication and cooperation ability	25-26 questions
	Reflecting and developing ability	27-28 Questions

### 3.1. Analysis of early childhood teachers' professional philosophy and teacher moral situation

Figure 1 shows the professional philosophy and ethics of early childhood teachers. As can be seen from the teachers' evaluation of their own professional philosophy and teacher ethics, questions 1-2, which are related to the indicator of "professional understanding and awareness," scored "3.5" and "4.125" respectively, which are significantly lower than the other questions. "These scores are significantly lower than the scores of other questions. The lowest score for the question "I am willing to work in early childhood education for the rest of my life" indicates that the professional beliefs of early childhood teachers need to be improved. The scores for the questions "Attitudes and behaviors toward young children," "Attitudes and behaviors toward child care and education," and "Personal development and behaviors" ranged from 4.45 to 4.57. This indicates

that early childhood teachers have a high opinion of their own professional ethics.

Figure 1. Preschool teachers' professional ideas and ethics

### 3.2. Situation analysis of early childhood teachers' own expertise

Figure 2 shows the professional knowledge of early childhood teachers. The data show that in the evaluation of teachers' professional knowledge, questions 13-14, which correspond to the indicator "general knowledge", scored "3.5" and "4.125", respectively. "These scores are lower than the scores of other questions. The lowest score was given to the question "Often cannot answer questions about natural and social sciences asked by children", indicating that teachers' general knowledge needs to be further developed. The 10th question, which corresponds to the indicator "knowledge of early childhood development," scored 4.125, indicating a lack of knowledge in understanding issues that tend to arise in early childhood development. Other questions scored between 4.23 and 4.38, which is relatively low compared to the scores for professional philosophy and ethics in the previous section, suggesting that early childhood teachers believe their expertise needs to be strengthened.

Figure 2. Preschool teachers' professional knowledge

### 3.3. Analysis of professional competencies of early childhood teachers

Figure 3 shows the professional competencies of early childhood teachers. The data show that the best scores for questions 18 and 23 are "4.5", which correspond to the "ability to organize and care for the day" and "ability to motivate and evaluate" respectively. "This indicates that the teachers' abilities in these two areas are high. Questions 16, 19-20 had the lowest scores of 4.187, corresponding to "ability to create and use the environment", "ability to support and guide play activities", and "ability to reflect and develop". "This indicates that teachers' abilities in these areas are low and need further improvement. With the exception of questions 18 and 23, which corresponded to the indicators of "ability to organize and care for the day" and "ability to motivate and evaluate," the rest of the questions scored between "4.18 and 4.3," which is consistent with the above. The relatively low scores for professional knowledge indicate that teachers' recognition of their own abilities is low and needs to be further improved.

Figure 3. Professional competence of preschool teachers

#### 4. CONCLUSION

Based on the use of multimedia, this paper constructs the specification system for the cultivation of talents of preschool education majors in colleges and universities around the cultivation objectives, explains the principles and ideas of arranging practical aspects, and designs the cultivation program of preschool education majors in colleges and universities accordingly, and the following conclusions can be drawn.

(1) Regarding the evaluation of the teachers' professional philosophy and ethics, the scores of questions 1-2, which correspond to the index of "professional understanding and awareness", are "3.5" and "4.125" respectively. "These scores were significantly lower than the scores of other questions. The lowest score for the question "I am willing to work in early childhood education for the rest of my life" indicates that the professional beliefs of early childhood teachers need to be improved.

(2) Regarding teachers' evaluation of their professional knowledge, the scores for questions 13-14, which corresponded to the indicator of "general knowledge," were 3.5 and 4.125, respectively. "These scores are lower than the scores of other questions. The lowest score was given to the question "I often cannot answer questions about

natural and social sciences asked by children", indicating that teachers' general knowledge needs to be further developed.

(3) Regarding the teachers' evaluation of their own professional abilities, questions 18 and 23 scored the best with 4.5, corresponding to the indicators of "ability to organize and care for children during the day" and "motivation and evaluation," respectively. The teachers' ability in these two areas is high. Questions 16 and 19-20 had the lowest scores of 4.187, corresponding to "ability to create and use the environment", "ability to support and guide play activities", and "ability to reflect and develop", respectively. "This indicates that teachers' abilities in these areas are low and need further improvement.

## **ABSTRACT**

The information integration-based practice teaching model is integrated with intelligent systems to set up problem-oriented situations to further stimulate college nursing students to enhance their learning interest and internal drive in practice. The project task-driven approach promotes upward extension of students' thinking, and through the use of information technology, timely and accurate information on students' learning status, learning obstacles and learning effects is collected for teachers to achieve accurate teaching, supplemented by developmental evaluation, so as to implement the teaching objectives from classroom to practice. Through comparison, it was found that the control class taught in accordance with the original teaching method had an exit score of 77.8 and an overall core competency rating of 64.4, while the experimental class taught with information integration technology had an exit score of 83.1 and an overall core competency rating of 81.9, so the results were improved. Therefore, the use of combining information fusion technology in the teaching of nursing practice in colleges and universities is more effective.

## **KEYWORDS**

Nursing Practice Teaching; Information Convergence Technology; Task Driven; Intelligent Systems

## . INTRODUCTION

Nursing is one of the most important professions in the secondary vocational health professions. However, in some institutions, in order to achieve the goal of quickly cultivating skilled talents, the teaching method is still based on the "teacher speaks, students listen" fill-in-the-blank education. The classroom is the only teaching environment, and teachers' preparation and students' learning are based on textbooks, so there is a lack of relevant and effective teaching content and extensive information sources, which is not conducive to the development of students' creativity and autonomy [1-2]. With the continuous development of society, the demand for application-oriented talents in various industries is on the rise. More and more employers are interested in talents with strong hands-on and practical skills, so that graduates can be quickly put into the workplace and shorten the subsequent training time [3-4]. The demand for nursing students is also the same, so its practical teaching is becoming more and more important. With information technology as a platform, universities should focus on strengthening practical teaching while adhering to the important status of theoretical teaching. Teachers should improve the level of practical teaching in vocational education, combine it with information technology, and use advanced teaching methods so as to improve the quality of teaching and even the learning performance and ability of students. How to apply information integration technology in nursing professional practice education is one of the important issues that need to be urgently addressed in the process of teaching reform in vocational education [5-6].

The literature [7] considers nursing skills practice as an important aspect of service to patients and as one of the priorities of nursing staff. It affects not only the recovery of patients but also the overall level of nursing staff quality; therefore, practice teaching should be a very important part of nursing profession teaching. The literature [8] argues that colleges and universities do not pay enough attention to the way of practice teaching reform and are backward from the concept, and the majority of schools are limited to the application of information technology only to the application of images and dummies, and do not apply high-end information technology teaching methods such as microgrid teaching and high simulation technology

to the teaching of nursing practice, and the overall performance is rather backward. The literature [9] proposed that in future studies different standard competencies for nursing students of different academic levels need to be developed for access to the lead teacher so that clinical teaching work can meet the needs of talents at each academic level. The literature [10] concluded that the core model of nursing education in the UK is self-directed learning, usually teacher-led, which improves the ability of students to learn independently. The literature [11] found that countries such as the Czech Republic and Poland generally have nurse leaders and highly qualified nurses as teachers, with the aim of enabling students to learn more specialized clinical skills during clinical practice and enabling them to develop their own professional ethics and literacy, etc.

This paper is precisely based on the thinking of clinical practice, and under the guidance of constructivist learning theory, a practical teaching model based on information fusion is constructed. Information fusion in this paper contains two aspects: first, the fusion of multiple information technology platforms, such as the fusion of technologies such as network communication, multi-sensing systems, big data, intelligent systems, and digital resources. The second is the integration of information technology and teaching, i.e. education technology should not only stay in the learning environment, but be embedded in the learning system, which requires a shift from tool-based thinking to artificial intelligence thinking. After building the practical teaching platform of information integration, students can be dynamically evaluated according to their mastery of new knowledge in a tiered grouping display, and face-to-face interaction between teachers and students can be promoted by problem-oriented and project task-driven lines, so as to achieve the purpose of clearing doubts and solving problems.

## **2. Teaching Nursing Practice in Universities with Information Fusion Technology**

### **2.1. Hands-on teaching**

Practical teaching means that in a certain teaching environment, teachers organize and instruct students in a purposeful way, so that students can carry out learning that is compatible with professional practice and has application and practicality, thus they can pass on

practical knowledge, form skills, develop their practical ability and innovation ability, and improve their overall quality. Generally speaking, practical teaching can be divided into two aspects: on-campus practice and off-campus practice. Among them, on-campus practice includes experimental class and practical training class, the experimental class is the cultivation of professional theory application ability, and the practical training class is the cultivation of basic skills application ability. Off-campus practice mainly includes apprenticeship and internship, apprenticeship is the cultivation of professional skills application ability, and internship is the cultivation of comprehensive practical application ability.

## **2.2. Nursing Practice Teaching**

Nursing is a highly practical professional discipline that requires students to have a solid theoretical foundation as well as the ability to perform skilled nursing practical training. The content of practical teaching in nursing school mainly includes the skills included in nursing work, such as bed making method, patient transportation method, assisting patients to change the lying position method, the use of protective gear, clean disinfection and sterilization techniques, aseptic operation techniques, isolation techniques, entry and exit care, dietary care, patient cleaning care, observation of patients' vital signs, various methods of drug administration, intravenous infusion and intravenous blood transfusion techniques, The nursing knowledge and basic nursing operation techniques include observation of patients' conditions, resuscitation and care of critically ill patients, care of terminally ill patients, and writing of nursing-related documents. Through these nursing operation skills, we provide professional nursing services for patients, so the quality of nursing practice teaching is directly related to nursing services.

## **2.3. Information integration innovation, highlighting the educational service function of the practice platform**

Under the background of "industry-education integration", the implementation of "Internet+education training" cooperative education mode is in line with the policy guidance of collaborative innovation and achievement transformation. Relying on the information integration characteristics of the "Internet+" professional cluster practice teaching platform, the professional, open and shared

education information service function of the platform can be highlighted, forming a community of information sharing and win-win benefits.

### **2.3.1. Technology integration innovation, highlighting the paid service function of the practice platform**

By virtue of the practical teaching platform of "Internet+" professional clusters, universities can carry out technical cooperation with medical institutions, open the interchange of resources between universities and institutions for a fee, and implement mutual recognition channels for course credit conversion through the point system to ensure students' participation in classroom and clinical practice. The government and medical institutions can precisely release various kinds of supply and demand information such as supply and demand of local regional and industrial talents, R&D of school-enterprise cooperation projects and technical services, retrieve and recommend relevant value-added services for a fee, encourage students to participate in project R&D and technical services, etc. to guide their learning with practical experience, enrich their experience and accumulate experience. In addition, by virtue of the platform shared information, universities can also adjust the professional structure and talent training plan timely through the industrial clusters, and purchase teaching services such as innovation and entrepreneurship information, frontier technology courses, research and technology services, and library resources from the platform suppliers. In the environment of knowledge payment, the value of existing resources is given full play, intellectual property rights are respected, knowledge "dividends" are realized, and the paid service function of the practice platform is manifested.

### **2.3.2. Cultural integration and innovation, highlighting the mutually beneficial win-win function of the practice platform**

Based on the concept of mutual benefit and win-win situation, universities should take advantage of cultural resources and use the practice teaching platform of "Internet+" professional cluster to strengthen the integration of campus culture and hospital culture, which helps the cultural innovation of both partners. The university can join hands with the hospital to form a "dual-teacher" team, in which the teachers in the university and the high-level practitioners in

the hospital jointly guide the practice teaching to carry out classroom teaching case studies. Through the introduction of real cases of clinical work in hospitals, the teachers can carry out practical teaching, spread and promote the culture of medical-educational collaboration in the school, and spread the cultural influence to the campus and the society.

### **3. Set up in-class tiered mixing for task-driven problem solving**

#### **3.1. Introduction to the problem situation**

Teachers can collect students' confusions and questions based on the pre-course pre-reading session and introduce the session by carefully designing problem situations. The problem situations are related to students' previous thinking difficulties and similar to their life experiences, so they can stimulate students' interest in learning. By motivating students to engage in class, it can greatly reduce ineffective content and improve the efficiency and quality of classroom teaching.

#### **3.2. Project Task Driven**

Teachers carefully design "step-by-step" tasks between problem situations and teaching objectives, interconnecting tasks and layering them with difficulty, just like playing a game of "breakthrough". This helps students with different learning bases and levels to find appropriate developmental tasks, experience success and joy in solving problems and completing tasks, and gradually increase their self-confidence.

#### **3.3. Classroom testing**

In order to understand the learning effect of students in time, classroom testing is a necessary part. Teachers must leave enough time for students to complete tests in class, including practical operations and knowledge quizzes, and make instant evaluation of practical operations, on-site hands-on and on-site demonstration. For the knowledge quizzes, students can answer and submit them online through the practice teaching platform, which will automatically correct and analyze students' completion and scores horizontally and vertically in multiple dimensions. Through the practice teaching platform, teachers can instantly grasp the classroom teaching situation, consider whether the teaching objectives are achieved and

what confusion students still have, etc., and provide big data support for their accurate confusion and evaluation of student learning.

### 3.4. Research Subjects and Methods

One hundred and forty nursing students with a mean age of (20.6±1.5) years were included in the study and all students gave their informed consent to this study. The students were grouped according to the random number table method, i.e., experimental and control groups, with 70 students in each group. The control group was taught according to the original teaching method, while the experimental group was taught using the information fusion-based practice teaching platform. The comparison of case analysis exit exam scores is shown in Table 1, and the comparison of nurse core competency scale scores is shown in Figure 1. By comparison, it was found that students in the control class taught according to the original teaching method had an exit exam score of 77.8 and an overall core competency score of 64.4, while students in the experimental class taught using information fusion technology had an exit exam score of 83.1 and an overall core competency score of 81.9.

**Table 1.** Comparison of case analysis scores

Group	Number of people	Admission Test	Results
Control class	70	74.6	83.1
Experimental class	70	76.3	77.8

**Figure 1.** Total core competency score

#### 4. CONCLUSION

This paper proposes a practical teaching platform based on information fusion technology, and then interest as a carrier, so that classroom knowledge becomes a source of interest maintenance through the teacher's elaborate design of teaching content, which stimulates students' interest by optimizing classroom teaching. The teaching content is presented in a multi-information technology integration way, so that students can participate in it and have new experiences and gains at times. In this way, the students' entrance score is 74.6 and their exit score is 83.1, which is complementary to each other and greatly stimulates their curiosity and motivation, thus laying the foundation for nursing professionals.

### **ABSTRACT**

With the development of data technology and the popularity of the Internet, the role of high efficiency brought by big data in the medical nursing system has gradually come to the fore. This paper firstly explains the advantages of medical nursing application in the era of big data and the comparative analysis of the application of big data in medical nursing at home and abroad, and then summarizes the problems arising in the development and application of big data medical nursing in China and puts forward targeted countermeasures. Finally, the data analysis of the development of medical nursing career, as of the end of 2018, there were 1653,297 registered nurses and a total of 2082,258 licensed physicians in China, and the development of China's nursing career lags behind the development trend of the discipline of nursing. This study, through the establishment of a big data interaction platform, can provide a carrier

for the processing and utilization of massive data, which is important for promoting the deep integration of big data with the field of medical nursing.

## **KEYWORDS**

Big Data; Medical Care; Application Status; Solution Countermeasures

## **1. INTRODUCTION**

With the popularization of big data infrastructure and the development of the Internet, big data has been gradually applied to the medical care industry, and the advantages of big data have brought convenience and progress in the field of medical care [1-2]. However, many new challenges have been encountered in the construction and application of big data medical care, which need to be urgently considered and solved by the academic community, namely, how big data fits the needs of medical care and how medical care can gain new development through big data applications [3-4]. In this paper, we summarize the dilemmas of big data application in medical nursing and propose targeted solutions through the investigation of the current situation of big data application [5-6].

In [7], a review of the "flipped classroom" teaching model and its application and research status in the field of medical education was conducted, aiming to provide reference for Chinese nursing educators to promote nursing education reform in the new form in line with Chinese conditions. The literature [8] analyzed the current status of TCM nursing interventions in AD in recent years, and TCM interventions have gradually become one of the important ways to prevent and treat AD. As an important part of Chinese medicine, TCM nursing also plays a key role in the prevention and treatment of AD, and clinical studies have also confirmed that TCM nursing can improve the cognitive function, psychiatric symptoms and self-care ability of AD patients to a certain extent. The aim of TCM nursing is to further promote and facilitate its application in AD and to provide a feasible reference for TCM prevention and treatment of AD.

This paper first summarizes the problems that arise in the development and application of big data medical care in China,

namely, the lack of technical support and specialized service personnel in rural areas, so that the rural population cannot enjoy the medical convenience brought by intelligence in the era of big data, and the data collection equipment and platform construction are not perfect. China has a huge amount of medical data resources, but not enough attention is paid to data collection, and the data entered are not comprehensive. The deep integration of big data with the healthcare field is promoted by proposing targeted solutions, i.e., cultivating big data thinking in the modern healthcare system. This study focuses on the platform construction of big data medical care in the direction of precision care and nursing management, creating a big data center platform that allows more nursing staff to participate and industrialize, and further promoting the innovation and creation of big data medical care.

## **2. Status and Problems of Big Data Application in Medical Care**

### **2.1. The current state of big data applications in medical care**

With the construction of big data infrastructure, the application of big data in medical nursing has increasingly become an important topic of academic interest. The application of big data in medical nursing is at a relatively mature stage in foreign countries, being applied to several nursing fields, such as elderly care, infant and child care, critical care, etc. For nursing workers, the involvement of foreign countries using big data can change the original nursing decision-making mechanism, rationalize nursing resources, and give clinical nurses more decision-making power. Incorporating big data into the decision-making and policy-making process can prevent nurses from being inefficient and improve the effectiveness of medical care by adjusting the nursing process and promoting the rational allocation of nursing resources. Nurse leaders can use big data to achieve the triple aim of improving quality, improving patient experience and reducing costs. Currently, the application of big data in medical nursing in China is in the initial stage, but there are developments, such as: Guangzhou University of Traditional Chinese Medicine constructed a target diagnosis model for cervical cancer infection, combined with a big data information monitoring system for cervical cancer, to provide a basis for early diagnosis and treatment of cervical cancer patients; Beijing nursing staff reduced the incidence of infection in hemodialysis patients

through preventive nursing interventions with big data to improve patients' quality of life.

## **2.2. Problems with the application of big data in medical care**

### **2.2.1. Big data medical applications are not sufficient and comprehensive**

At present, China's collection of big data is only voluntarily declared by hospitals, through which they can statistically analyze the situation of the hospital itself, and also compare the situation of other hospitals horizontally for data analysis. The national level only stays at the point where hospitals that voluntarily join can have statistics and analysis of data, but does not include primary hospitals, specialist hospitals, basic health centers, township medical service centers, nursing homes, etc. The lack of technical support and specialized service personnel in rural areas prevents the rural population from enjoying the medical convenience brought by intelligence in the era of big data.

### **2.2.2. Data collection equipment and platform construction is not perfect**

China has a huge amount of medical data resources, but not enough attention is paid to data collection, and the data entered is not comprehensive, leading to data bias in research and search. Zhang Luxia pointed out that China has a high degree of health care informatization, but the uneven degree of informatization and unified data standards among different regions make it difficult to directly extrapolate foreign medical big data quality assessment models to China for use. Therefore, it is urgent to establish a health care big data quality assessment model suitable for China's national conditions and develop assessment tools. However, China has not yet established an authoritative platform for data preservation and analysis.

### **2.2.3. Big data concept lags behind for clinical care workers**

Big data can improve work efficiency and reduce the burden of nursing staff, but at the hospital level, big data has not been pushed from theory to application, and inertial thinking has limited the application scenarios of big data. There is still much room for the development of big data in clinical applications and personnel

management in hospitals, and the lack of big data thinking ability of medical and nursing staff leads to the limitation of the application scope of big data. Hospital outpatient nursing management is not IT personnel, and they do not have a good grasp of big data related technology or even a serious lack of it, so they need to introduce or focus on training talents with both big data technology, nursing knowledge and management skills.

#### **2.2.4. Immaturity of policies and legislation for big data privacy protection and big data industry**

China should improve relevant legislation to protect the security of big data and user privacy, and safeguard the rights and interests of big data collection and big data users. In 2018, although the state introduced relevant regulations in the application of big data: the Notice on the Issuance of National Management Measures for Health Care Big Data Standards, Security and Services (for Trial Implementation), the regulations related to the legal collection and use of medical data are not perfect enough. The legislation on privacy protection of big data is not detailed enough. The state and government do not support the big data industry, especially big data medical care, enough in terms of policy.

### **3. Countermeasures to solve the dilemma of applying domestic big data in medical care**

#### **3.1. Improve the sophistication of data collection equipment and data processing systems**

China is generating huge amounts of medical data every day, and there is a need for efficient and comprehensive data collection with more advanced and convenient devices to improve the efficiency and quality of data collection. Medical institutions can monitor through various wearable devices or cell phones, while strengthening the development of new analytical tools to enhance the relevance of big data collection and clinical applications. Greater efforts can also be made to promote the construction of authoritative platforms for big data, focusing on the construction of platforms for big data medical care in the direction of precision care and nursing management, creating big data center platforms that involve more nursing staff and industrialization, and promoting the creation of innovations in big data medical care. It can also strengthen the construction of the

processing big data center platform to provide a platform for the processing and analysis of big data, and at the same time provide a guarantee for the professionalism of the nursing discipline.

### **3.2. Fostering big data thinking in modern healthcare systems**

Leverage the guidance of big data to provide a more standardized framework for medical care. Every caregiver can become a creator of nursing data as well as a decision maker in nursing. Abandoning the superstition of authority, using big data to break the inertia, exploring the blind spots of nursing managers, and giving more big data-minded nursing participants the opportunity to join the decision making process to make nursing decisions more rational. Big data nursing is an important part of promoting big data healthcare, especially in data collection, to improve nurses' ability and confidence in big data collection, analysis and application. Increase support for innovation and creativity in the nurse community, and actively explore ways to apply big data in nursing, so that the scenarios of big data use meet the actual needs of nursing, especially for specialty nursing.

### **3.3. Promote the deep integration of big data and health care field**

Accelerate the application of big data into medical institutions, especially to reach the medical institutions in townships. Strengthen the training of community nursing personnel, improve the construction of township networks, use big data to guide the work of community nursing staff, bring township medical institutions into full alignment with tertiary hospitals, and allow community medical services such as medical checkups to benefit a wider range of people using big data. Relying on core technologies such as the Internet of Things and cloud computing, we will change the situation that each community unit is an "island" in the past, realize information sharing among streets and counties, effectively solve the problem that big data resources are not shared universally in grassroots and less developed areas, and effectively improve medical facility construction and medical services by relying on big data technology.

### **3.4. Promote the deep integration of big data and health care field**

Figure 1 shows the number of human resources for health in China from 2010-2018. According to the China Statistical Yearbook 2019, by the end of 2018, there were 1,653,297 registered nurses and a total of 2,082,258 licensed physicians in China. The development of nursing in China lags behind the development trend of the discipline of nursing, with very little relevant research on nursing theory and clinical practice and insufficient research funding, resulting in the low status of the discipline of nursing in China, serious lag in discipline construction, lack of high-level nursing experts, lack of respect for nurses by patients, and too slow development of the holistic nursing model.

**Figure 1.** Number of health human resources in China from 2010 to 2018

Table 1 shows the number of health technicians per 1,000 population in China from 2010-2018. The number of registered nurses per 1,000 population was 1.25, and the ratio of health care workers was 1:0.79. According to the World Health Organization, the number of nurses per 1,000 population was 8.1 in high-income countries, 4.0 in upper-middle-income countries, 1.4 in low- and middle-income countries, 1.0 in low-income countries and 2.8 nurses per 1,000 population in all member countries. In comparison, the number of registered nurses per 1,000 population in China is low and only slightly above the level of low-income countries, with 26,799 registered nurses in Chongqing, for example, and only 0.82 registered nurses per 1,000 population in 2018.

**Table 1.** Number of health technicians per 1000 population in China from 2010 to 2018

particular year	hygienic personnel			Practitioner			Registered nurse		
	total	city	county	total	city	county	total	city	county
2010	3.63	5.17	2.41	1.68	2.31	1.17	1.02	1.64	0.54
2011	3.62	5.15	2.38	1.69	2.32	1.17	1.03	1.65	0.54
2012	3.41			1.47					
2013	3.42	4.84	2.19	1.48	2.08	0.97	1.00	1.59	0.50
2014	3.46	4.93	2.16	1.50	2.12	0.95	1.03	1.63	0.50
2015	3.49	4.99	2.15	1.52	2.14	0.96	1.06	1.66	0.51
2016	3.58	5.14	2.17	1.54	2.20	0.96	1.10	1.74	0.53
2017	3.66	5.35	2.14	1.54	2.22	0.94	1.25	1.99	0.58
2018	3.81	5.58	2.21	1.58	2.28	0.94	1.25	1.99	0.58

#### 4. CONCLUSION

This paper studies the current situation, dilemmas and their countermeasures of medical nursing based on big data technology, and the following conclusions can be drawn.

(1) Use big data to guide the work of community nursing staff, so that rural medical institutions can be fully integrated with tertiary hospitals, and so that medical services such as community medical checkups can use big data to benefit a wider range of people. Realize information sharing among streets and districts, effectively solve the problem of failure to share big data resources universally in grassroots and less developed areas, and effectively rely on big data technology to improve medical facility construction and medical services.

(2) Analysis of medical nursing career development based on big data technology. The number of registered nurses per 1,000 population is 1.25, and the ratio of medical and nursing personnel is 1:0.79. In high-income countries, the number of nurses per 1,000 population is 8.1, while in upper-middle-income countries it is 4.0, in lower-middle-income countries it is 1.4, in low-income countries it is 1.0, and in all member countries the number of nurses per 1,000 population is 2.8. The number of registered nurses per 1,000 population in China is relatively low and only slightly above the level of low-income countries.

## ABSTRACT

This paper analyzes and explains the health education resources and psychosocial service system (PSS) respectively, starting from the structure of mental health education (MHE) resources and PSS in colleges and universities (CU). It also analyzed the data of psychological services in a city using the synergistic development of MHE resources in CU and the structure of PSS. The way of holding regular mental health lectures was approved by 36.34% of the residents. Thus, with the effective allocation of mental health resources in universities, the structure of social psychological service system is more diversified. It can well see the various psychological service needs of residents.

## KEYWORDS

Big Data; Mental Health; Educational Resources; Psychosocial Services

## 1. INTRODUCTION

At the present stage, people's material conditions have changed dramatically along with the current economic development and social progress, and their wealth has increased significantly. In particular, more emphasis has been placed on spiritual satisfaction, which has led to many problems in mental health, and these problems have had

an adverse impact on the physical and mental health of individuals and social harmony and stability [3-4].

The continuous development of MHE resources in CU also provides a new structure program for the PSS, using the reasonable allocation of MHE resources in CU. In turn, it helps social psychological services to become more diversified [5-6].

The structure of the PSS aims to enrich the spiritual culture of the masses, and the literature [7] argues that the structure of the PSS should be viewed from the perspective of the whole society, be oriented from the psychological needs of the society as a whole, respect and understand the psychological demands of individuals and groups, and conform to and understand the laws of psychological behavior. The literature [8] argues that the first priority of the structure of the PSS is to build a perfect mental health service network, construct a mental health service platform, and achieve extensive coverage of mental health services, and then substantially promote mental health services to achieve concrete effects. The literature [9] believes that improving people's mental health through mental health services is currently the most realistic and effective channel to achieve the goal of social psychological service system structure, and the realization of mental health services is the first priority and premise of the social psychological service system. The literature [10] argues that psychological services belong to the category of public services and public goods from the essential analysis, and the structure of the PSS should start from a comprehensive perspective of social psychology and focus on avoiding the occurrence of negative social mentality.

In order to explore the application of MHE resources in CU in the structure of PSS, this paper analyzes and studies from three parts. The first part analyzes and explains the MHE resources in CU, including the analysis of MHE, college MHE and college MHE resources. The second part is the analysis of the structure of PSS, and gives the basic content and corresponding description of the system structure. The third part is the analysis of the synergistic development of MHE resources in CU and the structure of social psychological service system, with the relevant data analysis of mental health service in a city. It mainly includes the factors affecting

the structure of PSS and the effectiveness of synergistic development using MHE resources of CU.

## **2. Analysis of MHE resources in CU**

The perfect state of mental health is the state of harmonious development, which is reflected in the harmony between human and nature, human and society, human and others, and human and self, with good physiological and psychological development functions and good social adaptability, etc., and with relatively ideal personality characteristics. The concept of mental health in the framework of multiculturalism is to examine and understand one's own psychology and the psychology of others with equality, tolerance and respect, so as to truly realize the integration and compatibility between the psychological cultural environment and the psychological ecological environment. CU should strengthen the philosophical reflection on the presupposition of psychological theories, so as to promote the dialogue and communication between different views of mental health, promote psychological theories towards meaningfulness, contextualization and depth, expand the boundaries and scope of understanding psychology, and promote and lead the continuous expansion and innovation of psychological theoretical vision. Through further optimization of the allocation of MHE resources in CU, it contributes to the structure of social psychological service system for MHE in CU.

### **2.1. MHE Analysis**

MHE originated from the West, and was initially conducted in the mode of combining theories, methods and techniques of Western psychology with local Chinese educational practices. In imitating, copying and reflecting, it slowly created and explored theories and methods in line with China's national conditions and students' reality, and gradually developed into a nationwide sensational and fervent situation of MHE.

MHE is an educational activity that promotes the overall and harmonious development of students' physical and mental health based on their psychological and physiological development characteristics, relying on psychological theories and techniques, and in accordance with specific plans and purposes. MHE is not only to use psychological knowledge to realize the meaning and value of

psychology itself, but also to cultivate a sound personality so as to enhance psychological quality and improve the quality of life.

MHE is a systematic project that requires the support of all sectors of society. The system needs to integrate various resources from the individual's psychological needs and current psychological situation, using various ways and means, and to set purposes and plans and use them for active education and counseling, ultimately promoting the harmonious development of students' personalities and thus enhancing their mental health.

## **2.2. MHE in CU**

CU provide a solid backing for the output of talents in society, and MHE in CU also makes an important contribution to maintaining the stability of society. The integration of college MHE into daily ideological and political education work is also accepted by college ideological and political educators, and MHE is incorporated into daily teaching activities and given certain credits at the same time.

MHE in CU is a kind of education that educators use theories and techniques of psychology, pedagogy and other related disciplines according to the physiological and psychological development characteristics of students. Through the MHE curriculum, MHE activities, subject penetration, psychological counseling and consultation and optimization of the educational environment and other ways and methods related to MHE. It is a kind of educational activity that helps students solve their psychological problems in the process of growth and promotes the improvement of psychological quality and healthy development of physical functions of all students.

## **2.3. MHE Resources for CU**

It is generally believed that resources are a general term for various environmental elements or things that can be exploited by human beings under certain socio-historical conditions to improve their own welfare or survival, which have some scarcity and are subject to social constraints.

For the view of MHE resources in CU, they should include human, material, financial and information resources needed to carry out educational practice activities. All the resources needed for educational practice can be called educational resources, that is,

educational resources is the collective name of various resources needed for educational practice. In this paper, the MHE resources in CU are defined as faculty members, educational funds, venues and facilities and MHE institutions.

### **3. MHE resources and PSS structure in CU**

As an indispensable and important part of the structure of social psychological service system, MHE in CU helps provide more professional talents for social psychological service system. Through reasonable allocation of MHE resources in CU, it can effectively maximize the allocation of MHE resources and help the structure of social psychological service system to a higher level.

#### **3.1. PSS**

The social psychology was introduced by the German scholar Scheffler in his book written in 1875. Marx specifically began a scientific and systematic analysis of social-psychological phenomena, and he considered social psychology to refer specifically to the psychological state embodied in society and most groups at a certain time. Social psychology includes both individual and group psychology and is characterized by its extensiveness and relative stability. Extensiveness means that it will produce a wide range of influential and group demonstration effects in the process of development, and stability means that it should have a fermentation period, growth period and disappearance period.

This paper argues that the PSS is drawn to fully meet the psychological needs of the people, improve their mental health as much as possible, cultivate a positive social mentality, and create a good social atmosphere. Combining theories, techniques and methods from multidisciplinary fields such as applied psychology and public management, it integrates resources from various government departments, social organizations, social groups, markets and other subjects through public policy adjustments and changes in governance. It is a systematic service project to calm social mentality, resolve social conflicts, prevent and control social risks, gather social consensus, and lead value orientation.

### **3.2. PSS structure basic content**

China's PSS is developed on the basis of the previous mental health service system, from focusing on crisis control at the social level to full participation in social governance. It has gradually expanded and brought into play the functions of value leadership, emotional support and emotional relief of the PSS at the macro level of society. The structure of the PSS mainly includes two elements.

The first is to establish a sound working mechanism, strengthen organizational leadership, set up a multi-departmental leading group responsible for special work, and establish a joint meeting system. Establish and improve the supervision and evaluation mechanism, the structure of PSS into the local development planning outline and supervision and evaluation of the assessment content. Focus on the implementation of education and training programs for service providers, services for patients with severe mental disorders and enhanced management mechanisms.

The second is to build diversified ways and methods of structure of psychosocial services and do a good job of platform structure. Establish and improve the education system, institutions and enterprises psychological services platform, grassroots psychological services platform, professional medical institutions mental health services platform, psychological assistance services platform, to foster the incubation of social professional institutions. Use the time, do a good job of publicity and education, to strengthen mental health science and technology publicity.

### **3.3. Analysis of the synergistic development of social psychological service system structure**

The original intention of social psychological service system structure is to practice the fundamental purpose of serving the people, and the purpose is to improve the level of mental health of the general public, promote the stability of social mentality and interpersonal harmony, make the general public more self-esteem and self-confidence, more rational and peaceful when things go wrong, and more positive life and work. This requires the concerted efforts of the government system, social organizations, the market and the general public, and the concerted governance of strengthening the MHE resources of CU

and the structure of social psychological service system should become the preferred policy.

### 3.3.1. Analysis of the factors influencing the structure of social psychological service system

At present, the structure of PSS has received more and more attention, but there are still some degree of problems in the development and structure process. In order to analyze the effective measures for solving the problem, we visited a city to investigate the factors affecting the structure of PSS.

#### (1) Lack of enthusiasm for public participation

The public is the service object of the PSS, and the participation of the public is especially important to the structure effectiveness. However, through the questionnaire survey, the choice of psychological service needs is not satisfactory. The results of the survey are shown in Figure 1.

For the demand of psychosocial services, only 6.27% of people think they need it very much, 10.54% think they need it in general, 45.26% think they don't need it, and 35.68% think it is optional. This shows that most people think they do not need psychological services, or think that psychological services are optional, and the public has not yet established the correct demand for psychosocial services.

**Figure 1.** Choice of psychological service needs

#### (2) Diversification of demand for psychological services

For the masses, although the enthusiasm for participation is relatively low, there is still a certain demand for psychological services. For people who want to receive psychological services, the diversification of psychological service needs has become an obstacle to the structure of a social psychological service system. The results of the research visit for the psychological service demand of the public and the analysis of the diversified psychological service demand are shown in Figure 2.

From the survey data, the content of the public's demand for social psychological service system tends to be diversified. 14.64% want to relieve work stress through psychological services, 10.07% think psychological services can help optimize family education, 13.55% feel that psychological services can effectively improve parent-child relationships, and 6.79% want some degree of mental health status assessment. For 8.57% of the people, psychological services can help them reduce personal anxiety and relaxation, the largest proportion of the demand for psychological services to control depression is 21.51%, and there is a part of the people want to psychological counseling and improve interpersonal communication skills through psychological services, accounting for 11.16% and 13.71% respectively. This shows that the structure of social psychological service system should be more diversified to meet the different psychological service needs of different people.

Figure 2. Results of the psychological services needs analysis

### 3.3.2. Synergistic development of MHE resources in CU

In response to the factors that affect the structure of social psychological service system, the structure of social psychological service system is helped to be more diversified through reasonable allocation of MHE resources in CU. The analysis of the effectiveness of synergistic development results of MHE resources in CU for the structure of social psychological service system is shown in Figure 3.

Through the effective allocation of college MHE resources in the structure of social psychological service system, it can better provide one-to-one psychological consultation, group psychological counseling, psychological column propaganda, network psychological consultation and hotline consultation for the masses, accounting for 16.94%, 8.72%, 11.65%, 19.37% and 6.98% respectively. And regular psychology lectures are the most chosen service method by the public, accounting for 36.34%. This shows that through the effective allocation of MHE resources in universities, more residents can be helped to realize diversified psychological service needs. Different MHE professionals can provide more diversified psychological service methods, which in turn help the residents to build a good mental health lifestyle.

Figure 3. Effectiveness of MHE resources

#### 4. CONCLUSION

In order to explore the application of college MHE resources in the structure of PSS under the background of big data, this paper starts from college MHE resources and PSS. The effective allocation of college MHE resources and the effectiveness of social psychological service system structure are analyzed accordingly with the mental health development data of a city.

In order to make the MHE resources of CU better integrated into the structure of social psychological service system, it is necessary to reasonably allocate the MHE resources of CU so that the two can develop effectively and synergistically. In turn, it helps the social psychological service system become more diversified and realize the diversified psychological service needs of the residents.

## **ABSTRACT**

The implementation of the rural revitalization strategy and the extension of the Internet platform have led to the influx of policies, capital and personnel into the rural e-commerce market, giving rise to the transformation and upgrading of rural cross-border e-commerce. Taking "Internet+" as the background of the times, this paper analyzes the real problems of rural cross-border e-commerce such as unsound infrastructure, logistics service to be improved, insufficient personnel training mechanism, and lack of agricultural technology level and industrial scale. On this basis, recommendations for improving rural cross-border e-commerce infrastructure and optimizing the operation mode of rural cross-border e-commerce enterprises are given in a targeted manner. The results show that the disposable income of rural farmers who opened agricultural electronic cross-border commerce increased by 15.3%, effectively helping farmers to realize poverty alleviation. The development of rural cross-border e-commerce trade proposed in this paper facilitates the globalization of agricultural production, trade and consumption, and promotes the transformation of traditional agricultural trade into a digital trade model.

## **KEYWORDS**

Agriculture; Rural revitalization; Internet; Cross-border e-commerce

## 1. INTRODUCTION

With the continuous development of digital technology, the era of digital economy has quietly arrived. The application of digital technology has broken the limitation of global geographic space and promoted the transformation of global trade to digital trade [1]. With the continuous popularization of mobile Internet and the gradual improvement of logistics system, Chinese e-commerce gradually moves from urban to rural areas. Cross-border e-commerce in rural areas has ushered in an important development opportunity period [2-3].

At present, the global epidemic is still in the pandemic stage, and the demand for digital trade and online consumption is more urgent. As an important part of China's cross-border e-commerce, the development of rural cross-border e-commerce is conducive to building a more benign dual domestic and international cycle for agricultural products and further extending the boundaries of China's agricultural trade [4]. As the world's largest producer and consumer of agricultural products, the scale of China's agricultural trade has continued to grow in recent years, and cross-border trade in agricultural products urgently needs to expand its market through online channels [5].

With the continuous sinking of e-commerce in rural areas, the production and life patterns in rural China have undergone significant changes [6]. Taobao villages as well as rural e-commerce cooperatives have emerged, the development trend of clustering of rural e-commerce industry chains has become more and more obvious, and many individual farmers have started to try to market local products through e-commerce platforms, which has changed the traditional trade model of agricultural products [7]. In addition, to support the development of cross-border e-commerce, China has established five batches of a total of 105 comprehensive pilot zones for cross-border e-commerce, which provide extensive customs clearance, logistics, finance, exchange and information support for cross-border trade of agricultural products [8]. Meanwhile, with the continuous promotion of the development strategy of rural revitalization, various regions have introduced relevant financial support policies to encourage the development of cross-border e-

commerce agricultural trade, which has created a favorable external environment for cross-border agricultural e-commerce business in China [9].

This paper mainly elaborates the challenges faced by China's cross-border trade of agricultural products, while providing the effectiveness of further enhancing the industrial empowerment of digital economy. On this basis, targeted countermeasures are given to improve the network infrastructure of rural cross-border e-commerce, optimize the operation mode of rural cross-border e-commerce enterprises, improve the quality of rural cross-border e-commerce logistics services and construct a training system for rural cross-border e-commerce talents, with a view to promoting the realization of rural cross-border e-commerce informatization and helping rural revitalization.

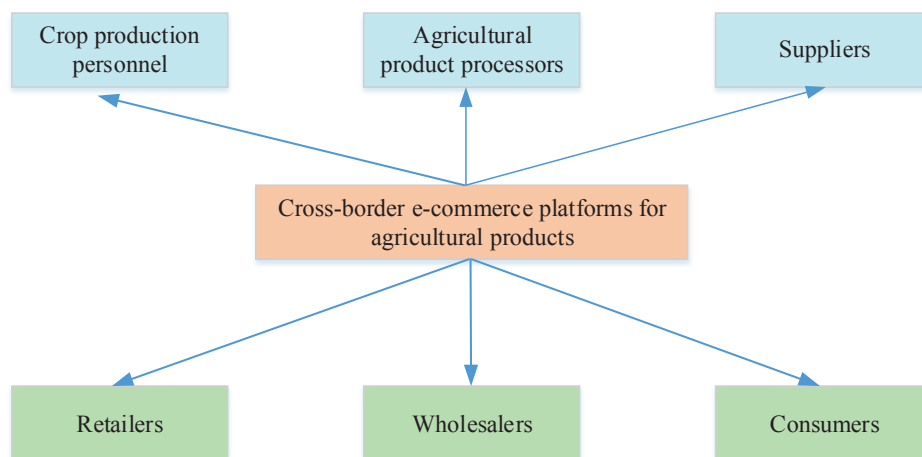

## **2. The foundation of the cross-border e-commerce ecosystem for agricultural products**

### **2.1. Network Infrastructure**

Jiangsu Province's Internet infrastructure resources remain at the forefront of the country. By the end of 2021, the total length of fiber optic cable lines in Jiangsu was 4.16 million kilometers, an increase of 170,000 kilometers over the same period in 2020, and the total length continued to rank first in the country. The total number of fixed Internet broadband access ports is 74.643 million, ranking second in the country. In terms of Internet users, by the end of 2021, the number of fixed Internet broadband access users in Jiangsu Province reached 40,716,000 (excluding broadcasting data), a net increase of 3,148,000 over the end of 2020, ranking second in the country in terms of total number of users. The household broadband access penetration rate is 115.3 per 100 households, ranking third in the country. Among them, rural broadband access users reached 15.607 million, ranking first in the country. With the perfect network facilities and high network coverage and other information technology applications continue to promote, accelerate the development of cross-border e-commerce of agricultural products in Jiangsu Province.

## 2.2. Product cross-border e-commerce ecosystem construction

Cross-border e-commerce ecosystem is defined as a "population" of individuals, organizations, enterprises or government agencies related to cross-border e-commerce activities. The cross-border e-commerce platform is used as a means and medium of communication, competition and cooperation to continuously achieve complementary advantages and resource sharing. The e-commerce ecosystem can dynamically realize the communication, sharing and circulation of logistics, trade flow, capital flow and information flow among populations and between populations and the environment. Figure 1 shows the schematic diagram of cross-border e-commerce ecosystem for agricultural products. According to the viewpoint of business ecosystem theory, the main elements in the ecosystem can be divided into four categories: leading population, key population, supporting population and parasitic population according to their respective status and role.

**Figure 1.** Schematic diagram of cross-border e-commerce ecosystem for agricultural products

The leading stock refers to the cross-border e-commerce platform for agricultural products. As the core of the whole system, the cross-border e-commerce platform not only connects the key populations and supporting populations in the system to create one-stop services, but also plays the role of coordinator and communicator. By providing platform and regulation and other related services, the leading species integrates system resources and provides an indispensable foundation for the symbiosis and evolution of the ecosystem.

The key species is the main body of transactions in cross-border e-commerce of agricultural products. Without key species, the whole ecosystem cannot function properly. Key species include crop producers, agricultural product processors, suppliers, wholesalers, retailers and consumers of agricultural products.

Support species provide support services for trade flow, capital flow, information flow and logistics in the entire agricultural products cross-border e-commerce ecosystem. Although support populations carry out activities and provide support around core and key populations, unlike parasitic populations, support populations are not dependent on the ecosystem for survival.

The parasitic populations are companies that provide support services for the cross-border e-commerce ecosystem, including operation service providers, online marketing service providers, e-commerce consulting service providers, translation companies, legal institutions, etc.

### **2.3. Optimize the operation mode of rural cross-border e-commerce enterprises**

Through in-depth study of the existing operation mode of rural cross-border e-commerce through visits and surveys, we analyze the regional characteristics of rural areas and propose a more suitable combination of "cross-border e-commerce mode + rural areas".

First, to create a hybrid model of "online + offline", the first rural 5G base station will be completed and opened in 2019, and rural areas will gradually be covered by 5G network, so a new online brand display platform + offline channels can be constructed with the realistic skills needs of physical e-commerce. At the same time, the education process should pay attention to the convergence of agriculture, farmers and professional courses, the preparation of professional teaching materials and innovative education model. In addition, we should form a rural cross-border e-commerce management system and a learner-based teaching model, optimize relevant talent training programs, use rural cross-border e-commerce scenario education, and export "finance + cross-border e-commerce + logistics" knowledge.

Second, complete the school-enterprise cooperation cultivation mechanism. The government should establish a rural cross-border e-commerce industrial park and introduce e-commerce enterprises, rural business entities, universities and students to create more practice opportunities for teachers and students. It should develop a differentiated combination incentive system and tax incentives and subsidies for e-commerce enterprises of different scales and development potentials, establish a normalized system of cooperation between industry, academia and research, and open periodic rural cross-border e-commerce vocational skills competitions.

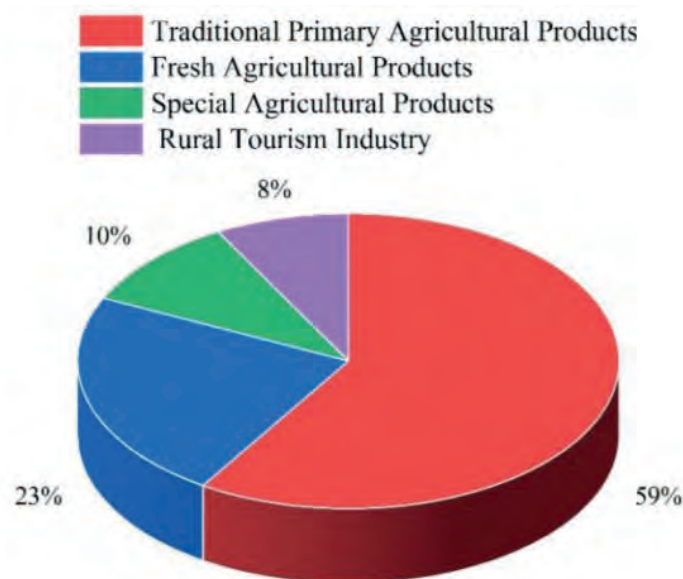

Third, construct a localized cross-border e-commerce talent training mechanism. Develop a targeted training program to cultivate local cross-border e-commerce talents by virtue of the advantages of the agricultural industry and regional rural characteristics, highlighting the actual needs of the agricultural economy. Specifically set up customized classes and practical training bases for rural cross-border e-commerce, and periodically launch rural cross-border e-commerce promotion activities to recruit industry-wide talents.

### **3. Results and Analysis of Informatization Path for Cross-border E-Commerce in Agriculture**

In recent years, as the work of poverty eradication has continued to deepen, the Yanji municipal government has been increasing the project investment in 10 poor villages and 6 key poverty-related villages. In particular, by supporting the "Internet + poverty alleviation" model to promote the industrial development of poor villages and key poverty-stricken villages as the main means, the development of rural e-commerce industry in the above 16 villages has been significantly strengthened, and 33 kinds of special brands of poverty-alleviating agricultural products have been established and focused on sales through Taobao, WeChat, Shake Live and other platforms. The layout of the industrial development of the surrounding villages has been gradually formed with the poor villages and key poverty-related villages as the center, and the industrial development of the surrounding villages has been driven by radiation.

At present, there are more than 50 types of agricultural products sold on the Internet in Yanji City, with more than 300 single products and more than 120 "three products and one standard" products. In 2020,

the online sales of agricultural products in Yanji City reached 1.224 billion yuan, with 59% of traditional primary agricultural products, 23% of fresh agricultural products, 10% of special agricultural products and 8% of rural tourism industry. 10%, and rural tourism industry accounts for 8%. Among them, among primary agricultural products, Yanbian rice ranked first in sales volume, with 10.19% of the network retail sales and greater consumer viscosity. Next, Yanbian sticky corn and Yanbian soybeans ranked second and third respectively, with online retail sales accounting for 9.8% and 8.3% respectively. Fresh agricultural products accounted for a relatively small proportion, only strawberries, apples pears, plums and other seasonal fruits. In recent years, with the deepening of the structural reform on the supply side and the integration of one, two and three industries, the Yanji municipal government has introduced a number of policies to continuously strengthen the efforts to cultivate the brand of agricultural products and the construction of quality assurance system.

**Figure 2.** Network sales of agricultural products in Yanji City in 2020

At the same time, the local combined with the tourism development strategy, and actively promote the development of rural farm caravans, suburban tourism, picking tours and other tourism industries, has achieved remarkable results. Thanks to this, Yanbian's special agricultural products such as spicy cabbage, cold noodles, rice wine, rice intestine and mingtai fish, as well as rural tourism industries have shown rapid development momentum, and the proportion of these two categories in the online retail market has

increased year by year. 2020, among the special agricultural products, spicy cabbage, rice wine, mingtai fish, etc. were among the top three, and the proportion of online retail sales were 5.4%, 5.1%, and 4.7%. In the rural tourism industry, rural tourism brands such as "small bridges and flowing water people" in Wufeng Village of Xiaoying Town and "ancient Korean villages" in Chunxing Village of Yilan Town are among the top, with the online retail sales accounting for 4% and 3.6% respectively.

#### **4. CONCLUSION**

The strategy of rural revitalization is crucial to the economic transformation of China, especially the relatively remote and backward rural areas, and to a large extent, it has added nutrients to the sprouting and growth of rural cross-border e-commerce. Relatively speaking, the rapid development of rural cross-border e-commerce is of great significance in promoting "Internet + agriculture" and practicing the rural revitalization strategy. It is noteworthy that the informationization of rural agricultural cross-border e-commerce has increased by 15.3% for rural areas, which indicates that the sustainable development of rural cross-border e-commerce requires strong support from government policies, collaborative development of cross-border e-commerce enterprises and logistics enterprises, and active participation of rural indigenous villagers and high-quality talents.

## **ABSTRACT**

Under the background of big data and comprehensive rule of law, college students are an important force in the future construction of the country. This paper firstly constructs the cultivation model of rule of law thinking ability of college students, which mainly consists of three parts: theoretical rule of law thinking ability cultivation, practical legal thinking ability cultivation, and perfect system management. Then it analyzes the reasons for the problems of the rule of law thinking ability of college students, including the deviation of the concept of rule of law thinking cultivation and the lack of teachers. Finally, the analysis of the rule of law thinking ability of college students was conducted by big data technology. The results show that 61.04% of the researched college students are interested in cell phone AAP and 46.98% are interested in WeChat microblog, and colleges and universities can cultivate college students' rule of law thinking for this purpose. This study transforms the cultivation of rule of law education for college students from legal knowledge to rule of law awareness through big data, which is conducive to promoting the cultivation of rule of law thinking of college students.

## **KEYWORDS**

Big Data; Training Model; College Students; Rule of law thinking skills

## **1. INTRODUCTION**

As the trend of globalization of big data technology develops and intensifies, the knowledge economy has become the driving force for the development of various countries and regions. Higher education institutions are an important platform for implementing quality education and promoting the all-round growth of college students [1-

2]. The education and training of university students' rule of law thinking ability has a significant effect on the promotion of legalized governance in China. Different subjects of society are actively participating in this process, positioning the starting point as the cultivation of university students' awareness of the rule of law and launching a series of publicity work on the rule of law [3-4]. Combining the improvement of teachers' quality level with cultural construction, the work of cultivating the rule of law thinking ability of college students is given a strong impetus to support, so that college students can receive more knowledge about the legal system and gain more in a good atmosphere [5-6].

The literature [7] points out the common features of college students' rule of law thinking in the context of new media and analyzes the defects of the normative practices of college students' rule of law thinking development. By exploring the "double-edged sword" effect of information technology development on the development of rule of law thinking in the context of new media, the paper proposed the correct use of new media to build a three-in-one pattern of social education, school education and family education for the development of rule of law thinking among college students. The literature [8] analyzes the current problems in the rule of law thinking of college students, explains the necessity of cultivating the rule of law thinking of college students in the context of the comprehensive rule of law, and proposes the cultivation strategy of the rule of law thinking of college students in the context of the comprehensive rule of law, so as to learn the law, respect the law, abide by the law and use the law with practical actions. Only with rich legal knowledge and good rule of law thinking can college students become an important force to promote the comprehensive rule of law, improve their comprehensive competitiveness and problem-solving ability, and better contribute to the construction of the country.

This paper firstly compares the construction, characteristics and contents of the rule of law thinking ability cultivation mode of college students, and elaborates the significance of rule of law thinking ability cultivation of college students. Then, we analyze the reasons for the problems of cultivating the rule of law thinking among college students from five aspects: deviation of the concept, insufficient teachers, thin content, single cultivation method and poor environment. Finally, based on the big data technology, the teaching content of rule of law education is enriched, the cultivation method is improved and the cultivation environment is optimized to propose countermeasures to strengthen the cultivation of rule of law thinking among college students.

## **2. Constructing a model for cultivating university students' rule of law thinking skills**

### **2.1. Theoretical rule of law thinking skills development**

First, theoretical legal thinking skills development is imaginative teaching and brain-mapping learning. This is envisioned by the tutoring style and the seminar style. One of the features of the tutor-led approach is that students are able to think in a relaxed atmosphere, and one of the features of the seminar approach is that students are able to express their opinions directly. Imaginative teaching and brain-mapping learning models take advantage of and innovate these features. Imaginative teaching is a model for teachers to teach, and it should become the dominant method for law teachers to teach. The key is to let students imagine and understand without being bound, to break through the traditional rote memorization to make abstract legal concepts or propositions tangible, and at the same time to create the right type of confusion, as if each legal concept or proposition is a visible and bouncing elf. Through imaginative teaching, on the one hand, teachers can teach with ease, and on the other hand, students can understand and reflect deeply on theoretical issues through imagination with great interest.

#### **2.1.1. Brain Map Type Learning**

Brain mapping is a model for students to develop theoretical thinking skills both in and out of class. Brain mapping is derived from "brainstorming", which is the practice of drawing on diagrams to form an unbounded mental web of human interaction with one's own mind and recording that web one by one. The key role of brain-mapping learning is that it is characterized by a non-linear philosophical effect. The effect of  $1+1>2$ .

#### **2.1.2. Gathering Style Networking**

The idea of gathering-style communication was inspired by the book club model of Northwestern University of Political Science and Law. The idea was to create a model similar to the community exchange model - a gathering exchange - because of the pressure the book club model would bring to students. The "party-style exchange" requires students and teachers to get together and talk like a family, but the content of the talk must be limited to law-related issues and matters, and the participants of the party can form a certain theoretical and logical thinking through the talk. The "get-together" should become a branded teaching model in law schools, where everyone (teachers and students alike) is a teacher and a student at the same time. The law school should invisibly consider the

performance of students and teachers in the "party exchange" as one of the criteria for evaluating the quality (quality of teaching, etc.) of teachers.

## **2.2. Practical legal thinking skills development**

The cultivation of practical legal thinking skills focuses on guiding students to actively practice, guiding them to combine theoretical thinking with practice and form a set of practical logical thinking. Based on the following considerations: First, although the legal clinic teaching model has been implemented in many law schools, it is still in the embryonic stage and not yet mature. Second, the maturity of moot court development is higher compared to the clinic style. Third, the moot court model is more virtual and does not allow students to truly feel the reality. Drawing on the merits of the legal clinic model and the degree of development of the moot court model, the legal aid moot court model was constructed in terms of practical thinking skills cultivation.

The legal aid moot court model contains two characteristics: First, it has the nature of pro bono assistance. Second, it has the nature of a moot court. Of course, the premise of whether this model can operate healthily requires law schools to promote "pro bono legal aid" both on and off campus in order to get a large number of cases. Second, although the model emphasizes student autonomy, it should also set up certain practical performance management mechanisms to prevent the model from becoming a formality. Finally, students' autonomy should play a key role, and they should clarify the importance of their own practical thinking skills and actively participate in the legal aid moot court.

## **2.3. Improve system management**

The way to cultivate college students' rule of law thinking is not all in the classroom, but permeates all aspects of students' study and life. It is necessary to cultivate a rule of law atmosphere on the campus to act according to the law and protect rights. No matter the leaders of the institution or ordinary teachers and staff, they should abide by the legal system, deal with school affairs according to the law, and be a good example and role model of governing the school according to the law, so that students will believe in the law and do things according to the rules and regulations and legal procedures. The school should pay attention to the participation of students, listen to their opinions, and incorporate their rationalized suggestions when formulating and improving rules and regulations related to students' interests. In the process of revising the rules and regulations for the implementation of disciplinary actions against students, I brought the

draft document to the classroom and let everyone discuss it in groups and give their opinions, which resulted in positive discussions and enthusiastic speeches from students. In particular, most of the students thought that the investigation of student disciplinary actions should involve not only the staff of the department concerned, but also members of the student council of the school or department, in order to ensure the fairness and transparency of the investigation. The school's sense of student ownership was created as a result of the changes made to the article in accordance with the students' suggestions. By participating in legal activities and using legal knowledge and methods to think and analyze problems in practice, students can slowly develop the habit of thinking about the rule of law and their ability to think about the rule of law can gradually improve.

### **3. Research Analysis of College Students' Rule of Law Thinking Ability Based on Big Data**

#### **3.1. Analysis of the cultivation of rule of law thinking among college students**

Figure 1 shows the main reasons for the cultivation of rule of law thinking among college students. In the information database of teachers of ideological and political theory courses in colleges and universities, an online survey was conducted among teachers of undergraduate ideological and political theory courses (hereinafter referred to as "Civics"). The data of "the main factors affecting the cultivation of the rule of law thinking among college students" show that, besides the lack of students' enthusiasm and initiative in the course, the other aspects are: first, the teachers' teaching ability, quality, theoretical level, responsibility and commitment; second, the lack of attention of the school and the unreasonable arrangement of the curriculum and class time. These are all factors that affect the cultivation of rule of law thinking of college students. Therefore, the cultivation of college students' rule of law thinking ability is weak, no matter the guarantee of school policies or the investment of funds. Due to the influence of the biased educational philosophy of university leaders, schools accordingly pay more attention to the development of teachers of professional courses. The status of "basic" course teachers in the school is not particularly important, which causes some teachers to slacken on the course teaching and lack of responsibility and commitment. Schools can hold academic seminars and lectures on rule of law education, organize rule of law education forums, broadcast rule of law-related movies and broadcasts, and encourage students to create or participate in school rule of law clubs, which can broaden students' access to rule of law

information, establish a campus culture that respects the rule of law, and effectively enhance the effect of cultivating rule of law thinking.

Figure 1. The Main Reasons for Cultivating College Students' Thought of Rule of Law

### 3.2. Analysis of new media teaching methods

Figure 2 shows the acquisition methods of interest to the studied college students. With the continuous development of current science and technology and network information, new media technology has been continuously integrated into our teaching. The application of new media can not only concretize abstract knowledge, but also transmit information to students in multiple channels and in all directions, increase the interest of the classroom, improve the teaching effect of the classroom, and thus achieve the teaching objectives. The application of new media technology has higher requirements for teachers' computer operation level, integration of information of materials and control of classroom teaching. By mastering this technology well, teachers not only let students learn knowledge in a relaxed environment, but also improve classroom effects. 61.04% of the researched college students are interested in mobile AAP and 46.98% are interested in WeChat microblogging, which shows that college students like to use the Internet and mobile clients to get the resources they need. Colleges and universities can make use of this way to cultivate rule of law thinking, using scattered and fragmented time to show through tools such as WeChat, QQ and Weibo, and pushing or releasing some latest events at any time so that students can understand the information in a short time. In WeChat, a small bit of legal knowledge is pushed every day using the school's official WeChat public number. In the school QQ service number, we post updates on the latest law changes and promulgations; in the official school microblog, we post stories of legal figures, legal cases and legal anecdotes, so that students can feel the

legal atmosphere in a relaxed and pleasant environment. This way of teaching is subtle and will slowly change the way of thinking of college students. At the same time, the school can also combine the hot legal events on TV and internet, and use the vividness and image of media video, image and sound to present them through catechism and micro-lesson, so that the students will be subconsciously interested in law, from which they can better grasp the rich legal knowledge points and achieve the ideal effect of rule of law education.

Figure 2. Acquisition methods of interest of surveyed college students

#### 4. CONCLUSION

This paper discusses the cultivation of rule of law thinking of college students from the theoretical basis of rule of law thinking and big data technology, and sorts out the concept, characteristics and contents of rule of law thinking. After analyzing the current situation of cultivating the rule of law thinking among college students, we found that 61.04% of the surveyed college students are interested in mobile AAP and 46.98% are interested in WeChat microblog. This indicates that college students like to use the Internet and mobile clients to get the resources they need. The school can combine the hot legal events on TV and internet and use the vividness and image of media video, image and sound to present them through catechism and micro-class. As long as the classroom enthusiasm of college students is enhanced and the teaching effect is highlighted, so that the students' legal knowledge, awareness of the rule of law and ability to apply the law can be improved continuously and the formation of their rule of law thinking can be promoted.

## **ABSTRACT**

This paper firstly analyzes the means and ways of technology application based on the current situation of artificial intelligence technology development. Secondly, based on pedagogy and psychology, the research of distributed learning theory, constructive cognitive learning theory and situational learning theory are taken as the theoretical basis for the analysis of the feasibility of technology application in the teaching scene of painting and design universities. Finally, based on the research on the product scenario and user analysis of the current stage of the application of artificial intelligence to painting and design education in colleges and universities at home and abroad, the problems of the existing technology application are summarized and its application significance value is discussed. The results show that the application of AI technology to painting teaching in colleges and universities effectively improves students' learning efficiency by 23.6% and increases their learning interest by 33.8%. The research of this paper provides suitable application strategies for the popularization and characteristic development of the future application of AI technology in college painting and design education, and has certain practical significance for the development of social education multi-structure.

Artificial Intelligence Technology; Distributed Learning; Teaching in higher education; Painting Design

## 1. INTRODUCTION

As AI technologies are widely used in more and more industries and fields, the application model of AI technologies in art and design education is undergoing a process of moving from ambiguity to clarity [1]. First of all, the dissemination of AI technologies into the field of education has been the forefront of AI applications. Image recognition, language recognition, and other processing based on AI technologies have been applied in the process of popularization and instrumentalization of education [2]. Numerous AI courses are emerging, and the wide application of AI technology in the education sector has become one of the main directions of education reform and education optimization in recent years [3-4].

The impact of AI technology on the ecology of art design has also been gradually reflected, and in 2018, Google launched the "DeepMind" AI program, which allows users to learn to draw independently and achieve artistic expression by decomposing and reconstructing many pictorial information [5]. The substantial breakthrough of artificial intelligence technology in art creation has inspired art and design professionals to explore the creation of artificial intelligence [6]. In the field of art and design, which is bound to go to the market, the impact brought by the application of AI technology is an objective existence that every art and design creator cannot ignore [7]. Moreover, art and design education based on AI technology does not reject the traditional human educational engineering with inheritance, humanity, and systemic nature [8]. Rather, it helps human beings to improve education and learning efficiency through the application of AI technology with higher efficiency, so as to better achieve the purpose of education universality, intelligence and automation [9].

This paper firstly summarizes the technical and theoretical foundations of AI technology applied to art and design education in colleges and universities, and forms the basic dimensions of the investigation. Secondly, it summarizes the current situation of the application of AI technology in college art and design education, including the change of AI technology on art and design ecology and the specific application and analysis of AI technology in college art and design education. Finally, through the analysis of textual

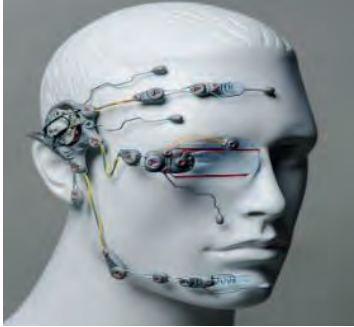

information, questionnaire data and interview results, the current situation, problems and causes of the application of AI technology in college art and design education are summarized.

## **2. Analysis of the current situation of the application of artificial intelligence in college painting education**

### **2.1. The Impact of Artificial Intelligence on the Ecology of Painting and Design**

The influence of artificial intelligence on painting and design is firstly reflected in the influence on the creation of painting and design, which is also the realistic basis for the application of artificial intelligence technology to painting and design education in colleges and universities. Thanks to the development of intelligence and automation of AI technology, the creative ability of painting, which traditionally requires a long period of painting education, can be cultivated. In the era of artificial intelligence, relying on computer algorithms, distributed learning, neural networks, natural language processing and other underlying technologies, the "painting creation ability" of AI systems can be cultivated, and this ability can create excellent paintings. Table 1 shows the impact of artificial intelligence on art and design creation.

**Table 1.** Impact of Artificial Intelligence on Art and Design Creation

The impact of artificial intelligence on the creation of painting and design	Contrast		Case Study	Impact
	Traditional	Emerging		
Innovative Artists The Creative Concept	Art from Life The content determines the form, art is the expression of the subject's emotions	The creative style of classic heirloom artists can be restored by AI technology	 <p>"The Next Rembrandt" is entered into an algorithmic system for automatic AI creation</p>	The artist expresses his thoughts on the world through artificial intelligence and cognition
Expanding and restructuring Designer community	Artistic creation is a small number of artists or design masters master designers area of expertise	Everyone is an artist Home, will design and creation community to almost all to almost all general public	 <p>Artist "Cyborg", AI intelligent system forms a super designer that empowers to every general public</p>	When human intelligence creates works superior to human hair artists continue to innovate the concept and form of creation
Innovative art design Creative approach to design Style	Artists rely on creativity and experience to create, requiring a high level of artistic education and artistic talent	A collaborative human-machine approach that gives AI systems the ability to create art independently of humans	 <p>Artificial intelligence deer class can automatically generate more than 8,000 posters in one second, which greatly develops the commercial prospect of artificial intelligence art design</p>	The creative process and results of AI can be a great source of inspiration and a huge source of material

The impact of artificial intelligence on painting creation is divided into three main aspects: first, AI technology revolutionizes the creative concept of art. Secondly, AI technology expands and reorganizes the group of designers. Third, in artificial intelligence innovates the creative method of art and design.

## **2.2. The current application of artificial intelligence in college painting and design education**

### **2.2.1. Teaching content**

The current stage of human-machine collaboration is an inefficient state of human-machine collaboration, and in March 2018, China became the second country in the world to include the development of artificial intelligence technology as a national strategic direction. This signifies that China is currently progressing from the mobile information era driven by the Internet of Things to the era of full AI applications. The ability of human-computer synergy includes the ability to integrate information of teaching materials, the ability to synergize teaching methods, and the ability to create painting and design. Due to the uniqueness of its discipline, painting and design education focuses on both the accumulation of art theoretical knowledge and the comprehensive development of creative inspiration and hands-on skills in painting. Artificial intelligence technology based on distributed learning can be well integrated into the production and creation of educational content.

### **2.2.2. Teaching Media**

Artificial intelligence technology as the framework basis and technical support of a new teaching media, virtual classroom based on VR and AR technology has become a new medium for education and teaching. With the catalyst of this medium, it is more conducive to the popularity and innovation of art and design education. In the future, artificial intelligence is responsible for the duty of imparting knowledge, teachers are responsible for the duty of educating people, and the role of teachers will be changed as a result.

The transformation of teaching media has brought new problems. since the 1990s, teachers can export knowledge to students through the use of a variety of educational media, and students can likewise meet the corresponding needs through a variety of information

channels. under the mode of AI + online education, a series of AI online class platforms have emerged at home and abroad, such as Squirrel AI, New Oriental Online, VIPKID, etc. Until July 2020, the users of mobile Internet in China reached 1.319 billion, and Chinese users occupied 32.17% of the global mobile Internet. The development of mobile Internet makes education information in the network of good and bad, so the development of teaching media, the control of educational content has become a brand new problem.

### **2.2.3. Teaching Environment**

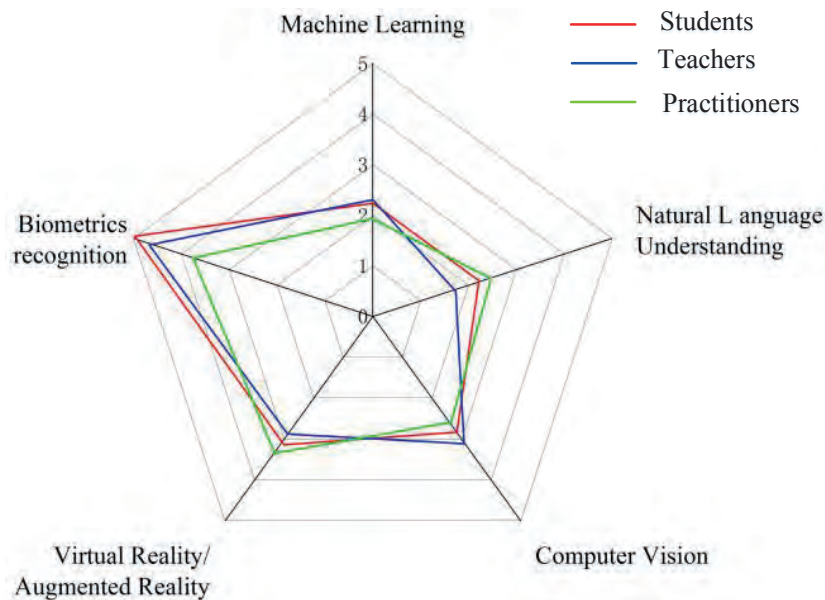

The educational environment under the application scenario of artificial intelligence technology has similarities with the teaching environment in the traditional sense. Analyzed from an objective perspective, the new teaching environment is the basis for carrying out art and design creation, and the objective environment determines the discovery and burial of artistic creativity, and its application changes are mainly divided into the following three aspects.

(1) The physical environment is explained from a narrow perspective, with the development of network technology, virtual reality technology and augmented reality technology. The physical environment of education has been transformed from specific locations such as classrooms and creative workshops to learning environments that can support inter-temporal interaction and contextual experiences.

(2) Broad resource acquisition environment, online information blowout In the network era, the Internet of Things and mobile Internet have become the bearers of information resources. "Beili Beili" is the largest multicultural community in China, which includes communities about art, education and other related areas. "Zhihu, a high-quality Q&A community in China, gathers top commentators in the art, history, technology, and education industries on the Chinese Internet. By selecting two platforms, "Beili Beili" and "Zhihu", to study the information resources in the teaching environment, we found that the speed and popularity of video resources are much higher than that of textual information resources. In terms of audience's understanding of the content, textual information brings a stronger sense of impact.

### 3. Findings and Analysis of Artificial Intelligence in College Painting Education

The statistics for which AI technologies are most likely to be applied to college art and design education are shown in Figure 1. It can be seen that: the top three are natural language understanding (AI translation, question and answer system, etc.), computer vision (image understanding, 3D vision, dynamic vision, machine vision, etc.), and biometric recognition (face recognition, iris recognition, palm pulse recognition, etc.), which are close to each other, accounting for 30% or less. This indicates that from the perspective of students, teachers and practitioners, these three AI technologies are currently the most suitable for application in the field of art and design education.

**Figure 1.** Statistics of art and design education in higher education

For what AI-related technologies have been used in current learning/teaching/work, the statistics show that: computer vision (image understanding, 3D vision, dynamic vision, etc.) has the highest percentage of users, with the highest contribution from practitioners in comparison, indicating that this AI technology is used most frequently among practitioners. The second highest ranking is natural language understanding (AI translation, question and answer system, etc.), in which the highest percentage contribution is from students, indicating that the application of AI technology by the student group is mainly focused on natural language understanding.

The proportion of teachers' applications of the five technologies is more evenly distributed.

On the whole, AI-related technologies have gained a certain degree of popularity in the field of painting and design in colleges and universities, and specific application tools and application environment have been initially formed, and the auxiliary functions for art and design learning and teaching have been initially revealed.

With regard to the attitude of applying AI technology to art and design education in domestic colleges and universities, the statistical results show that the highest percentage of respondents said "AI technology will be fully applied to art and design education". Among them, the proportion of students contributed the most, but the proportion of students, teachers and practitioners all contributed similar values. It means that most of the respondents are optimistic and open to the application of AI technology in art and design education in colleges and universities, and the percentage of "AI technology will assist to complete part of art and design education" is the second highest.

#### **4. CONCLUSION**

This paper discusses the issues related to the application methods, application processes and application techniques of artificial intelligence technology in art and design education in colleges and universities. Through the comparison of the existing application results, application methods and application contents of domestic and foreign universities, the teaching tools, teaching methods and teaching concepts of art and design education are substantially studied. In addition, this study also carries out quantitative research and analysis on the interest attitude, cognitive degree and practice way of applying AI technology to art and design education in colleges and universities through the research questionnaire method.

## **ABSTRACT**

The article firstly discusses the application of artificial intelligence technology in the student management system platform of colleges and universities. In this process, universities should actively take measures to promote the construction of student management platform, establish scientific management concept, improve management system and strengthen the construction of data management faculty, so as to promote the innovation of student management system in universities. Based on the analysis of student management personnel leaving based on artificial intelligence technology, it can be learned that: the lowest leaving rate in the four years from 2009 to 2012 was in School D in 2012, but its leaving rate also nearly reached 5.2%. In this study, we use the advantages of artificial intelligence technology to improve student management in colleges and universities to ensure the efficiency of school management.

## **KEYWORDS**

Artificial Intelligence Technology; High School Students; Management System Platform; Work efficiency

## 1. INTRODUCTION

Applying artificial intelligence in the field of education is conducive to improving traditional teaching patterns and mechanization, promoting personalized education, and fostering innovative thinking talents [1-2]. Calculations with traditional manual statistical analysis of data are slower, have a higher error rate, and are difficult to perform for long periods of time without interruption, while the use of computers allows for faster, more accurate, and longer uninterrupted work [3-4]. With the strong support of artificial intelligence technology, statistical analysis of all aspects of student information is efficient and accurate. By analyzing and mining the big data of students, artificial intelligence can develop a set of scientific and reasonable, personalized educational programs based on the understanding of each student's learning characteristics to provide higher quality education for students, thus promoting the development of education [5-6].

Based on the historical characteristics of the development of artificial intelligence technology and the objective rules of student management in domestic universities, the literature [7] conducted a preliminary brief study on the development trend of artificial intelligence in student management in the future. The literature [8], in the context of AI technology, can improve the skills and ideological awareness of student work managers in colleges and universities, establish the awareness of Internet big data, improve the quality and ability of student cadres team, improve the student management system, and make student management work smoothly. Literature [9] uses artificial intelligence technology to do a good job in student management in order to make the school management more standardized, make the school better and better, and cultivate more excellent talents for the Party and the country.

This paper firstly introduces the relevance of artificial intelligence technology and teaching management application, and proposes a new concept of student management in colleges and universities under artificial intelligence environment. Colleges and universities should establish strategic goals that are compatible with the environment, adhere to the human-oriented concept in the management process, break through the internal hierarchy and implement borderless management, and establish equal and

democratic management relationships among students. The article concludes with an analysis of students' psychological problems based on artificial intelligence technology, which can understand the psychological state of college students nowadays and accordingly provide positive psychological counseling to students, thus contributing to their having a healthy psychological state.

## **2. Artificial Intelligence Technology**

In the era of artificial intelligence, modern information technology has the prospect of deep integration in all aspects of school education and teaching work. The student management data platform collects student behavior data such as student leave, absenteeism, rewards and punishments, etc. The use of AI-related technologies to discover and analyze data trends, intrinsic laws, etc. can provide new ideas and methods for school rectification work. Artificial intelligence is a branch of computer science whose goal is to use computer technology to simulate, extend and expand human intelligence and to produce machines with a certain level of intelligence. In addition to computer science, artificial intelligence involves many other disciplines, and through the combination with the needs of various fields, it generates a "comprehensive knowledge base", makes intelligent strategy analysis, and forms an intelligent system with "information → knowledge → intelligence" conversion mechanism as the core. In this way, it is possible to solve the problems of certain fields of work in order to provide intelligent services for the national economy, society, culture, education and other fields, and thus further promote the modernization of various industries.

### **2.1. Building a student management system**

With the development of information technology, the role of various education information platforms in supporting education teaching management and improving education services has become increasingly significant. As a fundamental resource of various educational information platforms, student data plays a crucial role in supporting in-depth analysis, scientific decision-making, real-time warning and feedback, self-diagnosis and improvement in education and teaching management. Building a student management system based on artificial intelligence, collecting student data from the source, aggregating, organizing, analyzing, mining and sharing

student data, and improving data feedback capabilities are conducive to scientific decision-making for school diagnosis and improvement. With the help of the platform, regular and automated periodic independent diagnosis and improvement can be realized, while the effective implementation and operation of teaching diagnosis and improvement work can be supported by multi-level and multi-dimensional means through information technology, which can promote the modernization of the school's internal governance capacity and thus further improve the quality of school teaching and management services. Colleges and universities should accelerate the construction of student management system platforms, actively introduce advanced information technology and build management data information platforms. At the same time, the existing resources within the school should be integrated and its characteristic development structure should be adjusted, and thus the fragmented data should be effectively saved into the student management system.

## **2.2. Structure and role of the student management system platform**

The student management system platform has a data layer that aggregates raw data and a functional layer with various management modules. The functional layer includes modules for school orientation management, dormitory assignment, class management, leave approval, award and loan management, student activities on campus, student internship and employment management, etc. It brings together the management data of the whole learning and life cycle of students from enrollment to departure. The amount of data generated by students in the school is huge, including basic personal information such as students' names, gender, birthdays and nationalities, academic information such as the date of enrollment, classes and majors, family information such as home address and parents' siblings, dormitory information such as floor and bed numbers, academic information such as study courses and exam results, as well as daily leave approval and cancellation information, scholarship and loan information, internship and employment information, etc. There are many different items and categories. Some of these categories have a high frequency of data generation, such as leave and cancel information, information on participation in

activities and rewards and punishments, which results in a large amount of data generated by each student from enrollment to departure. It is very difficult for schools to aggregate and manage the data of thousands or even tens of thousands of students at the same time, and it is impossible to personalize the management and services for each student's data, and even more difficult to conduct further data analysis and decision-making. This will lead to student data, although it has been continuously generated, but only dormant in the database, can not play the role, and the use of artificial intelligence technology, can solve the above problems.

### **3. The application of student management in universities based on big data and artificial intelligence technology**

#### **3.1. Application in student management**

The key group of people in the college student management system is college students. The college student management system is a dynamic data process from when students first enroll to after graduation, which contains many elements of information service and provides the most original data for the future development of colleges and universities. At the stage of students' initial enrollment, it is possible to make use of big data and artificial intelligence technology to count various data and information of enrolled students, so as to prepare and provide the best solutions for orientation work. For example, the dormitory allocation of college students can be reasonably allocated with the help of big data and artificial intelligence technology. It can divide the enrolled students into more basic information such as their majors, regional cities, nationalities and interests, and provide the best solution for students' dormitory assignment. In student security management, it can identify suspicious people and lawless elements around the campus in a timely manner with the help of face recognition technology, intelligent access control, intelligent establishment equipment and artificial intelligence system, so as to provide a high-quality campus environment for students and effectively protect the life and property safety of teachers and students in colleges and universities.

#### **3.2. Application on teaching mode**

Big data and artificial intelligence for college student management system services are reflected in the teaching mode, which reverses

the teacher's dominant position in traditional teaching and puts students' future development needs as the first priority, so that students' learning is more closely related to the cultivation of abilities. With the introduction of big data and artificial intelligence technology, students can learn teaching resources through online courses or simulate practice and develop various abilities through artificial intelligence. This technology also facilitates communication between teachers and students outside the classroom and enables interactive teaching and learning exchanges. Through these technologies, teachers can also use the platform to exercise their authority and further understand how students usually learn in online courses. Students can also use the intelligent platform to sign in, write assignments, and listen to class punch cards and other works. The application of this teaching mode can greatly facilitate students' learning life, and also actively drive students to take the initiative to learn and strengthen the ability to absorb knowledge.

### **3.3. Analysis of students' psychological problems**

Figure 1 shows the analysis of students' psychological problems. We can get: only 8% of students who have psychological problems turn to counseling, other ways of psychological relief are telling parents (22%), confiding in friends (23%), self-regulation (17%), and seeking help from teachers (7%), all of which are effective ways of psychological relief. The data also show that 23% of the respondents believe that even if they encounter psychological problems, they will only keep them inside and will not tell anyone, which can easily lead to students' psychological disorders that cannot be channeled and depression that cannot be relieved, resulting in psychopathology. When students encounter psychological problems, they will make their self-confidence drop, which requires teachers or counselors to help them overcome their psychological barriers and find self-confidence again according to their specific situations. The lack of psychological counseling facilities and equipment as well as personnel in colleges and universities makes students with psychological problems not get proper care and help, and psychological problems are not solved and treated in time, even causing undue tragedies, which seriously affects the healthy growth of students.

Figure 1. Analysis of students' psychological problems

### 3.4. Analysis of student managers' departure in colleges and universities

Table 1 shows the departure of student managers in colleges and universities. Although the departure rate of college counselors is decreasing year by year, it seems that the overall stability of college counselor team is not high. In the four years from 2009 to 2012, the lowest turnover rate was in School D in 2012, but its turnover rate also nearly reached 5.2%, which is still a relatively high rate. The growth cycle of a counselor takes about 3-5 years, and their departures inevitably cause schools to hire new teachers who are young and have no management experience to rush into the job. Although these young teachers are enthusiastic about their work, they lack experience and are not familiar with the laws of student management, so they can only rigidly apply the school's rules and regulations, and their management methods are too dull. The unstable counselor team causes discontinuity in student management and makes it difficult to implement the school's rules and regulations. Frequent changes of counselors also have a great impact on the students they manage, making them lack ownership and a sense of collective honor, and making class discipline lax, making it difficult to form a class collective with strong cohesion. Some capable counselors see this position as a springboard to get civil service, graduate school and find a better job, so it is difficult to do their job

well. The replacement of counselors has become a common occurrence in private universities, which brings great difficulties to student management.

**Table 1.** Resignation of university student management personnel

school	2009	2010	2011	2012
A	8.30%	7.80%	4.50%	2.10%
B	8.90%	8.60%	5.50%	2.80%
C	8.30%	9.30%	7.80%	5.50%
D	6.50%	6.90%	5.50%	1.90%
E	7.20%	9.10%	4.90%	3.50%

#### 4. CONCLUSION

Based on the historical characteristics of the development of artificial intelligence technology and the objective rules of student management in domestic universities, this paper analyzes the necessity of the application of artificial intelligence in student management in universities. The following conclusions can be drawn.

(1) Based on the analysis of students' psychological problems by artificial intelligence technology, it can be seen that only 8% of students who have psychological problems turn to psychological counseling, other ways of psychological relief are telling parents (22%), confiding in friends (23%), self-regulation (17%) and asking for help from teachers (7%), which are effective ways of psychological relief, and through artificial intelligence technology can clearly understand Each student's psychological problems, so as to carry out targeted psychological counseling and establish correct values of life for students.

(2) The analysis of the situation of college student management personnel based on artificial intelligence shows that although the departure rate of college counselors is decreasing year by year, the overall stability of the college counselor team seems to be low, and its departure rate is nearly 5.2%. According to the artificial intelligence technology, it can accurately and quickly control the feedback of the departure rate of college counselors, so as to improve the efficiency of school management.

## **ABSTRACT**

Cardiopulmonary physical investigation is a significant part of the core course of rehabilitation therapy technology (RTT) in colleges and universities. In this paper, we designed and developed AR teaching software based on augmented reality intelligence technology to simulate the real cardiac physical examination, and designed and realized the real-time interactive visualization application software for the cardiac physical examination part of the medical-related professional diagnosis course. The abstract and difficult theoretical course content was transformed into virtual reality content that is easy to understand and visualize, and real-time interaction was realized. The results show that AR technology can improve students' interest in learning RTT by 23.93%, effectively break through the difficult points of teaching RTT, and improve students' performance in RTT by 15.28%. The AR teaching proposed in this paper is applied to the teaching of higher vocational RTT to enrich teachers' teaching means, improve teaching effect, increase students' learning interest, and have a positive impact on improving students' performance in RTT.

## **KEYWORDS**

Cardiopulmonary physical examination; Rehabilitation Therapy Technology Program; AR Teaching; Real-time interaction

## 1. INTRODUCTION

With the progress of modern education technology, the utilization of augmented reality technology (AR-T) has also commenced to infiltrate into the field of education, and the New Media Consortium of the United States has twice registered AR-T as an innovative technology that will have a weighty influence on modern education in the Horizon Report [1]. AR-T has gathered many worthwhile experiences in a variety of learning modes, such as game learning and collaborating learning, and has positively and efficiently combined digital teaching resources and the real world, and has produced popular educational products such as AR books, AR educational software and AR educational games [2-3]. Thus, the growth of AR-T has placed a respectable substance for its utilization in the ground of education.

The rehabilitation therapy technology (RTT) profession is a science about space, and the RTT profession has characteristics such as regional and comprehensive, involving a large time scale and space scale, and the abstract subject characteristics increase the learning difficulty [4]. AR-T can cover the abstract, especially the geographic knowledge with large time and space scale, real three-dimensional in the actual environment, and the students can be immersive in the increased truth world to observe, experience and understand knowledge, creating advantageous conditions for teaching RTT that are difficult to be compared with other technologies [5]. Faced with the speedy increase of AR-T, teachers should take a confident attitude to encounter the occasions and tasks that AR-T brings to the education of RTT majors [6].

The utilization of amplified truth technology provides educators with brand novel teaching tackles. At the same time, it stimulates students' interest in learning novel knowledge and allows them to stimulus novelty through hands-on experience [7]. Therefore, the utilization of augmented reality in the education industry is a new leap in the progress of educational technology, which creates an environment for independent learning [8]. The traditional "teaching for learning" learning style has evolved into a novel learning style in which students acquire knowledge and skills through a novel information-based environment and tools, which is in line with the educational

perception of the novel teaching reorganization and helps to grow core professional skills and literacy of medical students [9].

In this paper, through a questionnaire survey of students and an interview survey of teachers, we learned about the recent teaching status of RTT majors in colleges and universities, the possibility of applying AR-T in the teaching of RTT majors, and the analysis of teachers' and students' attitudes toward the utilization of AR-T in the classroom of RTT majors. Based on the statistical analysis, the utilization case of AR-T in teaching was designed with reference to the cardiopulmonary physical examination of RTT majors in conjunction with the actual teaching in colleges and universities. Using an accurate experimental research method, classroom teaching experiments were implemented in experimental and control classes of the same level, so as to verify the effectiveness of AR-T applied in teaching RTT majors.

## **2. AR intelligent teaching software system module design and implementation**

The software construction design was completed according to the front-line teaching needs, the practical components to be realized and their supplies were analyzed, and the basic system movement design, software visualization design and collaboration design were completed based on the head-mounted augmented reality device to develop and realize the teaching software for RTT. By importing the operation in the wearable AR device, the real-time interactive visualization utilization software of the diagnostic part of the diagnosis course involving medical profession was designed and realized.

### **2.1. AR-T requirements for visual design**

Visualization is one of the most important elements of AR software. The visualization design of the software needs to fully consider various factors. In the RTT program, the cardiac auscultation part is one of the most representative contents of diagnostics, and its traditional teaching methods are.

(1) Showing the auscultation zone of each valve of the heart on the body surface.

(2) Introduce the changes in auscultatory sounds caused by valve lesions and ask students to visualize the variations in lesions based on their knowledge of cardiac anatomy.

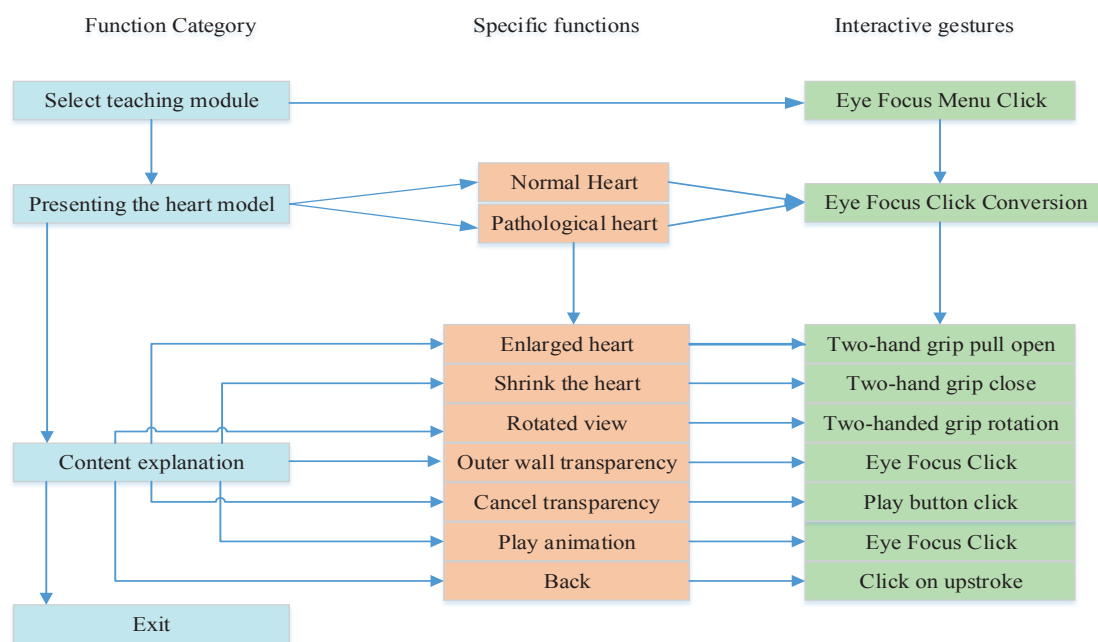

(3) To infer the status of the lesion back from the abnormal heart sounds, multiple associations, transformations, and inferences are made, which has always been the focus and difficulty of teaching diagnostics.

The software reasonably introduces augmented reality technology into the theoretical teaching of the auscultation course, and uses AR-T to project the heart in three dimensions into the classroom. The AR glasses are used to receive and operate through the somatosensory control system to show the teaching content to students, effectively visualizing and concretizing the abstract theoretical knowledge and reducing the trouble of teaching and learning. The conforming dynamic 3D models were established, in which the establishment of the heart model needs to consider aspects such as the visual fineness and realism of the heart model, whether the storage and modification of information can be fed back to the background database in a timely manner. These aspects, because they involve dynamic molding of numerous mutual heart sickness states, are considered in terms of efficiency and material reusability, and the group chose to model some major constructions in the heart separately (left atrium, left ventricle, right atrium, right ventricle, and each valve). Then they are combined in the run, and the modeling can be run in different disease states by simply modifying the affected lesion sites. However, since it is a dynamic model, the separate modeling may have extremely small-time transformations during the dynamic display, which may gather to a non-negligible level if repeatedly played several times. Therefore, in order to achieve a good display effect, this paper chooses to completely re-model all the different disease states to guarantee the display effect as much as possible.

## **2.2. Real-time interaction methods related to teaching content**

The current real-time collaboration methods that head-mounted augmented reality devices can recognize. Voice collaboration can recognize keywords, and gesture collaboration mainly includes clicking, grasping, moving, zooming in, zooming out, rotating, playing

and other functions. The AR teaching software for cardiac physical examination of RTT can present the teaching contents used for teaching through the above collaboration methods. The teacher can design the model projected by the control according to the functional characteristics of the head-mounted augmented reality device to show the abnormal blood flow status in valve lesions from multiple angles for students to observe, thus improving the efficiency of teaching and learning. The specific collaboration design of the software is shown in Figure 1.

**Figure 1.** Real-time collaboration design

### 3. Results and analysis of the utilization of AR intelligent teaching in RTT program

#### 3.1. Statistics and analysis of examination results

Through the analysis of the results of the preliminary survey, a teaching experiment program was developed based on the current situation of teaching RTT to students in a college. At the end of the experiment, the RTT test was used to compare whether there was a significant difference between the performance of the experimental class and the control class in RTT. To find out whether the subjective factors such as interest in learning RTT and learning effect of the students in the experimental class changed through questionnaire survey. The interview survey was used to find out whether AR-T

could help teachers overcome the shortcomings of the traditional teaching model and whether it could play a role in facilitating teaching.

The results of the analysis according to SPSS software are shown in Table 1. It can be seen in the statistical data that the mean scores of the experimental class (Class A) and the control class (Class B) in RTT were 64.28 and 56.37, respectively, and the mean difference between the two classes' post-test scores was 6.25, which was significantly higher than the mean difference of the pre-test RTT scores. The independent sample test data are shown in Table 2. It can be seen that the Levene's test of equivalence of variances significance was  $0.688 > 0.05$ , which means that the condition of assuming equal variance holds. The Sig (two-tailed) =  $0.026 < 0.05$  with reference to the assumed equal variance indicates that there was a significant difference between the post-test scores of the experimental and control classes in rehabilitation therapy techniques within the 95% confidence interval.

Comparing the statistics before and after the experiment, it can be seen that before the teaching experiment began, there was no significant difference between the geographic scores of the experimental and control classes, indicating that the students in both classes were basically at the same level of rehabilitation therapy techniques. And at the end of the experiment, the RTT scores of the experimental class were significantly higher than those of the control class. Through the analysis of the experimental results, we can get the conclusion that AR-T applied to the teaching of RTT can improve students' learning achievement in RTT.

**Table 1.** Statistical results of geographical posttest score group

Classes	Number of cases	Mean	Standard Deviation	Standard error mean
Class A	48	64.28	11.25636	1.69289
Class B	47	56.37	10.56952	1.57493

**Table 2.** t-test results of independent samples of geographical posttest scores

	Levene's variance equivalence			Mean Equivalence t-test			Difference 95% confidence interval test	
	P-value	Significance	t-value	Free	Sig.	Mean	Lower limit	Upper limit
Equal variance	0.163	0.698	2.296	87	0.026	5.239	0.6565	9.8738
Unequal variance			2.289	86.32	0.027	5.239	0.6512	9.8535

### 3.2. Statistics and analysis of questionnaire survey data

The professional performance of RTT can only be used as an aspect to evaluate the effectiveness of AR-T utilization in teaching RTT. In order to increase the scientificity and accuracy of the evaluation of the experimental results, questionnaires and interviews were conducted with teachers and students of the experimental class respectively after the experiment to understand the utilization effect of AR-T in improving students' interest in learning RTT and breaking through the difficulties of teaching RTT.

The survey results showed that 89% of the students expressed interest in the teachers' utilization of AR-T in teaching, 9% of the students expressed indifference, and 2% of the students were not interested. Compared with the conventional teaching method, 95% of the students prefer teachers to apply AR-T to assist teaching, while 5% of the students prefer the conventional teaching method. In terms of learning interest, 70% of the students thought their interest in learning geography had become stronger after the teachers used AR-T, 25% of the students thought their learning interest had not changed much, and 5% of the students thought their learning interest had become weaker. In terms of classroom attention, 66% of the students thought AR-T could sometimes attract their classroom attention, 25% thought AR-T always attracted their attention, and 9% thought AR-T could not attract their attention. The above data show that most students are more interested in the utilization of AR-T in the classroom. Compared with the conventional teaching methods, students prefer teachers to apply AR-T for teaching, and the utilization of AR-T can effectively improve students' interest in learning RTT and attract students' attention in the classroom.

#### **4. CONCLUSION**

In today's comprehensive information age, the utilization of AR intelligent technology in the professional teaching of RTT in colleges and universities is the trend of the times and an innovative move to reshape the classroom. In this paper, to verify the teaching effect of AR intelligent technology applied in the teaching of RTT, two classes with the same level of learning in the teaching of RTT were selected as experimental subjects for the experiment. Under the premise of ensuring the same control variables, the experimental class applied AR-T to assist teaching, while the control class used conventional teaching methods. After the experiment, the teaching effect was evaluated by analyzing the test scores, questionnaire results and interview findings of the teaching in RTT. The results showed that AR-T could improve students' interest in learning RTT by 23.93%. AR-T could effectively break through the difficult points of teaching RTT. AR-T could improve students' performance in RTT by 15.28%.

## ABSTRACT

The water and fertilizer integrated automatic control system in this paper is based on wireless communication technology, which connects the wireless communication module to the core controller PLC of the variable fertilizer applicator. The cell phone APP or computer website can control the fertilizer applicator from a distance in order to complete the command control of data dynamic monitoring, switching control, fertilizer application amount setting, water and fertilizer mixing and pump start/stop. The use of water-fertilizer integration can substantially improve the utilization rate of fertilizer, which can reduce the amount of fertilizer by about 40% per year, and the annual water volume per hectare is only 30%-40% of that of furrow irrigation, with cost savings of 6,000-9,000 yuan. Through water and fertilizer integration automatic control system, it can reflect the water demand condition of crops more comprehensively, save the cost and effectively realize water-saving irrigation and precise fertilization.

## KEYWORDS

Water and fertilizer integration; Wireless Communication; Automatic control systems; Dynamic data monitoring

## 1. INTRODUCTION

Traditional heliostat greenhouses are mainly used for irrigation and fertilization of crops by hand, but the lack of a scientific theory of fertilizer distribution and application by farmers has led to serious waste of water and fertilizer [1]. Water and fertilizer integration system is a modern agricultural technology that can apply water and fertilizer to crops simultaneously through pressure pipes [2]. This technology delivers water and fertilizer mixture through a network of pressure pipes and applies water and fertilizer to crops by means of drip and sprinkler irrigation to achieve efficient use of water and fertilizer [3-4]. The use of agricultural water-fertilizer integration technology can significantly reduce the amount of fertilizer, improve the rationality of water and fertilizer use, reduce nutrient losses in the soil, and enhance the mobility of N, P, and K in the soil [5].

The literature [6] and other scholars studied a set of adaptive optimal irrigation monitoring schemes, which laid the theoretical foundation for the subsequent progress of smart agriculture. Literature [7] and other scholars designed a farm irrigation system capable of remote control and monitoring. The literature [8] researched and proposed an intelligent irrigation system based on open source technology, which focuses on sensing ground parameters such as soil moisture, temperature, and environmental conditions to make real-time predictions of farm irrigation needs and to make automatic irrigation decisions based on this information data. In the literature [9], it is pointed out that Palestine has introduced water-fertilizer integration technology from Israel, and after nearly two decades of application and improvement it has been used in more than 97% of vegetable production in the Jordan River Gorge region, while more than 87% of farms have achieved a significant increase in production efficiency with the help of this technology, putting Palestine at the forefront of agricultural development in the world.

The water and fertilizer integrated remote automatic control system proposed in this paper consists of fertilizer dilution system, uniform mixing system, remote automatic control system, monitoring system and field sprinkler irrigation system, and applies data acquisition, data processing, wireless communication and intelligent control technologies. It consists of programmable controller, wireless

communication module, touch screen, and components such as EC, pH sensor, pressure sensor, solenoid valve and pump to form a complete system. Local control of the fertilizer applicator is realized through the touch screen, and the fertilizer applicator can be controlled from a distance to complete relevant commands with the help of cell phone APP or computer website.

## **2. Water and fertilizer integration automatic control system**

### **2.1. System Composition**

The water-fertilizer integration remote automatic control system is mainly composed of 4 parts: fertilizer dilution system, uniform fertilizer mixing system, remote automatic control system, monitoring system and field sprinkler system. The fertilizer dilution system realizes the dilution and supply of different types of fertilizers and the filtration of impurities in the water-fertilizer mixture through fertilizer drums, mixing pumps, water injection pipes and fertilizer suction switch filters. The uniform fertilizer mixing system includes water inlet channel, fertilizer suction channel, fertilizer mixing channel, water-fertilizer mixing and fertilizer application channel and fertilizer application pump, which can complete the mixing of different fertilizers in proportion and the stable delivery of water-fertilizer mixture in high lift. The remote automatic control system includes PLC, wireless communication module, relay, touch screen, cell phone APP or computer website. The system under off-site through cell phone APP or computer website, local through the touch screen to send commands, can realize the control of fertilizer mixing, fertilizer suction and mixing, timed start of fertilizer suction program. The monitoring system consists of a touch screen, pressure sensors, EC sensors, pH and gauges equipped with 3 types of sensors. The touch screen is able to display the EC value, pH value, water pressure value and other functional options during operation. The field sprinkler system is mainly composed of delivery mains, solenoid valves, spraying components and field pipe network.

### **2.2. System working principle**

The water and fertilizer integrated remote automatic control system is based on PLC as the core, with remote communication module, 1 fertilizer applicator as 1 remote control object and 1 equipment code set. After the wireless communication module is connected to the

network, each variable in the system can be viewed through the cell phone APP or computer website to control the solenoid valve switch of the fertilizer applicator, the start/stop of the fertilizer pump and mixing pump and set different fertilization programs, etc. At the same time, the relevant data monitored is transmitted to the cloud platform, which can be viewed by users in real time on the cell phone APP or computer website.

## **2.3. Important system components and key technologies**

### **2.3.1. Water and fertilizer integrated fertilizer applicator**

The water-fertilizer integrated fertilizer applicator is equipped with control system, monitoring system and uniform fertilizer mixing system. The control software is used to control irrigation, fertilizer application and dilution of fertilizer solution when working. Combined with the data analysis of sensors on the concentration and pH of water and fertilizer mixture, the corresponding fertilization plan is formulated. When the crop does not need to be fertilized, the fertilizer pump can be turned on for water replenishment to achieve high head irrigation. The overall piping of the fertilizer applicator consists of UPVC pipes with an inner diameter of 25.20mm connected. The core components of fertilizer suction on the water-fertilizer integrated fertilizer applicator are mostly venturi type, and SSQ-200 jet pump is selected as the fertilizer suction component. The principle of fertilizer suction by jet pump is that when the water with certain pressure passes through the conical nozzle, the water velocity changes rapidly and a negative pressure is generated in the cavity. Under the action of external atmospheric pressure, the fertilizer solution is sucked into the jet pump, and the centrifugal pump transports the water-fertilizer mixture along the pressure pipe to the field, thus realizing water-fertilizer mixed irrigation.

When the jet pump is used as a fertilizer suction device, the numerical size of the flow ratio  $q$ , pressure ratio  $h$  and fertilizer suction efficiency  $\eta$  are used to indicate the strength of its performance.

$$q = \frac{Q_s}{Q_n} \quad (1)$$

Where  $Q_s$  is the inlet flow ( $m^3 / s$ ),  $Q_n$  is the working fluid flow ( $m^3 / s$ ).

$$\eta = q \frac{h}{1-h} \quad (2)$$

The jet pump conforms to Bernoulli's equation and the continuity equation when it is used as a fertilizer sucker to suck fertilizer.

Bernoulli's equation is :

$$\frac{v^2}{2g} + \frac{p}{\gamma} + Z = C_1 \quad (3)$$

The continuity equation is :

$$v \cdot A = C_2 \quad (4)$$

If you do not count the various losses in the suction line, the suction volume can be calculated by equations (3) and (4) derived as follows:

$$Q = \sigma \cdot \sqrt{-2g \left( h + \frac{p_2}{\gamma} \right)} \quad (5)$$

According to the above formula, the flow rate sucked into the jet pump changes with the change of vacuum at the throat. Only when the  $h + \frac{p_2}{\gamma} \leq 0$ , that is, when the pressure inside the jet pump is less

than the atmospheric pressure, the fluid inside the jet pump will be sucked in, and thus achieve the effect of fertilizer absorption.

### 2.3.2. Control System

As the hub of the whole system, the PLC plays an important role in information acquisition and data processing of the system. According to the functional requirements of the fertilizer applicator, the number of its input bits and output bits are determined. In addition, the touch screen and 3 kinds of sensors and PLC all adopt 485 communication method, the wireless communication module connects and communicates with PLC through network cable, and the solenoid valve of fertilizer suction pipe controls its switch through pulse signal. According to the above needs, Siemens series industrial products S7-1200PLC is selected as the controller, and the program is written with

the help of PORTAL V15 programming software, and the program is written in the form of ladder diagram.

The wireless communication module is selected as an important tool to realize remote control, and the supporting development tool is selected as ZKTools for setting the project of ZKG-2R3E wireless communication module. the relationship of variables is set in ZKTools software, and the PPI protocol is set to communicate with the PLC and associate with the data inside the PLC. The variable name and variable value are set on the remote control interface, and the project file is downloaded to ZKG-2R3E through ZKTools. After inserting the cell phone communication card inside it and communicating with PIC, remote control as well as SMS alarm can be realized by logging in the corresponding device code in cell phone APP or computer website.

### **3. The effectiveness of water and fertilizer integration in farmland**

#### **3.1. Balanced water and fertilizer, saving fertilizer and labor, with obvious agricultural efficiency gains**

The water-fertilizer integration technology of irrigation and fertilizer application is fast and has high nutrient utilization rate, which can effectively avoid the problem of volatile loss and slow dissolution caused by fertilizer application in the dry topsoil layer. In particular, it avoids the problem of volatilization loss of ammonium and urea, nitrogen fertilizer applied on the surface, which not only saves chemical fertilizer but also helps environmental protection. With the water-fertilizer integration system, you only need to open the valve and close the electric gate to directly deliver the fertilizer needed by the crop to the roots of the plant evenly with water. The use of fertilizer, water and pesticides in integrated water-fertilizer and furrow irrigation is shown in Table 1. The crop "drinks slowly and carefully", which greatly improves the utilization rate of fertilizer, can reduce the amount of fertilizer by about 40% per year, and the annual amount of water per hectare is only 30%-40% of the furrow irrigation. At the same time, greatly reduce the problem of water pollution caused by excessive fertilization in vegetables and orchards. Water-fertilizer integration saves 40%-50% of fertilizer compared with traditional technology fertilization, and the same field can save about half the cost of fertilizer expenditure. The amount of pesticides per hectare is

reduced by 15%-30%, saving 10-15 laborers and saving 6000-9000 RMB.

**Table 1.** Comparison of water and fertilizer integration and furrow irrigation

		Orchard	Vegetable Garden
Amount of water used	Water and fertilizer integration	759 t/hm <sup>2</sup>	2348.4 t/hm <sup>2</sup>
	furrow irrigation	2300 t/hm <sup>2</sup>	6180 t/hm <sup>2</sup>
Amount of fertilizer	Water and fertilizer integration	457 kg/hm <sup>2</sup>	384 kg/hm <sup>2</sup>
	furrow irrigation	843 kg/hm <sup>2</sup>	671 kg/hm <sup>2</sup>
Amount of pesticide	Water and fertilizer integration	9.43 kg/hm <sup>2</sup>	7.94 kg/hm <sup>2</sup>
	furrow irrigation	11.35 kg/hm <sup>2</sup>	9.07 kg/hm <sup>2</sup>
Cost	Water and fertilizer integration	12135Yuan	16348Yuan
	furrow irrigation	18274Yuan	25460Yuan

### 3.2. Temperature and humidity control, disease mitigation, and protection for facility agriculture

It is due to the adoption of water and fertilizer integration, vegetables, melons and fruit winter has been guaranteed. Both control the amount of watering, reduce the humidity, but also to improve the ground temperature, to avoid excessive watering caused by the crop compost, yellow leaves and other problems, to play a certain role in temperature control and humidity regulation of the facility agriculture. Many diseases of crops in the greenhouse are soil-borne diseases, which spread with the flow of water, such as pepper blight, tomato blight and so on. The use of water and fertilizer integration can directly and effectively control the occurrence of soil-borne diseases, reduce the humidity in the shed and reduce the occurrence of diseases.

## 4. CONCLUSION

Water and fertilizer integration technology through artificial quantitative control, to meet the needs of the crop in the critical growth period "eat and drink enough", to eliminate any deficiency

symptoms, according to the different crop needs design, the water, nutrients at regular intervals, according to the proportion of direct provision to the crop. Therefore, the production can achieve the goal of good crop yield and quality. According to research and analysis, the use of water-fertilizer integration technology can reduce the annual fertilizer dosage by about 40%, and the annual water volume per hectare is only 30%-40% of the ditch irrigation, compared with the traditional technology of fertilization to save 40%-50% of chemical fertilizer, the same field can save about half of the cost of chemical fertilizer, pesticide dosage per hectare reduced by 15%-30%, saving 10-15 labor, saving costs of 6000-9000 yuan .

## **ABSTRACT**

This paper starts from the necessity of artificial intelligence (AI) technology for the cultivation of innovative and entrepreneurial talents in colleges and universities, and analyzes its practical significance and characteristics. Then it analyzes and explains the strategy of cultivating college students' innovative and entrepreneurial talents, including the analysis of the current situation of college students' ability dimensions and the analysis of the influence of AI technology on college students' employment. Finally, the reform direction of college students' innovative and entrepreneurial talents cultivation mode is given. Innovative teaching methods and the introduction of teaching equipment are the main ones, accounting for 13.65% and 12.78% respectively. Thus, AI technology can effectively influence the innovation and entrepreneurship (IAE) talent cultivation mode of college students, and can help colleges and universities realize the all-round cultivation of talents.

## **KEYWORDS**

AI Technology; College Students; Innovation and Entrepreneurship; Talent Development

## 1. INTRODUCTION

Using AI, big data technology and cloud calculating technology to promote the "intelligence+" strategy and the optimization and upgrading of traditional industries to achieve high-quality economic expansion is an important strategy for China's industrial expansion and economic transformation [1-3]. Universities have the important mission of providing high-quality technical and skilled talents for China's industrial upgrading and expansion [4]. With the continuous progress of society and quick expansion of science and technology, AI technology has been gradually applied to various industrial fields, replacing part of the traditional manual work [5-6]. AI has also brought some influence to traditional college education, bringing challenges and opportunities for innovation and change of college talent training mode [7].

Every wave of industrial revolution and the alteration and advancement of industry will put forward higher level and higher-level demand for talents, thus promoting the change of talent cultivation mode [8]. AI, as a new focus of international competition, guides the expansion of all fields of society in the track of intelligence. The application and in-depth expansion of AI in the engineering field has changed the traditional industrial production method and put forward new supplies for the competence structure of engineering talents [9]. As the main base for cultivating and outputting engineering talents, colleges and universities should timely and accurately grasp the changes of social demand for engineering talents, constantly adjust and reform the talent cultivation mode, and deliver engineering talents meeting the requirements for the market [10].

In order to explore the submission of AI technology in the cultivation of college students' IAE talents, this paper analyzes and researches from three parts. The first part explains the necessity of AI technology in the cultivation of innovative and entrepreneurial talents in colleges and universities, including its practical significance and cultivation characteristics. The second part is the analysis of the cultivation strategy of college students' innovative and entrepreneurial talents, including the study of the recent situation of college students' ability dimensions and the analysis of the impact of AI technology on college students' employment. The third part is the reorganization analysis of

college students' innovative and entrepreneurial talents cultivation, using AI technology to analyze and explain the reform of talents cultivation mode, so as to verify the tender of AI technology in college students' innovative and entrepreneurial talents cultivation.

## **2. The necessity of AI technology in the cultivation of IAE talents in universities**

The publication of the Expansion Plan of New Generation AI established the national expansion strategy of AI, which not only creates new chances for the future expansion of Chinese industries, but also puts forward higher requirements for the training mode of college students. AI is mainly the study of the basic concept, method and technology of how to pretend human intelligent performance by using software and hardware.

With the extensive operation of AI technology in various fields of social life, the technology is no longer restricted to simply pretending human performance, which means that with the continuous expansion of AI technology, technical skill talents must continuously improve their learning ability, especially the innovation ability will become the core quality to encourage the sustainable expansion of talents. On this basis, higher education in the era of AI should actively encourage the cultivation of innovative and entrepreneurial talents, taking into account the needs of economic transformation and industrial upgrading.

### **2.1. The Relevance of Integrating AI Technology into College Talent Training**

In the era of AI, the talent cultivation mode of colleges and universities needs to be reformed accordingly. Every technological innovation will bring updates of teaching tools and evaluation methods to the education industry, and AI technology will become the driving force of talent cultivation in colleges and universities. AI technology can also have a significant impact on talent allocation and resource sharing, bringing beneficial effects on talent cultivation in colleges and universities. AI technology not only puts forward new requirements for talent cultivation, but also has an impact on the teaching methods and teaching environment of colleges and universities, and provides a more comfortable learning environment for students.

The wide operation of AI technology will change the mode of talent cultivation in colleges and universities. Talent cultivation in colleges and universities must combine the demands of the market and enterprises to carry out model reform and focus on guiding students to improve their own innovation and creativity. At the same time, the operation of AI technology in various scenes changes the way of talent training in colleges and universities, from traditional classroom teaching to students can learn anytime and anywhere, the learning practice environment for students will be more efficient and convenient.

## **2.2. Characteristics of AI Technology for Talent Training in Universities**

### **(1) Characteristics of Lifelong Learning**

The incorporation of AI technology makes it necessary for talent to develop and advance in order to scientifically develop expansion plans and help companies optimize their business processes. In the expansion process, technically skilled personnel can accumulate knowledge and improve their capabilities, as well as innovate according to the needs of AI expansion. At the same time, their knowledge structure, comprehensive ability and moral quality also need to be constantly improved in order to adapt to the changes of the times and help the expansion of the "Smart+" era. This requires them to actively understand advanced information technology and market needs, and maintain a lifelong learning character.

### **(2) Characteristics of sustainable expansion**

Lifelong learning of talents includes continuous improvement of their knowledge reserves and business levels to achieve lifelong expansion goals. The expansion of AI needs the support of talents. The characteristics of continuous expansion can meet the different needs of different positions and realize the sustainable expansion of talents. The rapid expansion and innovation of science and technology have put forward higher requirements for technical skill talents, which requires such talents to always maintain a learning attitude of keeping up with the times. Through continuous learning, they can improve their adaptability to changes in the industry and market, innovate continuously according to the expansion needs of enterprises, and improve their business ability and professionalism.

Although high quality technical skill talents have high technical level and comprehensive ability, they still need to have strong ability of continuous expansion and learning ability, and continuously strengthen their learning and strive to improve their personal ability while the times are progressing.

### (3) Systematic characteristics

In the expansion process, highly qualified technical skill talents need to maintain continuity and systematization in order to gradually improve their abilities. Taking the career planning of college students as an example, the lifelong expansion plan needs to have a certain degree of continuity in order to help high-quality technical skill talents to get gradual improvement and growth, and finally become composite technical talents. High-quality talents must learn relevant technologies and knowledge systematically to meet the needs of technical positions and lay a good foundation for promoting enterprise expansion, economic expansion and social progress. Through the systematic accumulation of professional theoretical knowledge and practical skill experience, the practical skills and comprehensive quality of high-quality technical skill talents will achieve gradual improvement, which will help form a situation of promoting high-quality economic expansion with technological innovation. Therefore, high-quality technical skill talents must recognize the current expansion situation, actively align with the digital economy and AI era, and always maintain continuity and systematization in the learning and employment process in order to continuously adapt to the needs of economic and social expansion.

### **3. Analysis of Innovation and Entrepreneurial Talent Cultivation Strategies for College Students in High Schools**

The rapid expansion of AI technology has brought significant changes to the labor market, and AI will replace more and more jobs. With the continuous expansion of AI technology, higher education should face the future and keep pace with the times. Colleges and universities must accelerate the transformation of talent cultivation mode and cultivate innovative technical skill talents needed by society.

### **3.1. Analysis of the current situation of competency dimensions of college students in higher education**

The analysis of college students' competency dimensions can be more helpful to solve the problems that arise in the process of talent cultivation in colleges and universities. Under the competence dimension of college students, there are five main elements including teamwork, communication and expression, language ability, critical innovation and lifelong learning. The results of the survey research and data analysis in the form of self-rating are shown in Figure 1.

In terms of teamwork, 36.02% of students believe they are fully capable of working with others and coordinating within a team. 46.27% of students believe they are capable of leading teamwork in most cases. Only 2.47% of the students are not very good at cooperating with others and organizing team projects. The current teamwork ability of college students is generally good, but it needs to continue to be improved. In the era of AI, it is not only necessary to focus on teamwork, but also to strengthen the ability of human-computer collaboration.

In terms of communication and expression, 40.24% of the students chose "fully meet" and 42.62% chose "relatively meet" respectively. This indicates that most of the college students have good communication and writing skills, and can communicate well with others and complete the writing tasks related to their majors.

In terms of language ability, only 8.94% of the students think they can use foreign languages for international communication, and 41.27% of the students think they are not fluent enough to communicate with foreigners, and their speaking ability is lacking. With the deepening of globalization and internationalization and the increasingly close communication between different countries in the world, the foreign language ability of talents is especially important.

In terms of critical innovation, only 19.67% of students believe that they are fully aware and capable of critical innovation, flexible in their thinking, and able to reflect and make adjustments to specific situations in a timely manner. More than half (58.24%) of the students have the awareness of critical innovation, but they are still lacking in how to innovate.

In terms of lifelong learning, 60.16% of college students have the awareness of independent learning and lifelong learning, and can actively learn new knowledge. Only 2.37% of college students think they have no awareness and ability of lifelong learning at all. This indicates that talents have a strong concept of lifelong learning.

**Figure 1.** Analysis of the current state of the competence dimension

### 3.2. Analysis of the Impact of AI Technology on College Students' Employment

The expansion of AI has encouraged the upgrading and transformation of industrial structure and broken the balance of supply and demand in the traditional job market. Figure 2 shows the survey on the impact of the expansion of AI technology on the employment of college students, more than half (55.81%) of the students think that the expansion of AI technology has a great impact on the employment of college students. 45.31% of the teachers also hold the same view, and 16.41% of the teachers and 12.56% of the students think it has a very great impact. Only a few students and teachers think that the expansion of AI technology has no impact on the employment of college students. It can be seen that both students and teachers have recognized the impact of the expansion of AI technology on the innovative employment of college students.

It can be seen that both students and teachers have recognized the impact of the expansion of AI technology on the innovative employment of college students.

**Figure 2.** The impact on the employment of university students

### 3.3. The reform of innovation and entrepreneurial talent cultivation of college students in higher education

A strong education is a strong country, and first-class education and first-class talents are powerful supports and guarantees for national strength and national rejuvenation. Reforming talent cultivation mode and improving the competence of engineering talents in the new era are the core and key to improve the quality of engineering talents cultivation, and the cornerstone to adapt to the expansion of AI technology and encourage the new round of scientific and technological revolution. Aiming at the operation of AI technology in the cultivation of college students' IAE talents, the analysis of its talent cultivation mode reform is shown in Figure 3.

**Figure 3.** Analysis of talent training model reform

The integration of AI technology into the reform of college students' IAE talent cultivation can make corresponding changes to talent cultivation in all aspects. Through AI technology, the talent cultivation mode of colleges and universities begins to change into innovative cultivation concept, adjusting cultivation goal, developing with school characteristics, improving practical ability, strengthening training, improving teaching ability, innovating teaching methods, introducing teaching equipment, integrating teaching resources and reconstructing evaluation system. The most prominent of the reform is the innovative teaching methods accounting for 13.65%, only the teaching methods in line with the expansion of AI technology can better meet the expansion of AI era. Next is the introduction of teaching equipment accounted for 12.78%, in addition to good methods also need good equipment to help college students improve their practical skills. Thus, AI technology can well help colleges and universities to carry out the reform of college students' IAE talent training mode, making college students more in line with the talent needs of the AI era.

## 4. CONCLUSION

AI is the new focus of current international competition and the new direction of the world's future expansion. Talents are the core human support to encourage the progress of science and technology, and it is the responsibility and mission of higher engineering education to reform the cultivation of engineering talents under the expansion demand of artificial intelligence in order to meet the trend of the times. This paper focuses the perspective on the demand of AI expansion on talents' competence in colleges and universities, and under the guidance of AI technology, data analysis is carried out on college students' competence dimension, employment impact and reform of talent cultivation mode. In this way, a systematic investigation and research on college students' IAE its cultivation mode under the background of AI technology is launched.

## ABSTRACT

This paper first introduces the connotation of mathematical modeling and the classification of mathematical modeling ability levels, and discusses the necessity of cultivating mathematical modeling ability. Then the current situation of integrating mathematical modeling ideas into the teaching of public mathematics courses is analyzed, and its problems are analyzed in terms of teaching materials, teaching methods, interaction between students and teachers and teaching effects, and reasonable reform measures are proposed. Finally, the effectiveness of the reform practice is evaluated in terms of comprehensive grades and teaching feedback. In terms of students' experience of participating in mathematical modeling, 79.2% of them think that their awareness of applying mathematics to think about problems has increased, and 53.8% think that their computer application skills have been improved. Thus, the method proposed in this paper can improve the efficiency of public mathematics classroom teaching and strengthen the integration of mathematical modeling ideas with the classroom.

## KEYWORDS

Education Information Technology; Mathematical modeling; Teaching Reform; Public Mathematics Classroom

## 1. INTRODUCTION

Mathematics is one of the subject knowledge that students must accept, which can develop students' thinking and enhance their innovation consciousness, and has a very important role in their future development [1-2]. Nowadays, many mathematical problems are abstract and students cannot solve them from the surface meaning, so introducing modeling ideas into mathematics teaching can deepen students' understanding of overall mathematical knowledge, master and understand mathematical knowledge through modeling, and improve teaching quality and efficiency [3].

The literature [4] presents their exploration and practice on the introduction of mathematical modeling ideas in calculus teaching by exemplification study. The literature [5] classifies mathematical modeling competencies into three levels. The literature [6] suggests to integrate the mathematical modeling ideas into the applied undergraduate teaching, so as to solve the problems existing on teaching materials, students, teachers and teaching methods, expire students' interests of learning and abilities of solving practical problems by theoretical knowledge, and meet the applied undergraduate institutions' demand for talent cultivation.

In the literature [7], the former suggests that students should be given a proper subject position in mathematical modeling teaching, while the latter advocates student-centered "scenario" teaching to stimulate students' interest in learning, and suggests that mathematical modeling teaching must be carried out in stages. In the paper [8], a survey was conducted to analyze the mathematical modeling ability of first-year students, and six obstacles affecting students' ability in mathematical modeling were proposed, and a three-stage, multi-method teaching experiment was conducted to give some valuable suggestions. The literature [9] suggests applying Mathematical Modeling ideas and methods to teaching by introducing the Mathematical concept, proving theorem and explaining exercises.

This paper discusses the current situation of integrating mathematical modeling ideas into the teaching of public mathematics courses in the context of education informatization, some problems, and measures and suggestions for reform. The paper is divided into three parts for discussion. The first part explains the connotation of mathematical modeling and the grade classification of mathematical modeling ability, and illustrates the importance of cultivating mathematical modeling ability. The second part discusses the current situation of mathematical modeling teaching and the reform measures, analyzes the problems in teaching and proposes corresponding reform measures. The third part is the evaluation of the effectiveness of reform teaching practice, and discusses the effectiveness of reform measures in terms of comprehensive grade evaluation, teaching effect feedback, and curriculum suggestions.

## **2. The integration of mathematical modeling ideas into the teaching of public mathematics courses status and reform**

### **2.1. The connotation of mathematical modeling ideas**

Mathematical modeling is the construction of a mathematical structure by a specific mathematical method with a real object as the target in public mathematics teaching. The most important feature of mathematical modeling is that it simplifies complex problems and abstracts concrete problems. It focuses on solving problems from their essence, hoping to obtain the most convenient way to solve them. The process generally consists of several parts: analysis of the problem, model assumption, model solution, result analysis, result verification, and application. From this process, it can be seen that mathematical modeling is a process of abstracting concrete mathematical problems, and it can be said that it is the best medium between mathematical problems and practical problems, realizing the process of "mathematization". The introduction of modeling ideas frees students from the learning of theoretical mathematics, makes them realize the practical role of mathematics in real production and life, truly combines mathematics with the field of study, and brings the productivity of mathematical knowledge into play.

## **2.2. A three-level classification model for mathematical modeling proficiency levels**

The three-level division model of mathematical modeling divides students' mathematical modeling ability into three levels, and within each level specific requirements are made for students' analytical problem solving ability, problem solving ability, presentation ability, and communication ability, respectively. In addition to the curriculum standards promulgated by the state, many scholars also classify mathematical modeling into three levels. Table 1 shows the three-level model.

**Table 1. Three-level model**

	Level 1	Level 2	Level 3
Correctly understand the meaning of the question	Must discuss with classmates or with instructor before completing task	Can find information from real-world problems and translate it into problems that need to be solved	Be able to elucidate missing and useless information, identify conclusions and the degree of openness.
2. select the variables and find the connection between them	Must discuss with classmates or be prompted by instructor to complete	Can identify key variables and show the relationships between them	Can independently find relationships between variables and abstract them into appropriate models using formulas
3. solve mathematical models	Can solve problems after prompting	Can work with mathematical problems, but cannot optimize models	Can independently solve mathematical problems, evaluate and improve models.
4. communicate modeling results in writing and orally	Written reports are well organized and can communicate orally with appropriate encouragement	Can express results independently and clearly.	Can express results independently and clearly, and creatively
5. Simple applications	Can solve real-world problems that can be handled directly with mathematical formulas	Can translate between mathematical language and ordinary language	Can solve classical or general modeling problems.
6. Integrated application	Can transform real-world problems into mathematical problems and answer them	Can solve realistic problems using distinctive mathematical methods and interpret and test the results	Can optimize problem solving strategies based on Level 2 with some creativity.

### 2.3. Analysis of the current situation of public mathematics classroom teaching in Chinese universities

From the current situation of teaching and learning in Chinese mathematics classrooms, its situation needs to be improved. From the perspective of teaching materials and teaching methods, there is the disadvantage of being too old-fashioned; from the perspective of students and teachers, there is the dilemma of poor interaction and

communication between teachers and students. The specific performance is as follows.

(1) The content of some teaching materials lacks modernity. With the further development of higher education, college mathematics teaching has also undergone a series of reforms and changes, the majority of teachers through their own unremitting efforts, from the teaching content of continuous development, contact students the actual needs of the teaching content of the profession, hoping to broaden the horizons of students. However, there is one problem that many front-line teachers cannot solve, and that is about the content selection of the textbook itself. In terms of the current advanced mathematics textbooks for economics, some of the case problems that are behind the times can already be withdrawn from the textbooks. And another part of new research results should be added to the textbook, but this interface is not properly handled at present. The teachers, in turn, must respect the textbook when teaching, and cannot tamper with it at will, a situation that seriously affects the efficiency of classroom teaching.

(2) Some teachers' teaching methods need to be innovated to suit the needs of contemporary college students. At present, in Chinese public mathematics teaching, there exists a phenomenon that the teaching concept of teachers has not kept pace with the times. These teachers are still stuck in the traditional teaching mode, simply taking into account their position as the main speaker, but ignoring the existence of students as the receptor. In such a teaching mode, teachers do not really understand the learning situation of students, often until the time of the examination, the teacher only found that the students learn the degree of poor, but at this time the semester course is over, and mathematics is such a difficult subject, students cannot remedy the course left behind. Over time, students become more indifferent to learning mathematics.

(3) Teachers simply teach theoretical knowledge of mathematics, with less connection to the practical. Students entering higher education institutions have experienced the training of problem solving in college entrance exams, so they are very good at doing problems. But in fact their ability to combine theory with practice is often limited. However, teachers of higher mathematics in higher education

institutions do not understand this, and they often only see that students' scores in mathematics in the college entrance examination are not bad, so they start to teach them a lot of, difficult mathematical knowledge, but a large proportion of students actually do not develop high quality problem-solving ability. So much so that the phenomenon of mastering a lot of mathematical theory but still not being able to solve practical problems occurs. The current situation of public mathematics classrooms without the penetration of modeling ideas deserves profound reflections from teachers, and they should actively explore solutions to the problems.

#### **2.4. Measures to improve the application of mathematical modeling ideas in public mathematics classrooms**

Facing many problems and difficulties in the public mathematics classroom, the majority of higher mathematics teachers have made active exploration, hoping to find a suitable method to build a bridge between students and teaching materials, between students and teachers, to solve all kinds of awkward situations in the public mathematics classroom, so that teachers' classroom labor can be rewarded with teaching results and higher mathematics can no longer be a subject that makes students talk about it. With the introduction of higher mathematics modeling ideas, it has brought an opportunity for mathematics teachers in colleges and universities to revolutionize the classroom. As the application of modeling ideas in the classroom deepens, teachers are getting more and more comfortable with its study and application in the classroom.

(1) When conducting introductory lectures, modeling ideas can be applied. There is an old Chinese saying: "A good start is half of success." Many students in colleges and universities are not interested in mathematics classes because they are intimidated by the high level of mathematical knowledge when they take the first class. In order to avoid this, it is necessary for advanced mathematics teachers to have a good introductory class. Instead of dumping all the deep and difficult mathematical knowledge on students at the initial stage of the course, teachers should start from the practical aspects of life in order to stimulate students' interest in learning. For example, before teaching students definite integrals, teachers can start with problems that are related to real life, such as the area of an ellipse or

the distance of variable speed linear motion, and use this form to stimulate students' enthusiasm for knowledge exploration. In addition, when teaching some difficult concepts, teachers can also introduce some related historical background to students to arouse their curiosity.

(2) When teaching abstract concepts in mathematics, modeling ideas can be introduced. In the past, when teaching concepts, it is the most headache for teachers; because of the lack of necessary life foundation, many students often have difficulty in understanding the concepts in higher mathematics, let alone carry out in-depth discussions. However, the introduction of mathematical modeling idea breaks this deadlock, it starts from the practical of students' daily life, let students understand the concepts from their familiar fields, balance the relationship between concrete and abstract, integrate the mathematical concepts that seem to be unrelated to life into actual life, let students try to apply them to solve practical problems in life, so as to deeply understand the meaning of the concepts.

(3) Modeling ideas can be introduced when teaching exercises homework. Any learning has to be consolidated by homework and exercises in order to receive good teaching effect, and this is especially true for higher mathematics learning. If there are no exercises as the consolidation of knowledge, it will become the norm that most of the knowledge learned will be forgotten. Therefore, consolidation in terms of exercises and homework after learning is a crucial part for students. Since the introduction of modeling into the public mathematics classroom, teachers often integrate some real-life problems into the exercises to help students understand the knowledge better, so that they can explore and discover them.

### **3. Evaluation of the effectiveness of teaching practice**

Since the teaching practice is targeted at two classes in Zhejiang Tongji Vocational College of Science and Technology, the teaching method incorporating mathematical modeling ideas proposed in this paper is used. After a semester-long teaching practice, we used questionnaires to conduct a survey on students to understand their evaluation of the teaching model of this paper. A total of 100 questionnaires were sent out and all of them were returned, of which 100 were valid. The questionnaire mainly investigated the students'

attitudes toward learning mathematics before and after the experiment, the way they learned mathematics, whether they improved their academic performance, the improvement of their overall ability, and the gap between the current teaching mode and the desired teaching mode. Through statistical analysis of the questionnaires, students' attitudes toward learning mathematics, learning styles, academic performance, and comprehensive ability all improved significantly after the experiment, and the number of excellent students in all aspects exceeded 70% of the total number of students, indicating that the teaching effect was very good. Figure 1 shows the statistical analysis of the data on the evaluation of mathematical modeling teaching methods.

**Figure 1.** Statistical analysis chart of teaching style evaluation data

Regarding the effectiveness of current teaching in teacher training colleges, 79.4% of students thought that daily mathematics classroom teaching was helpful but not obvious, and less than 15% of students thought that daily mathematics teaching could significantly improve modeling ability. Regarding the objectives of developing the mathematical modeling ability of teacher-training students, the survey results showed that the objectives were, in order, to develop the application ability to solve practical problems (70.16%), to form a scientific view of mathematics and teaching (20.8%), and to prepare for future teaching practice and to guide mathematical modeling

competitions in primary and secondary schools (15.85%). It is evident that the current mathematics teaching cannot fully meet the needs of students regarding applications, and there is a need for mathematical modeling classes to make up for this deficiency. It should be noted that when answering the question about the purpose of learning mathematics, the majority of students (65.3%) were able to realize the importance of mastering mathematical thinking and learning to think mathematically, rather than utilitarian only to solve practical problems. Figure 2 shows the feedback on teaching effectiveness.

**Figure 2.** Feedback on teaching effectiveness

In terms of students' experience of participating in mathematical modeling, students generally felt that they had gained the most in terms of their awareness of applying mathematics to think about problems (79.2%) and their computer application skills (53.8%); only nearly 15% of students felt that their ability to consult literature had improved through mathematical modeling; another 34% said their mathematical thinking skills had improved; 31.3% said they saw problems 31.3% said they had more perspectives on problems; and 45% said they were more responsive. This indicates that the current mathematical modeling instruction can develop students' application and computational skills relatively well, but students do not make full use of the large amount of literature, perhaps due to too much

teacher guidance and narrow student modeling ideas. Figure 3 shows the students' teaching experience.

**Figure 3.** Teaching experience

In terms of suggestions regarding the mathematical modeling course, 70.1% of the students wanted the class to take the form of a joint discussion between teachers and students, with teachers giving only methodological guidance. 79.2% of the students thought that the main focus of the mathematical modeling class was to explain the modeling methods and strategies, while 46.25% thought that the modeling class should analyze and optimize students' models. As for the evaluation methods of mathematical modeling class, most of the students agreed with the comprehensive evaluation based on usual homework and reports (46.8%) and open-book exams (29.4%). The survey showed that they would like to see more advanced teaching methods and evaluation tools for a new course like mathematical modeling, which aims to improve students' mathematical quality. Figure 4 shows the students' teaching suggestions.

**Figure 4.** Teaching suggestions

#### 4. CONCLUSION

The purpose of this paper is to investigate the current situation of integrating mathematical modeling ideas into the teaching of public mathematics courses and to propose new reform measures. The following conclusions are mainly drawn.

(1) Traditional mathematics teaching is mainly based on theoretical lectures, basically full of abstract theoretical knowledge points, and students are basically in a passive learning state. Moreover, after learning, they do not understand the background of knowledge generation, nor do they know how to apply it concretely, which is not conducive to the improvement of students' ability to solve practical problems.

(2) With the introduction of mathematical modeling ideas in public mathematics classrooms, the state of teachers' lectures has changed, and the current situation of students' learning has also changed greatly. The teaching method of joint participation of students and teachers is more able to attract students' interest in learning mathematics, and it can actually improve students' ability to apply mathematical knowledge to real life, to apply what they have learned, to combine mathematical theory and practical problems, and to make mathematics really work.

## **ABSTRACT**

How to fully mobilize social auditing power and form audit supervision synergy in collaboration with social auditing institutions has become a real problem for grassroots auditing institutions. Based on the SFIC model, this paper firstly elaborates the current starting conditions of the synergy between national audit and social audit from the perspective of auditors. Then, it discusses the current situation of catalytic leadership of audit synergy from the perspective of audit process and audit technology, and analyzes the current situation of system design from the perspective of audit purchase service. Finally, the process and results of audit synergy are analyzed based on audit bulletins, and about 50% of the respondents indicate that they have a long-term mechanism to coordinate the work of state and social audits by carrying out information technology construction in their own units. The synergistic relationship between state audit and social audit proposed in this study has a significant role in developing the practice of synergy between state audit and social audit, so that the role of state audit can be played to a greater extent.

## **KEYWORDS**

SFIC Model; Catalytic Leadership; System Design; Audit Synergy

## 1. INTRODUCTION

As an important organ for auditing and supervising the financial and economic activities of the state, state auditing organs play an irreplaceable role in ensuring the rational use of public funds, maintaining national economic security, and preventing corruption [1-2]. As the role of state auditing has been enhanced, the scope of state auditing has expanded from the traditional outgoing audit, economic responsibility audit, and financial audit to the audit of special funds for poverty alleviation and the outgoing audit of natural resources assets of leading cadres [3-4]. The heavy audit tasks have constrained the function of state auditors to better provide public services, which is not conducive to the anti-corruption role of state audit institutions. The supervision of state-owned enterprises by state audits needs to be strengthened, which provides a good opportunity for synergy between state and social audits [5-6].

The literature [7] suggests that government auditing and oversight achieve the purpose of governing the country through "power management", "money management" and "affairs management". The literature [8] suggests that collaborative auditing is a new way to innovate government auditing, and this new way can better play the role of auditing as a way to govern the country. The literature [9] suggests that by auditing and monitoring the implementation of national policies, defects in policies can be corrected in a timely and accurate manner.

This paper studies the relationship between state audit and social audit as well as the existing central and local policies in China, on the basis of which the necessity and feasibility of synergy between state audit and social audit are analyzed, while the current situation of synergy between auditing institutions and internal audit in China is studied and summarized, and the existing problems are analyzed and the causes of the problems are identified in conjunction with the SFIC model. Finally, based on the existing path choices and existing problems, the optimized path of state audit and social audit synergy is explored.

## **2. SFIC Model**

### **2.1. Model Selection**

Generally speaking, when foreign scholars conduct research on collaborative governance, they generally do so from the following aspects. The first is the specific concept of synergy, the second is the elaboration of theories related to collaborative governance, and the last point is a comprehensive analysis of the success factors of collaborative governance. Collaborative governance is a hot topic of research nowadays, and many scholars carry out research on it from a variety of perspectives. For the field studied in this paper, which is auditing, collaborative theory plays a great role in enhancing the efficiency of conducting auditing work while helping each party audit its own strengths. However, one of the prerequisites in using collaborative governance theory to help audit work is to deeply analyze and select a technical model suitable for audit research, which is the basic condition for conducting audit collaborative work and can better combine audit and collaborative governance. In this paper, the SFIC model is finally selected as the theoretical framework.

The founders of the SFIC model used a total of 137 cases from different countries and regions for continuity analysis, and the cases cover a wide enough range of fields, covering a comprehensive and rich theoretical knowledge and practical experience, and have been a classic model in the field of synergy. Ansell and Gash, in their research on synergy-related theories, argue that the paths for carrying out synergistic work are very complex and diverse, and that the mutual cooperation between synergistic subjects is reflected at almost every stage. The SFIC model has been used in a wide range of research and practical applications, for example in modern agricultural development, in various fundraising efforts, and in auditing and business management.

### **2.2. Model Introduction**

There are four components of the SFIC model: Starting Conditions, Catalytic Leadership, System Design, and Synergistic Process.

### **2.2.1. Starting conditions**

The starting condition is extremely important in one way, because if it is handled well it will promote the cooperation between synergistic subjects, and if it is not handled well it will have some negative effects on the cooperation between synergistic subjects. Because of the special characteristics of each synergistic subject, their rights may not be symmetrical, and the resources they hold are also asymmetrical. So this is prone to some subsequent developments that affect the synergistic process between two or several of them. Specifically, if the power between them is asymmetric, the weaker party will easily become the subordinate of the other party and lose the status of the main body. The same consequence is true for the asymmetry of resources and the asymmetry of capabilities. This imbalance naturally affects mutual trust.

### **2.2.2. Catalytic Leadership**

The success of any organization or collaborative approach cannot be achieved without the effect of good leadership. Good leadership in groups is very important, and this is also true in the development of collaborative governance efforts. Good leadership can bring together the interest needs of each collaborative subject's own members, and at the same time can explore and discover how to achieve a win-win situation in collaborative governance. If each collaborative governance body feels that its own interests are not being met, the leader can play a key role in bringing his or her leadership strengths to bear to develop relevant solutions. According to scholar Weiss, being a leader must simultaneously have several qualities. The first is the ability to bring members together and promote broad participation. The second is the need to ensure that one has organizational influence. Thus, a good leader has an irreplaceable role and advantage when it comes to promoting a virtuous collaborative governance process.

### **2.2.3. System Design**

No organization can function well without a scientific institutional foundation, and the same is true in collaborative governance. A scientific system can ensure a virtuous cycle of collaborative governance. Generally speaking, there are several important issues to consider in designing a scientific system in collaborative

governance. The first point is to fully understand what the characteristics of a scientifically sound system are and what are the important factors. A scientifically sound system should be able to include all synergistic subjects, and an excellent scientific system should also cover how to enter the process of collaborative governance. Secondly, a scientific and reasonable system should be designed with clear rules related to collaborative governance and open and transparent rules. This is mainly to ensure that the whole process of collaborative governance is fair, open and transparent. Under such rules, there will be a higher level of trust among the collaborative subjects, which is more conducive to the development of collaborative governance.

#### **2.2.4. Collaborative Process**

Ansell and Gash argue that the process of collaborative governance should not be linear but cyclical. In collaborative governance, the core part should be the process that belongs to the collaborative process. The effectiveness of the core part will directly affect the overall effectiveness of the process, so understanding and studying the synergistic process will be the most important part of collaborative governance. Face-to-face communication is a relatively direct and fast way of communication, and often the seemingly simple communication is more effective. In collaborative governance, it is extremely important to reach a common goal or consensus among all collaborative subjects, which can lead to a higher level of trust and deeper communication between them. This direct and effective way of communication will promote the benign development of the collaborative process.

### **3. Data Analysis**

#### **3.1. Situation analysis of the number of state-owned enterprises audited by the state**

Figure 1 shows the state audited state-owned enterprises from 2010 to 2016. As of December 2016, the State Audit Office has released 267 audit result announcements on its website, of which the number of enterprise announcements involved is 125, including 73 for central SOEs and 24 for financial institutions. Since 2010, the government has fixedly disclosed the audits of state-owned enterprises to the society in the form of audit announcements. According to the Audit

Law and supporting interpretative regulations, enterprises and financial institutions in which state-owned capital occupies a controlling or dominant position should be included in the scope of state audits, specifically: those in which the proportion of state-owned capital to the total capital (equity) of the enterprise or financial institution exceeds 50%. State-owned capital accounts for less than 50% of the total capital of enterprises and financial institutions, but the main body of state-owned capital investment has effective control of the enterprise.

**Figure 1.** State audit of state-owned enterprises from 2010 to 2016

### 3.2. Analysis of the synergy between national audit and social audit

Figure 2 shows the construction of the information technology platform. From the perspective of two-way cooperation, the guidance and supervision of internal audit work is still being explored. At the same time, since the internal audit association is decoupled from the audit institutions in each city, for example, the Texas Audit Bureau is not decoupled from the internal audit association, it is necessary to cooperate with the internal audit association and use their work responsibilities to establish a long-term cooperation mechanism between the internal audit association, the audit institution and the audited unit. Second, in terms of the management of audit

informatization in the surveyed units, about 50% of the respondents said that their units carry out informatization construction work. Both grassroots audit institutions and internal audit currently have many problems with the use of information technology, neither the technology nor the ability to develop information technology platforms, and the ability to maintain them later is weak. They have yet to take full advantage of modern information technology to develop innovative audit methods, and also lack a long-term mechanism for coordinating government auditing and internal auditing work. the emergence of Order 11 has enabled auditing authorities to start paying attention to internal auditing work, but the intensity and time frame of attention is far from adequate. There is no long-term mechanism for internal audit, governmental audit and internal audit associations in government departments, and no guidelines for long-term cooperation in internal audit departments.

**Figure 2.** Information platform construction

#### **4. CONCLUSION**

In this paper, under the requirement of the development of society and the deepening of the concept of full audit supervision, the following conclusions are obtained based on the SFIC model to study the synergy between state audit and society.

(1) Central and local state-owned enterprises listed companies account for 31.85% of the total number of listed companies, while the above-mentioned percentage of audits of listed companies with state-

owned components is less than 5%, which is sufficient to show that the state audit is weak in the audit supervision of listed companies with state-owned components. The main reason is that the Audit Office has limited staff and limited time, and a large number of administrative and institutional financial funds as well as the supervision of the use of various special funds also require state auditing, resulting in the limited scope of auditing state-owned enterprises. Overall, the number of audits of state-owned enterprises covered by state audits is low.

(2) For the analysis of the problem of synergy between national audit and social audit, about 50% of the respondents said that their units carry out information technology construction work, whether it is the grassroots audit organization or internal audit, there are many problems with the use of information technology at present. To realize the construction of informatization, the information of auditing institutions and internal audit should be on a common platform, which can avoid many problems caused by the difficulty of information circulation between the two sides. The construction of audit informatization can provide strong data support for national audit guidance and supervision of social audit.

## **ABSTRACT**

The integration development of music education and local music and culture industry in higher education institutions is to better inherit the local characteristic culture. In this paper, the quantitative analysis of data on the integration development of music education and local industry in colleges and universities is carried out under the big data technology. In terms of teaching methods, the percentage of focusing on music teaching evaluation is 32.12%. In terms of synergistic development, popular vocal music, ethnic instrumental music, opera singing and ethnic dance increased by 55.59%, 40.23%, 93.65% and 41.46% respectively. It shows that the integration development of university music education and local music and culture industry strongly strengthens the local music and culture industry and realizes the inheritance and development of local intangible cultural heritage.

## **KEYWORDS**

Big Data Technology; Music Education; Local Music; Cultural Industry; Higher Education Institutions; Integration Development

## **1. INTRODUCTION**

As the cradle of education and cultivation of music talents in China, colleges and universities are responsible for cultivating music talents who meet the requirements of cultural development in the new era,

and they are also an important position for the dissemination of music culture [1-2]. Therefore, under the requirements of cultural development in the era of big data, the advantages of university music education should be brought into the development of local music and cultural industries [3-4]. How to connect music education with music market and how to innovate education concept and teaching mode so as to realize the organic integration of music education and music industry will be a problem that every college music education practitioner needs to face and think about [5-6].

The deep development of music culture industry has extended it to a broader level. China is a country with many ethnic groups, and the resources of ethnic folk music culture are rich and varied, especially the local music culture resources are very precious and need to be inherited and protected by us [7-8]. But how to fully exploit the value of these cultural resources from the perspective of cultural industry is also an urgent problem [9-10]. Therefore, the development of music culture industry promotes the development of college education reform, and at the same time provides many employment opportunities for students, so that the professional skills learned in school can be recognized by society and give full play to their own value [11-12].

In order to explore the integration and development of music education and local music culture industry in higher education institutions under the big data technology, this paper firstly analyzes and explains the big data technology, the characteristics of big data and the application of big data. Then the development status of music teaching in higher education institutions is briefly explained, and the relationship between local music culture industry and music education in colleges and universities is elaborated. Finally, the data analysis of the method and synergistic development of music education in colleges and universities using big data technology is presented as a way to illustrate the influence of local music culture industry on music education in colleges and universities.

## **2. Big Data Technology**

### **2.1. Characteristics of Big Data**

Big Data is a collection of data that cannot be captured, managed and processed by conventional software tools within a certain time frame.

It is a massive, high-growth and diverse information asset that requires new processing models to have greater decision-making power, insight discovery and process optimization capabilities.

Big data has several characteristics.

First, the volume is large. People generally use "massive" to describe the huge amount of data, usually reaching the petabyte level (1PB =  $1024 \times 1024$ GB).

Second, diversity. People generate all kinds of behavioral data in all aspects of social life, including online transactions, learning and voice and video, etc.

Third, speed. This feature refers to two aspects, namely the speed of data generated and the speed of data processing through device technology. The Internet accurately records every data in the process of each person's activity, and then quickly screens, refines, and applies it through big data technology.

Fourth, authenticity. The data generated are all objective records of people's life trajectories by the Internet, without any deviation, thus more realistic and credible and persuasive.

Fifth, value. The extracted data has a very reliable reference value for the next work, which is conducive to making quick decisions and judgments. However, the density of these data is low, and there is often only a small portion of valuable information in a large data group. Some experts believe that big data also has characteristics such as timeliness and complexity.

## **2.2. Characteristics of big data applied to education**

The advent of the data era also provides new opportunities for the development of education, and people can use big data technology more quickly and easily for the selection of education and teaching methods. From the huge amount of data, we can find the data that is beneficial to education and teaching and apply it to teaching research. The following features will be found in the application of big data to education.

First, promote personalized development. For each student's learning data, exclusive teaching programs are developed, and the teacher's subjective experience judgment in traditional education is shifted to

objective data analysis and reasoning, which is more reasonable and effective.

Second, improve the problem of educational imbalance. This will make education more equitable and narrow the education gap between urban and rural areas. As long as there is a network, no matter where you are, you can enjoy first-class educational resources, and the current MOOC, micro-courses, and online courses are all better evidence.

Third, adaptive. The learning system will automatically recommend relevant learning content based on the generated data.

### **3. Music Education in Higher Education Institutions and Local Music Culture Industry**

#### **3.1. The current situation of music education in higher education institutions**

Music education in higher education institutions is also trying to develop with the continuous progress of society, but there are still certain problems in the process of development.

For one thing, the understanding of music education in colleges and universities is still at a superficial stage. Its education targets are mostly adults around 20 years old, who need to enter the society directly after graduation, use their professional skills to serve the society and create their own value. This requires colleges and universities to be different from other educational stages in terms of educational purposes and tasks, and not to be understood by the concept of music education in primary and secondary schools.

Secondly, there are problems with the curriculum of music education in colleges and universities. Among them, the curriculum is too autonomous and is set up only by school teachers according to their own ability level to offer courses, without standing in the students' perspective and offering courses according to the students' actual needs.

Thirdly, the theory and practice of music education in colleges and universities are disconnected from each other. At present, the content of the courses offered by the music majors will not be accepted by the people, and there is a suspicion of high and low, so the disconnect

between theory and practice of music education is also a more serious problem at present.

### **3.2. Local Music Culture Industry**

For the whole music culture system, local music culture industry is an important part of it and a special product under the cultural reproduction of today's society. Music education in colleges and universities, as the main form of education for musicians to learn music systematically, is inextricably linked to the industrial development of local music culture. Music culture industry is one of the current music culture phenomena, which directly responds to people's demand for music culture. The reform and development of music education depends on the reflection of the demand of music culture industry. As a branch of the whole music culture industry, the local music culture industry directly reflects what kind of music talents are needed in today's society, and determines what kind of music awareness, general music knowledge and music ability such talents need to have.

### **3.3. The relationship between music education and music culture industry**

Interaction refers to the positive mutual influence and effect of both sides of things. Specifically for music culture industry and college education, firstly, music culture industry has been booming in recent years, but behind the rapid development, there are also problems such as lack of professional talents and lack of theoretical guidance, which become bottlenecks for further development. Secondly, as a local college music education, it is itself shouldering the heavy responsibility of serving local cultural development, and is facing the real problems such as weak quality of students' art practice and difficult employment. Through the organic interaction between the two, music culture industry can provide more practice and employment opportunities for music education in local colleges and universities. In turn, music education in local colleges and universities can provide a constant supply of talents and intellectual support for the music culture industry. This is a win-win situation, so it is not only feasible but also necessary to comprehensively promote the interaction between the two.

#### **4. Analysis of the path of music education integrating local music culture industry**

The local culture industry and colleges and universities should be closely connected, and the music culture industry should provide some necessary conditions for the development of local colleges and universities as much as possible, which can not only solve the needs of music hardware facilities of colleges and universities, but also play a certain role in promoting the development of local culture industry. This section uses big data technology to analyze and argue the path of music education in higher education institutions to integrate the development of local music culture industry, and elaborate the effectiveness of the application of local music culture industry development to integrate music education in colleges and universities.

##### **4.1. Analysis of teaching methods**

For the integration and development of college music education and local music culture industry, it is necessary to break through the original traditional teaching mode and use big data technology for the integration and development of music education and music culture industry. This section uses big data technology to analyze and demonstrate the teaching methods of college music education, so as to illustrate the innovative teaching methods of college music education. The results of its analysis are shown in Figure 1.

In terms of innovative teaching methods in college music education, the most recognized teaching method is focusing on music practice, accounting for 32.12%. This indicates that schools should actively provide students with opportunities to participate in practice, create a platform for them to realize their ideas, and focus on cultivating students' musical practice skills and their awareness of participation in practice. In addition to focusing on practice, 22.95% of students believe that it is important to encourage innovation in the process of teaching music. Music teachers in higher education should focus on creating contexts that foster students' creativity and provide them with a variety of possibilities for development. This suggests that the integration of music education and local cultural industries should be carried out by collecting various types of integration teaching cases to stimulate students' creative and innovative abilities, aiming to improve students' auditory cognitive abilities and creativity, and providing

cross-disciplinary teaching methods that integrate multidisciplinary fields into one to accommodate the synergistic development of music education and music cultural industries.

**Figure 1.** Analysis of innovative teaching methods

#### 4.2. Synergy Development Analysis

Strengthening local music culture education in college music education is not only a need for music education itself, but also a need to assist the development of local music culture industry. In this section, we use big data technology to analyze data on the synergistic development of local music culture in college music education. The results of its analysis are shown in Figure 2.

In terms of the synergistic development of university music education and local music and culture industry, both popular vocal music, national instrumental music, opera singing and folk dance are on the rise from 2017 to 2021. Among them, popular vocal music increased from 14.73% in 2017 to 22.92% in 2021, an increase of 8.19 percentage points. Ethnic instrumental music increased from 16.35% in 2017 to 22.93% in 2021, an increase of 6.58 percentage points. Opera singing increased from 12.19% in 2017 to 23.61% in 2021, an increase of 11.42 percentage points. Folk dance increased from 13.82% in 2017 to 19.55% in 2021, an increase of 5.73 percentage

points. This shows that music education in colleges and universities is making efforts to integrate local music and cultural industries and to cultivate qualified music and cultural talents for local areas, with emphasis on local characteristics. This is a bold attempt to carry out the construction of professional discipline characteristics for music majors in local universities.

**Figure 2.** Synergistic Development Analysis

## 5. CONCLUSION

In this paper, data analysis is conducted for the development of music education in higher education institutions integrating local music culture industry in the context of big data, and the following conclusions are drawn.

(1) For higher education institutions, music majors should combine with local economic development, adapt to local economic and social development, realize the professional orientation of serving local music culture, and meet the specific needs of local economic development for music talents.

(2) College music education should adopt a multi-dimensional perspective and scan the demand for music professional jobs, the interactive development relationship between college music education and local music culture industry with the vision of market, higher education, professional characteristics and local traditional music culture education characteristics. In this way, we can make

college music education go to socialization and industrialization, so that college music education can be actively and normally integrated into the urban cultural construction.

# The application of big data technology in the owner's information self-governance management platform under the perspective of residents' life

---

**Weixu Tian\***

Guizhou Minzu University. Guiyang (China).

E-mail: [twx21@sina.com](mailto:twx21@sina.com)

---

## **ABSTRACT**

Information technology has been integrated into all aspects of people's lives with its superb permeability and powerful advancement, so it is necessary to build information technology in all industries. In this paper, the design goal is to provide property managers with an information management platform for the owner management process, and the research and design of the property management information platform is guided by the integration of information and automation of management in the property management process. The results show that the owner management platform proposed in this paper has improved the property management efficiency by 23.62%, and the questionnaire also verifies that the owner information management platform has received high satisfaction among owners. The owner management platform system designed in this paper has significantly improved the management efficiency and service quality of the property management process, and also enhanced the owner's satisfaction with the management of the community property.

## **KEYWORDS**

Information Technology; Permeability; Property Management; Information Management Platform; Management efficiency; Service Quality

## 1. INTRODUCTION

With the increasing development of information technology, the spread of information products in society, and the increase of complicated affairs, the way property management companies manage communities can no longer meet the rhythm of modern residents' lives [1-2]. For example, traditional property management has been posting notices or making house calls to convey information, but the notices sometimes fail to reach the attention of busy residents, and the house calls are often unsuccessful. Likewise, community residents are frustrated by not being notified in real time of, for example, water and power outages. Problems such as lack of information, lack of communication channels, time-consuming and labor-intensive collection of tenants' opinions, and lack of satisfactory property management services are common problems faced by property management [3-4].

Along with the vigorous development of real estate, property companies are mushrooming like a spring and the market competition is becoming more and more intense. Literature [5] argues that the advantages brought by property management informatization make the functional modules in the process of customization with reasonable, step-by-step and milestone goals, which effectively avoid the problem of high input and low return, and also effectively ensure the orderly completion of the system. The literature [6] argues that in the informatization process, it makes it possible to make reasonable use of personnel and also to deploy them in real time to achieve maximum utilization of resources and orderly property management. The literature [7] argues that in the process of information communication, fast, correct and concise communication can be achieved to avoid disorderly and unreasonable utilization of information. The literature [8] argues that user interaction plays a good role in customization, and the selection of a reasonable property process according to the user's needs can achieve a great increase in user satisfaction as well as maximization of benefits.

This paper first develops and utilizes the owner's resources to realize the sharing and exchange of information. However, due to the many factors involved in the transformation process of old neighborhoods, the imperfect information management tools increase the

management difficulty and hinder the process of neighborhood information transformation. Then, the research design of property management informatization platform is carried out with the two goal-oriented around information integration and management automation in the property management process. Finally, the feasibility and effectiveness of the owner's informatization management platform is verified from two perspectives of owner's satisfaction and property management efficiency through the application of the owner's informatization management platform.

## **2. Owner management platform modeling and database design**

### **2.1. Property management platform design modeling**

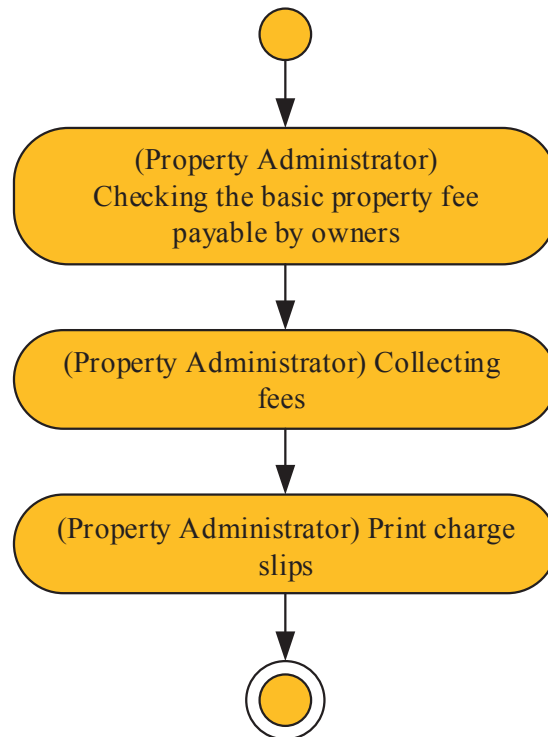

UML, also known as Unified Modeling Language, is an industry standard for modeling real objects in reality, providing a standard representation for people in different fields to communicate and understand each other. It can create models not only for static and dynamic structures and behaviors, but also for software systems, and can create different models for computer software systems, business systems, and industrial systems. Most importantly, the Unified Modeling Language is well suited for all phases of the system, from requirements analysis to final testing and system maintenance and development.

The behavioral model of an owner management system contains two categories, namely static and dynamic behavioral models. However describing the system requirements as understood by the users is the key to constructing the static structural model of the system.

The actions of the property manager can maintain property and parking information, collect various fees, handle the warranty process of the business, register the warranty tasks of the owners, record the comments and suggestions of the owners, and register the incidents that occur to the owners.

The behavior of the janitor can clean the public sanitation area, carry the trash cans, and fill out the work log. Security guards' actions can fill in the work daily report, security patrol, and register security incidents. Maintenance staff can repair public facilities, repair the owner's warranty equipment, and give feedback on the repair results. In which the property manager will process the owner's warranty task

and then feedback to the warranty clerk for repair. When the property manager collects the basic property management fees, he/she first inquires the basic property management fees that the business should pay, then collects the corresponding fees, and finally prints the bills for the fees. The process of collecting basic property management fees by the property manager is shown in Figure 1.

**Figure 1.** Basic property charging process

## 2.2. Owner management platform database design

In order to realize the informationization of the owner management system platform, 28 databases are designed in this system. Next, the process of database design is described in detail. In order to complete the database design quickly and efficiently, some database design specifications are designed before designing the database tables.

(1) The database is designed to use utf-8 format.

(2) The primary key id is always in the format of table\_id, and the corresponding primary key name of the table is in the format of table\_name. The foreign key is also always in the format of the primary table name\_id.

(3) If the number of enumeration type fields in the table is greater than 2, the data type is tinyint(2), and the enumeration value starts from 0.

(4) User, role, rights, role, \_right, user, \_role are the system-defined tables related to user rights. If there are more than one foreign key field of user-id in other tables, use user-id for the "operator" field and rename the other fields. Permission table right is the function identifier can not be repeated.

Any work is centered on the owner, and any system is also centered on the service object. The core object of this system platform is the owner. In the database design of this system platform, proprietor is the core position of the database. proprietor table includes ID, name, pinyin code, gender, cell phone number, QQ number, date of birth, work unit, marriage, ID number, education, place of origin, whether the head of the household, operator, operation date, comments and other fields. The owner table is shown in Table 1.

**Table 1. Owner's Table**

Field Name	Data Type	Length
Proprietor-id	bigint	12
Proprietor-name	varchar	30
Spell-code	varchar	15
Gender	varchar	5
Mobile-phone	varchar	11
QQ	varchar	11
birthday	datetime	8
company	varchar	30
Is-married	varchar	2
Id-card	varchar	18
education	tinyint	2

The owner table contains all the information directly related to the owner. In the database design of this platform, the tables that are connected to the proprietor table with a join key are the owner family table, the housing contract table, the parking space contract table, the receipt table, etc. The access mode used in this system is role-based access control, and the role-right table is established between the role table and the right table. role-right is connected to the role table with the foreign key role-id, and the other side is connected to the right table with right-id as a foreign key, thus forming an RBAC-based access control database.

### 3. Application results and analysis of owner management platform

#### 3.1. Owner satisfaction survey results statistics

The satisfaction percentage was calculated based on the owners' satisfaction evaluation of each secondary index, and then the satisfaction percentage of the primary index was calculated based on the proportion of the secondary index, and then the owner satisfaction of the property management company in M residential area was calculated based on the proportion of the primary index. The final results are shown in Table 2.

**Table 2.** Owner satisfaction statistics

Projects	Overall Service	Maintenance Manage	Environmental Manage	Safety Manage	Service Manage	Integrated Manage
Satisfaction	58.96%	47.51%	75.93%	59.82%	65.19%	36.72%
Evaluation	General	Unsatisfactory	Satisfied	General	General	Unsatisfactory

The level of satisfaction of the owners of the district with the property service is 56.87%, so it is said that the overall recognition and satisfaction of the owners with the intelligent owner management platform is high. Among them, the satisfaction level for the management of environment as well as services is relatively high, while the evaluation level for maintenance and comprehensive management is not high.

#### 3.2. Maintenance management satisfaction survey results

Figure 2 shows the survey of owners' satisfaction with the maintenance management of the district. The indicator with the highest satisfaction is the maintenance of public facilities, and the indicator with the lowest satisfaction is the timeliness of maintenance. The satisfaction levels of timeliness of housing maintenance, quality of maintenance and maintenance of public facilities were 45.17%, 49.09% and 54.49%, respectively.

**Figure 2.** Maintenance management satisfaction survey results

### 3.3. Service Management Satisfaction Survey Results

Figure 3 shows the service management satisfaction survey. The owners' satisfaction with the service management was 63.21%, where the highest satisfaction was with the uniform dress code and the lowest satisfaction was with the timeliness of problem handling. The satisfaction rate of customer service uniform dress code, promptness of problem handling and customer service reception service attitude are 75.41%, 49.36% and 64.45% respectively.

**Figure 3.** Service management satisfaction survey results

## 4. CONCLUSION

Owner management platform informatization is a platform that integrates property management process, basic information of buildings and buildings, property fee collection process sharing and maintenance management. The platform changes the traditional property management process which relies on experience, manual implementation and paper documents. The informatization platform brings into play the characteristics of working with high efficiency and processing with convenience in the current information age, making the efficiency of property managers much higher. On the information-based platform for property management, staff are able to work anywhere, anytime, 24/7, and are not limited to the old way of working where they had to be on the ground in real time. This has enhanced the work life experience for both property managers and owners.

## **ABSTRACT**

The effective path to explore the integration of art elements into logistics packaging design is to realize the green and low-carbon logistics packaging. This paper uses the artificial neural network model under artificial intelligence technology to quantitatively analyze the data on the integration of fine art elements into logistics packaging design, and also gives the acquisition methods of fine art elements and the connotation of logistics packaging design. From the logistics packaging design method, the design method with its material accounts for 34.92%. In terms of low-carbon packaging design materials, the percentage of corrugated paper logistics packaging materials is 53.26%. This shows that the use of art elements into logistics packaging design choosing corrugated paper materials or equivalent Honeycomb cardboard material can better retain design elements and achieve sustainable development of logistics packaging.

## **KEYWORDS**

Artistic elements; Artificial Intelligence; Artificial Neural Networks; Logistics packaging; Low Carbon; Corrugated paper material

## 1. INTRODUCTION

With the advent of the industrial information age, changes in the elements of fine arts, which are closely related to the packaging industry, have been more widely used in logistics packaging [1]. With the development of science and technology, the way of application of art elements is also evolving, and this involves the effect of feelings brought by logistics packaging materials to consumers [2-3]. Logistics packaging materials can bring direct feelings or indirect feelings. The direct feeling is caused by the texture of the logistics packaging material itself, which can feel soft, smooth and so on. Through the visual and tactile sensation of material texture on the surface of packaging materials, the intimacy and allure between consumers are established [4-5].

The changes in real life and the development of the times have made people's aesthetic interests change, advancing the deformation and innovation of art elements in the application of logistics packaging [6-7]. The appropriate comprehensive use of multiple material-based art elements in logistics packaging, through certain design laws and composition methods for design performance, can bring people a pleasant spiritual feeling from culture, history, symbols and other aspects [8-9]. The reasonable application of multiple material art elements in logistics packaging can make consumers feel the spirit of the region's culture while also achieving spiritual balance and satisfaction [10-11].

In order to explore the effective path of integrating art elements into logistics packaging design, this paper analyzes and argues from three parts. The first part illustrates the artificial intelligence technology, including the connotation of artificial intelligence and the development and application of artificial neural network. The second part is the analysis of art elements and logistics packaging design, including the acquisition of art elements and the connotation of logistics packaging design. The third part is the analysis of logistics packaging design examples, using artificial neural network model to analyze the data of logistics packaging design methods and design materials, so as to understand the effective way of using art elements into logistics packaging design.

## **2. Artificial Intelligence Technology**

### **2.1. Artificial Intelligence**

Artificial intelligence is the use of computers to simulate the behavior of the human brain, including learning, reasoning, decision-making, prediction, association and other aspects, to study how to make the computer to do the past only human can do the work rich in intelligence, which is itself an interdisciplinary discipline. There are three types of artificial intelligence, namely, narrow AI (i.e., weak AI), general AI, and strong AI. All current research falls into the narrow AI category.

Due to the academic background and different views and perspectives on intelligence, AI has formed two different types of schools from the very beginning. One type is the rational school, which is based on logical procedures. They start from the perspective that both the human brain and computers are information processors and find that humans cannot really make optimal decisions rationally when making decisions. Therefore, computers are used to extend the rational thinking part of human beings. The other type is the perceptual school, which obtains artificial intelligence by simulating the synaptic connections of human brain neurons. This type of intelligent simulation is better at problems that are difficult to analyze with logic.

### **2.2. Development and Application of Artificial Neural Networks**

#### **2.2.1. Artificial Neural Networks**

Artificial neural network is different from human brain, but it is derived from human brain. It is a new neural network constructed artificially based on human knowledge of the neural network of the brain, which is capable of achieving a specific function as required. The basic components of artificial neural networks are artificial neurons, which simulate abstract biological neurons from the perspective of structure and function. The neural network in the human brain consists of a large number of interconnected nerve cells. Nerve cells, or neurons, are composed of two main parts, namely, protrusions and cell bodies, which can be further divided into axons and dendrites.

The artificial neuron is similar to the human brain neuron with multiple

inputs  $u_1, u_2, \dots, u_n$  and one output  $y_i$ .  $\omega_{ij}$  is the connection weight of the first input signal of the  $i$  neuron.  $\theta_i$  is the queue value of the  $i$  neuron.  $x_i$  is the summed net input of the  $i$  neuron.  $f(x_i)$  is the action function of the  $i$  neuron, which is also called the excitation function.

The expression of the net input  $x_i$  and the expression of the excitation function  $y_i$  are:

$$x_i = \sum_{j=1}^n \omega_{ij} u_j - \theta_i \quad (1)$$

$$y_i = f(x_i) = f\left(\sum_{j=1}^n \omega_{ij} u_j - \theta_i\right) \quad (2)$$

Different artificial neuron models consist of different action functions, and the common action functions are step function, linear function, Gaussian function, S-type function, etc. The common excitation function expressions are shown below.

(1) Linear functions:

$$y = f(x) = x \quad (3)$$

(2) Step function:

$$f(x) = \begin{cases} 1, & x \geq 0 \\ -1, & x < 0 \end{cases} \quad (4)$$

(3) Gaussian function:

$$f(x) = e^{-(x^2/\sigma^2)} \quad (5)$$

(4) Sigmoid function:

$$f(x) = \frac{1}{1 + e^{-x}} \quad (6)$$

### 2.2.2. Analysis of artificial neural network model mechanism

At present, there are many kinds of artificial neural networks, such as BP neural network, wavelet neural network, Hopfield neural network, fuzzy neural network, ELMAN neural network, convolutional neural

network, etc. According to the flow of the input signal in the network, artificial neural networks can be divided into feed-forward networks and networks with feedback.

The feed-forward neural network first obtains input information from the input layer, then transmits it to the intermediate layers, followed by a weighting process in each intermediate layer to the output layer, and is activated by the excitation function. Finally, it is output from the output layer, and there is no information feedback between the neurons in each layer.

Feedback neural networks allow information to be propagated backwards from the output layer to the hidden layer, or from the hidden layer to the input layer. The output of each neuron layer may be influenced by the feedback from the neuron's previous output or the current input, which gives the feedback neural network a "short-term memory" property similar to that of the human brain.

### **3. Artistic elements and logistics packaging design**

#### **3.1. Acquisition of aesthetic elements**

Elements in nature are a widely used category in design creation, and the basis of design should come from the truths presented by the life born in nature. This means that nature is the source of our ideas for design and creation. There are many aesthetic feelings in nature, and Chinese and foreign educators and aestheticians often refer to nature as "the book without words". The visual elements of the natural landscape are extracted from nature, so in the application of the visual elements of the natural landscape, the prerequisite is to have a basic aesthetic awareness of the natural landscape. Compared with social beauty and artistic beauty, the form factor is more decisive in the natural landscape. Generally speaking, its form includes color, shape, sound and other aspects of content. When extracting the natural landscape as visual elements, its formal beauty is mainly expressed in two aspects: color and form. Color is the color, shape is the shape, shape. At the same time, the beauty of the natural landscape is in the shape, in the selection of natural landscape visual elements is not without rules and regulations as long as the famous landscape is haphazardly selected and applied to the packaging, for the selection of this type of visual elements is a rule to follow.

### **3.2. Logistics packaging design**

Packaging decoration design, also known as packaging visual communication design, is a basic component of packaging design. There is a concept of "packaging screen" in packaging decoration design, which includes various design elements such as text, patterns and colors. As an important design element, art elements are indispensable in packaging decoration design, and there are many ways to apply them. However, we should pay attention to the principle of appropriateness of the application of art elements, the selected visual elements should be concise, and the principle of appropriateness should be paid attention to the arrangement of the picture, and the phenomenon of haphazard piling up should not occur. At the same time, logistics packaging products from different regions, as a type of product packaging with strong culture, should consider the culture and adaptability of logistics packaging in the process of art elements integration design.

## **4. Analysis of the path of integrating aesthetic elements into logistics packaging design**

### **4.1. Analysis of logistics packaging design methods**

In the logistics packaging design, by refining the fine art elements of traditional art style and reasonably applying the laws of formal beauty, the logistics packaging becomes an effective communicator of culture. This section analyzes the method of applying fine art elements in logistics packaging design by using artificial neural network model, and its analysis results are shown in Figure 1.

In terms of the methods of integrating art elements into logistics packaging design, the four design methods of taking its shape, making its color, using its material and implying its meaning account for 26.48%, 11.25%, 34.92% and 27.35% respectively. This shows that the use of materials is more practical in the design of art-integrated logistics packaging. The logistics packaging design that is designed and created through the concept of design, thinking and handwork has practical and aesthetic creative activities. It is characterized by skilled and specialized skills, using the characteristic laws of material materials, tools, and production methods to master

and apply. The simple processing and utilization of natural materials, the inheritance of the beauty of the craft of folk art in packaging design, the focus on the use of functionality, and the perfect unity of technology and art, will be able to take packaging design to a new level.

**Figure 1.** Analysis of logistics packaging design method

#### **4.2. Low carbon logistics packaging design material analysis**

The development of the Internet has made the express and logistics industry more and more, and the traditional online shopping flow packaging cannot meet the needs of China's green development. Using different art elements as well as packaging design materials to protect the environment and thus promote the sustainable development of logistics packaging industry is the inevitable way. In this section, artificial neural network is used to analyze the current commonly used raw materials for logistics packaging design, and the results are shown in Figure 2.

In terms of the low-carbon materials that art elements are incorporated into logistics packaging design, the five logistics packaging materials - degradable plastics, honeycomb paperboard products, pulp molded plastic products, nanopackaging, and corrugated paper - account for 11.24%, 13.95%, 15.61%, 5.94%, and 53.26%, respectively. It can be seen that corrugated paper material

applications account for more than half of the total. This is because corrugated paper materials have a variety of characteristics such as good cushioning performance, light weight, firmness, sufficient raw materials, low cost, ability to package a variety of items, metal usage, good printing performance, and recyclability. At the same time, good printing performance can also make the art elements remain on the logistics packaging for a longer period of time.

**Figure 2.** Logistics packaging design materials

## 5. CONCLUSION

In order to investigate the effectiveness of the application of art elements into logistics packaging design, this paper analyzes the relationship between art elements and logistics packaging design from artificial intelligence technology and analyzes the data using artificial neural network model. The conclusions are drawn as follows.

(1) In terms of the methods of integrating art elements into logistics packaging design, the four design methods of taking its shape, making its color, using its material and implying its meaning account for 26.48%, 11.25%, 34.92% and 27.35% respectively. This shows that using its material is more practical in art fusion logistics packaging design, which is designed and created through the concept of design, thinking and handwork.

(2) In terms of low-carbon materials for the integration of art elements into logistics packaging design, the percentage of corrugated paper

logistics packaging materials is 53.26%. This indicates that the integration of art elements into logistics packaging design should start in a low-carbon direction to achieve sustainable development in the logistics packaging industry.

### **ABSTRACT**

Associated with outmoded foreign occupation, the cross-border e-commerce (CBE) platform has incomparable advantages for agricultural products to expand domestic and foreign markets. This paper selects SWOT analysis method to effectively sort out the competitive advantages, competitive disadvantages, opportunities and threats of Zhejiang agricultural products CBE logistics system itself. The progress of China's agricultural products CBE is promoted by taking advantage of the introduction of national policies, the climbing rate of network coverage and the technical support provided by the progress of big data industry. Finally, the analysis of agricultural products imports and export volume and its growth rate in the context of big data is obtained: the growth rate of agricultural products out import and export in 2016 is 8.69% and 2.70% respectively, and is expected to fall in 2019. This study provides reference and reference for the construction and optimization of CBE logistics system, so as to better promote the progress of CBE of agricultural products in Zhejiang.

## KEYWORDS

Big Data; SWOT Analysis; Agricultural Products; Cross-border e-commerce

## 1. INTRODUCTION

cross-border e-commerce (CBE), as a novel engine to drive the growing of foreign trade, has great potential for progress. Although China's CBE started late, it has developed well [1-2]. In CBE trade, the proportion of trade in agricultural products should not be underestimated. As a large agricultural country, China, using the mode of CBE, vigorously supports the progress of foreign trade of agricultural products, while relying on the booming big data industry to solve related problems, which not only can increase farmers' income, but also encourage the progress of agricultural economy, and then encourage the healthy progress of the national economy [3-4]. Relying on the strong Chinese agricultural products supply market, cross-border agricultural products e-commerce can obtain stable sources of goods and provide consumers with rich and diverse agricultural products, thus achieving faster progress [5-6].

The literature [7] chose SWOT analysis method to effectively sort out the competitive advantages, disadvantages, opportunities and threats of Zhejiang agricultural products CBE logistics system itself, and then encourage the better progress of Zhejiang agricultural products CBE. The literature [8] makes a comprehensive analysis of the internal advantages and disadvantages, opportunities and challenges of the external environment of the CBE logistics of agricultural products in Henan Province with the help of SWOT analysis method, and proposes countermeasures for the progress of CBE logistics of agricultural products in Henan Province.

This paper firstly conducts a SWOT analysis on the progress of CBE of agricultural products, and analyzes the advantages, disadvantages and external opportunities and threats of Zhejiang in building a CBE logistics system for agricultural products. Then, to encourage the construction of "One Belt and One Road", China will spring filled play to the relative compensations of domestic regions, instrument an extra practical opening approach, reinforce the collaboration and

cooperation between the central and western regions, and expansively improve the level of exposing economy, which also brings great opportunities for Zhejiang's economic and trade progress. Finally, using SWTO to analyze the import and export growth value and growth rate of agricultural products CBE platform, the results reflect that the economic growing of agricultural products presents the problem of instability, and in response to this problem, we should make good use of the policy dividend to actively explore the progress of new trade rules, innovate the new mode of foreign trade progress, and further provide new support and progress opportunities for cultivating the logistics system of agricultural products CBE.

## **2. SWOT analysis of the current situation of CBE of agricultural products**

### **2.1. Advantages**

Diversified product supply. China is a vast country with a wide range of terrain and climate types, suitable for the growth of a variety of crops. Relying on the strong supply market of Chinese agricultural products, CBE of agricultural products can obtain stable sources of goods and provide consumers with rich and diversified agricultural products, thus achieving rapid progress. The construction of CBE platforms continues to improve, and there are more than 5,000 CBE platforms in China, which can well meet the needs of agricultural products enterprises to transport out foreign trade business. At the same time, the popularity of smartphones and the popularity of QR code payment have encouraged mobile payment facilitation, which also encourages more enterprises to participate in CBE trade, and the completion of a perfect and secure third-party payment platform is just around the corner.

### **2.2. Disadvantages**

The quality and safety of agricultural products are not high. China's agricultural products are often contaminated for three main reasons: First, the lack of a sound animal epidemic prevention system, resulting in frequent outbreaks of animal and plant diseases. For example, China's meat exports to the European Union were detected with excessive bacteria, and the poultry exports to Japan also failed to meet the access standards and requirements. Although this is also

related to the strict inspection and quarantine requirements of the relevant countries, but also illustrates the gap between the technical level of China's control of the quality of agricultural products and developed countries. Second, pesticide and veterinary drug sales are not properly regulated, and prohibited pesticides and veterinary drugs are still in circulation in the market. Third, the domestic air pollution, water pollution and soil heavy metal pollution problems are more serious. These factors have led to the frequent occurrence of quality problems in China's exports of agricultural products, hindering agricultural exports. At the same time, China's third-party temperature-controlled logistics construction is not perfect, there is a lack of hardware equipment, cold storage construction of low information technology and other problems, the complete closed temperature-controlled transport chain has not yet been built. The producers of agricultural products are mostly scattered households, and some CBE platforms lack strong supervision and management of these businesses, coupled with the lack of platform supervision, the traceability mechanism has not been perfected, so if there are problems with the quality of agricultural products, it is difficult to trace the person responsible. In terms of agricultural products information tracking, agricultural products cannot be marked, and it is impossible to trace the whole production process of agricultural products. Enterprise operators are not aware of the use of big data, at present, although many domestic enterprises through CBE to carry out foreign trade business of agricultural products, but most enterprises are weak in Internet thinking, poor ability to use big data, old-fashioned marketing methods, these are obstacles to the further progress of CBE of agricultural products.

## **2.3. Opportunity**

### **2.3.1. "Belt and Road" Strategic Opportunity**

To encourage the construction of "One Belt and One Road", China will give full play to the relative rewards of domestic regions, instrument an extra practical opening approach, strengthen the collaboration and assistance between central and western regions, and broadly expand the level of open economy, which also brings great opportunities for Zhejiang's economic and trade progress. In the context of "One Belt, One Road" strategy, by promoting the

construction of Zhejiang Ocean Economic Progress Demonstration Zone and Zhoushan Islands New Area, strengthening the construction of ports in coastal cities such as Ningbo and Zhoushan, increasing scientific and technological innovation, and forming new advantages in participating and leading international cooperation and competition, Zhejiang is gradually becoming the "One Belt, One Road" especially the 21st Century Maritime Silk Road construction of the main force. And CBE is becoming an important carrier of Zhejiang's economic transformation and upgrading, thanks to the Yangtze River Economic Belt customs integration reform and the "Yi-Xin Europe" train through the whole series of good, Zhejiang Province, "One Belt and One Road" along the import and export of countries is a better Growth momentum. At the same time, the "Belt and Road" strategy is also conducive to Zhejiang to accelerate the opening of domestic and international logistics channels to achieve the organic connection between the two, providing a rare opportunity for the better progress of CBE of Zhejiang agricultural products.

### **2.3.2. Create an upgraded version of modern agricultural park**

Zhejiang government attaches great importance to the construction of functional grain production areas and modern agricultural parks "two zones". 2016, Zhejiang was first approved to create the country's only agricultural "machine for human" demonstration province, and then approved to create the country's first demonstration province of green progress of animal husbandry. What's more, in the first three quarters of 2016, the added value of Zhejiang's agriculture, forestry, animal husbandry and fishery industry grew by more than 2.5%. At present, Zhejiang province has built 29 model agricultural whole industry chains in animal husbandry, aquaculture and bamboo, with a total annual output value of more than 100 billion yuan. In the process of promoting the construction of the whole agricultural industry chain, the Internet has played an indispensable role. 2015, Zhejiang's agricultural products network retail sales exceeded 30.4 billion yuan, an increase of 69%. During the "Thirteenth Five-Year Plan" period, Zhejiang will also deepen the construction of the "two regions" on the basis of actively creating about 30 agricultural industry clusters and about 100 special agricultural towns to encourage the integration of one, two and three industries and accelerate the progress of the whole agricultural industry chain. In addition, Zhejiang to "enterprise

as the leader, the base as the basis, the standard as the core, the brand as the leader, market-oriented", in the characteristic advantages of agricultural production base construction, based on the selection of a number of export agricultural production demonstration base, these are for the further progress of Zhejiang agricultural products CBE provides a material basis and a strong Guarantee.

## **2.4. Threats**

### **2.4.1. Lack of cooperation and low efficiency among agricultural logistics organizations**

The distribution of farmers and small and medium-sized agricultural enterprises in various cities in Zhejiang is relatively scattered, and there is a lack of large-scale operation in the transportation and marketing of agricultural products, and a lack of cooperation and win-win awareness among relevant logistics organizations. The low degree of logistics organization, single service function, less value-added services and serious homogeneous competition lead to low logistics efficiency, which not only increases the logistics cost of CBE of agricultural products, but also restricts the progress of agricultural products logistics system. At the same time, the progress of specialized CBE agricultural products third-party logistics enterprises and fourth-party logistics lags behind, with low market share and logistics specialization level to be improved.

### **2.4.2. Domestic and foreign policy risks**

CBE of agricultural products will be affected by different domestic and foreign political, economic and trade systems, tax rates, exchange rate fluctuations, and policy changes, which will also affect the normal operation and progress of CBE logistics. CBE logistics involves domestic and overseas logistics systems, as well as customs supervision, customs clearance, inspection and quarantine in different countries. Customs policies, inspection and quarantine standards and strengths vary from country to country and are prone to change and uncertainty. This makes the cross-border logistics of agricultural products face many risks such as product quality inspection and customs clearance, which can easily cause losses to the CBE of agricultural products and related customers.

### **3. Data Analysis**

#### **3.1. Analysis of agricultural products import and export volume and its growth rate in the context of big data**

Figure 1 shows the import and export volume of agricultural products and its growth rate. The world economy has shifted from faster progress before the international financial crisis to low growth, and the economic recovery is not enough momentum, and the growth rate of international trade has dropped significantly. From the data on the IMF website, it can be seen that the growth rates of agricultural exports and imports in 2016 were 8.69% and 2.70%, respectively, and are expected to fall in 2019. The economic growth rate of developed economies, although fluctuating up, is still below 2.5%, while the growth rate of China's agricultural exports is also declining in fluctuation. The overall international economic situation is relatively sluggish, with weak external demand and weak international markets, which all bring certain difficulties for agricultural products CBE to enter the international market. Enterprises should make meticulous and multi-level division on the quality and safety of agricultural products, and produce high, medium and low-end agricultural products to meet the needs of consumers at all levels. Relevant departments should set strict inspection and quarantine standards for agricultural products, establish traceability mechanisms for agricultural products through information technology such as big data and cloud computing, strengthen the construction of agricultural product quality rating system, and improve the level of agricultural product quality supervision. The government needs to pay attention to the cultivation of talents for CBE of agricultural products, and can set up a CBE talent training base for social enrollment in order to cultivate composite talents.

**Figure 1.** Import and export volume of agricultural products and its growth rate

### 3.2. Flow and flow of CBE of agricultural products in Zhejiang

Figure 2 shows the proportion of major export countries in Zhejiang Province from January to December 2015. Zhejiang's exports mainly flow to North America, Europe, East Asia, Southeast Asia and other countries and regions. Agricultural products as an important part of Zhejiang's export commodities, the export flow of its agricultural products are also mainly concentrated in North America, Europe, East Asia, Southeast Asia and other countries and regions.

**Figure 2.** Proportion of export countries in Zhejiang Province from January to December 2015

Figure 3 shows the percentage of major importing countries in Zhejiang Province from January to December 2015. The imports of Zhejiang agricultural products mainly come from Southeast Asia, Europe, Australia and other countries and regions. For the statistics of the flow and flow of Zhejiang agricultural products CBE, it can be seen that the flow of Zhejiang agricultural products CBE is more stable. Meanwhile, although there are more countries and regions conducting cross-border trade of agricultural products, the flow of some countries and regions is lower.

**Figure 3.** Proportion of import countries in Zhejiang Province from January to December 2015

#### **4. CONCLUSION**

Based on the study and discussion of the present condition and difficulties of agricultural products CBE, this paper investigates the advantages, disadvantages and external opportunities and challenges of the agricultural products CBE logistics system itself using SWOT analysis, and the following conclusions can be drawn from this study.

(1) By analyzing the import and export of agricultural products and their growth rates in the situation of big data, the growth rates of agricultural products import and export in 2016 were 8.69% and 2.70% respectively, and the progress rate of China's agricultural exports also declined in fluctuations. The country needs to strengthen the construction of the quality rating system of agricultural products, expand the level of quality supervision of agricultural products, and use the mode of CBE to vigorously support the progress of foreign trade of agricultural products. This will not only increase farmers' income, but also encourage the progress of the agricultural economy, which in turn will encourage the healthy progress of the national economy.

(2) Through the analysis of the flow and flow of CBE of agricultural products in Zhejiang, the export flow of its agricultural products is also mainly concentrated in North America, Europe, East Asia, Southeast Asia and other countries and regions. And the import of agricultural products mainly comes from Southeast Asia, Europe, Australia and other countries and regions. It is believed that under the correct guidance of the government and with the active cooperation of the enterprises, China's agricultural products CBE will be settled in a long way.

## ABSTRACT

This paper focuses on the effects of pesticides on the functional diversity of soil microbial communities. Firstly, the methods of biodiversity measurement and data processing were introduced. Then the spatial and temporal patterns of changes in soil microbial AWCD of four forest types during pesticide spraying and the effects of pesticides on the diversity and metabolic functions of soil microbial communities in the ecosystem were presented. After 72 h of warming, the microbial community AWCD values of soils sprayed at 0.94, 1.88 and 4.70 kg ai Ha<sup>-1</sup> were reduced by 17%, 19.4% and 19.5%, respectively, relative to the control. The initial application of pesticides had some inhibitory effect on the carbon source utilization of the soil microbial community. The Simpson index of the three concentrations of pesticide treated soils differed significantly from the control, with 22.2%, 20.5%, and 22.9% reduction, respectively, which indicated that the dominant populations in the soil were significantly affected. Pesticide contamination had a significant effect on the functional diversity of the soil microbial community.

## KEYWORDS

Big data; Pesticide contamination; Community functional diversity; Soil microorganisms; AWCD values; Simpson index

## 1. INTRODUCTION

With the intensive exploitation of agricultural resources, solid wastes, sewage, fertilizers and pesticides accumulate in the soil year by year, resulting in explicit or latent complex pollution of the soil environment [1]. This not only affects crop diversity, but also directly endangers the diversity of soil microorganisms [2]. As an important component of soil ecosystems, soil microorganisms play an important role in promoting soil quality and plant health.

The literature [3] concluded that soil type is the main factor affecting the structure and distribution of soil microbial communities. The literature [4] investigated how the number and population patterns of soil microorganisms were affected by soil type during the tobacco growing season. The results showed a significant positive correlation between the number of soil microorganisms and soil nutrients under different soil types. The literature [5] investigated the microbial diversity of soil particles as influenced by fertilization conditions using the T-RFLP method. The results showed that the diversity of soil microorganisms was more pronounced in soils with high organic matter content and fine particles. Therefore, it can be seen that there is an extremely close relationship between the community structure diversity characteristics of soil microorganisms and soil type and soil conditions, and to accurately reflect the real situation of soil microbial diversity, it is necessary to first understand the influence of soil and bad conditions on it. The literature [6] pointed out that soil microbial carbon content is a key driver of nutrient and energy flow in subsurface soil ecosystems and contributes directly to the conversion of soil organic matter. The literature [7] concluded that there are interactive and synergistic effects of temperature and moisture conditions that can influence soil microbial diversity characteristics. The literature [8] investigated the changes in soil microbial communities after years of treatment with three alternative pulse herbicides, diquat, linuron and chlormequat. It was found that the structure and function of the soil microbial community were significantly altered by the three herbicides. The soil bacterial diversity was reduced and the microbial community structure was significantly different after treatment with the three herbicides. In the literature [9], the effect of the new insecticide acetamiprid on the soil microbial community was studied using the DGGE method.

Throughout the experiment, the effect of acetamiprid on soil microbial communities at normal field use concentrations was not significant, and there was no significant decrease in soil microbial genetic diversity. High concentrations of acetamiprid had some effects on soil microbial community gene diversity, but the effects were not long-lasting, and the differences between the soils of different treatments gradually decreased from the fourth week after incubation.

This paper mainly explores the effects of pesticides on the functional diversity of soil microbial communities. The experimental method of this experiment and the measurement method of soil microorganisms were introduced respectively, and the spatial and temporal patterns of changes in AWCD of four forest types of soil microorganisms before and after the implementation of pesticides were explored, and the effects of pesticides on the diversity and metabolic functions of soil microbial communities in the ecosystem were investigated.

## **2. Community functional diversity of soil microorganisms**

The functional diversity of soil microbial community is an important indicator to characterize the distribution of soil microbial community in the soil. By understanding the characteristics of soil microbial community, we can understand the health of soil ecosystem in time. In nature, only 1%-3% of all soil microbial species can be isolated and purified by human. Most of the soil microorganisms cannot be purely cultured by artificially simulated conditions due to the limitations of temperature, pH, nutrients, water and fertilization, and thus the life activity of all microbial populations in soil cannot be clarified by quantitative analysis. The BIOLOGECO microplate method is a means to characterize soil microbial communities by reflecting the metabolic diversity of soil microbial carbon sources. It has been widely used in the evaluation of soil microbial community diversity. Currently, the functional diversity of soil microbial communities can be characterized by the variation of different enzymatic activities in the soil and the metabolic fingerprinting of "carbon use level" based on BIOLOG ECO microplate technology. In this study, we focus on the metabolic diversity of soil microbial populations and explore the spatial and temporal variation of soil microbial AWCD in four forest types in order to correctly and comprehensively reveal the influence of different forest types, spatial and temporal succession and

pesticide application on the functional diversity of soil microbial communities.

### **3. Determination of the functional diversity of soil microbial communities**

The BIOLOG ECO microplate method was used to determine the functional diversity of soil microorganisms. First, fresh soil equivalent to 10g of dried soil was weighed and added to 100ml of phosphate buffer in a triangular flask. Then, shake at 160r/min for 10-15min, take 3ml of supernatant and add to 27ml, 0.145mol/L NaCl solution to dilute, repeatedly dilute to 1/1000 times and then aspirate 150 $\mu$ L of solution to inoculate into BIOLOG plate. Finally, the plates were incubated continuously for 10 d at 25C in an incubator, and read every 24 h at 595 nm with a VAMAX automatic plate reader. The equation for calculating the functional diversity of the soil microbial community is shown in Table 1. The mean rate of change AWCD values, species richness Shannon-Winner index SW, species dominance Simpson index SP and community evenness McIntosh index and utilization of different types of carbon sources were calculated according to Eq.

**Table 1.** Equations for calculating the functional diversity of soil microbial communities

Indicators	Evaluation purposes	Calculation formula	Note
AWCD value	Characterizing the ability of soil microorganisms to utilize a single carbon source Assessing the species richness of soil microorganisms Species richness	$AWCD = \sum (C - R) / n$	$C$ is the absorbance value of each hole, Light absorption for control holesvalue, $n$ is the number of medium wells.
Shannon-Winner Index	Assessing the species richness of soil microorganisms	$H = -\sum Pi(\ln Pi)$	$Pi$ The ratio of the relative absorbance value of the first well to the sum of the relative absorbance values of all reaction wells Ratio of
Simpson Index	For assessing the dominance of some of the most common species	$D = \sum_{i=1}^M [ni - (ni - 1) / N(N-1)]$	$N$ is the sum of the relative absorbance values of all reaction wells
McIntosh Index	For assessing the species homogeneity of soil microbial communities	$U = \sqrt{\sum ni^2}$	$ni$ is the relative absorbance value of the $i$ well

## 4. Results and Analysis

### 4.1. Spatial and temporal variation of soil microbial AWCD values

Microsoft Excel 2003 software was used to perform basic statistical processing of experimental data such as mean and standard error and to plot the pictures. One-way ANOVA analysis of variance (ANOVA) was performed using SPSS 16.0 software. The Duncan test was used to test the significance of differences in AWCD values, soil microbial diversity index, and carbon source utilization. Principal component analysis was used to analyze the diversity characteristics of soil microbial carbon metabolism. Figure 1 reflects the temporal

and spatial variation patterns of AWCD of soil microorganisms in four forest types during pesticide spraying. In the temporal variation pattern, the AWCD values of different soil layers of the four forest types showed a trend of increasing, then decreasing, and then increasing with time. The overall trend of AWCD values in the surface layer was 2 Months > 10 Months > 0 Months > 6 Months, and the overall trend of AWCD values in the 0-20cm layer was 2 Months > 10 Months > 6 Months > 0 Months, which was due to the differences in soil temperature and moisture conditions in different sampling periods.

In the spatial variation pattern, the AWCD values of soil microorganisms in the surface layer of the four forest types were higher than those in the 0-20 cm layer, indicating that the metabolism of carbon sources by soil microorganisms in the surface layer was higher, and the number of microorganisms in the surface soil was more and the life activity was vigorous. Among different forest types, the size pattern of AWCD values showed that Yew red pine forest > Stinking fir red pine forest > Xing'an larch forest > White birch forest, indicating that Yew red pine forest had the highest soil microbial AWCD values. The soil microbial community exhibited extremely high physiological activity due to its strong ability to utilize and metabolize a single carbon source. In contrast, the soil microbial AWCD value of Xing'an larch forest was the smallest, and the utilization capacity of soil microorganisms for carbon sources was weak compared with that of purple linden red pine forest. This is related to the stand conditions, soil nutrient content, and soil enzyme activity among different forest types. It can be seen that soil microbial AWCD values can be influenced by many factors such as spatial and temporal variation, soil environmental conditions and forest type. Figure 2 shows the temporal variation pattern of AWCD values in the 0-20 cm soil layer.

**Figure 1.** Temporal variation pattern of AWCD values in topsoil

**Figure 2.** Temporal variation pattern of AWCD values in the 0-20 cm layer of soil

#### 4.2. Effects of pesticides on the diversity and metabolic functions of soil microbial communities in ecosystems

The BIOLOG technique, based on redox colorimetric reaction, is an effective means to quantitatively describe the carbon source utilization capacity of soil microbial communities. Since different microorganisms utilize a single carbon source to different degrees, making the solution in each pore also show different degrees of color

change, the change in AWCD values can accurately reflect the overall activity of the soil microbial community. The effect of repeated applications on the utilization of carbon sources by the soil microbial community is shown in Fig. 3. Before the pesticide treatment, the AWCD values of the soil microbial community in each plot did not differ significantly throughout the warming period, indicating that the activity of the soil microbial community in each plot remained basically the same. After the first application, the AWCD values of the microbial communities of the treated soils were all significantly lower than those of the control soils, and the differences were significant throughout the warming period. After 72 h of incubation, the AWCD values of the microbial communities in soils sprayed at 0.94, 1.88 and 4.70 kg ai Ha<sup>-1</sup> were reduced by 17%, 19.4% and 19.5%, respectively, relative to the control. After 168 h of incubation, the AWCD values of microbial communities in the three concentration-treated soils were still lower than the control by 17%, 19.4% and 19.5%, respectively. The above results indicated that the initial application of pesticides would have a significant inhibitory effect on the overall soil microbial activity, which was enhanced with the increase of pesticide concentrations.

The effects of repeated pesticide applications on the functional diversity of soil microorganisms are shown in Figure 4. before the first application, there were no significant differences in the three diversity indices of soil microorganisms in each plot. After the first application, all three diversity indices of soil microorganisms were lower than the control level, indicating that the dominant population, species richness and homogeneity of soil microorganisms were affected to some extent by the pesticide treatment. The Simpson indices of the three concentrations of pesticide treated soils were significantly different from the control, with 22.2%, 20.5% and 22.9% reduction, respectively, indicating that the dominant populations in the soil were significantly affected. Shannon and McIntosh indices were lower than the control level but not significantly different, indicating that species richness and homogeneity were less affected.

**Figure 3.** Changes in soil microbial community warming process after pesticide treatment

**Figure 4.** Effect of repeated applications on the functional diversity of microbial communities

## 5. CONCLUSION

In this paper, the effect of pesticides on the microbial species and microbial population of soil on different forest types was investigated by BIOLOG ECO microplate method, and the pattern of pesticide effect on the microbial species and microbial population of soil on different forest types was found. The following conclusions are drawn.

(1) Soil microbial AWCD values can be influenced by many factors such as spatial and temporal changes, soil environmental conditions and forest types.

The metabolic capacity of surface soil microorganisms for carbon sources is higher, and the number of microorganisms in the surface soil is higher and their vital activities are vigorous. Between different forest types, the size pattern of AWCD values showed that yew linden red pine forest > odorous fir red pine forest > Xing'an larch forest > white birch forest.

(2) The dominant populations, species richness and homogeneity of soil microorganisms were affected to some extent after the pesticide treatment. The Simpson indices of the three pesticide concentrations were significantly different from the control, indicating that the dominant populations in the soil were significantly affected. Shannon and McIntosh indices were lower than the control level but not significantly different, indicating that species richness and homogeneity were less affected.

## ABSTRACT

In this paper, the performance of the SVM classification model differs by choosing different types of kernel functions in the context of "One Belt, One Road", starting from big data technology. The performance of the SVM model proposed in this paper is analyzed, and the factors influencing the implementation of foreign law identification system are quantitatively analyzed. The accuracy of the model in this paper is 89.9%, which is 5.5%, 4.2%, and 6.4% higher compared to FastText, CNN, and LSTM, respectively. In terms of influencing factors, the identification method, identification channel, and identification procedure increased by 98%, 109.72%, and 32.9% from 2016 to 2020, respectively. This shows that the main factors affecting the smooth operation of the foreign law identification system can be effectively analyzed by using big data technology.

## KEYWORDS

Big Data Technology; SVM; Kernel functions; Performance Analysis; Foreign law identification system; One Belt One Road

## 1. INTRODUCTION

Since the "One Belt and One Road" initiative was proposed, its construction has been proceeding in an orderly manner, and the interaction between countries along the route has become increasingly close. The increasing investment cooperation between China and the countries along the "Belt and Road" has led to an

increase in the number of foreign-related civil and commercial cases in China year by year, and the types of cases have shown diversified characteristics [1-2]. In judicial practice, due to the different geographical locations of the countries along the route, the legal systems and trial modes are also different. This can lead to opposite judgment results for the same disputes and unpredictable legal risks for investors [3-4]. The "Belt and Road" is an inheritance of the ancient Silk Road, and the trade among the countries along the route is becoming increasingly close, but the existing foreign laws in China are of uneven quality, and there is a need to correctly improve the content of applicable foreign laws [5-6].

Effective identification of foreign law is the prerequisite and foundation for the correct application of foreign law, and is the key to resolving overseas trade and investment disputes of Chinese enterprises. Effective identification of foreign law is conducive to enhancing the image of Chinese courts and arbitration institutions, improving the overall investment environment in China, and echoing and complementing the implementation of China's "One Belt, One Road" strategy [7-8]. Obviously, a large number of foreign-related disputes require the identification of foreign law, and the internationalization process of China also requires the identification of foreign law. The path of foreign law identification should be designed in accordance with the concept of equal treatment of domestic and foreign law in private international law [9-10]. Because of its strong procedural nature and technical requirements, foreign law has become an issue that needs to be improved in the legislation and practice of Chinese private international law and civil procedure law [11].

In order to explore the application of big data technology in analyzing the factors influencing the operation of foreign law identification system in the context of "One Belt, One Road", this paper analyzes and demonstrates in three parts. The first part is an algorithm analysis, which illustrates the SVM classification model with big data technology and explains the basic principle of the model and the choice of kernel function. The second part is the problems of foreign law identification in the context of "One Belt, One Road", including the allocation of responsibilities, negative attitudes, complex types and lack of identification channels. The third part is the data analysis,

which evaluates the performance of the SVM model proposed in this paper, and analyzes the factors affecting the smooth operation of the foreign law identification system by using the SVM classification model. The above three parts are used to demonstrate the application of big data technology in the foreign law identification system.

## 2. Big Data Technology - Support Vector Machines

SVM was first proposed by Cortes and Vapnik in 1995, and it shows many unique advantages in solving small sample, nonlinear and high-dimensional pattern recognition, and can be extended to other machine learning problems such as function fitting.

The support vector machine approach is based on the VC theory of statistical learning theory and the structural risk minimization principle, which seeks the best compromise between the complexity of the model (i.e., the learning accuracy for a given training sample, Accuracy) and the learning ability (i.e., the ability to identify arbitrary samples without errors) based on limited sample information, with a view to obtaining the best generalization ability (or generalization capability).

### 2.1. The basic principle of SVM

In layman's terms, SVM is a two-class classification model whose basic model is defined as a linear classifier with maximum interval on the feature space, i.e., the learning strategy of a support vector machine is interval maximization, which can eventually be translated into the solution of a convex quadratic programming problem.

The SVM optimal classification function is expressed as follows:

$$S(x) = \text{sign} \left[ \sum_{i=1}^n a_i y_i K(x_i, x_j) + b \right] \quad (1)$$

Where  $a_i$  is the non-negative Lagrange multiplier,  $y_i$  is the category,  $K(x_i, x_j)$  is the kernel function, and  $b$  is the classification threshold.

### 2.2. Kernel function selection for SVM

At present, there are four kinds of kernel functions commonly used in SVM, mainly Sigmoid kernel function, polynomial kernel function, radial basis kernel function, and linear kernel function. Among them, the polynomial in this paper adopts 2nd order polynomial, and all

kernel function expressions are as follows.

The linear kernel function is:

$$K(x_i, x_j) = x_i^T x_j \quad (2)$$

The polynomial kernel function is:

$$K(x_i, x_j) = (gx_i^T x_j + \gamma)^c \quad (3)$$

Where  $g > 0$ ,  $c$  are natural numbers.

The radial basis kernel function is:

$$K(x_i, x_j) = \exp(-g \|x_i - x_j\|^2), g > 0 \quad (4)$$

The Sigmoid kernel function is:

$$K(x_i, x_j) = \tanh(gx_i^T x_j + r) \quad (5)$$

### **3. Problems Identified in Foreign Law in the Context of “One Belt, One Road”**

Foreign law identification refers to the question of how to identify the provisions of a foreign law on a particular issue when the court of a country, in an international civil or commercial case, should apply a foreign substantive law in accordance with its own conflict of laws norms. This process involves both the identification of the existence of a legal provision or precedent and the true meaning of that legal provision or precedent, i.e., the "identification" and "clarification" of foreign law.

#### **3.1. Foreign law identifies the negative attitude of the subject**

In China, the attitude of the subjects of foreign law identification is relatively negative for a number of reasons. First, the most important reason is that judges are unfamiliar with foreign law and prefer to apply their own familiar domestic law as compared to foreign law. Second, language difficulties are one of the reasons for the negative attitude of judges toward foreign law identification. In foreign-related civil and commercial cases, judges must first be familiar with the foreign law involved in the case. However, there are 66 countries along the "Belt and Road", with more than 50 different languages and complicated language conditions, so it is impossible for judges to be

familiar with the laws of each country due to language difficulties. Due to the different judicial education of the judges, which leads to bias in legal concepts, this undoubtedly increases the difficulty of identifying foreign laws, and some countries' laws may also be affected by religious factors.

### **3.2. Complex types of cases to be identified under foreign law**

In the process of implementing the "Belt and Road" strategy, Chinese enterprises will take the lead in infrastructure construction and energy cooperation and development projects, and a new wave of overseas mergers and acquisitions, engineering contracts, international transportation and cross-border e-commerce transactions will emerge. The new rounds of M&A, engineering contracting, international transportation and cross-border e-commerce transactions will be the climax. The types of cross-border disputes will be more complex, and the demand for legal clarification will increase significantly. Compared with the traditional identification of corporate law, maritime law and trade law, Chinese courts will face more identification of foreign contract law, tort law, intellectual property law, merger and acquisition law, as well as foreign investment and financial regulation laws, some of which are more specialized and detailed.

### **3.3. The country of origin of the foreign law to be identified mostly lacks identification channels**

Many countries and regions along the "Belt and Road" include Russia, Kazakhstan, Vietnam, Poland and other countries belonging to the civil law system, as well as Malaysia, Singapore, India, Pakistan and other countries belonging to the common law system. Most of the countries along these routes are developing countries with which China has had infrequent civil and commercial dealings and few professionals practicing law in China, whose laws are not well known to us and are not among the countries and regions identified by the courts more frequently in practice. Moreover, many of these countries are non-English speaking, and there are language barriers and difficulties in finding legal articles, searching the internet, treatises and other resources.

## 4. SVM-based analysis of foreign law to identify operational influences

### 4.1. Performance analysis of SVM

In this section, the performance of the foreign law identified impact factor SVM analysis model is compared and the model output prediction results are provided for the impact factor analysis. In this paper, three metrics are used to evaluate the baseline model, including accuracy ACC, macro precision MP, and macro recall MR, which are widely used in classification tasks. To evaluate the performance of the model, the foreign law identified influence factor SVM analysis model is compared with FastText, CNN, and LSTM in this paper. The experimental results are shown in Table 1.

**Table 1.** Comparison of experimental results

Mission	ACC/%	MP/%	MR/%
FastText	84.4	49.7	40.5
CNN	85.7	36.4	32.7
LSTM	83.5	72.8	54.8
SVM	89.9	25.6	21.4

On the existing dataset, the accuracy of the model in this paper is 89.9%. Compared with the other three methods by 5.5%, 4.2%, and 6.4%, respectively, the performance of the model in this paper is significantly better than other classification analysis methods, indicating the effectiveness of the method proposed in this paper. Compared with the traditional classification task model, the method in this paper pays more attention to data pre-processing to make the data more adaptable to the model, and makes full use of the good learning ability and low generalization error rate of SVM to achieve good prediction in the analysis of the influencing factors identified by the foreign method.

### 4.2. Analysis of operational influence factors

Under the influence of "One Belt, One Road", the number of foreign-related cases is increasing, the number of countries involved is increasing, and the types of foreign-related cases are becoming more complex, and the requirements for the identification of subjects are also higher. In this section, the SVM classification model is used to classify and analyze the cases related to foreign law identification in recent years, so as to find the influential factors affecting the

operation of foreign law identification. The results of the analysis are shown in Figure 1.

In terms of factors influencing the operation of foreign law identification, from 2016 to 2020, identification methods, identification channels, identification procedures, and identification mentality become the main factors affecting the smooth operation of the foreign law identification system.

**Figure 1.** Analysis of operational influences

In terms of identification methods, the number has increased from 11.72% in 2016 to 23.21% in 2020, an increase of 11.49 percentage points, indicating that the depth of "One Belt, One Road" has made it more difficult to find ways to identify foreign law. The number of identification channels increased from 15.13% in 2016 to 31.73% in 2020, an increase of 16.6 percentage points. Identification procedures grew from 15.66% in 2016 to 20.81% in 2020, an increase of 5.15 percentage points. When a legal expert retained by the parties issues a contrary opinion or the parties disagree, the court then exercises its discretion and determines that the foreign law cannot be identified. The identification mentality decreased from 57.49% in 2016 to 24.25% in 2020, a decrease of 33.24 percentage points. This indicates that the implementation of the foreign law identification system can be effectively promoted after an exemption

system regarding errors in the application of foreign law in a way that legally supports and protects judges.

## **5. CONCLUSION**

Focusing on the legal difficulties arising from the construction of "One Belt, One Road", we found that the current foreign law identification system is not operating smoothly mainly due to the objective circumstances that make it difficult to identify, such as the unified opinion of experts to identify foreign law and the lack of detailed provisions on the identification process. There is also the subjective mentality that experts find it difficult to identify foreign law and apply it correctly. Accordingly, feasible suggestions will be made.

(1) Improving the method of identifying experts in foreign law, clarifying the criteria for experts, and compiling a roster of experts.

(2) Improve the mechanism of responsibility for the identification and application of foreign law, and clarify the responsibility for the identification of foreign law and the system of exemption from liability for errors in the application of foreign law.

## **ABSTRACT**

In order to comprehensively promote the construction of "Curriculum Civics" in engineering majors of higher vocational colleges and universities under the background of integration of industry and education, based on the opportunities and challenges of promoting the construction of Curriculum Civics under the background of integration of industry and education. This paper combines the characteristics of engineering courses in higher vocational colleges and universities, and addresses the problems of course thinking politics being formal and not obvious. It explores the path of promoting the construction of curriculum thinking politics from three aspects, namely, the excavation of curriculum thinking politics resources, the determination of curriculum thinking politics goals and the integration of curriculum thinking politics resources, and devotes itself to scientifically and steadily promoting the construction of curriculum thinking politics and cultivating high-quality technical skills talents. The results show that the integration of industry-education integration into the curriculum thinking and politics can effectively improve the construction of students' ideology and morality, and the attendance rate of students increased by 23.18%. The construction of industry-education integration into curriculum thinking and politics

cultivation system proposed in this paper can effectively promote the cross-border and synergistic development of regional economic industrial chain and vocational talents value chain.

## **KEYWORDS**

Industry-education integration; Curriculum Civics; Senior Engineering Major; Resource mining; Regional Economic Industry Chain; Synergistic Development

## **1. INTRODUCTION**

Traditional engineering colleges and universities emphasize the teaching of professional knowledge and skill cultivation, but do not pay attention to value shaping, which has led to some extreme social incidents and sounded an alarm for higher education [1-2]. In the 2016 National Conference on Ideological and Political Work in Colleges and Universities, General Secretary Xi Jinping clearly pointed out that "all other courses should guard a section of drains and plant a good responsibility field, so that all kinds of courses and In 2016, General Secretary Xi Jinping clearly pointed out that "all other courses should keep a good channel and plant a good field of responsibility, so that all kinds of courses and ideological and political theory courses can go in the same direction and form a synergy effect". This has opened a new situation of the ideological education in colleges and universities [3-4].

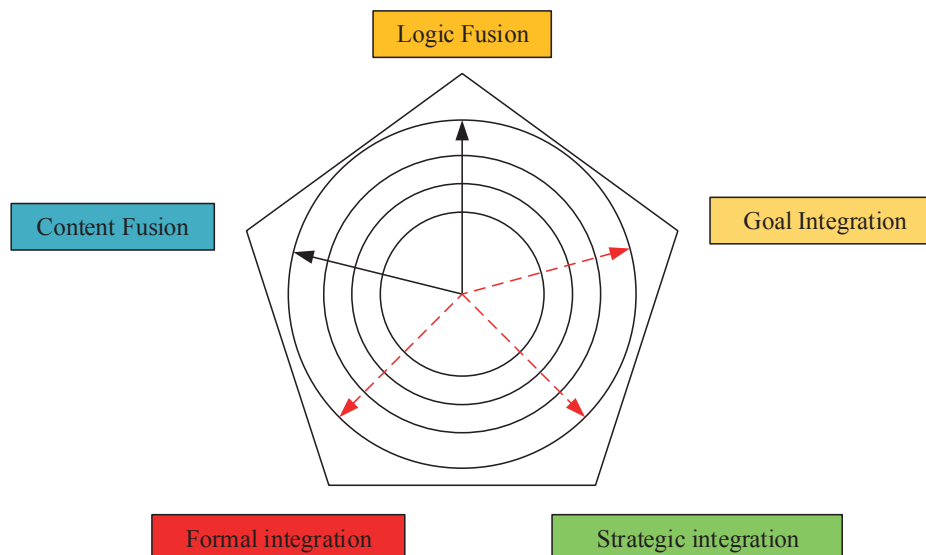

In the literature [5], it is proposed that the construction of higher vocational curriculum thinking politics should be promoted on the basis of industry-education integration, and the advantages of university-enterprise teachers and resources should be brought into play by the platform of industry-education integration. In the literature [6], it is believed that the construction of curriculum thinking and politics promotes the implementation of the fundamental task of "establishing moral education" in multiple channels and dimensions, creates a new situation of "three-wide education", and promotes the construction of high-quality curriculum thinking and politics. According to literature [7], the traditional vocational education is mainly run by administrative mode, and teachers are mainly full-time teachers, among whom there are many teachers who go from "school to

school" and lack working experience in enterprises, so they do not have a deep understanding of students' future employment positions.

This paper first explains the human orientation and inherent unity of the two co-education, and introduces the coupling, symbiosis and affinity characteristics of the co-education subject of "Curriculum Civics" + "Industry-Education Integration". The necessity of constructing a symbiotic system of mainstream values discourse and education elements is discussed. Secondly, the logic and practical path of the collaborative education model of "curriculum thinking and government" + "industry-education integration" are proposed. It is emphasized that the interdisciplinary integration and co-construction, the collaboration and innovation among education subjects and the "enterprise culture" education should be highlighted in the education practice. Finally, it is pointed out that the construction of "big data + education" and other big moral education framework system can effectively promote the cross-border and synergistic development of the regional economic industry chain and the value chain of vocational talents.

## **2. The integration of curriculum thinking and politics into industry-education integration talent cultivation model**

In order to play the role of the concept of curriculum thinking in the model of integration of education and industry, it is necessary to make the concept integrated into the model, constituting a new model with both professional skills and inner quality training. How to integrate the concept into the model is the core issue, which requires a corresponding method to achieve. Next, specific methods will be proposed to build a logic diagram of the integration of Civics and Political Science resources into the science and industry education system as shown in Figure 1.

**Figure 1.** Civic resources integrated into the science, industry and education system

## 2.1. Digging into Civic Political Elements

In order to integrate the concept of curriculum thinking and politics into the talent training model of industry-education integration, it is necessary to explore the thinking and politics elements of different courses in the model, including theoretical courses, practical training courses and industrial practice courses, which is the basic condition for the integration of the concept of curriculum thinking and politics. There are two ways to explore the elements of the curriculum, one is to explore the textbook or educational content, teachers should carry out in-depth analysis to find the elements of Civic Science and Politics in the textbook or educational content. The second is for extra-curricular content, where teachers can substitute external thinking and political elements into the course teaching, which can also achieve the purpose of course element mining. The following will analyze the common elements of Civics in both types of courses.

### 2.1.1. The ideological element of the theory course

The theoretical courses in the industry-education integration talent cultivation mode mainly work around the textbook, so teachers should use the first way of digging Civic and Political elements in this course to dig, but they can also supplement it with the second way to dig. Take the textbook of Communication Principle of Communication Engineering as an example, teachers can find out a lot of thinking political elements in the textbook through the first way of mining. For

example, for the introductory content, teachers can see the importance of communication engineering in the modern industry, with the help of communication engineering can make people's division of labor and collaboration relationship more smooth and close, and improve the efficiency and communication range of human communication. This can serve to improve efficiency and enhance the synergy of work. In that role various industries will begin to integrate and cooperate with each other, promoting the transformation of domestic industries and providing momentum for national development. This is in line with the requirements of the National Diversification Policy Initiative, a Civic Element. In addition, if the teacher uses the second type of mining in the theoretical course, he or she can substitute some extracurricular, real-life occurrences into the teaching of the theoretical course, such as the impact of the new achievements of national communication engineering on the international political status of the country.

### **2.1.2. The ideological element of the practical training course**

The practical training courses are mainly carried out after the theoretical courses, aiming to let talents master the way of applying theoretical knowledge in a simulated environment, and also initially help them accumulate experience and prepare for the practical teaching in the industry afterwards. The practical training course also has rich elements of thinking and politics in it, and teachers should also make deep excavation. In the practical training course, it is suggested that teachers mainly use the second way to dig, which can combine with extra-curricular thinking resources to raise questions and prompt talents to think during their practical training. This can make the talents' thoughts clearer and know why they learn and what they will bring to help themselves and the society after learning, and their political concepts, thoughts and consciousness are shaped in this way. For example, in the packaging industry, teachers can cite common problems in the modern packaging industry and lead talents to think about the adverse effects of these problems and how they will affect China's international political landscape if they can be solved, etc.

## **2.2. Changing the teaching model**

The teaching mode adopted by many modern institutions in the industry-education integration talent training mode is teacher-led, which will cause talents to perform passively and is not conducive to the play of their subjective initiative. They do not think about the problem, usually remember what the teacher said, and participate in practical training or practice according to the teacher's requirements, which can only cultivate employment-oriented talents and cannot play the role of thinking politics training. Therefore, under the concept of Curriculum Civics, institutions and teachers must start to change the teaching model, putting talents in the leading position and teachers working as the guide. This teaching model is the only way to make the concept of curriculum thinking and politics into the integration of industry-education personnel training mode, and give full play to its proper role.

In the changed teaching mode, because talents occupy a dominant position, they have ample room for activism and are in a position to develop their own thinking, plus the teacher's guidance can stimulate talents' initiative and prompt them to start thinking. The teacher as a guide has to raise guiding questions with the meaning of thinking, so that talents can think about these questions in order to achieve the purpose. In the case of graphic design, for example, the teacher as a guide can ask similar questions about how we should promote traditional Chinese culture in fashion design. These questions will make talents start to think and gradually try to integrate the design elements of China's excellent traditional culture in Packaging design to enhance China's international influence with the help of cultural exchange.

## **2.3. Reforming the curriculum**

For a long time, the curriculum systems of domestic institutions have been characterized by distinctive course boundaries, i.e., there are obvious boundaries between different courses. This has led to the independence of courses from each other, making it difficult to integrate the skills courses with the Civic and Political Science courses, and the concept of Civic and Political Science in the curriculum naturally cannot play its proper role. Faced with this situation, institutions must start to reform the curriculum system,

aiming to change the relationship between the courses people, so that skills courses and Civics courses are integrated with each other. So that the skills course teachers and Civics course teachers collaborate with each other to play the role of the concept of curriculum Civics.

After the reform of the curriculum system, teachers can collaborate with each other and give each other some help in their own expertise in the collaboration, i.e., the expertise of teachers of skill courses is skill education and their weakness is Civic Education. This makes it difficult for such teachers to effectively carry out thinking and political education in their own courses, and they also encounter some difficulties when tapping into the thinking and political elements. However, the expertise of Civic Studies teachers is the opposite of weaknesses, and they can help skills course teachers to effectively carry out Civic Studies education or explore Civic Studies elements, and also get professional information from skills course teachers, which can be used in Civic Studies education. It can be seen that the reform of the curriculum system makes the relationship between the skill courses and the Civics courses harmonious, and the concept of Civics in the curriculum can be smoothly integrated into the industry-education integration talent training mode, and with the help of the concept of Civics in the curriculum can cultivate both internal and external talents.

### **3. Results and Analysis of Industry-Education Integration into Curriculum Civics**

#### **3.1. Industry-education integration into the curriculum Civics evaluation index establishment**

The organization of industry-education integration, i.e., the structure built by each stakeholder to achieve the goal of industry-education integration, i.e., the professional construction, curriculum and teaching materials construction, teacher team construction and internship and training base construction carried out by both sides in the process of cooperation.

The implementation of industry-education integration means observing the intensity of information communication and the effectiveness of training and guidance in the cooperation between the two parties. The intensity of information communication includes the

number of seminars conducted and the degree of openness of information technology communication between the two sides. Training guidance considers the percentage of pre-service training provided by the school to students, the percentage of follow-up guidance provided by the school to students, and the number of employees trained by the school for the company.

The effect of industry-education integration is observed in three aspects: employment level, student satisfaction, and the gold content of the graduation certificate. The employment level examines the retention rate of students in internship, the contracting rate of students in internship, and the monthly salary of students at graduation. Student satisfaction examines students' recognition of the enterprise, recognition of the teachers, and recognition of their own ability improvement. The gold content of the graduation certificate contains the percentage of the number of dual certificates and the percentage of the professions with vocational certificates.

### 3.2. Data analysis of evaluation indicators

(1) Industry-education integration integration curriculum thinking and political resources input

University H has a more complete internship and training base, the government funds the establishment of experimental teaching centers and key laboratories, and enterprises provide practical equipment support and build educational bases with the university. The university increases the funding for practical teaching, and the average practical funding for students increases year by year. The economic investment of University H from 2019 to 2022 is shown in Table 1.

**Table 1.** University of H Stakeholder Economic Input Table 2019-2022

	2019	2020	2021	2022
Percentage of government economic input	66.21%	86.37%	68.11%	70.08%
The proportion of enterprise donated equipment	15.51%	7.98%	14.47%	11.69%
The proportion of school practice funds	9.38%	7.89%	8.89%	9.98%
Average practice expenses per student (yuan)	3516.41	3485.52	4510.59	4859.55

## (2) Industry-education integration integration curriculum thinking and government system establishment

In recent years, the government has continuously issued guiding policies on the integration of industry and education, guiding schools to establish partnerships with enterprises to cultivate applied talents. In 2017, the government issued two policies, "Several Opinions on Deepening the Integration of Industry and Education" and "Measures". Enterprises pay more attention and guidance to internship students, and implement a set of training system of pre-job training, on-the-job guidance and post-job assessment. The university will manage the assessment of students such as attendance check and practice report submission. The number of systems established in University of H 2019 to 2022 is shown in Figure 2.

**Figure 2.** Table of the number of courses and teaching materials in University H from 2019-2022

## 4. CONCLUSION

In this paper, the basic concept and importance of the concept of Curriculum Civics and the method of integrating Curriculum Civics into the model of training talents for industry-education integration are studied, and the basic concept and importance of Curriculum Civics and the method of integrating Curriculum Civics into the model of training talents for industry-education integration are explained. On

the basic concept of the concept of curriculum thinking and politics, it points out the shortcomings of the current mode of training talents for integration of industry and education, and clarifies the importance of integrating the concept of curriculum thinking and politics in this mode, so that institutions should actively reform this mode. The adoption of the method in the paper can provide some help to the institutions and prompt them to integrate the concept of curriculum thinking and politics into the training mode of industry-education integration talents, so as to cultivate talents with both internal and external merits and contribute to the development of the country.

## ABSTRACT

In this paper, we start from the shortcomings of traditional education and discuss in depth the connotation, purpose, interaction mode and transformation of an educational concept of psychological training from the new perspective of "experience", so as to construct a comprehensive, multi-level and three-dimensional model of experiential psychological training. Then the psychological analysis of teachers was conducted. The number of students in junior high school classes generally reaches 50 or more, with even larger numbers in county towns and rural areas. Among them, the class size was maintained at 50 students between 2002 and 2005. Teachers felt greater work stress and were unable to adopt positive stress coping styles, and teachers' work stress was significantly correlated with physical and mental behavior. Finally, this study explored new paths for teacher education development in the context of the information technology era, injected new energy into the new curriculum reform, and added its contemporary connotation to teachers' psychological optimization and professional growth.

## KEYWORDS

Internet; Experiential Psychology; Training Model; Educational Philosophy; Faculty Development; Work stress

## 1. INTRODUCTION

With the integration and innovation of new materials, new energy, high technology and the Internet, the third industrial revolution, named by Western scholars, is quietly arriving. With it, education informatization is developing rapidly, and the international Internet has become the world's largest knowledge carrier and the most convenient way to disseminate information [1-2]. Modern technologies such as cloud education, digital schools, satellite-delivered classrooms, and smart campuses have changed the traditional sense of teachers' superior knowledge mastery and the authority of textbooks. Students growing up in the high-tech era are more sensitive to information technology than their teachers and may be more proficient in acquiring knowledge from modern media than their teachers [3-4]. The rapid changes in science and technology have not only built a good platform for innovation in education, but also posed a serious challenge to the development of education. As the innovation of education is on the verge, it is urgent to grasp the pulse of the times, abandon the traditional educational barriers, and explore new paths of teacher development [5-6].

The literature [7] recognizes the value of teachers' mental health and should explore its role in society, education and students' development in an all-round way in order to form a conscious awareness of the need for teachers to carry out mental health education, to fully grasp the task of teachers' mental health education, to coordinate teachers' mental health development with society and school education, and to build a harmonious and unified modern school education system. The literature [8] suggests that teachers themselves should have the following basic qualities: the ability and quality to understand students in a comprehensive, in-depth and detailed manner. Have the ability and quality of self-education to constantly improve themselves and their own education and teaching. Have the ability to constantly improve their own mental health and to have a positive attitude toward their work and students.

In this paper, psychological techniques are skillfully used to promote teachers' spiritual growth and psychological maturity in the context of Internet information technology. Through communication and sharing, members are guided to improve their cognition, stimulate their inner

values and vitality, and ultimately improve their psychological quality. It is through the special charm of "experience" that we have thought more about and gained deeper insight into the optimization of school education and teaching in the process of constructing the psychological training model. Through the experiential psychological training of teachers, we can deepen their personality, improve their quality, change their teaching philosophy, and help students to transform into the spirit of personality and perfection while receiving knowledge, and promote the optimization of students' outlook. The re-education of teachers' psychology and the shaping of their harmonious personality and complete spiritual world are profound connotations of the optimization of teachers' outlook and new viewpoints and directions for traction teacher development.

## **2. Impact of experiential psychological training on teacher development**

### **2.1. Meaning of experiential and experiential psychological training**

Experience means to know the things around you through practice. In contrast, "experiential" psychological training is guided by the concept of humanistic education, which transforms psychological knowledge into inner feelings through various psychological techniques. The educated person is exposed to a carefully designed situation, and through profound experience and true perception, the educated person implicitly generates educational meaning, and eventually comprehends the difficulties and wisdom of life according to the logic of life, thus changing personal attitudes, correcting radical concepts, and improving psychological quality. It can be seen that experience is a way for individuals to participate in the world, a state of human existence, and the participation, involvement and practice of body and mind. Experiential psychological training is based on the premise of emotional experience, and in the interpersonal interaction of the group, through the application of various psychological techniques, such as empty chair technique, hypnosis technique, intentional dialogue, etc., the members can change their roles, feel deeply, rapport, heal trauma, and stimulate potential. Therefore, experiential psychological training is not only concerned with how much knowledge teachers learn and how many psychological laws they

master in the training, but more importantly, through experiential psychological training, the value of human life and the meaning of life can be enhanced and expanded through experience. Experiential psychological training has proved to be the best form of psychological education and psychological assistance for teachers in group situations, and it is also an effective model.

## **2.2. Experiential Psychological Training Situational Experience**

In reality, the teacher's own personality quality and mental health level far exceed the constraints of his teaching ability and professional knowledge on students' growth, and teachers' own bad factors bring various negative influences to students intentionally or unintentionally. However, in the past, teachers' training only focused on the improvement of teachers' business level, but neglected the improvement of teachers' spiritual level, which is a big defect in education practice. In contrast, "experiential psychological training" creates realistic situations for members to participate and experience through "psychological growth workshops", and through communication and interaction, they can change their thinking, clarify their ideas and sublimate their cognition, and eventually grow psychologically and change their behavior. Therefore, the use of experiential re-education to improve teachers' psychological abilities and psychological capital makes teachers the greatest beneficiaries of psychological education and creates practical support for the development of teachers' empathy. By changing teachers' psychological skills from vague theories to observable, operational, and "technical" practical training, we reduce the blindness of teachers' psychological learning and increase the effectiveness of psychological training. In particular, it is conducted in a group setting, where teachers can experience, analyze, and solve problems in specific situations to reflect consistent patterns in their lives, so that they can deeply feel their inner emotions, vent their repressed emotions, and understand the true meaning of life. Teachers learn, perceive and grow in the experience, thus opening their hearts and minds, accepting reality, changing their patterns, perfecting their personalities, and eventually making a real improvement in their own mental abilities and even a complete change in their values. This is the charm of experience. Because there is experience, there is feeling, and when there is feeling, it becomes vivid, and when it is

vivid, it can move and move the heart, so as to have an awakening, and finally inspire the desire to change and the passion to create. Therefore, perception and experience are also an important part of experience sublimation, mind change, psychological maturity and individual development. Through experiential training, we really touch the heartstrings of people's hearts, achieve the purpose of optimizing psychological education, and realize the reshaping of teachers' spiritual personality.

### **2.3. Innovation of the experiential psychology classroom model**

In the classroom of the digital information age, it is the new mission of the teacher to stimulate students to "move", grow in wisdom and improve their abilities. Therefore, it is imperative to reform the classroom in the traditional sense. The methods of carefully imparting knowledge and forcibly instilling ideas are clearly no longer appropriate for today's students. In its place is a new experiential classroom model that stimulates the inner world of students, develops their potential, and grows their talents. Education is rich in practical experience, and the innovation of the new model lies in the experience. Through activities that promote emotion, break through defenses, and deep experience, teachers promptly guide students immersed in their perceptions to think deeply, reflect on the past, summarize the present, and thus look forward to the future. For this reason, the new classroom is flexible, free and efficient. In the experiential psychological training, the organic combination of points, lines and surfaces of members, groups and classes is the key. The teacher sometimes leads from the front, sometimes pushes from the back, and sometimes accompanies the members, which are the means of teaching, while explaining, experiencing, and sharing are different strategies. This new concept fills the imperfections in the process of education and teaching, and provides a reference for future teaching reform.

### **2.4. Educational Philosophy**

In the past, the biggest task of students in education was to get the maximum knowledge from teachers or textbooks. How students behave and grow up healthily was neglected, and their creative potential was ruthlessly stifled. As a result, reading loses its connection with students' cultural cultivation, and reading has no

more relationship with human life experience and personal growth. Students' innermost anxiety is hollow. They have been educated for years but have become test-taking machines with no ambition, no passion, no imagination, depleted creativity, and numbness and indifference. And in the age of information technology, Internet technology and new media have become the basic means of education. How students seek, draw and use knowledge and how to improve their mental personality appears to be very prominent. Therefore, through experiential psychological education, students can have profound and extensive experiences, truly internalize knowledge and perception into unlimited potential, and maximize the creative wisdom boiling in their minds, so that they can become not only the inheritors of knowledge and culture, but also the creators of new energy of new technology, thus continuously promoting the optimization of students' outlook.

### **3. Psychological analysis of teachers**

#### **3.1. Elementary school teacher stress**

Figure 1 shows the average class size at the primary level by urban and rural areas from 2002 to 2009. Class sizes at the primary level in China are large and have not eased over the years, and have increased slightly. Class sizes are consistently distributed within the 45-person level area in county, town, and urban elementary school, and at the 30-person level in rural areas. Class size is not only a response to the way teaching is organized, but also an indicator describing the workload of teachers. Reducing class sizes and increasing the level of attention given to students also helps to improve the quality of teaching and learning. At the elementary school level, the majority of developed countries have average class sizes of around 20 students, with only Chile, Japan, and South Korea having class sizes of around 30 students. In other words, Chinese teachers are working under far more pressure than international levels.

**Figure 1.** Average class size of primary school in urban and rural areas from 2002 to 2009

### 3.2. Middle school teacher stress

Figure 2 shows the average class size at the junior high school level by urban and rural areas from 2002 to 2009. Class sizes in junior high schools generally reach 50 or more students, with higher numbers in counties and towns and in rural areas. The class size in rural middle schools has changed faster than in counties and towns, and is now close to the level of urban middle schools. From these two charts, it is clear that class sizes in Chinese primary and secondary schools are generally too large, and that teachers have limited capacity to attend to every child. Coupled with the imperfection of the educational assessment system, teachers' demands on students' classwork increase in order to meet teaching goals, and with it comes a huge workload and pressure. Teachers feel greater work stress and fail to adopt positive stress coping methods, and their work stress is significantly correlated with their physical and mental behaviors. The results found that primary and secondary school teachers had an overall moderate level of stress, but more negative job stress than positive job stress, and workload was the main source of teachers' stress experience, which affected the level of teachers' mental health.

**Figure 2.** Average class size of junior high school in urban and rural areas from 2002 to 2009

#### 4. CONCLUSION

The "experiential psychological training model" comes from the exploration in practice and the real experience of the explorer's heart, and the experiential psychological training is also a new attempt of teachers' continuing education in the new curriculum reform. The following conclusions can be drawn from the study of the experiential psychology model of teacher development based on Internet information technology.

(1) For elementary school teacher stress analysis, class sizes at the elementary school level in China are large and have not been relieved for many years and have increased slightly. Class sizes in county and urban elementary school have been distributed within the level area of 45 students and in rural areas at the level of 30 students. Class size is not only a response to how instruction is organized, but also an indicator that describes the workload of teachers. Reducing class sizes improves the level of attention given to students and also contributes to the quality of teaching and learning.

(2) For the analysis of teacher stress in junior high schools, class sizes in junior high schools have generally reached 50 or more

students, with higher numbers in counties, towns and rural areas. Among them, the class size was maintained at 50 students between 2002 and 2005, and the situation decreased after 2006. Workload is the main source of teachers' stress experience, which can affect the development of teachers' mental health level.

## ABSTRACT

This paper first introduces the specifics of data mining technology and the specific process of its use in teacher teaching evaluation system, digital processing of stored data, collection of teacher teaching data, determination of data mining purpose, mining data, and evaluation model using data mining technology. Then the teacher teaching quality evaluation system was constructed, the evaluation data was extracted, and the continuous type of data in the sample was discretized. Finally, the rubrics were analyzed for fine-grained sentiment as well as for classification of attributes. The students evaluated the teachers' teaching effectiveness the best, with an overall evaluation of 931 explicit and 21,314 explicit and implicit, followed by teaching attitudes, as well as the teacher's personality, teaching language, and teaching content. Data mining technology can analyze the large amount of data generated from teacher evaluation in a deeper way, which has far-reaching implications for the development of education and teaching decisions.

## KEYWORDS

data mining technology; teacher evaluation; discrete processing; fine-grained sentiment analysis; support vector machine; teaching quality

## 1. INTRODUCTION

The supervision of the teaching process and the quality of teaching in the classroom is a proven method of ensuring the quality of classroom teaching [1-2]. Teaching evaluation is used as an effective method to detect the quality of teaching in all institutions, and through the observation and assessment of teachers' teaching in a working period, scientific and effective assessment results are formed, and based on

the results, the teaching process is continuously improved [3-5]. The literature [6] proposes a classroom observation method in line with this, i.e., the quality of teachers' effective teaching behaviors can be linearly "deduced" from the quality of classroom teaching. This paper first introduces the basic principles of data mining technology and its application scenarios, then analyzes the specific process of data mining technology in the process of teacher teaching evaluation, determines the purpose of data mining according to the known conditions, then cleans and screens the data and mines the existing data. Finally, the system of teacher teaching quality evaluation is constructed, and the evaluation data are extracted, sentiment analysis and attribute classification are performed.

## 2 APPLICATION OF SUPPORT VECTOR MACHINE SVM ALGORITHM IN TEACHER TEACHING EVALUATION

The support vector machine SVM algorithm takes the problem to be solved and solves it by a quadratic programming. For example, by assuming the existence of a hyperplane on the sample set  $\varpi \cdot x + b = 0$  can divide the existing samples into two major classes, where the training set is  $J(x_i, y_i), x_i \in R^n, y_i \in \{-1, +1\}, i = 1, \dots, n$ , then there is a hyperplane that can make the sum of the two classes of samples to their distances can reach the maximum, then the plane is the hyperplane, and the hyperplane is calculated by the formula:

$$\min \frac{1}{2} \|\varpi\|^2 + C \sum_{i=1}^n \xi_i, (\xi_i \geq 0, i = 1, \dots, n) \quad (1)$$

Where  $\xi_i$  is the relaxation variable,  $b$  is a threshold, and  $C$  is the penalty parameter. We transform the above problem of calculating the optimal plane into a quadratic programming pairwise problem by Lagrange operator, which is given by:

$$\max \sum_{i=1}^n \alpha_i - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j y_i y_j K(x_i, x_j) \quad (2)$$

Where  $\alpha_i$  is the Lagrange multiplier, and the decision function obtained by solving this pairwise problem is:

$$f(x) = \text{sgn} \left( \sum_{i=1}^n \alpha_i y_i K(x_i, x_j) + b \right) \quad (3)$$

Although the theory of support vector machine SVM has a wide range of applications at present, it still encounters some problems in our practical applications

such as kernel function selection, induction, optimization and inner product parameter finding.

### 3. SYSTEM CONSTRUCTION OF TEACHER TEACHING QUALITY ASSESSMENT

#### 3.1 EXTRACTION OF EVALUATION DATA

In this paper, evaluation data were extracted from the evaluation data of Xinhai Middle School in the first semester of the 2019-2020 academic year and combined with teachers' personal information to form the basic structure of the rating data table. To ensure that the sample can contain each attribute characteristic that affects the evaluation grade, stratified sampling is used to randomly select 12 evaluation sample data for the five levels of evaluation data. The evaluation grades were obtained by statistically calculating the average of all student ratings for each teacher, converting them to the corresponding grades and adjusting them manually. It can be seen that the factors that may affect the evaluation grade in the table are: the teacher's gender, age, length of teaching experience, title, education, attitude, level, method and effectiveness of teaching of the four evaluated items, etc. Table 1 shows the evaluation sample data.

**Table 1** Evaluation sample data

Serial number	Teachers	Gender	Age	Teaching experience	Title	Academic qualifications	Teaching Attitude	Teaching level	Teaching methods	Teaching Effectiveness	Grade
1	Teacher 1	Female	38	11	Assistant Lecturer	Bachelor's degree	21	28	18	23	Moderate
2	Teacher 2	Male	37	7	Assistant Lecturer	Bachelor's degree	23	32	21	23	Excellent
3	Teacher 3	Male	44	21	Lecturer	Bachelor's degree	24	32	22	23	Excellent
4	Teacher 4	Female	31	9	Assistant Lecturer	Bachelor's degree	21	28	19	20	Good
5	Teacher 5	Female	37	2	None	Bachelor's degree	14	20	12	14	Failing
6	Teacher 6	Female	37	10	Assistant Lecturer	Undergraduate	19	27	18	20	Moderate

#### 3.2 COMMENTARY FINE-GRAINED EMOTIONAL ANALYSIS

To analyze the rubrics, rubric pre-processing is required, which is completed in the rubric favorability analysis and fine-grained analysis. Based on the rubric classification algorithm, the system can classify each teacher's rubric into positive and negative sentiment, and give the support rate and positive and negative rating of the rubric.

Based on the data mining algorithm, the system can realize the fine-grained classification and sentiment analysis of a teacher's comments. Figure 1 shows the

fine-grained analysis results for "teacher", which shows the specific fine-grained sentiment distribution.

**Figure 1** Fine-grained sentiment analysis of the rubric

After the above fine-grained analysis, this paper conducts rubric analysis on nearly 40,000 valid rubrics, and the number and proportion of positive and negative evaluations of all explicit and implicit attributes can be derived, and it is more obvious that there are more implicit feature attributes and less explicit features in the rubrics. Therefore, this paper focuses more on the number and proportion of positive and negative evaluations after combining the explicit and implicit attributes. And the results of the implicit attributes and the combined explicit and implicit ones are compared.

To ensure the completeness of the fine-grained analysis, the number and proportion of positive and negative evaluations of the combined explicit and implicit attributes in the rubric are given in Table 2. There were not many explicit attributes expressed in the students' comments, and their proportion was small. In contrast, the proportion of the combined explicit and implicit attributes is higher; in addition, we can also find from the positive evaluations that students have the best evaluation of teachers' teaching effectiveness, followed by teaching attitude, and also pay more attention to the teacher's personality, teaching language, and teaching content. In the pejorative evaluation, some students are more concerned about the overall evaluation of teachers' teaching and the content of teaching, and they have negative evaluation of these two items. From this, it is clear that teachers should pay more attention to strengthening the teaching skills in the above aspects in order to improve the overall

effectiveness of teaching in secondary schools. Table 2 shows the comparison table of the fine-grained classification results of the rubrics.

**Table 2** Comparison of the results of the fine-grained classification of the rubric

Broad Categories of Attributes	Attribute subcategories	Explicit quantities		Corresponding percentage		Explicit and implicit quantities		Corresponding percentage	
		Positive	derogatory	Positive	derogatory	Positive	derogatory	Positive	derogatory
Teaching Attitudes	Teaching attitude	539	9	1.60%	0.01%	14912	55	36.31%	0.18%
	Treatment of students	1019	7	2.57%	0.00%	4124	28	10.04%	0.08%
	Classroom management	166	7	0.49%	0.00%	710	53	1.72%	0.16%
	Grooming	591	6	1.47%	0.00%	920	4	2.23%	0.04%

#### 4. CONCLUSION

This paper mainly uses data mining techniques to mine and analyze the rating data and rubric data of the teacher evaluation system, constructs rubric rules, and analyzes the rubric text data for positive and negative tendencies and fine-grained sentiment analysis. The following conclusions are mainly drawn.

In terms of fine-grained attribute classification, there are more implicit feature attributes and fewer explicit features in the rubric. The students were most concerned about the teachers' teaching effectiveness, followed by their teaching attitude, their

personality, teaching language, and teaching content. Some students were more concerned about the overall evaluation of teachers' teaching and the content of teaching, and held negative evaluations of these two items.

## ABSTRACT

This paper proposes image segmentation based on decomposition strategy and multi-objective evolutionary fuzzy clustering (MOEFC), which uses a weighted sum-based decomposition strategy to decompose multi-objective fuzzy clustering into multiple single-objective subproblems. These subproblems are simultaneously optimized by MOEA and the final trade-off solution regarding detail preservation and noise suppression of the image to be segmented is obtained. To further accelerate the convergence of the algorithm, opposition learning (OBL) and hybrid population initialization are introduced into the optimization process. By comparing MOEFC with different segmentation algorithms on different types of images with AR and ARI results of 99.69 and 99.4 on SI2 and 99.77 and 99.13 on SI3, MOEFC achieves higher metrics than other comparison algorithms. The algorithm in this paper has excellent performance in image detail retention and noise removal.

## KEYWORDS

Multi-objective optimization; Image segmentation; MOEFC algorithm; Decomposition strategy; MOEA; OBL

## 1. INTRODUCTION

With the continuous development of mathematics and computer technology, digital image processing techniques have also progressed [1]. Digital image processing involves various aspects including image enhancement, image segmentation, image compression, and image fusion. In a general digital image processing system, there is a unified structure that includes the image input device, the computer that performs the processing and analysis control, the storage system and the output device [2]. Different image processing contents have different processing models and programs, which are stored in different storage systems, which not only occupy more storage resources, but also have no uniform evaluation criteria [3]. If relatively unified evaluation indexes are set for these different image processing tasks, and the

control parameters of the image processing models are used as optimization variables, and the optimal control parameters are searched by an optimization algorithm, it will be able to unify the image processing problem and achieve optimal image processing [4]. The literature [5] uses panoramic techniques for height estimation hybrid stereo vision on UAVs. Literature [6] on the use of panoramic image techniques in robot localization pathfinding.

In this paper, we propose image segmentation based on decomposition strategy and multi-objective evolutionary fuzzy clustering, which transforms the fuzzy clustering combined with image local information into a multi-objective optimization problem. In which, the standard FCM objective function to maintain image details and the image local information constraint term for noise suppression are simultaneously used as the objective function. To further improve the search capability, OBL and hybrid population initialization are introduced in the algorithm. Among them, the mixed population initialization enables the algorithm to start the search from promising initial points, and OBL helps to speed up the convergence of the algorithm.

## 2. MULTI-OBJECTIVE EVOLUTIONARY FUZZY CLUSTERING IMAGE SEGMENTATION BASED ON DECOMPOSITION STRATEGY

In this paper, MOEFC is proposed to transform the fuzzy clustering problem combining local information of images into a multi-objective optimization problem. The standard FCM objective function and the local information constraint term are simultaneously optimized as the objective function, and the final trade-off segmentation result that can maintain the image details and remove the noise effectively is obtained.

### 2.1 MULTI-OBJECTIVE FUZZY CLUSTERING MODEL CONSTRUCTION

Suppose the image to be segmented is  $X = \{x_1, x_2, \dots, x_N\}$  and  $N$  is the number of pixels of the image to be segmented.  $x_i$  is the  $i$ th pixel of the image and takes the value of the gray value of that pixel.  $\max$  and  $\min$  denote the maximum and minimum gray values of the pixels in image  $X$ , respectively. If  $c$  denotes the number of fuzzy clusters and individual  $z = (z_1, z_2, \dots, z_c)^T$  denotes a set of candidate clustering centers, then the multi-objective fuzzy clustering problem of MOEFC can be defined as:

$$\min F(z) = [f_1(z), f_2(z)]^T \quad (1)$$

$$z = (z_1, z_2, \dots, z_c)^T, x_i \in X, i = 1, 2, \dots, N \quad (2)$$

$$f_1(z) = \sum_{i=1}^N \sum_{p=1}^c u_{ip}^m D(x_i, z_p) \quad (3)$$

$$f_2(z) = \sum_{i=1}^N \sum_{p=1}^c u_{ip}^m \sum_{\substack{j \in N_i \\ j \neq i}} w_{ij}^p D(x_i, z_p) \quad (4)$$

where  $f_1$  is consistent with the standard FCM objective function and is used to maintain image details. To suppress the effect of noise on image segmentation, the local information of the image is introduced into  $f_2$ . Considering that the Euclidean distance is sensitive to images containing noise, a widely used kernel function, the Gaussian radial basis function, is used in this paper as a similarity measure for multi-objective fuzzy clustering. In MOEFC, according to the distribution of pixel gray values, the bandwidth is defined as the distance mean squared difference of pixel gray values, which is calculated as follows:

$$\sigma = \sqrt{\frac{\sum_{i=1}^N \left( dis_i - \frac{1}{N} \sum_{i=1}^N dis_i \right)^2}{N}} \quad (5)$$

For the multi-objective fuzzy clustering problem, MOEFC uses a weighted sum-based decomposition strategy to decompose it into multiple single-objective subproblems:

$$\min g^{ws}(z | \lambda) = \lambda f_1(z) + (1 - \lambda) f_2(z) \quad (6)$$

where  $g^{ws}$  denotes a subproblem and the weight vector  $\lambda = (\lambda, 1 - \lambda)^T$  is used to control the effect of two objective functions, image detail retention and noise suppression, in fuzzy clustering.

## 2.2 ALGORITHM FRAMEWORK AND TARGETED OPERATOR DESIGN

In the initialization operation of MOEFC, the weight vector and the subproblem neighborhood are generated according to the methods in the literature. The genetic operations of MOEFC include crossover and variation, where the crossover operation uses a differential evolution strategy and the variation operation uses a Gaussian variation operator. According to the differential evolution strategy, the  $k$ th clustering center of intermediate individual  $y_i$  can be generated as follows:

$$y_{i,k} = \begin{cases} z_{i,k} + F \times (z_{l_1,k} - z_{l_2,k}) & \text{if } rand \leq CR \\ z_{i,k} & \text{otherwise} \end{cases} \quad (7)$$

In the MOEFC framework, the OBL operation is introduced in both the population initialization and evolutionary main loops. In the MOEFC framework, the OBL operation is used in the population initialization and individual update steps. In the optimization process, the distance between the current solution and the optimal solution directly affects the time taken by the algorithm to search for the optimal solution.

By weighing both cost and performance factors, MOEFC employs K-means, standard FCM, and Ncut algorithms as methods for generating partial individuals. In addition, the OBL operation on the initial population further ensures that MOEFC can start the search from the initial point with potential.

## 3. EXPERIMENTAL RESULTS AND ANALYSIS

In order to verify the segmentation performance of MOEFC, MOEFC is compared and analyzed with seven segmentation algorithms. Among them, KFCM\_S1, KFCM\_S2, FLICM, RFLICM, KWFLICM, KFND, MSFCA. In addition to the comparison experiments with the above algorithms, the analysis and discussion about MOEFC algorithm itself will be given in this section. In this section of experiments, MOEFC and the comparison algorithm will be applied to segmentation of artificial images, natural images, medical images and remote sensing images, and the details of the images to be segmented are shown in Table 1.

**Table 1.** Image information to be segmented

Image name	SI1	SI2	SI3	Bern	Ottawa
Image size	128×128	256×256	244×244	301×301	290×350
Split class number	3	4	4	2	2
Image name	Italy	SM. R1	SM R2	MR1	MR2
Image size	412×300	181×217	181×217	256×256	256×256
Split class number	2	4	4	4	4
Image name	3096	14037	Flower	Coins	Cameraman
Image size	481×321	481×321	128×128	308×242	256×256
Split class number	3	3	3	3	3

In this section of experiments, different levels of Gaussian noise and pretzel noise will be added on the three artificial images SI1, SI2 and SI3. The segmentation accuracy AR and ARI are used to measure the segmentation performance of different algorithms on the artificial images. Let  $n_{ij}$  denote the set consisting of pixels that belong to region  $i$  in the segmentation result but region  $j$  in the reference map,  $n_i$  denote the set of pixels that belong to region  $i$  in the segmentation result, and  $n_j$  denote the set of pixels that belong to region  $j$  in the reference map, then AR and ARI are defined as follows:

$$AR = \frac{\sum_{i=1}^c n_{ii}}{N}, ARI = \frac{\sum_{i=1}^c \binom{n_{ij}}{2} - \sum_{i=1}^c \binom{n_i}{2} \cdot \sum_{j=1}^c \binom{n_j}{2}}{\binom{n}{2}} \quad (8)$$

$$\frac{1}{2} \left[ \sum_{i=1}^c \binom{n_i}{2} + \sum_{j=1}^c \binom{n_j}{2} \right] - \sum_{i=1}^c \binom{n_i}{2} \cdot \sum_{j=1}^c \binom{n_j}{2} \bigg/ \binom{n}{2}$$

where  $c$  is the number of clusters and  $N$  is the number of pixels. In contrast to AR, ARI contains a statistical-based normalization component. Therefore, the more random the pixel class label distribution is, the more the value of ARI tends to 0. According to Equation (8), the larger the AR and ARI of the segmentation result, the closer the segmentation result is to the reference map.

The segmentation accuracy results of each algorithm on SI2 are shown in Figure 1, where SI2 and SI3 are disturbed by 30% Gaussian noise and 30% pretzel noise, respectively. It can be seen that MOEFC achieves higher metrics than the other compared algorithms.

**Figure 1.** Segmentation accuracy results of each algorithm on SI2

#### 4. CONCLUSION

In this paper, the image segmentation problem is modeled as a multi-objective fuzzy clustering problem. A weighted sum-based decomposition strategy is used to decompose the multi-objective fuzzy clustering problem into multiple single-objective fuzzy clustering problems. Each single-objective fuzzy clustering problem is controlled by a different weight vector to control the balance between image detail preservation and noise suppression. These single-objective fuzzy clustering problems are simultaneously optimized by the evolutionary algorithm, and the final segmentation results are obtained that can balance detail preservation and noise suppression. To speed up the convergence of the algorithm, opposition learning is introduced into the optimization process. A hybrid population initialization method for the image segmentation problem is also designed. Finally, through different types of image segmentation experiments, the segmentation accuracy of the algorithm in this paper reaches more than 99%. It is proved that the algorithm in this chapter can obtain segmentation results that maintain the image details while effectively removing the noise in the image.

## ABSTRACT

In the absence of a cultural core, an animation work is only a superficial and mediocre piece of work, and it is more important to incorporate the best local cultural elements into the creation of an animation. Information fusion technology is usually used for multi-source image synthesis, image analysis and understanding, etc. Data layer fusion is mainly applied to image processing, which can improve the degree of integration of traditional cultural elements in animation design to a greater extent. The study examines the ways in which traditional Chinese culture is used in animation design and analyses the evaluation of animation works and the selection of traditional cultural elements. The results show that only 27.05% of users were found to prefer bright and strong colours, while 69.67% of users preferred natural and soft colours. This study adds more traditional cultural elements to anime design, thus achieving a win-win effect for both anime design and traditional cultural heritage.

## KEYWORDS

Information fusion technology; Data layer fusion; Image analysis; Animation design; Traditional cultural elements

## 1. INTRODUCTION

Anime characters, i.e. the images in anime works. It can be argued that any successful and outstanding anime work that receives wide market acclaim must have achieved a deep portrayal of the characters[1-2]. Therefore, producers of anime works should make sure that the historical and cultural backgrounds of the characters are presented to every audience, so as to ensure the artistic and commercial success of the works [3-4]. In the process of designing and shaping characters, producers should also be aware that anime characters not only reflect the content of anime works, but also enhance the cultural appeal of the country [5-6].

Literature [7] proposes that ethnic culture is one of the many important components of China's culture, and in order to better promote ethnic culture and promote the development of animation design, attempts can be made to apply traditional ethnic elements to popular animation design. Literature [8] suggests that the audience of animation is wide, so domestic animation should focus on the use of elements with Chinese characteristics, so as to make China's animation industry have Chinese characteristics and improve the international competitiveness of domestic animation.

In this paper, redundant or complementary information of multiple cultural elements in space or time is fused based on certain guidelines through information fusion techniques in order to obtain a consistent description or interpretation of the object under test, while information

fusion effectively utilises cultural element resources so that a greater amount of information about the object and environment under test can be obtained. The use of traditional Chinese culture in animation design is then studied in three aspects: the character of the animation work, the subject matter of the animation work and the creation of the scene of the animation work, and the analysis of the animation evaluation and the selection of traditional cultural elements, this study thus promotes the development of the animation design industry.

## **2. INFORMATION FUSION TECHNOLOGY**

### **2.1 FUNCTIONAL MODEL OF INFORMATION FUSION**

The JDL functional model has now become the basic starting point for the study of information fusion. Information fusion is divided into four levels, and within the functional model, each level can be divided into different subsets, and the division between levels one and four is artificially divisible. The actual information fusion system is the integration and intersection of these parts, and the JDL model, which was initially created for the military domain, can be extended to the non-military domain as well. Currently, most of the work in information fusion is focused on the research of first-level algorithms. In information fusion, multi-sensor estimation and decision fusion techniques offer huge advantages in terms of survivability, reliability and robustness compared to individual sensor information processing techniques. The two main types of multi-sensor estimation and decision fusion are currently distributed and centralised.

### **2.2 HIERARCHICAL DESCRIPTION OF INFORMATION FUSION**

#### **2.2.1 DATA LAYER FUSION**

Data layer fusion is characterised by fusion directly on the detection judgement layer or signal layer in a multi-sensor distributed detection system. Data layer fusion is commonly used for multi-source image synthesis, image analysis and understanding. Data layer fusion is mainly for applications in image processing, which require high data transmission bandwidth and alignment accuracy between data. From an information fusion perspective, synthesis on the data layer is highly blind, as there is no way to check the consistency of the characteristics contained in the original multi-sensor data.

#### **2.2.2 TARGET FEATURE INFORMATION FUSION**

Target feature information fusion is the joint recognition of feature layers, which is essentially a pattern recognition problem. Multi-sensor systems provide more feature information about the target for recognition than a single sensor, increasing the number of feature space dimensions. The specific fusion method is still the corresponding technique for pattern recognition, but before fusion the features must be correlated and then the feature vectors must be classified into meaningful combinations.

## **3. WAYS OF USING CHINESE TRADITIONAL CULTURE IN ANIMATION DESIGN**

### **3.1 THE USE OF CHARACTERS IN ANIME PRODUCTIONS**

Figure 1 shows the animation character designs of *The Fisherman's Boy* and *The Three Monks*. Both *The Fisherman's Boy* and *The Three Monks* have very obvious traditional Chinese cultural elements in their character designs, which are typically Chinese in character and therefore easily remembered by the world. Anime characters are the main body of anime works. A good character has a significant impact on the whole anime work, and the success of anime characters often represents the success of anime works. When designing anime works, full consideration should be given to the positioning of the character, its period background, regional characteristics and memory of national customs and culture. Only when the

characters in anime works are consistent with the time and ethnic background of the time can they stand the test of time and withstand careful scrutiny and deliberation, so that they can be passed on for a longer period of time.

**Figure 1.** Animation character design of “Fisherman” and “Three Monks”

### 3.2 USE IN THE SUBJECT MATTER OF ANIME WORKS

Figure 2 shows the application of the Four Great Masterpieces, Journey to the West, to an animation work. The subject matter represents the content of the animation work, and the choice of the subject matter is indicative of the content chosen for the entire animation design. The subject matter is used throughout the entire animation work. Without a good and attractive theme, the audience will be reduced to a large extent and the meaning of the design will be lost, which means that all the previous efforts are useless. In contrast, Chinese culture is profound, has a long history, and has a wide variety of traditional artistic expressions. Each era, such as the Tang, Song, Yuan, Ming and Qing dynasties, has its own cultural traditions and a variety of historical stories that are sufficient to become the main subject of animation design.

**Figure 2.** The application of Journey to the West in animation works

### 3.3 USE IN THE CREATION OF SCENES FOR ANIMATION WORKS

Figure 3 shows a court scene from an anime production. The success of the creation of anime scenes represents the success of the anime work. The creation of an animation work must be combined with the context of the time period in which the story takes place, the regional flavour, the ethnic identity, the cultural background, etc., in order to achieve the integrity, logic and coherence of the animation work. There are many works with traditional Chinese cultural elements, such as theatre, costumes of each dynasty, paintings, shadow puppets and erhu pipa, etc. The integration of these cultural elements with Chinese characteristics in the process of animation design will definitely attract more and more audiences and bring the audience closer to the animation works, so that people can understand the inner meaning of animation design in a deeper way. This is certainly a big step forward in animation design.

**Figure 3.** Court scenes in animation works

### 3.4 ANIMATION EVALUATION AND SELECTION OF TRADITIONAL CULTURAL ELEMENTS

Figure 4 shows the bar chart of “How young users learned about Quanzhou Puppets”. Young people tend to be more receptive to both old and new things. Based on the re-analysis of the questionnaire data of the target group, we can see that the perimeter of animation only accounts for 14.75% of the ways to learn about the art of Quanzhou Tideline Puppets, which indicates that this means of communication or method is less utilised, and the author has discovered the potential of the perimeter of animation in the dissemination of Quanzhou puppet culture.

**Figure 4.** “Bar chart “Young users learn about the Quanzhou Puppet Pathway

Figure 5 shows a pie chart of the colour scheme of young users' favourite cartoon images. In the above analysis of the colour elements of the Quanzhou puppets, we can find that, whether it is the face or the costume, the puppets we have seen so far are all coloured in bright colours of high purity due to the need to perform and to stand out under the stage lights, but in the user survey I found that only 27.05% of the users prefer Only 27.05% of the users prefer bright and strong colours, while 69.67% of the users prefer natural and soft colours.

**Figure 5.** Pie chart “Young users’ favourite colour schemes for anime images”

#### 4. CONCLUSION

Based on the information fusion technology, this paper starts the research from two aspects: the analysis of the application of Chinese traditional cultural elements in the field of animation character design and the analysis of the application of Chinese traditional cultural elements in the field of animation scene creation. The following conclusions can be drawn.

(1) The animation works use the oriental charm of Chinese landscape painting to shape the breathtaking animation scenes, fully reflecting the unique charm of traditional Chinese national elements. This is evident. The use of traditional ethnic elements makes the animation design truly attractive to the audience and brings the animation work closer to the audience, ultimately achieving real success.

(2) There is innovation in the form of communication, compared to the previous methods of communication there is a touch more initiative and interest that requires audience exploration, and the carriers can be more abundant and diverse.

# AN EXPLORATION OF THE CHALLENGES OF CROSS-BORDER DATA FLOW TO INTERNATIONAL INVESTMENT LAW BASED ON FUZZY NUMERICAL ANALYSIS METHOD

---

Lin Yang\*

Xi'an Peihua University, Xi'an, Shaanxi, 710125, China

[yanglin19941125@126.com](mailto:yanglin19941125@126.com)

---

## ABSTRACT

This paper firstly introduces the basic concept of fuzzy mathematical analysis method, which applies the principle of fuzzy transformation and the principle of maximum affiliation, establishes the set of influence factors and evaluation set, analyzes multiple influence factors of the research object, and carries out multi-level evaluation grading on them. The affiliation degree of each influencing factor is determined. Then the basic concepts of cross-border data flow and the types of cross-border data flow are introduced, and finally the cross-border data risk is analyzed as well as the governance ideas of cross-border data flow are explored. In terms of cross-border data flows, the total global data volume has reached 33 ZB (33 trillion GB) in 2018 and is expected to reach 175 ZB in 2025, with a 7-year data volume CAGR of 27%. It is a general trend to regulate cross-border data flow and deal with national information security, and the legislative protection of cross-border data should be strengthened.

## KEYWORDS

fuzzy numerical analysis; cross-border data flow; international investment method; fuzzy transformation; maximum affiliation; evaluation grading

## 1. INTRODUCTION

Data resources are important strategic resources that countries wish to control, and the competition among countries has gradually shifted from commodities and materials to the management and control of data [1-2]. In response to the protection of personal information and the development of technological innovation, countries have made active explorations at the legislative level [3-4]. The literature [5] considers that the right to data specifically includes both state-centered national data sovereignty and individual-centered data rights. The literature [6] argues that data sovereignty protection should be established and strengthened based on the value of data.

Literature [7] copes with the fact that big data raises numerous problems and requires an orderly construction of a legal system related to data sovereignty.

This paper first introduces the basic principles of the fuzzy mathematical analysis method, establishes the set of influencing factors and the evaluation set, analyzes multiple influencing factors of the research object, and evaluates them in a multi-level hierarchy. The affiliation degree of each influencing factor is determined. Then it introduces the basic scale and data flow of cross-border data flow, and finally analyzes the types of cross-border data flow, data risk and the governance ideas of cross-border data flow.

## 2. FUZZY NUMERICAL ANALYSIS METHOD

The fuzzy mathematical analysis method uses the principle of fuzzy transformation and the principle of maximum affiliation. The basic idea is to establish the set of influencing factors and the evaluation set, analyze multiple influencing factors of the research object, and grade them in a multi-level evaluation. Determine the degree of affiliation of each influence factor.

The affiliation function is a function used to quantitatively describe the degree of affiliation of the influencing factors to the landslide stability grade, which is the key to determine the degree of affiliation. In this study, the linear affiliation function of "ascending semi-trapezoidal" in fuzzy fitting is used to quantify the indexes, and the standard degree principle proposed by SAATY is used to compare each influence factor with each other to determine the relative importance of each factor in the same level and the previous level, and finally the contribution degree of each influence factor is expressed by a numerical value to complete the qualitative. The final degree of contribution of each factor is expressed as a numerical value, and the transformation from qualitative to quantitative is completed. The affiliation function  $\mu(x)$  is calculated by the formula:

$$\mu(x) = \begin{cases} 1 & x_i < a_i \\ \frac{x_i - a_i}{b_i - a_i} & a_i, x_i, b_i \\ 0 & x_i > b_i \end{cases} \quad (1)$$

If each factor  $U$ , a separate judgment  $U = (u_1, u_2, u_3, \dots, u_m)$  can be considered as  $U$  to  $\nu$  fuzzy mapping  $f$ , i.e.:

$$f: U \rightarrow H^2(V) \quad (2)$$

A fuzzy linear transformation  $T_f$  from  $U$  to  $V$  can be induced from  $f$ , which is regarded as a mathematical model for the comprehensive evaluation of  $B$  obtained from the weights  $A$ . Therefore, the fuzzy mapping  $f$  can induce a fuzzy relation  $T_f \in H(U \times V)$ , i.e.,  $T_f \in H(U \times V)$  can be represented by the fuzzy matrix  $R \in u_{m \times k}$  as follows:

$$R = \begin{bmatrix} r_{11} & r_{12} & \cdots & r_{1k} \\ r_{21} & r_{22} & \cdots & r_{2k} \\ \vdots & \ddots & \cdots & \vdots \\ r_{m1} & r_{m2} & \cdots & r_{mk} \end{bmatrix} \quad (3)$$

The fuzzy relationship  $R_f$ , can induce a fuzzy linear transformation from  $U$  to  $V$ , thus,  $(U, V, R)$  constitutes a fuzzy comprehensive evaluation model.

In order to synthesize the role of each indicator on employment competitiveness, this paper adopts a weighted average model for the weight  $W$  and the fuzzy matrix  $R$  for the synthetic operation, i.e., calculated by the model  $M(\cdot, +)$ , and the comprehensive evaluation formula is:

$$n \sum_{h=1}^k r_{ih} = 1 \quad (4)$$

If one weight  $W \in H(U)$  is input, a composite judgment is output:

$$B = W \cdot R \in H(V) \quad (5)$$

When the  $\sum_{h=1}^k b_h \neq 1$ , do the normalization process, and the other  $b_k = nb_v / \sum_{h=1}^k b_h$ ,

get the  $\bar{B} = (\bar{b}_1, \bar{b}_2, \dots, \bar{b}_k)$ .

### 3 CHALLENGES OF CROSS-BORDER DATA FLOWS FOR INTERNATIONAL INVESTMENT LAW

#### 3.1 CROSS-BORDER DATA TRAFFIC TYPE ANALYSIS

To identify the patterns of external factors affecting cross-border capital flows with respect to external factors affecting cross-border balance of payments, including exchange rate factors, interest rate factors, etc. Conduct group correlation analysis on cross-item transactions, such as transactions with correlation between trade in goods and transportation (freight), trade in goods and offshore financing under other investments, direct investment and profit remittance, patent and licensing fee expenses, etc., establish correlation rules and find regular factors and anomalies. Based on historical data, the level of foreign exchange transaction volume and trend of change are characterized and analyzed quantitatively using the correlation between risk events and external factors, enterprises' own characteristics and possible risk indicators, and enterprises are classified according to the analysis results to analyze and predict the risk points and probability of risk occurrence of different types of subjects under the changes of different external factors. Table 1 shows the breakdown of the 1st level correlation analysis feature bidding. Table 2 shows the indicator breakdown characteristics of the second level correlation analysis.

**Table 1** Tier 1 association analysis feature tender breakdown

Type of Indicator	Indicator Name

### 3.2 CROSS-BORDER DATA RISK ANALYSIS BASED ON FUZZY VALUES

As cross-border data flow in practice usually presents two scenarios: one is the dissemination or processing of data collected in daily transactions or other activities

across national borders; the other is the access to economic or non-economic subjects in third countries although they do not cross national borders. Of course, in either case, the relevant data may be "shared" across national borders, but in the absence of a rule of law restraint mechanism, the cross-border flow of data cannot exclude the possibility of abuse and cause negative or even negative externalities, such as infringement of personal privacy, property loss or personal damage to companies and enterprises, or In the light of this, it may violate the privacy of individuals, cause property loss or personal damage to companies and enterprises, and in the heavy cases, it may leak state secrets, induce ideological crisis, disturb social order or even threaten the regime. Therefore, the establishment and improvement of the rule of law mechanism is crucial to the regulation and risk prevention of cross-border data flow.

### **3.3 CROSS-BORDER DATA FLOW GOVERNANCE AND ITS IDEAS**

First of all, the legislation related to cross-border data flow should be strengthened to establish a regulatory system for the governance of cross-border data flow. The spirit of the rule of law requires the regulation and restraint of cross-border data flow to be based on law. A scientific and reasonable regulatory system can provide the basis and guarantee for cross-border data flow. The state should adopt scientific legislation to clarify the types, scope, processing methods, protection measures, risk prevention and other elements and contents of data that can flow across the border, not only to provide a basis for judging the legality of the cross-border flow of data and enhance the predictability of its behavior, but also to provide a basis for the state to review or enforce the regulation of the cross-border flow of data and ensure the security of data sharing.

The department continues to formulate or issue laws and regulations, forming an extremely rich textual basis. On the contrary, the construction of the normative system of cross-border data flow must first make a corresponding assessment of the existing normative system to test and confirm whether laws and regulations such as civil law and administrative law can, to a certain extent, eliminate the gap of insufficient normative supply through interpretation and other legal application techniques, and on this basis, the types of data that can flow across borders, such as the scope of conditions required in the subsequent revision of the International Investment Law should be In order to build a reasonable and complete normative system for cross-border data flow, we will fill in the gaps by using the technology of interpretation and other methods.

## **4. CONCLUSION**

This paper uses fuzzy numerical analysis to analyze the interplay between

cross-border data flow and international investment law, with the following main conclusions.

In the context of the digital economy era, cross-border data is increasing, and information security is the first factor to be considered. The legislative protection of cross-border data flow should be strengthened.

Cross-border data flow has promoted the emergence of relevant legislation and a normative system for the governance of cross-border data flow, which has formed an extremely rich textual basis.

---

## ABSTRACT

In the context of the new liberal arts, the curriculum design as well as the theoretical orientation of Introduction to Social Work lacks scientific conceptual support. This paper combines the OBE concept with the curriculum design of Introduction to Social Work, and proposes a scheme for designing the curriculum content of social work and the dimensions of the subjects of interest involved in it, based on the four issues within the OBE concept. The proposed scheme was also evaluated through the teaching practice of a medical university. The results of the implementation showed that students' professional recognition increased by an average of 12.4% and stability increased by an average of 16.8%. This study provides a general macro-dimensional framework and analytical ideas for social work curriculum design research and design practice.

## KEYWORDS

OBE concept; Introduction to social work; Curriculum design; Teaching practice

## 1. INTRODUCTION

Since the birth of social work, professionalization has been one of the main goals of its development, and professional social work education is the cornerstone and guarantee of social work professionalization [1]. Therefore, the social work curriculum, which is a core component of social work education, has been one of the focal points of concern and criticism by social work education, practice and other relevant stakeholders, especially in post-social work development countries [2-3]. Although there has been some academic exploration of social work curriculum design, two tendencies exist in existing research that have seriously constrained the development of social work curriculum design theory and practice: one is to discuss social work curriculum design in relation to social work, and not to examine social work curriculum design within the framework of more mature general curriculum theory [4-5]. The second is to discuss social work curriculum design in terms of the selection and organisation of social work curriculum content, without reflecting on and critiquing in depth the theoretical orientation of curriculum design and the values and paradigms behind it.

In the context of the new liberal arts, literature [6] discusses the design of a social work module on 'Effective Communication with Children and Adults', which aims to teach professional competency standards to M-level students. Literature [7] explores the authors'

reflections on their doctoral supervision experience through their involvement in the collaborative design, teaching and assessment of an online undergraduate course, proposes a model of collaborative teaching supervision and discusses how receiving teaching supervision can contribute to the development of trainees as social work educators. The literature [8] developed a course that responds to the stated social justice goals of the social work profession and contributes to the promotion of social justice, equitable distribution of resources and just environmental stewardship. In the literature [9], a methodology for teaching social work service course design and project management skills was developed through an analysis of the design and teaching practice of the “Social Work Project Management” course and its effectiveness. Accordingly, this paper proposes a course content design for Introduction to Social Work based on the four guiding principles of what, why, how and how to test the learning outcomes under the OBE concept, and carries out practical teaching through adequate theoretical preparation and task assignment.

## 2. CURRICULUM DESIGN BASED ON THE OBE CONCEPT

### 2.1 THE OBE CONCEPT

The OBE philosophy emphasises the following four questions: What are the student learning outcomes? Why do students want such learning outcomes? How can students be helped to achieve these learning outcomes? How to test whether students have achieved such learning outcomes? In order to meet the four connotations of the OBE concept, the reform of practical teaching is based on the following four questions to find a suitable point for the reform of practical teaching: Firstly, how to enhance students’ practical innovation ability based on the essential connotation of learning outcome orientation? Secondly, how to understand the requirements of the era of “innovation-driven” development based on the value of the era of learning outcome orientation? Thirdly, how to build a practical teaching system and put it into practice based on the ways of obtaining learning outcomes? Fourthly, how to carry out a comprehensive test in school and outside school based on the multi-dimensional assessment of learning outcomes? The framework of the OBE concept and practical teaching reform issues is shown in Table 1.

**Table 1.** Framework structure for the fit of OBE concept

OBE Concept Connotation	Fitting Point	Educational Reform Issues
Learning outcomes	4	Students’ practical innovation ability Enhancement
Why you need it	3	“Innovation-driven” development the requirements of the times
How to help	2	Practical Teaching System Construction and Practice
How to test	1	Comprehensive on-campus and off-campus Inspection

To improve students’ practical and innovative ability as the outcome of practice teaching, and to continuously improve the practice teaching system and implementation process as the path to comprehensively improve the practice teaching level of Introduction to Social Work.

### 2.2 INTRODUCTION TO SOCIAL WORK COURSE DESIGN

#### 2.2.1 COURSE CONTENT

The course content design for Introduction to Social Work under the OBE concept is shown in Table 2.

**Table 2.** Course content of “Introduction to Social Work

Module	Subject	Credit hours
Foundation Theory	Overview	4
	History of Social Work Development	2
	Social Work Value System	4
	Social Work Theory	2
Hands-on Skills	Casework	4
	Group Work	4
	Community Work	4
	Social Work Administration	2
Professional Expansion	Social Work Education and Internship	2
	Social Work Research	1

### 2.2.2 DIMENSIONS OF SUBJECTS OF INTEREST IN SOCIAL WORK CURRICULUM DESIGN

The interest of the social work curriculum design is the group or organisation whose interests are at stake in the design of the social work curriculum. Since the main sources of the objectives of the curriculum are “the development of the discipline”, “the needs of contemporary social life” and “the needs of the learners”, the relevant subjects of interest for the design of the social work curriculum are, accordingly The main stakeholders in the design of the social work curriculum are those who represent the development of the social work discipline, those who have an interest in the development of social work in contemporary society and the students. The main groups representing the development of the social work discipline are social work experts and educators, while the main organisations representing the development of the social work discipline are social work professional associations and social work educational institutions. The main groups that have an interest in the development of social work in contemporary society are service users and their carers and practitioners, while the main organisations that have an interest in the development of social work in contemporary society are social work service agencies, relevant government departments and NGOs. Service users and their carers are the clients of social work, and the needs of these clients guide the design of social work programmes.

## 3. ASSESSMENT OF TEACHING PRACTICE AND OUTCOMES IN INTRODUCTION TO SOCIAL WORK

### 3.1 TEACHING DELIVERY

Adequate theoretical preparation. Students who have not passed the examination will be allowed to enter the next stage of volunteering practice, and those who have not passed the examination will have to make up for it after a week of revision.

Adequate analysis of the learning situation. Survey students’ learning interests, learning needs, current learning situation and volunteering intentions through questionnaire star to grasp and understand the learning situation.

Active resource linkage. Field visits to social work agencies and volunteering projects through industry visits and return visits by graduates, etc., to select volunteering projects that match the academic situation and sign volunteering cooperation agreements.

Firstly, the students who have passed the theoretical assessment will be divided into groups of 5. The group will discuss fully, elect a group leader and make the division of labour and

volunteer service plan. After the grouping is completed, service dates and lengths are arranged according to the time requirements of the volunteering project, with each group following up one case in the casework project and each case having no less than four service interventions. The group work project requires each group to undertake one week of service, with a good work plan and service theme; the community work project requires each group to undertake one community volunteer service for waste separation community activities. The social work administration project requires the whole class to volunteer for the county-level charity project review meeting in the school district. At the end of the day, after each group has completed a certain methodological system of volunteering, they will summarise and discuss the project within the group, and make a PPT to share the group's achievements and feelings in the classroom, and the sharing performance will be counted as part of the usual grade. Through the PPT sharing, students will improve their oral expression skills and PPT production skills, and at the same time lay a foundation for the next stage of learning social service project roadshow skills.

### **3.2 ASSESSMENT OF RESULTS**

The model has been implemented in four classes of social work students in a medical university in the classes of 2021 and 2022 to date. Firstly, students' professional recognition and stability have increased significantly, with professional recognition increasing by an average of 12.4% and stability increasing by an average of 16.8%, maintaining a high level of professional stability. Secondly, students' professional sentiment and professional skills have increased significantly. Students have intuitively and deeply experienced the skills and techniques of social service through the volunteering project, and built up professional sentiment such as empathy and acceptance. Thirdly, the employment rate of students' precise counterparts has increased significantly. Through the docking of volunteer service projects, it is conducive to the involvement of employers in the training of talents in the industry as well as to the employment of students in internships, achieving the triple-win goal of students, schools and employers.

### **4. CONCLUSION**

The above content mainly explores the dimensions of interest subjects and their values and interest demands dimensions of social work curriculum design from a macro level, constructing a macro framework for social work curriculum design practice and providing an analytical idea for social work curriculum design research. Firstly, exploring the dimensions of social work curriculum design based on the OBE concept expands the vision of social work curriculum design research and provides a guarantee for more in-depth social work curriculum design research. Secondly, social work curriculum design is the result of social construction and the outcome of a game between various relevant stakeholders, so a viable curriculum design needs to integrate the claims and interest orientations of various relevant stakeholders as far as possible and explore the values and interest demands behind the curriculum.

## ABSTRACT

The innovative research of talent training model has an extremely important role in promoting the talent training activities of higher education institutions, which is not only beneficial for each higher education institution to improve the quality of talent training, but also provides important support to improve the employability of their talents. This paper firstly introduces the basic method of information fusion technology, which automatically analyzes and synthesizes the observed information of several sensors obtained in time sequence under certain guidelines to accomplish the required decision making and estimation tasks and then information processing. Then the theory of talent training model is studied and the factors influencing employability are discussed in terms of university factors, students, enterprises and society. Finally, a method of innovative model of employment education based on information fusion technology is proposed. In terms of influencing factors, the main ones are the cultivation level of colleges and universities, the quality ability of students, as well as the cultivation of enterprises and the policies of the society. The research of this paper is important for the construction of the innovative model of employment education in colleges and universities.

## KEYWORDS

English course; Civics teaching; information integration technology; employment education; enterprise cultivation; employability

## 1. INTRODUCTION

With the development of science and technology, students need not only solid theoretical knowledge and rich practical skills, but also innovative thinking and

entrepreneurial ability to meet the needs of enterprise development [1-2]. As the main site for cultivating innovative talents, colleges and universities should vigorously carry out innovation and entrepreneurship education to guide students to actively innovate, understand entrepreneurship and actively employ, which should follow the economic and social development trend [3]. The literature [4] considers that employability refers to the ability that people have to engage in a certain occupation, including basic employability and special employability. The literature [5] considers that employability refers to the ability of students to obtain a job position upon graduation, and that students obtaining a job is only a temporary state, while having employability enables graduates to obtain lasting employment and career security.

This paper first describes the process of information fusion technology to correlate, correlate, and synthesize data and information obtained from single and multiple information sources to obtain accurate location and identity estimates, as well as comprehensive and timely assessments of posture and threats and their significance. The components of the talent development model and the factors influencing employability are then explored, and finally, an innovative model of employment education with information fusion technology is proposed.

## **2 INFORMATION CONVERGENCE TECHNOLOGY**

Information fusion, also known as data fusion, which can also be referred to as sensor information fusion or multi-sensor information fusion, is an information processing process that correlates, correlates, and integrates data and information obtained from single and multiple information sources to obtain accurate location and identity estimates, as well as a comprehensive and timely assessment of the posture and threat and its significance; the process is an evaluation of its estimation, assessment, and need for additional information sources of a continuous refinement process, as well as a process of continuous self-correction of the information processing process to obtain improved results.

Information fusion technology can be summarized as: the information processing process that uses computer technology to automatically analyze and synthesize the observed information from a number of sensors obtained in time sequence under certain guidelines to accomplish the required decision making and estimation tasks. According to this definition, multi-sensor system is the hardware basis of information fusion, multi-source information is the processing object of information fusion, and coordinated optimization and integrated processing is the core of information fusion.

### 3 THEORY OF TALENT DEVELOPMENT MODEL

#### 3.1 THE CONCEPT OF TALENT CULTIVATION MODE IN HIGHER VOCATIONAL INSTITUTIONS

The concept of talent cultivation model is richly researched at home and abroad. According to the comprehensive previous research, the talent cultivation model of higher education institutions refers to the model consisting of clear cultivation objectives, high-quality cultivation specifications, real-time updated curriculum system, scientific management system and evaluation methods, which is established by higher education institutions to improve their competitive advantages and achieve the goal of effective employment of graduates in the market competition environment. It is a mode of human education. The connotation includes: first, there is a certain educational ideology to guide, educational ideology is the basis of talent cultivation activities, plays a guiding role, the "model" studied in the field of social sciences is aimed at social people, and social people have subjective motivation and purpose, different educational ideology reflects different values. Secondly, talent cultivation activities have two characteristics of wholeness and systemic, and talent cultivation model as the extension of talent cultivation activities should contain two major aspects of purposive elements and technical elements.

#### 3.2 COMPONENTS OF TALENT CULTIVATION MODEL OF HIGHER VOCATIONAL INSTITUTIONS

The components of talent cultivation model mainly involve four levels: First, what to cultivate people, which is expressed in the value level of cultivation objectives and cultivation specifications, and belongs to the purpose element. The second is what to cultivate people with, which is expressed in the cultivation system and cultivation content, and belongs to the content element. The third is how to cultivate people, which is expressed in the education method at the behavior level and belongs to the method element. The fourth is how to cultivate people, which is expressed in the quality evaluation system at the result level, and belongs to the evaluation element. Table 1 shows the components of talent cultivation model.

**Table 1** Components of the talent development model

Components of talent cultivation model in higher education institutions			
Elements of Purpose	Content elements	Elements of the Method	Elements of evaluation
What to cultivate	What to train people with	How to develop people	How to train people

#### 3.3 EMPLOYABILITY THEORY

Higher vocational education in China is both higher and vocational in nature. From the viewpoint of the attributes of vocational education, higher vocational education

belongs to "employment education" to a certain extent. Therefore, in order to study the innovation of higher vocational education talent cultivation mode under the guidance of employability, it is necessary to elaborate and understand the theories related to employability of college students.

### 3.3.1 COMPONENTS OF EMPLOYABILITY

From the research on the structure of employability conducted by domestic and foreign scholars in the first chapter of this paper, they all try to give a clear definition to the components of employability of college students, but due to the different bases of research, some views simply attribute the components of employability to the ability required to get a job without in-depth elaboration, some other views lack feasibility and start from a purely theoretical perspective, and - some views involve too many factors to highlight the priorities. Others are not feasible and are based on purely theoretical perspectives, while still others involve too many factors to highlight the priorities. Based on the innovation of talent cultivation mode, the main theme of this paper is the innovation of talent cultivation mode. Based on the previous research, this paper believes that the components of employability of talents in higher vocational colleges include four aspects: professional knowledge and skills, general skills, personal qualities and career planning ability. Table 2 shows the constitutive elements of talents' employability.

**Table 2** Components of talent employability

Employability			
Professional competencies	General skills	Personal qualities	Career planning skills

### 3.3.2 FACTORS INFLUENCING EMPLOYABILITY

At present, there is a serious structural contradiction between the employability of higher vocational students and the employment demand of the society, and it frequently occurs that "graduates cannot find suitable jobs and employers cannot find ideal talents". The vocational quality of higher vocational students is missing, their professional hands-on ability is not strong, their practical application ability is not enough, their team and cooperation spirit is not enough, their dedication and hard-working spirit is not strong, their innovation and entrepreneurial consciousness is poor, and their employability is generally not high. Therefore, to innovate talent training mode under employment orientation, we must start from the influencing factors of employability of senior vocational students. There are many factors affecting the employability of higher vocational students, such as the national employment policy, the condition of social and economic development, the quality of higher vocational education for students' training, etc. From the concept of employability, this

paper analyzes the factors affecting the employability of higher vocational graduates into four parts: universities, students, employers and society. Table 3 shows the influencing factors of employability.

**Table 3** Factors influencing employability

Factors influencing employability			
Higher Education	Students	Company	Social .
Training objectives	Overall quality	Production requirements	Employment Policy
Specialisation	Vocational Competence		
Career guidance	Career choice	Company	Social.

#### **4. AN INNOVATIVE MODEL OF EMPLOYMENT EDUCATION BASED ON INFORMATION FUSION TECHNOLOGY**

##### **4.1 BUILD A "THREE-PLATFORM" PRACTICE PROGRAM ORIENTED TO NATIONAL STRATEGIC NEEDS**

Firstly, build the service platform of school-enterprise innovation and entrepreneurship. Innovation and entrepreneurship practice education needs to continue to gather more enterprises and talent resources to help enterprises reduce labor costs and improve the efficiency of personnel matching. Both enterprises and universities need to establish precise employment service system and refine employment management service.

Secondly, build a platform for school-enterprise innovation and entrepreneurship cooperation. Relying on big data analysis, hold industry high-end forums, publish annual reports on human resources in big information industry, invite industry experts to share cutting-edge theories and development trends, and create a human resources management benchmark in big information industry. The first is the technical support platform, in which the university department in charge of innovation and entrepreneurship provides scientific and technological achievements and technical services for enterprises. Second is the pilot incubation platform, relying on science and technology parks, industrial technology research institutes, the construction of off-site parks and off-site research institutes, to provide pilot incubation services for the transformation of scientific and technological achievements. Third, the local enterprise cooperation platform, relying on local research institutes and local science and technology information network, to carry out various forms of school-ground enterprise cooperation, to promote the landing of scientific and technological achievements, to serve the regional economy.

Thirdly, build a platform to guarantee the innovation and entrepreneurship of the university and enterprises. Optimize and continuously operate the innovation and entrepreneurship talent exchange system, absorb the innovation and

entrepreneurship talent resources of the "Internet+" competition, optimize and improve the innovation and entrepreneurship talent pool, and realize the output of innovation vitality.

#### **4.2 BUILDING A COLLABORATIVE INNOVATION AND ENTREPRENEURSHIP TALENT CULTIVATION SYSTEM BETWEEN SCHOOLS AND ENTERPRISES**

Carry out a series of activities of school-enterprise in-depth docking internship experience. The school relies on the local regional science and technology park, allowing students to enter the enterprise, understand the enterprise, help the enterprise, through enterprise visits to visit, internship practice related activities, to help students familiar with the enterprise related industry prospects, corporate culture construction, the actual work environment, salary and benefits, personal position grade promotion development path, etc., so that college students set career goals. We invite employees from human resources and technical departments of enterprises to carry out career guidance, dock with school-enterprise talents during the school year, expand the cooperation model, jointly build with enterprises in multiple dimensions, introduce enterprise technical talents as student career mentors, and attract enterprises to campus for student career planning and innovation and entrepreneurship project guidance. The university provides the teachers related to innovation and entrepreneurship guidance with attachment in the science and technology park, which enables the teachers of innovation and entrepreneurship guidance and the enterprises in the science and technology park to have in-depth exchanges and learning. Continue to promote innovation and entrepreneurship competitions and related activities. The university organizes the "Internet+" innovation and entrepreneurship competition, promotes learning through competition, fully mobilizes students' enthusiasm, and brings into play students' innovation and entrepreneurship ability. Provide incubators for entrepreneurial projects, provide targeted support for start-up companies, strengthen cooperation between schools and enterprises, and promote the cultivation of students' innovative and entrepreneurial abilities.

#### **5. CONCLUSION**

This paper mainly discusses the construction of the innovative mode of employment education in the context of the Civic Education of college English courses, discusses the influencing factors affecting the employment of college students respectively, as well as puts forward new ways of employment education. The following conclusions are mainly drawn.

In terms of the influencing factors of employment, the main ones are students'

lack of vocational quality, poor professional hands-on ability, insufficient practical application ability, insufficient team and cooperation spirit, poor dedication and hard-working spirit, and poor awareness of innovation and entrepreneurship. As well as the national employment policy, the status of social and economic development, the quality of higher vocational education for students' training and other factors.

As for the innovative mode of employment education, the main measures are to set up "three platforms" practice projects and to build an innovative and entrepreneurial talent cultivation system with the cooperation of schools and enterprises.

## ABSTRACT

In the new era, the cultural industry is developing by leaps and bounds under the impetus of national policies and technological innovation, and the development of big data cultural industry presents new changes and new patterns. Local applied undergraduate colleges and universities should comply with local, “industry-education integration” and “symbiosis theory, continuously adjust the training plan of cultural industry professionals, clarify the training objectives of interdisciplinary professionals, and strengthen the construction of multi-industry integrated faculty. With the help of new media and other technical means to connect with the real social needs, we cultivate constructive cultural industry composite talents and gradually form a sustainable discipline construction and talent training development mode. Four questions related to talent cultivation concept were set in the questionnaire survey to test the concept of cultivating talents in cultural industry management in universities. The results show that the combined percentage of those who think it is in line and more in line with the talent cultivation concept ranges from 55%-75%, while the combined percentage of those who think it is not quite in line and not in line with it amounts to 25%-45%. This study provides intellectual support for the development of cultural industries, thereby promoting the prosperity and sustainable development of China’s cultural industries.

## KEYWORDS

Applied undergraduate university; Cultural industry management; Integration of industry and education; Symbiosis theory; Composite talents

## 1. INTRODUCTION

The “Internet +” action plan was proposed in China’s government work report in 2015, which aims to promote the in-depth integration of the Internet of Things, mobile Internet and cloud computing big data with the manufacturing industry, thereby promoting the overall development of Internet finance, e-commerce and related industries such as the industrial Internet, with the main field of the cultural industry As a result, the main field of the cultural industry has rapidly shifted to the field of internet platforms[1-2]. At the same time, national policies and financial support for the development of cultural industries are increasing, and the demand for cultural industry professionals is also increasing [3-4]. All these have provided a good social and ecological environment for the construction and discipline development of cultural industry majors, and the development of cultural industry in the new era has ushered in new opportunities and new dynamics [5-6].

The literature [7] suggests that the first thing is to be able to grasp the direction of talent training, which should reflect both the application-oriented orientation of undergraduate talent

training and the basic requirements of the dual functions of cultural industry management. The literature [8] starts from the development of cultural industry and the demand for talents, and gives some opinions on the training mode of cultural industry management professionals.

In this paper, under the impetus of big data technology and national policy innovation, local applied undergraduate institutions should continuously improve the overall quality of education, and promote the upgrading of the structure of local cultural industries and the deep development of “industry-education integration”, which has become a necessary issue of the times. The symbiosis theory is used to analyse and explore the methods and modes of “industry-education integration”, so as to determine the symbiotic relationship between subjects formed in “industry-education integration”. Finally, according to the requirements of training talents in the cultural industry of big data in the new era, the teaching mode should be continuously innovated to achieve modernization of means and flexibility of mechanism.

## **2. CULTIVATION MODE OF PROFESSIONAL TALENTS IN CULTURAL INDUSTRY IN THE CONTEXT OF BIG DATA**

### **2.1 LOCALITY, “INTEGRATION OF INDUSTRY AND EDUCATION” AND “SYMBIOSIS THEORY”**

#### **2.1.1 INTEGRATION OF INDUSTRY AND EDUCATION**

The “integration of industry and education” has thus become an important path for the development of local applied undergraduate colleges and universities and the improvement of talent training quality. How to improve the overall education quality of local applied undergraduate colleges and universities, promote the upgrading of the local cultural industry structure and the in-depth development of the “integration of education and industry” has become a necessary issue of the times. Promoting the development of “industry-education integration” in local applied undergraduate institutions is an important measure to expand local employment and entrepreneurship and cultivate new momentum for economic development.

#### **2.1.2 “SYMBIOSIS THEORY”**

The symbiosis theory is used to analyse and explore the methods and modes of “integration of industry and education”, so as to determine the symbiotic relationship among subjects formed in “integration of industry and education”. In particular, the basic conditions for the symbiotic system among universities, enterprises and the government are formed in the “integration of industry and education”, and the main reason why the symbiotic system can be formed among the subjects of “integration of industry and education” in local undergraduate colleges and universities is that there is a possibility of coupling between them in terms of target interests. The possibility of coupling. In other words, the key to the formation of a symbiotic relationship lies in the consistency of the goals of the subjects of the “integration of industry and education”, which is also related to the ultimate effect of the “integration of industry and education”. The coupling of interests between universities, enterprises and local governments creates a cooperative relationship of mutual support and dependence between the three parties, enabling them to integrate their resources through the “integration of industry and education” in order to ultimately achieve common interests.

### **2.2 COLD THINKING ON THE INNOVATION OF CULTURAL INDUSTRY PROFESSIONAL TRAINING IN THE NEW ERA OF BIG DATA**

The cultivation of talents in the cultural industry of big data in the new era should continuously innovate the teaching mode and realize the modernization of means and flexibility of mechanism. At the same time, various teaching resources should be integrated to achieve practical construction of teaching materials, rationalisation of curriculum and construction of a

composite teacher team. At the same time, it should strengthen cooperation between schools and enterprises, create a multidisciplinary knowledge platform, and create various practice platforms for the educated through competitions and dual tutorship, so as to continuously improve their various practical abilities. Local applied undergraduate universities can strengthen cooperation with cultural enterprises and institutions through the combination of industry-university-research to optimise the teacher team of cultural industry majors. According to the demand for talents from enterprises and institutions and to cultivate the practical application ability of educated people, local units can participate in the formulation of professional talents training programmes, the provision of teachers and practical teaching, etc., carry out the cooperation between schools and enterprises in the order training mode, introduce special corporate culture and management modules into the education and teaching of local colleges and universities, so that the curriculum of cultural industry management majors can be more targeted and forward-looking to meet the needs of the times of cultural industry development.

### **3. SURVEY ON THE CULTIVATION OF CULTURAL INDUSTRY MANAGEMENT TALENTS IN UNIVERSITIES**

#### **3.1 SUBJECT AND CONTENT OF THE SURVEY**

##### **3.1.1 SUBJECTS OF THE SURVEY**

According to the actual needs of the study, 15 higher education institutions were selected, including 2 first-class universities, 7 first-class disciplines and 6 general colleges and universities, and the targets of the survey were undergraduate students and graduates of cultural industry management.

##### **3.1.2 CONTENT OF THE SURVEY**

This paper adopts the empirical research method of questionnaire survey. The questionnaire is to examine the survey respondents' feelings about the professional talent cultivation mode, mainly to understand the problems and suggestions of the survey respondents on the cultivation of professional talents in cultural industry management. In this paper, four questions related to talent cultivation concept are set in the questionnaire survey to test whether the concept of cultural industry management talent cultivation in universities promotes students' personality development and the practice of this concept.

#### **3.2 QUESTIONNAIRE RESULTS AND ANALYSIS**

Firstly, the situation regarding "educational activities focus on understanding and valuing students' individual differences" is shown in Figure 1. As can be seen from Figure 1, 17.77% of the students believe that this is true and 49.2% believe that it is more true, with a total of 66.97% believing that the concept and the extent to which it is practised is good.

**Figure 1.** “Educational activities focus on understanding and valuing the individual differences of students”

Secondly, the survey on ‘respecting students’ subjectivity and attaching importance to the development of students’ subjectivity’ is shown in Figure 2. Figure 2 shows that 19.68% and 38.09% of the students thought that this concept and the degree to which it was practised were in line with this concept.

**Figure 2.** Survey on “Emphasis on the Development of Students’ Subjectivity

Thirdly, the survey on “Emphasis on the development of new competencies for professional students” is shown in Figure 3. From the results presented in Fig. 3, 7.3% and 26.66% of the students thought that the concept and its practice were in line and relatively in line respectively, and 33.96% of the students thought that the concept and its practice were better. At the same time, the proportion of those who think it is not quite compatible and not compatible is as high as 66.02%, indicating that more than half of the students have a low level of recognition of the concept and its practice of attaching importance to students’ creative abilities in the training of cultural industry management professionals.

**Figure 3.** Survey on “Emphasis on the development of new competencies for professional students”

Fourthly, the survey on “Promoting the unity of personal and holistic development of students” is shown in Figure 4. As can be seen from Figure 4, 25.07% and 46.98% of the students thought that the concept and its practice were good, with a total of 72.05% of the students believing that the concept and its practice were good. At the same time, the combined percentage of those who thought it was not quite compatible and not compatible amounted to 27.93%.

**Figure 4.** “Survey on the “Harmonization of Individual and Holistic Development of Students

Through the analysis of the above questionnaire data, it is found that there is more room for improvement in the areas of “education activities focus on understanding and respecting students’ individual differences”, “respecting students’ subjectivity and attaching importance to the cultivation of students’ subjectivity” and “promoting students’ personality development and overall development”. The unity of students’ personality and all-round development” shows that there is still much room for improvement in the cultivation of cultural industry management professionals in universities in terms of enhancing students’ uniqueness, subjectivity and harmony. In addition, “attaching importance to the cultivation of students’ innovative ability” is the talent cultivation concept with the lowest degree of compliance, which shows that there are many shortcomings in the cultivation of students’ creative thinking and innovative ability in universities.

#### 4. CONCLUSION

In this paper, under the background of big data, local applied undergraduate universities should seize the new opportunity of “Internet +” and cultural integration, actively explore new

paths and methods to cultivate composite talents in cultural industry, jointly run schools with regional cultural enterprises and institutions, build “Internet +” cultural industry composite talents cultivation system, strengthen cooperation and symbiosis with local government and relevant cultural enterprises, strengthen the construction of professional curriculum system and enhance practical ability training of educators, and continuously improve the core competitiveness of cultural industry educators. The university will also strengthen cooperation and symbiosis with local governments and relevant cultural enterprises, strengthen the construction of professional curriculum to enhance the practical ability training of educated students, and continuously improve the core competitiveness of educated students in the cultural industry so as to form an interactive and win-win development pattern, ultimately promoting the “Internet +” cultural industry complex talent training. This will ultimately promote the successful achievement of the goal of cultivating complex talents in the “Internet +” cultural industry.

## ABSTRACT

Undergraduate education is the foundation and core function of university organization. Driven by modern information technology, colleges and universities need to optimize information sharing channels as well as information dissemination methods through emerging technology industries such as big data and cloud computing, combined with standard processes of key technologies, to deeply analyze the different needs of audience groups. Facing the new development opportunities, how to achieve a new balance between tradition and innovation in the educational reform of local undergraduate colleges and universities, which mainly serve local cultural industries and social development needs, becomes a real challenge for their innovative development. The integration of moral and aesthetic education in colleges and universities based on cultural industries requires colleges and universities to implement core values, innovate moral and aesthetic education forms and help students establish cultural identity. In this regard, the article focuses on how to use cultural industry to promote the organic integration of moral and aesthetic education in colleges and universities.

## KEYWORDS

Cultural industry; Information integration; University education; Moral and aesthetic education integration; Big data; Cloud computing

## 1. INTRODUCTION

Traditional handicrafts and folk arts and crafts are closely related to China's social life and economic development, and once had a glorious history of development [1-2]. However, due to the development of the times and advanced technology, more and more traditional crafts have been neglected in the cold, such as jade carving, lacquerware, paper-cutting, velvet flowers and eight carvings in Yangzhou, so much so that there is a tendency of no one to succeed them, and even some traditional crafts have started to be lost [3-4]. The talent training of local universities also does not play a key role in supporting local industries [5]. In the context of the information age, the structure as well as the operation of undergraduate teaching organizations need new ideas and mechanisms, and the innovative undergraduate education organization model in the perspective of integration is an important guarantee for universities to adapt to the changes in the environment, especially for local universities to build first-class undergraduate education [6-7].

In the background of information age, the structure as well as operation of undergraduate teaching organization needs new ideas and mechanisms, and the innovative undergraduate

education organization model in the perspective of integration is an important guarantee for universities to adapt to the changes of environment, especially for local universities to build first-class undergraduate education. The development of traditional cultural industry is a very important part of local urban cultural construction and development, and the special talent cultivation of higher education lays the cornerstone for inheriting local cultural industry. The essence of integration and transformation development with tourism experience projects is also to solve the inheritance creativity and innovation development of local cultural characteristics.

## **2. OPPORTUNITIES BROUGHT BY THE DEVELOPMENT OF CULTURAL INDUSTRIES**

With the rapid development of cultural industries, cultural undertakings and cultural industries have received unprecedented attention in all sectors of society. As an important means and necessary way of cultural transmission and dissemination, education and teaching work has become one of the important driving forces for the prosperous development of cultural industry. The progress of cultural industry also brings more opportunities for the development of adult higher education in China, which not only gets the attention and support from the state, but also wins a broader and more flexible market platform, so that education and cultural industry can develop and progress together in a coordinated manner.

### **2.1 CULTURAL MARKET VITALITY ENHANCEMENT**

With the increasing importance attached to cultural construction, the flourishing development of cultural industries has brought about a favorable development environment for the cultural market, gradually improving the quality of services, making the market vitality and competitiveness significantly stronger, and creating favorable external conditions for the development of education. The improvement of the vitality of the cultural market has led to the optimization and adjustment of the structure of the cultural industry, a more reasonable distribution of cultural resources, and a more sound construction of cultural institutions, which has led to the improvement of the overall level of scientific and cultural development. The increased vitality of the cultural market has further cultivated the conscious self-confidence of Chinese culture, improved cultural creativity, added momentum to the reform of the cultural system, and provided a guarantee for the development of education.

### **2.2 INCREASED PERCEPTION OF EDUCATION FOR ALL**

The state's emphasis on science, education, culture and cultural industries will inevitably enhance the enhancement of the concept of education for all, thus mobilizing citizens' enthusiasm for participation and providing opportunities for the country to cultivate more high-quality and outstanding talents. The enhancement of citizens' education concept can also drive the development of education vitality, adjust the pace of education reform, and promote education reform to a new level. It can be seen that the development of cultural industry and the development of education are complementary, and they promote each other, influence each other and make progress together. The enhancement of the concept of education provides talent guarantee for the development of cultural construction, and also provides talent support for the realization of cultural creativity.

### **2.3 INCREASED INVESTMENT IN EDUCATION**

The development of education is inseparable from the active guidance and support of the government, which further increases investment in education as cultural construction unfolds. This provides a strong financial support and guarantee for cultural development. The further development of education reform requires a four-way linkage between the government, enterprises, schools and students, in which the government plays a pivotal role. The increased

investment in education can provide material support for the development of science and culture, ensure the perfection of educational infrastructure, and provide advanced technical equipment and devices to create good objective conditions for the construction of culture and clear the obstacles for the development of education.

### **3. THE EFFECTIVENESS AND COUNTERMEASURES OF THE INTEGRATION OF LOCAL TRADITIONAL CULTURAL INDUSTRY AND HIGHER VOCATIONAL EDUCATION IN THE DEVELOPMENT OF INDUSTRY-EDUCATION**

#### **3.1 REFORM OF TALENT TRAINING MODE WITH DEEP INTEGRATION OF INDUSTRY AND EDUCATION**

##### **3.1.1 CO-BUILD SCHOOL-ENTERPRISE PROFESSIONAL TALENT TRAINING MODE TO HELP ENTERPRISES CULTIVATE TALENTS**

We actively respond to the national policy to expand recruitment for the society, cooperate with local governments, industry associations and enterprise units, adhere to collaborative linkage and promote open sharing. Recruit enterprise employees as full-time college students for the traditional craft industry in order to improve the comprehensive quality of traditional craft practitioners and systematically train a new generation of inheritors with cultural literacy, technical literacy and business management skills. Enterprise management and marketing training is conducted for specific groups of students to train traditional craft talents in a preplanned, scaled and improved manner. Professional students are the prospective employees of the enterprises, creating a dual element and dual subject talent training model in which enrollment is recruitment and entry into the factory is entry into the school.

##### **3.1.2 CREATE A COMBINATION OF FULL-TIME AND PART-TIME FACULTY TO IMPROVE INNOVATION CAPACITY**

Through the master studio, the production line of enterprises is directly moved into the classroom, building a “school within a factory, school within a factory”, starting the construction of teaching factory projects in higher education institutions, inviting excellent Yangzhou jade carving enterprises to the campus training base, so that students can participate in practice under the joint guidance of enterprise experts and school teachers, allowing students to get out of the traditional classroom and into the project on site. Through the school-enterprise master teacher studio approach to course teaching, the core of professional teachers to lead students to practice operations. We create a team of full-time and part-time teachers to improve the comprehensive level of theory and skills of the teaching staff.

##### **3.1.3 COMBINING ENTERPRISE OPERATION MECHANISM IN THE TEACHING SYSTEM FRONT PRODUCTION PROCESS**

Reform the teaching mode, combined with the local non-foreign heritage tourism market development, through the leadership of the studio, the enterprise staff position operation mechanism combined into the teaching links, pioneering to lead students to follow the enterprise production process, according to the enterprise order requirements to design and create product samples, the teaching of the design works into intellectual investment products. Combined with the Internet + sales model, the results of their learning to the market, to generate economic returns. Cultivate a new era of new traditional craft talents who understand design, can produce and market.

### **4. THE INTEGRATION PATH OF MORAL AND AESTHETIC EDUCATION IN COLLEGES AND UNIVERSITIES BASED ON CULTURAL INDUSTRY**

Cultural industry is of great importance to promote the deep integration of moral and aesthetic education in colleges and universities, optimize the current educational configuration

and improve the educational structure. Therefore, managers of colleges and universities need to realize the integration of dual education based on cultural industry and oriented by culture. With the rapid development of information technology, the integration of information technology and education field can improve the competitiveness of the integration of moral and aesthetic education in colleges and universities, and information technology can effectively broaden the development channels of educational resources in colleges and universities, improve teaching quality and avoid homogenization of teaching contents. Building a collaborative education platform for cultural industry can provide colleges and universities with more professionally competent teaching organizations and higher quality cultural products, and also provide timely feedback according to the market operation mode, so as to guarantee teaching quality and meet the personalized needs of schools, students and related enterprises.

#### **4.1 COMBINING BIG DATA CLOUD COMPUTING TECHNOLOGY FOR CULTURAL INDUSTRY**

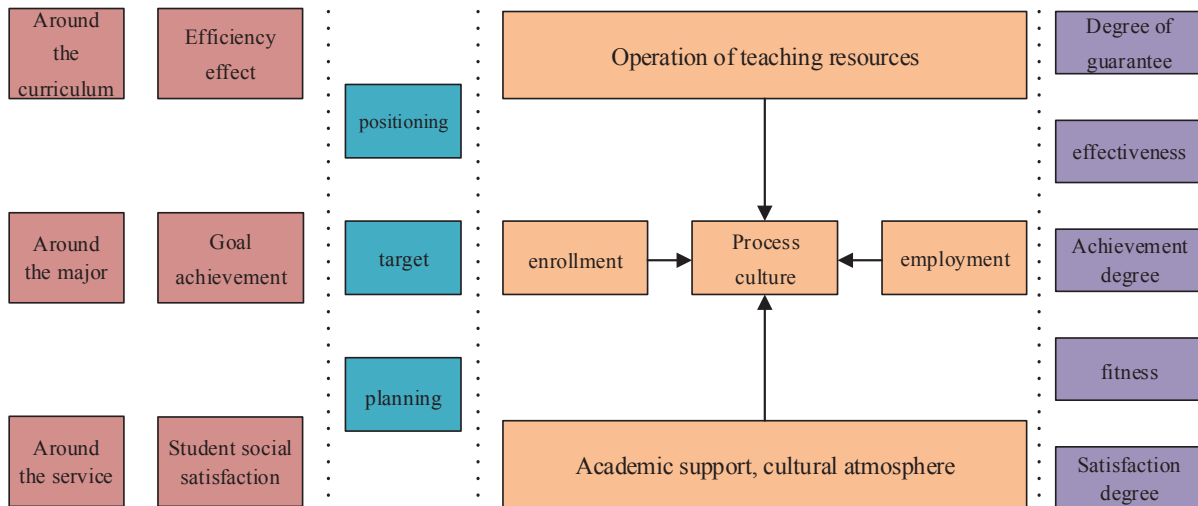

Traditional Internet technology has led to many problems in the online teaching process of higher education institutions, making it difficult to achieve the integration of moral and aesthetic education. In this regard, colleges and universities need to create a standard process of integrating moral and aesthetic education and combining key technologies through emerging technology industries such as big data and cloud computing, optimize the information sharing channels as well as the dissemination of information, and conduct a deep analysis of the different needs of audience groups. Through the emerging technology industry, it can better help teachers in higher education institutions seize the moment and provide timely guidance to students' values.

In the actual teaching process, teachers should also continue to optimize the teaching content based on students' feedback and evaluation information in the classroom as a way to better match students' thinking. Finally, teachers need to conduct regular curriculum workshops to study students' learning problems in current teaching activities, as well as to clarify which teaching methods are more conducive to the development of students' values and aesthetic skills. The school should also actively communicate and collaborate with other higher education institutions to improve teachers' professionalism by regularly assigning them to visit related institutions to learn from excellent teaching methods.

#### **4.2 PRACTICAL EXPLORATION OF UNDERGRADUATE COLLEGE ORGANIZATION REFORM IN LOCAL UNIVERSITIES**

The functions of the undergraduate student institute are shown in Figure 1. Undergraduate student college construction work idea: With the goal of improving the quality of undergraduate education and teaching cultivation, focusing on the integration of modern information technology into teaching management and student management, highlighting the resource allocation function and guarantee and supervision function, carrying out research and analysis of academic conditions, implementing the student-centered concept, conducting networked centralized examinations, strengthening the teaching process records, increasing the proportion of process evaluation, improving the classroom We will carry out progressive reform and deepening in various aspects, such as carrying out research and analysis of academic conditions, implementing the student-centered concept, conducting online centralized examinations, strengthening teaching process records, increasing the proportion of process evaluation, improving the level of "wisdom" in classrooms, optimizing educational and teaching conditions, and improving teaching and learning styles, so as to establish a nurturing environment suitable for students' growth and success, and thus achieve the goal of talent cultivation.

**Figure 1.** Function of undergraduate school

## 5. CONCLUSION

To realize the organic integration of cultural industry and college education management system. Colleges and universities need to actively develop synergistically with China's cultural industry, develop moral and aesthetic education teaching resources using emerging technologies such as cloud computing and big data, build a collaborative education platform for the cultural industry, optimize the mechanism of action, effectively improve the quality of dual education integration teaching, and then realize a region-wide education reform integrating practice and technological innovation, and promote the quality and efficiency of higher education moral and aesthetic education in the new era.

# ANALYSIS OF THE IMPACT OF CHINESE AND WESTERN CULTURAL DIFFERENCES ON THE PERCEPTION OF BRITISH AND AMERICAN FILM LITERATURE BASED ON BIG DATA

---

Yang Liu\*

Sichuan University of Media and Communications, Chengdu, Sichuan, 610000, China

[ly15631101293@163.com](mailto:ly15631101293@163.com)

---

## ABSTRACT

In the context of the rapid development of big data technology, cultural globalization is developing rapidly and cross-cultural communication is deepening. This paper examines the cognitive impact of British and American film literature from three aspects: the difference in narrative structure between China and the West, the communication problem, and the difference in values in Chinese and Western cultures. Based on the FV-SA-SVM method to classify emotions, and based on the set-up dictionary to extract the emotional words in the review, we then get the emotional tendency expressed by the review. The results show that: "Thumping" in particular, it has a total of 93% of general positive emotion and moderate positive emotion ratings. In comparison Fast and Furious had the highest percentage of highly positive emotions of the three films. This study provides an in-depth analysis of audience perceptions of the films and draws out strengths and weaknesses to guide the film industry in a better direction.

## KEYWORDS

British and American cinema; Narrative structure; FV-SA-SVM; Affective classification; Cognitive impact

## 1. INTRODUCTION

With the widespread use of computer network technology and three-dimensional technology in film production, a number of British and American science fiction blockbusters, represented by The Hobbit, have become highly sought after by film fans worldwide[1-2]. The literary aspect of the art of cinema exists objectively, whether it is in the form of original screenplays or screenplays based on novels, plays or other literary works, all of which are composed of literary language [3-4]. Film and literature have always gone hand in hand, and the presence of literature is a natural part of film works, and the presence of literature is the basis and source of power for the brilliance of film art [5-6].

Literature [7] investigates the application of British and American films in the introduction of English language and culture. From the important role played by British and American films, it proposes measures to strengthen the cultivation of teachers' cultural literacy, select good cultural introduction materials and create a combined introduction mechanism inside and outside the classroom, taking Forrest Gump as an example to analyse its specific application. In this paper, [8] compares the effects of film adaptations of Pride and Prejudice in the UK and the US. The aim is to analyse the cultural connotations and aesthetic interests of the two countries through the visualisation of Pride and Prejudice's superficial features.

The cultural exchange between Chinese and Western films in British and American cinema

requires not only learning to grasp and skillfully switch between the two languages, but also the ability to grasp the laws of language, special history and culture, analyse the psychology of the film and the audience, understand the aesthetic orientation of the audience, and carry out cultural re-creation to achieve good cultural exchange and commercial purposes. The FV-SA-SVM model is used to score the initially classified film reviews through an emotion dictionary, to filter out the wrongly scored data for reclassification, and to gain a deeper understanding of the distribution of different emotions in the three films *The Fast and the Furious*, *Thumping*, and *Mindhunter*.

## **2. CHINESE AND WESTERN CULTURAL DIFFERENCES IN BRITISH AND AMERICAN FILMS**

### **2.1 PROBLEMS IN THE EXCHANGE OF CHINESE AND WESTERN FILMS**

Film is a comprehensive art, a harmonious unity of rich forms and means of artistic expression, a synthesis of linguistics, literature and aesthetics. Film has multiple functions such as expressing emotions, reflecting life, disseminating information and interpreting history. Through watching films, audiences can not only obtain visual enjoyment, but also satisfy their spiritual sense of belonging and the search for the unknown. Translation is an important issue in intercultural communication in a multicultural context, and is always a challenge. Film translators play an important role in bridging the gap between Chinese and Western cinema, and through them, the audience not only enjoys the foreign atmosphere but also the charm of diverse cultures.

Film translation is not only a simple conversion of language and text, but also an artistic and aesthetic re-creation. The requirements for translators are very high, not only do they need to learn to grasp and skillfully switch between the two languages, but they also need to be able to grasp the laws of language, special history and culture, analyse the psychology of the film and the audience, understand the aesthetic orientation of the audience, and carry out cultural re-creation to achieve good cultural exchange and commercial purposes. Film translation is a special form of literature, the language and theme of the film carries the connotation of the traditional culture of that nation, and through the refinement of the film theme, the characteristics of the characters in the play are reflected, and this promotes the smooth development of the plot. However, the overall level of film translation in China is still at an early stage of development, especially when Chinese films are “going global”, there is an urgent need for high-level translation.

### **2.2 DIFFERENCES IN NARRATIVE STRUCTURE BETWEEN CHINA AND THE WEST**

China and the West present different narrative models in their narratives because of their different positioning of the audience for animated films. Western animated films are positioned for an all-ages audience, and the films’ narratives present a complex pattern, with a balanced-rebalanced model. The British and American action films, on the other hand, have a tendency to be under-aged because they have long targeted their audience at teenagers, and the narrative mode is dominated by the simple structure of binary opposition. 2019’s smash hit *The Fast and the Furious* breaks away from the binary opposition mode of previous films, presenting emotion and action in one, complex and varied character. The subversion of the main characters and the intensification of drama and conflict all add to the fleshed out and tense narrative of the film. This is tense and conflicting to British and American audiences, but Chinese audiences may still prefer a complex, conflicting narrative structure. What’s more, a change in one film would hardly break the stereotypes Chinese audiences have of British and American film literature.

## **3. THE COGNITIVE IMPACT OF BRITISH AND AMERICAN FILM LITERATURE**

### 3.1 COGNITIVE INFLUENCE CLASSIFICATION THEORY

The classification of emotions is based on the judgement of words that contain subjective tendencies to determine the viewpoint and emotional orientation of the audience contained in a film review. By studying the emotional orientation of audiences in film reviews, film producers and investors can grasp the views of audiences on films and improve their productions. There are two main approaches to classifying emotions: the first is based on a sentiment dictionary: this study is based on a big data approach to classifying emotions, and the sentiment words in the reviews are extracted from the set dictionary to obtain the sentiment expressed in the reviews. Therefore, whether the sentiment lexicon is well set up will affect its final classification effect.

The second method converts the sentiment words as feature words into a matrix and then uses a classification model such as SVM, for example, to classify the comments. So the final classification effect of this approach depends mainly on the filtering of the training set and whether the sentiment is correctly labelled.

For the movie review data, this study uses a machine learning-based approach to emotional classification, using the Cat's Eye APP viewer reviews as an example, "I'd like to take the opportunity to comment on the post-viewing emotions, it's really wonderful, through the form of the film shows a variety of British and American powerful, a variety of weapons and equipment, special forces powerful previously only seen in American films, more into the British and American The movie is a great way to show the strength of the British and American military team, and it is so touching and tearful that in the near future British and American movies will be stronger. The positive words such as "touching" and "tearful" make this sentence a positive comment and mark it as 1. "It's just so-so, not very good", "not very good" and other descriptions, you can judge this sentence as "average", negative comments from the comments, mark it as 0.

### 3.2 EXPERIMENTAL PROCEDURE

The next step is to perform sentiment classification experiments using FV-SA-SVM with the experimental hardware: the operating system is Windows 10 Enterprise. Processor is Intel Pentium (Pentium) G4560@ 3.50GHz dual core, memory is Magnesium DDR42400MHz 8GB and CoreTech DDR42400MHz 8GB, 16GB in total, hard disk is Hitachi HGSTHTS721010A9E6301TB, software platform: Python 3.6.

First, we want to verify whether the FV-SA-SVM model is universal and superior in classifying emotions for film reviews of different genres. In this paper, we select three representative films from the genres of action, romance, and suspense, Fast and Furious, Heartthrob, and Mindhunter, to conduct the study.

### 3.3 DATA ANALYSIS

The initial classification of the reviews was scored by means of an emotion dictionary to filter out the wrong scores for reclassification, and to gain more insight into the distribution of the different emotions in the three films, we considered positive reviews with scores falling between (0,10] to be average, (10,20] to be medium, and greater than 20 to be high, based on the scoring.

Figure 1 shows the positive sentiment segmentation statistics for the three films. Generally positive and moderately positive emotions accounted for the highest percentage of ratings, especially for 'Thumping', which had a combined total of 93% of generally positive and moderately positive emotions. In comparison, Fast & Furious had the highest percentage of highly positive sentiment among the three films, at 22%, followed by Mindhunter at 18%, while

Heartthrob had the lowest percentage of highly positive sentiment, at 7%. The above figures show that audiences' viewing experience of Fast & Furious and Mindhunter is still very good compared to that of Thumping.

**Figure 1.** Segmented statistics of positive emotions in three films

Conversely, negative reviews with an affective score between  $[-10,0)$  are average, those between  $[-20,-10)$  are medium, and those below  $-20$  are high. The segmentation of the emotional tendencies of the three films is studied according to the results of the emotional scoring.

Figure 2 shows the statistical chart of the negative emotion segmentation of the three films. From the negative sentiment segmentation of these three films, the proportion of average and moderate negative sentiment in Fast and Furious and Mindhunter is greater, while the proportion of high negative sentiment is less, but the proportion of high negative sentiment in Heartthrob is the greatest, reaching 34%, far exceeding the 5% and 7% of the other two films, indicating that the audience is very dissatisfied with the This indicates that audiences are very dissatisfied with the movie-going experience.

**Figure 2.** Segmented statistics of negative emotions in three films

#### 4. CONCLUSION

In this paper, in the context of big data, the FV-SA-SVM approach is used to classify the cognitive impact of British and American film literature in terms of sentiment. Through

simulation experiments, we verify whether the FV-SA-SVM model is universal and superior in terms of sentiment classification for film reviews of different types of films. The following conclusions can be drawn.

(1) Film is an artistic reproduction of life, and the cultural differences between East and West embodied in film translation are the product of the historical development of each country, and this cultural collision is also the driving force behind the development of literature. Due to the commercial and popular nature of film works, adopting the right cultural exchange strategy plays an important role in the development of China's film industry, the interpretation of traditional Chinese texts and the shaping of China's national image.

(2) Based on the FV-SA-SVM scoring of the initially classified movie reviews through the emotion dictionary, in the positive emotion segmentation statistics of the three movies, the audience still had a good viewing experience for *The Fast and the Furious* and *Mindhunter* compared to *Thumping Heart*. In the negative emotions section of the three films, "Thumping" has the largest proportion of highly negative emotions, at 34%, far exceeding the 5% and 7% of the other two films, indicating that audiences are very dissatisfied with the viewing experience of "Thumping".

## ABSTRACT

Abstract: In the context of the development of big data technology, a large number of pollutants aggravate the pollution and destruction of production environment, living environment and natural environment in rural areas, and the rural ecological environment further deteriorates, while the study of cross-area ecological governance of the Yellow River Basin rural areas becomes very urgent. Based on the functional positioning of the nine provinces in the Gansu section of the Yellow River basin as an important water connotation and recharge area of the whole Yellow River basin, the cross-river basin ecological governance of the Yellow River basin is mainly achieved by building a cross-Yellow River basin governance community. Using Stata software, Tobit regression analysis was conducted on the factors influencing the efficiency of rural ecological governance in the Yellow River basin from 2008 to 2017. The regression results show that the pure technical governance efficiency of the basin is basically maintained at the level of 0.62, indicating that the increase of investment in environmental pollution management as a proportion of GDP can significantly improve the rural ecological environmental governance efficiency, and the arable land area has a positive influence on the rural ecological environmental governance efficiency. This study explores the real governance efficiency of the Yellow River Basin ecological environment and its influencing factors, and provides reference and reference for the policy measures of rural ecological watershed governance in the Yellow River Basin.

## KEYWORDS

Tobit regression analysis; Huanghe River Basin; Regional large water network; Ecological trans-regional governance mechanism; Influencing factors

## 1. INTRODUCTION

The Yellow River Basin is crucial for China's economic, social, and ecological life. It insures the environmental protection and development of the region [1-2]. The proposed strategy of the research provides precise positioning and direction for the targeted objectives of the Yellow River Basin's governance [3-4]. According to the new historical perspective, the Yellow River

Basin's management incorporates political formation, while ecological conservation and high-quality development have consistent goals and cooperate in practice. The construction in the basin includes economic, cultural, social, and ecological aspects. [5-6].

The paper [7] calculated the sand transport in the primary and tributary streams of the Yellow River Basin in Gansu. Furthermore, it analyzed current problems in its management and protection processes in light of General Secretary Xi Jinping's requirements for the Yellow River Basin. In addition, it summarized the knowledge gained by previous generations through managing the Yellow River and put forward suggestions for soil erosion management and pollution prevention. In the paper [8], the concept and progress of environmental management in the Yellow River Basin are reviewed, considering the problems in upstream source management, systemic development, integrated management of the left and right banks, compound pollution in the basin, and socialization of environmental policies in the environmental management of the Yellow River Basin in Gansu.

This paper examines the perspective of the ecological conservation and high-quality development measures of the Yellow River Basin in the Gansu section as a crucial water connotation area and recharge function for the River Basin. By eliminating random errors and outside environmental factors from the rural ecological management of the Yellow River Basin using analytical software, the efficiency values obtained can more accurately reflect the level of actual rural ecological management efficiency in the basin's nine provinces, enabling the Yellow River Basin in Gansu to experience rapid development.

## **2. BUILDING A YELLOW RIVER BASIN GOVERNANCE COMMUNITY AND PROMOTING ECOLOGICAL PROTECTION IN THE YELLOW RIVER BASIN**

### **2.1. THE PATH TO BUILD A GOVERNANCE COMMUNITY IN THE YELLOW RIVER BASIN**

#### **2.1.1 IMPROVE LAWS AND REGULATIONS**

With the continuous enrichment, development and concentration of governance affairs in China, the Yellow River Basin, as a new type of governance area, involves various social affairs closely related to the well-being of the general public, and thus needs systematic laws and regulations to regulate them comprehensively. It is necessary to innovate social governance mechanisms, improve social governance, adhere to governance by law, strengthen the rule of law, apply the rule of law thinking and rule of law to resolve social conflicts, and improve the modernization of social governance, thus providing an important guarantee for the construction of the Yellow River Basin governance community

#### **2.1.2 BROADEN THE INTERACTION CHANNELS**

Broadly speaking, the public in the Yellow River basin includes social organizations, research institutions, enterprises, and the public, who are located in different geographical locations, involved in different issue contents, supported by information behind, and pursuing different interest goals. For this reason, an interconnected information hub platform should be established within the river basin to sort out and summarize relevant governance elements and form communication and feedback channels for different subjects and contents. On the one hand, the traditional interaction channels should be consolidated by adhering to the people-oriented principle, and the frontier technologies such as big data and cloud computing should be used to break through the boundaries of relevant exchanges, seminars, hearings, forums and lectures in time and space, so as to provide an effective form carrier for public participation in governance.

#### **2.1.3 BUILDING AN INTEREST COORDINATION MECHANISM**

In this situation, the establishment of a scientific and reasonable interest coordination

mechanism is helpful to incubate a benign game of interest community and form a harmonious and balanced interest pattern, so as to finally realize the benefit sharing in the Yellow River Basin. This is reflected in three aspects: First, by promoting the institutionalization and organization of interest expressions, and actively constructing the mediation mechanism of interest conflicts in the information feedback, preventing the intensification of conflicts and maintaining social stability. Secondly, by integrating interest demands and interest goals, we can find a breakthrough to resolve interest conflicts and achieve the integration and regulation of interests between groups and regions. Third, to establish a mechanism for distributing interests with fairness, legitimacy and justice, and to create a governance environment for sharing interests while pursuing Pareto optimality. Here, benefit sharing cannot be simply understood as the equal distribution of governance results, but should give more attention to the disadvantaged groups.

#### **2.1.4 ESTABLISHING A SOUND COLLABORATIVE GOVERNANCE MECHANISM**

The spatial development of the Yellow River Basin emphasizes the basin-wide boundary and aims at ecologically sustainable development, high-quality economic development and comprehensive human development, which can ensure natural regeneration, achieve wealth increase and enable the public to enjoy the fruits of development fairly. In this sense, the spatial development of the Yellow River Basin is the eternal goal of its collaborative governance, and collaborative governance is the access path to achieve spatial development. To this end, it is necessary to strengthen the role of the Yellow River Basin as a link between east and west, to establish a basin-wide spatial development mechanism, and to realize the full coverage of the collaborative governance mechanism, so that the ecological, economic and human development of the basin can be integrated.

### **2.2 BOOSTING ECOLOGICAL PROTECTION AND HIGH-QUALITY DEVELOPMENT OF THE HUANGHE RIVER BASIN IN GANSU SECTION**

#### **2.2.1 INCREASE THE PROMOTION OF HORIZONTAL ECOLOGICAL COMPENSATION MECHANISM IN THE WHOLE FLOW OF THE YELLOW RIVER**

It is recommended that the state support the ecological protection and restoration policy of the Yangtze River Economic Zone, *mutatis mutandis*. Annual arrangement of financial funds. The 9 provinces along the Yellow River should be allocated according to the factor method. Further increase the weight of "water resources contribution", "water use efficiency" and "soil and water conservation area" indicators in the allocation of funds in the calculation factors. After the funds are issued, there is no limit to the specific scope of use. By the provinces independent arrangements for the Yellow River Basin, water pollution control, soil and water conservation, water conservation, water conservation, soil greening, sand control and other ecological protection and restoration of the Yellow River Basin to promote ecological restoration and ecosystem function.

#### **2.2.2 ESTABLISHMENT OF THE YELLOW RIVER CITY ECOLOGICAL PROTECTION AND HIGH-QUALITY DEVELOPMENT FUND**

To accelerate the development of the ten ecological industries. Gansu Province has set up the Gansu Green Ecological Industry Development Fund, but the overall scale is small, coupled with attracting little social capital. Still can not meet the demand for funds for industrial development in Gansu Province, it is recommended that the central government follow the national green development fund model. 9 provinces along the Yellow River participate in shares to attract social capital. Establish a national-level fund for ecological protection and high-quality development of the Yellow River Basin to support ecological protection and industrial development in the nine provinces along the Yellow River. Provide a capital financing

and investment platform for the ecological protection and high-quality development of the Yellow River Basin, and focus on supporting major ecological and environmental protection projects industrial projects and investment in enterprises with good growth and high yield in the Yellow River Basin in the form of equity investment, such as environmental protection, pollution prevention and control, ecological restoration and water resources protection, greening of national space, energy conservation and utilization, transportation infrastructure construction, clean energy, etc.

### **3. RESEARCH FINDINGS**

#### **3.1 FLOW DISTRIBUTION CHARACTERISTICS**

The Arc GIS software is used to visualise and analyse the above processed data through spatial analysis methods, and the tourism flow forces are represented hierarchically through the natural breakpoint method. From the whole basin, the tourism flow force is unevenly distributed, primarily in the basin's middle and lower portions, with the tourism flow in the upper reaches concentrated in Shaanxi. When compared to the upper reaches, the distribution of tourism flow is more balanced at the middle and lower regions. In terms of provinces, tourism flows vary greatly between provinces, with more tourism flows in Shandong, Henan, Shanxi and Shaanxi, which have well-developed transportation and rich tourism resources, each with its own characteristics, with an overall bias towards provincial capitals and their surrounding areas, and in terms of pairs within provinces, tourism flows are mostly distributed in provincial capitals and their surrounding areas with rich tourism resources.

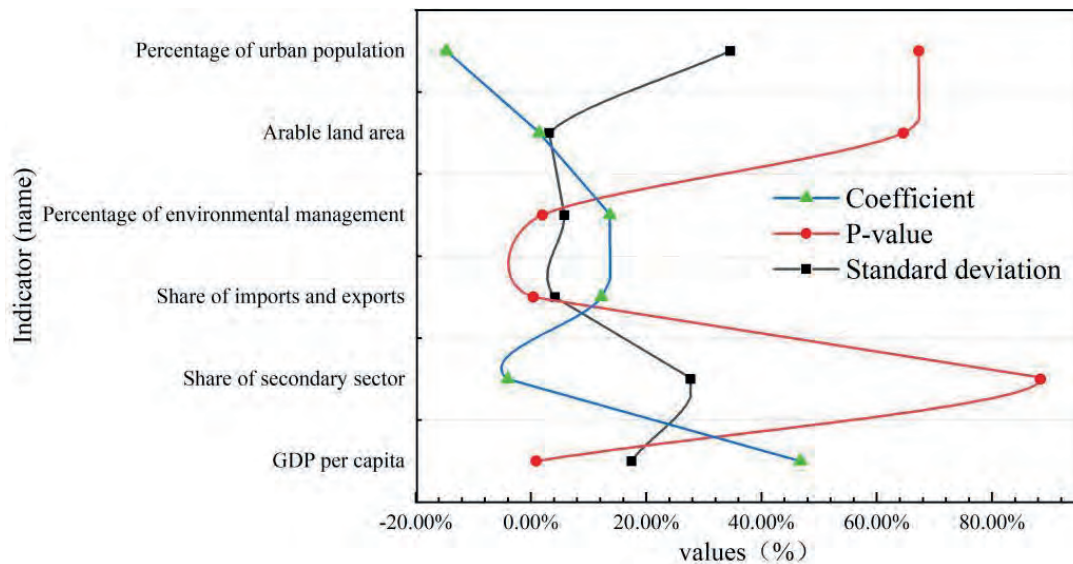

Figure 1 shows the differences in the distribution of tourism flows. The standard deviation mainly reflects the extent to which individuals deviate from the mean and reflects the absolute differences in areas. The standard deviation demonstrates that there are significant variations in how tourist flows are distributed throughout the basin. It shows the differences in tourism development between the cities in the basin, which are severely unevenly distributed, and that tourism development within the basin is not on the same horizontal line. In comparison to the basin as a whole, the dispersion of tourism flows in the upper, middle, and lower reaches differs significantly, with the higher and middle reaches exhibiting a smaller standard deviation than the lower reaches, where tourism flows are distributed rather evenly. Whereas some cities in the downstream region show a strong attraction to tourists and a clear preference for tourism flows, the concentration of tourism flows in some cities makes their role as core nodes obvious, but it can also be seen that there is little coordinated drive across the basin, leading to significant spatial differences in tourism flows.

**Figure 1.** Difference in tourism flow distribution

### 3.2 REGRESSION ANALYSIS OF FACTORS INFLUENCING GOVERNANCE EFFICIENCY

The factors influencing the effectiveness of rural eco-environmental management of the Huanghe River Basin are shown in Figure 2. Using Stata software. From 2008 to 2017, Tobit regressions were performed on the variables affecting the effectiveness of local eco-environmental administration in the Huanghe River Basin. The findings of the regression analysis reveal a considerably positive coefficient for GDP per capita, showing that this factor has a considerable impact on how effectively rural environmental protection is conducted. The efficiency of rural eco-environmental management will be greatly improved by increasing the proportion of all import and export to regional GDP in a particular region, according to the correlation of the ratio of total import and export to regional GDP. The coefficient of the proportion of financing in environmental pollution control to GDP is also optimistic, implying that a rise in the proportion of financing in environmental pollution control to GDP will also markedly enhance the effectiveness of rural eco-environmental management. The coefficient of the relationship between investment in the prevention of environmental pollution and GDP is positive, implying that increasing the connection between investing in the prevention of environmental pollution and GDP can markedly improve the effectiveness of exurban eco-environmental control. In contrast, the region of agricultural land has a positive but minor impact on this relationship.

**Figure 2.** Factors Affecting the Efficiency of Rural Ecological Environment Control in the Huanghe River Basin

#### 4. CONCLUSION

This paper use Arc GIS software to visualize and perform spatial analysis on the previously processed data, and it employs the Tobit model to perform regression analysis on the variables affecting the effectiveness of rural eco-environmental governance. One can infer the following conclusions.

(1) The distribution of tourism flows in the upper, middle and lower reaches varies greatly relative to the whole watershed, with a smaller standard deviation in the middle and upper reaches compared to lower reaches, where tourism flows are relatively evenly distributed. The concentration of tourism flows in some cities makes their role as core nodes obvious, but it is also clear that the basin as a whole is not well coordinated and driven, resulting in significant spatial differences in tourism flows.

(2) The Huanghe River Basin's rural eco-environmental management's detailed technical efficiency, pure technical efficiency, and scale efficiency have all changed significantly, and their respective mean values have all increased significantly. This suggests that possible errors and external conditions have a major effect on the efficacy of rural eco-environmental management.

## ABSTRACT

The aim of this analysis of the development path of vocal music teaching in colleges and universities is to better inherit Chinese vocal music culture. In this paper, with the help of big data technology, the requirements for the development and cultivation of vocal music culture in colleges and universities are explained, and an online teaching mode of vocal music based on big data technology is given. Data analysis is conducted for the online teaching mode of vocal music. From the comparative analysis of the teaching modes, the satisfaction of the online teaching mode is increased by 15.5% compared to that of the traditional teaching mode. In terms of practical advantages, 31.79% and 24.29% of the respondents said, respectively, that the use of online vocal teaching mode could better update the teaching content and diversify the teaching knowledge. This shows that big data technology can be used in effectively analyzing the development path of vocal music teaching in universities.

## KEYWORDS

Big data analysis; Universities; Vocal music teaching; Development path; Satisfaction; Online teaching model

## 1. INTRODUCTION

From ancient times to the present, education has always been one of the most important topics of concern, and with the continuous development in China's socio-political and economic fields, education in China has entered a wholly new stage [1-2]. Vocal education has an unshakeable position in the field of music education, and it is important to avoid being left unnoticed by those who work in this field. The current era is one of data, and the combination of Internet technology and traditional vocal teaching is increasingly recognized and welcomed by educators in current vocal teaching, and this new teaching mode follows the trend of modernizing vocal teaching [3-5].

Inheritance of national music culture can maintain the diversity and national characteristics of Chinese culture and set the tone for the innovative development of Chinese music culture, for which reason vocal music teaching courses are offered to music majors in universities [6-7]. However, with the development of the technological era and the deepening of China's policy in reform and opening up, various kinds of information and vulgar cultures have flooded students' lives, and the inheritance and development of efficient vocal music teaching has been impacted [8-9].

In order to analyze the development path of vocal music teaching in colleges and universities, this paper has offered arguments in three parts. The first part is the development of the traditional teaching mode of vocal music, including the incipient exploration period, the

development and progress period, and the full-scale prosperity period. The second part is an analysis of the online vocal teaching mode, including the advantages and limitations of the online teaching mode, which serves as the basis for the quantitative analysis of the data in the later part. The third part is the application analysis, which analyzes the online and traditional modes of vocal music teaching, and also gives an analysis of the advantages of online vocal music teaching. The analysis of the development path of vocal music teaching in universities is achieved through the above three parts.

## **2. DEVELOPMENT OF THE TRADITIONAL TEACHING MODE OF VOCAL MUSIC IN COLLEGES AND UNIVERSITIES**

### **2.1 INITIAL EXPLORATION PERIOD**

In the 1920s, the early Chinese vocal art pursued the "art of American singing". After the May Fourth Movement, a number of outstanding Chinese students who had studied vocal music in the West returned to China with the ambition of making contribution to the vocal career of the motherland, and the Western art of American singing was thus introduced on the stage in China. In terms of vocal music, vocalists and foreign vocal experts were employed as vocal teachers, and the teaching mainly copied from a Western model, which also laid the foundation for the development of vocal teaching models later on.

### **2.2 PERIOD OF DEVELOPMENT AND PROGRESS**

The founding of New China on 1st October, 1949 brought endless vitality to the development of vocal education in China, and Chinese music thus entered a phase of continuous development and progress. Music academies sprang up all over the country, and vocal teaching in general distinguished between American singing and Chinese folk singing.

### **2.3 FULL BOOM PERIOD**

In 1977 when the university entrance examination system was restored after a ten-year hiatus, a wave of education revival swept in and the number of applicants for music majors continued to increase. The development of vocal music teaching after the reform and opening up has shown an unprecedented prosperity. To date, a systematic, standardized and unique traditional mode of teaching vocal music has gradually been formed, which is mainly divided into three aspects: professional teaching, theory teaching and practical teaching.

## **3. ONLINE TEACHING MODE OF VOCAL MUSIC BASED ON BIG DATA TECHNOLOGY**

With the development of the times, the education model should keep up with the times and meet the diversified requirements in learning. In vocal music teaching courses, teachers should focus on the development of the art and carry out efficient course teaching in response to students' learning characteristics. The online teaching mode of vocal music with the addition of big data technology takes students as the main subject of the class and presents the course in a diversified way through the online platform, fully mobilizing students' learning enthusiasm and prompting them to actively engage in vocal music learning.

### **3.1 ADVANTAGES OF THE ONLINE TEACHING MODEL**

#### **3.1.1 SHARING EDUCATIONAL RESOURCES**

The sharing of educational resources, which were previously limited to the classroom and knowledge only offered in textbooks and some reference books, is the greatest advantage of online teaching. Nowadays, the above-mentioned limitation is broken by online teaching, which enables the flow of resources between different disciplines and different regions. With online teaching, teaching breaks the boundaries of time and space.

### 3.1.2 MORE FLEXIBLE COMMUNICATION

All teaching activities require the participation of both teachers and students, and the effectiveness of vocal music teaching can be guaranteed if there is harmonious communication and rapport between them. Compared to other subjects, vocal music teaching is unique in itself, which, to a certain extent, requires a high degree of interaction between teachers and students in the vocal music classroom. In the current era of rapid development of big data technology, both teaching tools and teaching contents and teaching methods are networked and modernized.

## 3.2 LIMITATIONS OF THE ONLINE TEACHING MODEL

### 3.2.1 WEAK TEACHER-STUDENT INTERACTION

The fact that students and teachers are not face-to-face in online teaching makes it impossible for teachers to quickly grasp the learning situation and psychological state of students. There is no direct emotional interaction between teachers and students, and it is difficult for students to feel the teacher's teaching status and adjust their learning in time. One of the difficulties that cannot be solved in online teaching is that emotional communication still needs to be achieved through face-to-face conversations between teachers and students.

### 3.2.2 OVER RELIANCE OF HARDWARE CONDITIONS

Online courses rely on electronic devices for teaching, which means that teachers and students must have one or more mobile phones or computers. This increases the cost of learning. Teachers need to spend a lot of time and effort in recording their courses, and the lack of equipment and environment for audio and video recording can also affect the effectiveness of teaching. In the case of live courses, there can also be problems with signal or radio system failure, which can seriously affect the effectiveness of online teaching.

## 4. APPLICATION ANALYSIS

This chapter focuses on the innovative cultivation strategies of big data technology for students in the development of vocal teaching in colleges and universities as a way to help provide effective directions for the development of vocal teaching in China.

### 4.1 COMPARATIVE ANALYSIS OF VOCAL MUSIC TEACHING MODES

For the online teaching mode based on big data technology, the data of vocal music teaching in S University is taken as an example, and the evaluation data of teachers and students on the two teaching modes of online and traditional teaching is collected as the object of comparative analysis. The results of this comparative analysis are shown in Figure 1.

### Figure 1. Comparative analysis results

In terms of the two modes of vocal teaching, the overall popularity of the online mode of vocal teaching is higher among teachers and students, with an overall rating of 37.79% for the online mode compared to 22.29% for the traditional mode, and an increase of 15.5% for the online mode compared to the traditional mode. This shows that the online vocal teaching mode can help teachers to tailor their teaching to students' characteristics, and the online teaching database consists of a corresponding syllabus repertoire list, leaving students free to learn.

#### 4.2 ANALYSIS OF THE ADVANTAGES OF THE APPLICATION OF THE ONLINE TEACHING MODEL

Based on the previous comparative analysis of the online teaching mode and the traditional teaching mode, this section argues for the analysis of the specific advantages of the application of the online teaching mode in vocal music teaching. The quantitative analysis of the data is carried out using the satisfaction level of teachers and students with the advantages of the application of the online teaching mode, and the results of its application analysis are shown in Figure 2.

Figure 2. Application Analysis Results

The results of the analysis of the advantages of the online teaching mode show that the online teaching mode based on big data technology can attract the interest of teachers and students in vocal music teaching to a greater extent, whether by means of mobile internet or online teaching platform, which can effectively help vocal music teaching to achieve the innovation of teaching methods and update of teaching contents. In particular, 31.79% of the students and teachers believe that the online mode of teaching uses internet information technology to update the teaching content in real time. In the process of teaching, multimedia is used as a medium for students to receive vocal knowledge more quickly and intuitively, and abstract music knowledge is transformed into the form of videos or pictures, making their music lessons more vivid and interesting. 24.29% of students and teachers believe that the use of mobile internet for vocal music curriculum design can make vocal music teaching more diversified and create a broader and more open learning environment for students.

#### 5. CONCLUSION

This paper analyzes the effective path of vocal music teaching development in colleges and universities with regard to big data, and draws the following conclusions after quantitative analysis of the data:

- (1) In vocal music teaching, build a network platform and innovate teaching methods.

It is necessary to make full use of network resources, and schools must establish better network teaching platforms for vocal music, such as establishing micro-lessons and other network teaching platforms.

(2) Make use of Internet information technology to update teaching content. Computer technology is the core support of modern technology, and this technology can be applied to vocal music teaching and supplementary teaching to enrich the students' artistic world.

## ABSTRACT

With the continuous development of big data technology and the accelerating pace of life, the informatization of college teaching is becoming faster and faster. The innovation of information technology-based teaching means and teaching mode of college Civic Studies mainly focuses on three aspects of MOOC teaching, VR teaching and micro-class teaching. Through big data analysis, we can understand the ideological dynamics of college students and implement multi-dimensional teaching evaluation. The multi-dimensional, multi-object and process evaluation methods are applied throughout the teaching process. In the analysis of the frequency of Civic Studies elements in the university curriculum, the frequency of Civic Studies elements in the compulsory textbooks is greater in the level of “family and nation feeling” than in the other four levels<sup>16</sup>. The frequency of “personality qualities” in the optional compulsory materials was 25 more than the other four levels. This study resolves the contradiction between large-scale learning and personalized, differentiated and customized learning, and promotes the practice and innovation of information-based teaching in universities.

## KEYWORDS

Big data technology; MOOC teaching; VR teaching; Micro-learning; Civics elements

## 1. INTRODUCTION

In the current era of rapid development of information technology, all kinds of thinking trends are communicating, intermingling and exchanging with each other under the means of information technology media[1-2]. To do a good job in ideological and political work in colleges and universities, we need to make good use of the main channel of classroom teaching, especially the Civics class [3-4]. Especially in the current Internet era, diversified values and ideologies are more likely to disorient young students who lack the ability to make accurate judgments, and the Civics class is charged with a more difficult historical mission [5-6].

The literature[7] uses information technology to innovate the mode and method of teaching and learning, which is an important way to accelerate the deep integration of information technology and education teaching. The literature[8] analysed in depth the six core elements of information technology teaching innovation in basic education, and followed the general process of scale development to develop a measurement tool for information technology teaching innovation in basic education with high reliability and validity. Literature[9] In the

context of information-based teaching reform, higher education institutions attach great importance to the construction of information technology and integrate it with music education to explore the optimal way to reform traditional music teaching.

This paper uses big data technology to promote the traditional strengths of ideological and political work in colleges and universities with a high degree of integration with information technology, enhancing the sense of modernity and attractiveness. The traditional classroom teaching mode and the MOOC teaching mode have complemented each other, and the hybrid teaching mode of “online” + “offline” has come into being. Another important significance of MOOC for Civics courses is to promote the popularisation of Marxism, so that more people can understand, know and come into contact with Marxism. Through VR simulations of the geographical environment and climatic conditions during the Red Army’s Long March, students can be immersed in it through scene reproduction and interactive experiences, feel the hardships of the Red Army’s encounter with the siege, life and death, understand the spirit of the Long March, and learn the noble qualities of the Red Army’s bravery and courage in going forward against all odds. Micro-teaching videos are the main teaching vehicle, and after the teacher has refined the content of each chapter this teaching method is not only clear in its objectives, but also very relevant and easy for students to understand. Finally, through the big data analysis, to understand the understanding of the ideological dynamics of college students, and the analysis of the Civics elements in the college curriculum, so as to achieve the practice and innovation of information-based teaching in the college Civics classroom.

## **2. INNOVATION OF INFORMATION TECHNOLOGY-BASED TEACHING METHODS AND TEACHING MODES IN UNIVERSITY CIVICS COURSES**

### **2.1 MOOC TEACHING**

The Civics course in higher education is not only a basic course, but also a core course that inspires the mind and touches the soul. Civics courses have always been the focus and difficulty of teaching, the difficulty of which is how to truly touch the hearts of college students and effectively stimulate their initiative in learning theory. The MOOC is a new model of course born in the era of big data, after which the wave of MOOC has spread from the United States to the whole world. It makes use of the virtual space of the Internet and the modern mobile world. It uses the virtual space of the Internet and modern mobile information technology to achieve instant learning anywhere, anytime, breaking the limits of time and space. In terms of classroom organisation and management, the ‘flipped’ classroom is a disruptive innovation that solves the contradiction between large-scale learning and personalised, differentiated and customised learning. In terms of curriculum implementation, the online platform covers the entire process of teaching, feedback, assignments, assessment, examinations, certificates and employment. In terms of teaching content, cloud technology is used to realise the big data storage function. Before class, Civics teachers post course tasks and quizzes on the platform, which students need to complete in a timely manner. Teachers can understand students’ mastery of knowledge points through the data fed back from the platform. This allows teachers to base their teaching design, corresponding case presentations, discussions, lectures and arrange deeper seminars in the classroom. The MOOC course online learning mode lacks teacher leadership and supervision, making the teaching effect deviate from expectations to a certain extent. Therefore, traditional classroom teaching mode and MOOC teaching mode to achieve complementary advantages, “online” + “offline” hybrid teaching mode came into being. Another important significance of MOOC for Civics courses is to promote the popularisation of Marxism, so that more people can understand, get to know and come into contact with Marxism, which is also the goal that educators are constantly pursuing.

## **2.2 VR TEACHING: FIRING UP STUDENTS' CONFIDENCE IN THEORY IN AN IMMERSIVE EXPERIENCE**

The emergence of virtual reality technology has made the teaching tools more scientific, efficient and colourful, and can provide visual and auditory materials that are intuitive, visual and multi-stimulating. The integration of virtual reality technology with the Civic Studies course is both an exploration of the educational and teaching reform of the Civic Studies course and an attempt to integrate the science and engineering disciplines with the humanities. In the process of using VR technology, students can learn about the corresponding content through offline field visits and online learning, and learn about the school's history, famous people and red stories, creating an ecology of Civic Education that combines reality and imagination. Through VR simulation of the geographical environment and climatic conditions during the Red Army's Long March, students can feel the hardship of the Red Army's encounter with the siege, life and death, understand the spirit of the Long March, and learn the noble qualities of the Red Army's courage and courageousness through scenes of reproduction and interactive experience.

## **3. BUILD A MOBILE LEARNING ENVIRONMENT AND VIGOROUSLY PROMOTE SMART TEACHING**

### **3.1 BIG DATA ANALYSIS TO ACCURATELY GRASP THE PULSE OF YOUTH THINKING**

Through big data analysis, we understand the ideological dynamics of university students and implement multi-dimensional teaching evaluation. The multi-dimensional, multi-object, process evaluation approach is used throughout the teaching process, combined with the teaching content, from the student learning process, before and after learning, mid-term and end-term personal development progress, class learning statistics, carry out school assessment, enterprise feedback, family interaction and other point-to-point matrix links to form a student online and offline growth record booklet, a comprehensive analysis to promote the overall development of students. There are many factors that influence a Civic Education class that is popular with students, including the content of the course, the level of teachers and teaching methods. The content of Civic Education should be changed according to events, advanced according to the times and new according to the situation, and teachers should work harder to cultivate their internal skills and strengthen the affinity and relevance of Civic Education. The severe challenges posed by information technology to the construction of the teaching team have further triggered deeper thoughts on the reform and development of the teaching of Civics and Political Science in universities.

### **3.2 ANALYSIS OF THE IDEOLOGICAL ELEMENTS IN THE UNIVERSITY CURRICULUM**

Figure 1 shows a line graph of the frequency distribution of the Civics elements. Data and Computing and Information Systems and Society (Compulsory 2), as basic teaching materials for the overall enhancement of students' information literacy, emphasise the cultivation of core literacy, which should also contain rich resources of thinking politics. Through a summary of the Civics elements in each textbook, it is found that Compulsory 2, Information Systems and Society, has the most Civics elements tapped, at 49 times, followed by Compulsory 1, Data and Computing, 45 times, Selective Compulsory 5, 3D Design and Creativity, 44 times, and Selective Compulsory 3, Data Management and Analysis, has the least Civics elements tapped, at 25 times. Overall, the compulsory materials have more Civics elements than the optional compulsory ones.

**Figure 1.** Line chart of frequency distribution of ideological and political elements

Figure 2 shows a line graph of the frequency distribution of the Civics element categories. The frequency of the “family feeling” dimension of the compulsory textbook is greater than that of the other four dimensions. The frequency of the “personality qualities” element in the optional compulsory textbook is greater than that of the other four levels. “The optional compulsory subjects, on the other hand, are designed to educate students in areas such as patriotism and national identity. The optional compulsory courses, on the other hand, are designed after students have completed the basic courses and are based on further education and personal development, so there are more elements of “personality qualities”, which is in line with the original design of the materials. In short, the compulsory textbooks focus on the emotional development of students, while the optional compulsory textbooks focus on the development of personal excellence and character development.

**Figure 2.** Line chart of frequency distribution of ideological and political elements

#### 4. CONCLUSION

The development of big data has brought a severe test to traditional ideological and political work. Compared with traditional teaching, information-based teaching has the distinctive features of wide coverage, large amount of information, fast dissemination, strong virtualization and high interactivity. The only way to do a good job of “big data + ideology and politics” is to use the laws of network communication, improve and innovate the content and form of online

publicity. There is a clear bottom line and correct direction for the reform and innovation of the teaching of Civics. Only with continuous “innovation”, the university’s Civics course can better take up the educational mission of adhering to the right path, spreading positive energy and guarding the main position as a microcosm, we must follow the laws of ideological and political work, the laws of teaching and education and the laws of student growth, and constantly improve our working ability and level.

## ABSTRACT

Ideological and Political Education in Curriculums is an important part of the teaching reform of universities in the new era. The university physics course is characterized by strong scientificity, wide audience and rich ideological and political education resources, and is responsible for the historical task of strengthening moral education. In this paper, according to the characteristics and teaching contents of the physics course, the teaching process integrates the ideological and political elements of scientific thinking, national sentiment, dialectical materialism education, craftsmanship, scientific and technological strength, etc., to explore the specific paths to improve the ability of teachers in the ideological and political education, improve the teaching methods and improve the practical ability of students. The results show that through the practice of the teaching mode of Physics Course + Curriculum Ideology and Politics, the overall teamwork ability of students in physics experiments has increased by 23.15%, effectively improving the learning effect of students in physics courses. The Physics Course + Curriculum Ideology and Politics not only serves the educational purpose of strengthening moral education, but also has a better promotion effect on students' pursuit of scientific spirit, scientific attitude and team spirit.

## KEYWORDS

Ideological and political education; Physics courses; Ideological and political elements; Scientific thinking; Physics experiments; Teamwork

## 1. INTRODUCTION

In the new era, the state has put forward new requirements for curriculum construction, both the series of speeches of General Secretary Xi and the series of meetings and documents of the Ministry of Education have made clear the importance of ideological and political education [1-2]. the Ministry of Education's "the guidelines for ideological and political education in colleges and universities" proposes to comprehensively promote the construction of ideological and political education is a strategic measure to implement the fundamental task of strengthening moral education, and clarifies the target requirements and content focus of the construction of the curriculum [3-4]. The literature [5] argues that how to better shape students' scientific character in experimental teaching while carrying out ideological and political education is an issue worthy of deep consideration by physics laboratory teachers in their teaching. The literature [6] argues that through clever and scientific content design ideological and political elements such as socialist core values, patriotism and struggle spirit are incorporated into teaching in a subtle form in order to achieve ideological and political education in physics experiments.

In this paper, firstly, depending on the characteristics of different experimental projects, love

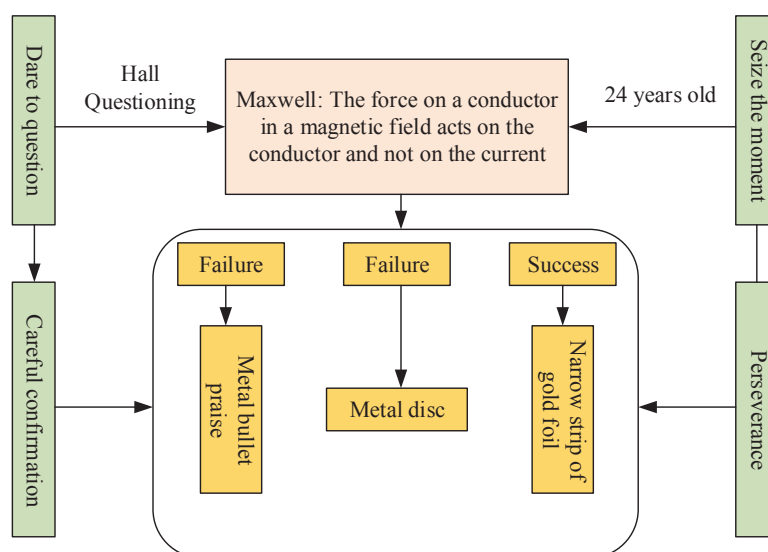

for the Party, love for the country, love for socialism, love for the people and love for the collective are the main lines to guide students to strengthen their ideals and beliefs, establish scientific values and enhance their comprehensive literacy. Secondly, in the background of physical experiments, experimental principles, experimental purposes, experimental operations and other aspects, through clever and scientific content design of the core values of socialism, patriotism, the spirit of struggle and other ideological and political elements into the teaching in a subtle form, to achieve the ideological and political education in physics experiments by moistening things silently. In the end, the concept of ideology and politics is integrated into the actual teaching of University Physics, trying to find the footing of the theory in the process of actual teaching and then reflecting on it for improvement.

## 2. PHYSICS COURSE + CURRICULUM IDEOLOGY AND POLITICS TEACHING MODEL

### 2.1 METHODS AND APPROACHES TO CURRICULUM IDEOLOGY AND POLITICS

The physics laboratory course teaches students basic physics knowledge and basic laboratory skills, enabling them to master physical concepts, learn to think scientifically, solve practical problems through scientific investigation, cultivate their scientific attitudes and responsibilities, and gradually form a scientific character that benefits them for life.

Using the thinking of curriculum ideology and politics to design a good experimental background and tell the story of scientists can better achieve the effect of nurturing people. For example, the Hall effect experiment, which is offered in almost every school, can incorporate rich ideological and political elements when telling the background of the experiment as shown in Figure 1.

**Figure 1.** Teaching design in the discovery of the Hall effect

After several failures Hall did not give up but changed his experimental ideas and eventually used narrow strips of gold foil to obtain scientific experimental data, successfully confirming the Hall effect phenomenon. By explaining the process of the discovery of the Hall effect, students are inspired to form a good scientific character on the road to scientific research, to seize the moment and learn diligently, not only to have the courage to question, but also to have innovative thinking and persistent efforts.

### 2.2 DISCOVERING THE IDEOLOGICAL AND POLITICAL ELEMENTS IN THE PHYSICS CURRICULUM

The nature and characteristics of the physics curriculum, as well as the cognitive characteristics and receptiveness of students, should be taken into account when exploring

the ideological and political elements of the curriculum. The selection of elements is based on the principles of authenticity, orientation and methodology. In this paper, physics is divided into two knowledge modules, and three elements are selected from each section to explore the ideological and political elements. In the process of explaining physics knowledge, these elements are subtly explored and integrated into the modules to guide students in the formation of relevant beliefs, sentiments, cultivation and spirituality.

A selection is used to explore the ideological and political elements in the optics section as shown in Table 1.

**Table 1.** ideological and political elements embedded in optics

Physics Knowledge Points	Bridging Points	ideological and political Elements
Reflection of light	Insert the story of Mr. Gao Yin, the father of fiber optics, in the video	Both down-to-earth and far-sighted, not looking for glory and profit open-mindedness.
Diffraction of light	China's sky eye, the 500-meter spherical radio telescope	The strong strength of the country's science and technology
Interference of light	An optical instrument company in Shenyang provided nearly 2,000 pieces of filters in an emergency.	Embodying the unity of strength and family sentiment that one side is in trouble and all sides are supported.

### 3. EMPIRICAL RESULTS AND ANALYSIS OF THE PHYSICS COURSE + CURRICULUM IDEOLOGY AND POLITICS TEACHING MODEL

In this paper, two lessons from the internship teaching, The Discovery of Electromagnetic Waves, are selected as teaching examples. The lesson is from University Physics 2 and the specific case design is as follows. The physical knowledge of this lesson includes electromagnetic waves, Maxwell's electromagnetic field theory and the concept of electromagnetic field. The content of this lesson is based on Maxwell's mathematical talent and his research into Faraday's laws of electromagnetic induction until he made his prediction about the existence of electromagnetic waves and eventually established a complete theory of electromagnetism. The content of the course reflects the approach to scientific enquiry, the invisibility of innovative thinking and the role of scientific development in driving the world.

#### 3.1 TEACHING OBJECTIVES

(1) Knowledge and Skills: Know the historical background of the discovery of electromagnetic waves and Maxwell's important contribution to electromagnetism; know the concept of electromagnetic waves, Maxwell's electromagnetic field theory, etc.

(2) Processes and Methods: Through the study of Maxwell's electromagnetic field theory, students will learn to use scientific thinking and reasoning methods such as association, inference and so on.

(3) Emotional and Attitudinal Values: Using the example of the pioneers in electromagnetism research, students will develop scientific qualities and scientific thinking methods to help them enhance their patriotism and establish a dialectical materialist world view. Using knowledge of electromagnetism as an entry point and historical examples of applied research on electromagnetic fields as a portrait, students will cultivate the scientific spirit of pursuing truth and exploring creativity.

#### 3.2 TEACHING EFFECTIVENESS

(1) Clarity of knowledge

Question Q2 was set in the questionnaire: "In this physics class, do you think that the teacher explained relevant physical concepts, such as the law of electromagnetic waves and

the law of conservation of energy, clearly?" The results of the survey are shown in Figure 2.

**Figure 2.** Clarity of electromagnetic wave knowledge

It can be seen that 36.87% of the students thought that the teacher explained the relevant physics concepts very clearly, 55.11% thought it was relatively clear, only 9.18% of the students were not very clear about the knowledge points and no students were not clear about the knowledge points.

At the same time, after checking the students' post-lesson exercises, I found that most students performed well in the exercise tests, which can be a good indication that the teaching of this lesson met the requirements of the objectives of the physics curriculum without reversing the priorities.

(2) Level of demand for curriculum ideology and politics

In the survey on the degree of demand for curriculum ideology and politics, the results of this survey were compared with the degree of demand of students in the previous survey on the status of curriculum ideology and politics in University Physics, and the results obtained are shown in Figure 3.

**Figure 3.** Comparison of the degree of demand for curriculum ideology and politics

It can be seen that the proportion of those who "very much hope" has increased by about 12 percentage points from 71.21% to 83.04%, while the proportion of those who "don't care" has dropped from 22.54% to 17.31%, and the proportion of those who "don't want to" has remained more or less the same. This indicates that after experiencing the

teaching of "curriculum ideology and politics", students do not reject the teaching of "curriculum ideology and politics" and can continue to teach "curriculum ideology and politics" in the future.

#### **4. CONCLUSION**

In this paper, the content of the university physics course is divided into modules to explore the content of the university physics course, and then select the elements that are suitable for a particular lesson to be infiltrated into the teaching process, so as to cultivate students into moral and talented successors of socialism. The teaching methods of physics classes are diverse and can be divided into two ways: classroom teaching and experimental teaching, both of which are complementary to each other. The two approaches are complementary and mutually supportive. By enriching the resources for ideological and political education, improving the teaching methods and elaborating the curriculum design, the students can implicitly achieve political and cultural identity and realise the purpose of collaborative education in the ideology and politics curriculum.

## ABSTRACT

Under the influence of the rapid development of Internet technology, the reliance on big data and information technology in the operation of more industries has also grown significantly. In this paper, the sharing of data and information and the optimisation of accounting models are achieved through cloud processing in the process of accounting information processing in enterprises, and a more efficient and secure cloud accounting model is established. The paper discusses in detail the effective countermeasures to control the application risks of cloud accounting, taking into account the needs of enterprises for accounting information technology and the operational risks of cloud accounting. The results show that the cloud accounting model increases the prediction accuracy of operational risks by 13.15% and the analysis efficiency of financial management by 21.36%. The cloud accounting model proposed in this paper improves the financial management concept of enterprises and enhances the comprehensive quality of their financial personnel, with a view to further promoting the stable development of enterprises.

## KEYWORDS

Big data; Cloud processing; Cloud accounting model; Accounting information technology; Operational risk; Financial management

## 1. INTRODUCTION

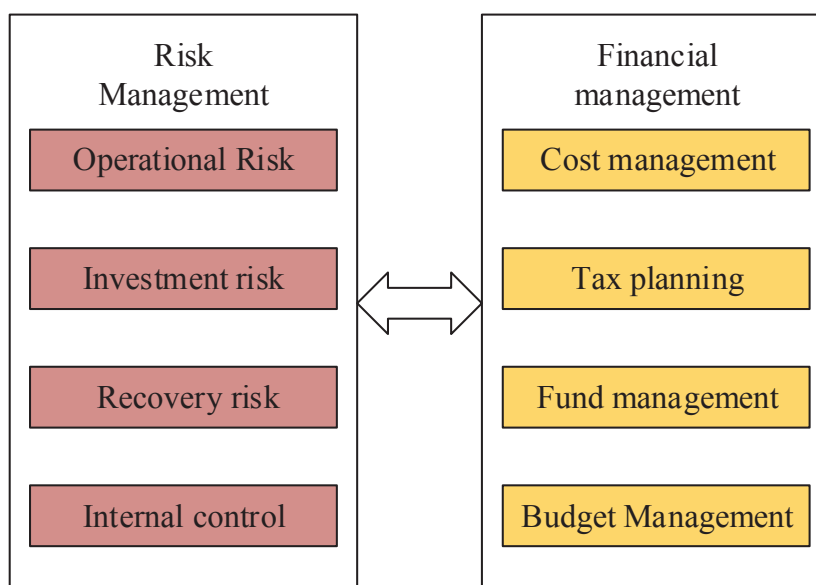

In recent years, due to the development of electronic information technology, accounting has also embarked on the development of information technology, such a model breaks the silo barriers of the old manual accounting model, reduces the competitive pressure of enterprises in the same industry in the era of big data, and the timeliness of information helps enterprise decision-makers to manage and make decisions more scientifically [1-3]. The implementation of accounting informatization in the era of big data helps to integrate various information resources and handle various economic operations in a highly intelligent manner through modern network technology, enriching the financial processing tools and enriching the operational processes of enterprises [4-5]. The means of implementation become more diversified, simplifying the financial accounting steps and enabling automatic processing of business, targeting the shortcomings of the traditional manual bookkeeping model on information sharing, accounting efficiency and accounting quality [6-7]. Literature [8] cloud computing technology and financial accounting by professional service providers, providing software and hardware effectively combined with a kind of accounting information processing

system.

This paper firstly applies information technology and network technology to financial management, realising the sharing of data and information and the optimisation of the accounting model through cloud processing. Secondly, the financial budgeting, application, profit and loss and other issues will be involved in the outgoing process, which is divided into different information modules and different authority levels for business convergence, and scientific calculation co-ordination is carried out on the basis of mastering detailed underlying financial data. Finally, the sharing features of enterprise finance and cloud technology are combined together, with multiple end-users logging in and uploading together, to better enhance the richness and timeliness of financial information sources, and to achieve dynamic data and information monitoring through a combination of embedding with cloud technology.

## 2. OPERATIONAL AND FINANCIAL RISKS OF THE BUSINESS

Today's situation shows that some enterprises have not yet realised the importance of integrating information management into financial accounting, and that the construction of an information platform has a positive contribution to controlling the quality of internal controls and promoting business reforms. Enterprise asset risk management and financial management are intrinsically linked in some way as shown in Figure 1. At other levels, enterprises have not established risk awareness and clear plans in terms of asset control, financial model business security, etc. If you want to establish a prevention system and further analysis, you should focus on the following aspects.

**Figure 1.** Diagram showing the linkage between asset risk management and financial management

### 2.1 PROJECT BUDGET MANAGEMENT RISKS

The increasing complexity of the market environment is an objective incentive for companies to strengthen their risk control capabilities in the production and operation process and to develop detailed project budget management measures to avoid the occurrence of 'grey rhinoceros' events. The integration and efficient use of resources is an important means of avoiding wastage of resources in the course of operations. In addition, every step of the way, guidance documents are put forward and product prices are set according to the needs of the market, so that the risks and challenges posed by market factors can be better addressed. Business processes and financial activities are closely linked, and financial industry integration offers new ways to improve the efficiency of departmental communication and to deal with

business and financial issues.

## 2.2 ACCOUNTING RISKS

In the project completion progress and maintenance process, should refer to the relevant guidance, focus on the process of project costs and the main source of funding, the need for timely financial occurrence risk assessment and the way in which funds are delivered to check, and have a clear record of the record. In the course of field infrastructure audits, it is often easy to revert to the completion date of the project as well as unexpected conditions that result in cost losses, and failure to account for the return on investment in the project assets will result in uncontrollable impacts on project funding.

## 2.3 RISKS IN THE MANAGEMENT OF PRODUCTION MATERIALS

The collection and labour costs of some of the relevant raw materials and the production and sales capacity of each region can have an impact on the asset performance and operational control model of production. Some production departments do not have detailed financial control measures based on the characteristics of the business and market demand, and the inefficient use of funds indirectly leads to a reduction in the overall efficiency of production. In addition, the control of raw material costs has a significant impact on the effectiveness of production operations, and traditional financial management usually uses an annual summary to account for the entire activity of production and operation. However, when linking cost budgets to each business of the enterprise to account for costs, data disclosure is prone to occur. In addition, sectoral power enterprises do not take governance costs into account, which to a certain extent reduces the authenticity of financial statements.

## 3. FINANCIAL RISK ANALYSIS IN THE CLOUD ACCOUNTING MODEL

### 3.1 ENTERPRISE H CASE STUDY

The main sources of Enterprise H include initial investment and annual income from school fees from an education investment company in Anhui, income from school-run enterprises, income from school-enterprise cooperation projects, income from leasing school real estate and other government grants and subsidies as shown in Figure 2.

**Figure 2.** Structure of the main sources of funding for H enterprises to run schools

Table 1 shows the sources of income of Enterprise H from 2013-2017, of which tuition fee income is the most important source of income for the operation of Enterprise H. From 2013 to 2015, tuition fee income accounted for 95%-98% of the total income, with the overall

decrease in the number of candidates in Anhui, the number of students of the school has seen a sudden decrease, and the proportion of tuition fee income to the total income has decreased compared with the previous period, but the tuition fee The income from tuition fees of Enterprise H is positively correlated with the number of students of the School, and the number of students of the College shrank sharply and the number of admissions dropped significantly from 2016 to 2017 as a result of the continuous expansion of the State. In addition H Enterprises is a significant source of revenue through a large number of loans. As of December 2017, the cumulative loans from financial institutions and other micro and small lending financial institutions of Enterprise H reached RMB150 million. The large number of financial loans has increased the generation of financial management risks for Enterprise H. Based on this, the issue of how to effectively prevent fluctuations in tuition fee income and return of bank loans to fund schooling has increasingly become an important issue facing the financial management of Enterprise H.

**Table 1.** List of revenue sources of Enterprise H from 2013-2017(%)

Year	Income from tuition and fees	Income from school-run enterprises	Income from real estate leasing	Other
2013	96.15	3.15	0.30	0.09
2014	97.96	7.95	0.51	0.13
2015	105.17	8.87	4.14	0.08
2016	110.62	6.69	3.51	0.52
2017	113.11	2.23	6.41	0.14

### 3.2 ANALYSIS OF FINANCIAL RISK IDENTIFICATION FOR ENTERPRISE H

Through the discussion in the previous chapters, it is clear that Enterprise H can only rely on its own funding to finance the school, but there are certain limitations in terms of funding channels and funding capacity.

In 2008, the school-enterprise combination stage, H enterprises began to participate in private higher education in the face of the improvement of the school's level of operation by means of joint ventures with enterprises to continue to attract private capital to invest in the school.

In 2013, the funding bottleneck stage, after the initial founder investment and credit funding, tuition fee income became the main or even the only source of funding, and the rolling development of "student-support" by Enterprise H was affected by the continuous decrease in the number of students, which made it difficult to increase the size of the college.

From 2014 to 2017, the College was in debt and faced with the pressure of repaying the principal and interest on its bank loans, which resulted in overdue interest payments and a decline in its credit limit, making it impossible for the College to obtain loans.

It can be seen that there is a certain phase of the college's fundraising and financing behaviour. The school has a single financing method and limited financing channels. Difficulties in financing have become an obstacle to the financing channels of H enterprises. The school should plan ahead and further broaden its financing channels to inject fresh "blood" into the development of the college.

## 4. CONCLUSION

This paper focuses on the security of market operations, internal management audits and financial systems as risk factors that can prevent the loss of costing information and major pitfalls in corporate credit. In order to avoid such defects from occurring, it is proposed that the

sharing of data and information and the optimisation of the accounting model are achieved through cloud processing, and a more efficient and secure cloud accounting model is established. The effective countermeasures to control the application risks of cloud accounting are discussed in detail, taking into account the needs of enterprises for accounting information and the operational risks of cloud accounting. The results show that in the process of cloud accounting mode application, it can effectively make the enterprise construction more standardized, enhance the comprehensive quality of enterprise financial personnel as well as establish sound cloud accounting mode and other aspects to enhance the application effect of cloud accounting mode suggestions, in order to further promote the stable development of enterprises.

---

## ABSTRACT

Taking the rural tourism industry as the research object, this paper adopts theoretical research, case studies, interviews and questionnaires, and conducts a combination of qualitative and quantitative analyses. On the basis of summarising training theories and taking into full consideration the industry characteristics of rural tourism, the current situation and problems of training in the industry are analysed with rural tourism as an example, and the causes of the problems are summarised in an all-round way to build a scientific, standardised and systematic training system for the rural tourism industry. The results show that by strengthening rural tourism training and improving the methods and ideas of rural tourism training, the quality of rural tourism operators and practitioners can be effectively improved, effectively increasing the operating income by 31.26%. This paper provides a comprehensive, systematic and in-depth study and analysis of training in the rural tourism industry, which has certain reference and significance for the training of talents in the rural tourism industry.

## KEYWORDS

Rural tourism; Training system; Quantitative analysis; Practitioner quality of practice; Business income

## 1. INTRODUCTION

The development of rural tourism requires a large number of high-level professionals, and in the early stages of rural tourism, farmers can engage in more basic tourism services [1-2]. However, as rural tourism develops further, its shortage of high-level talent is beginning to be highlighted, and the talent gap has become a major factor limiting the development of rural tourism in China [3-4]. Most practitioners are no longer able to adapt to the development of the industry and must have systematically studied, educated, business and management specialists, which must rely on institutions such as universities for specialised training [5]. In the new historical period, universities have to exercise the function of serving the society and give full play to their own advantages to serve the cultivation of talents and economic and social development [6]. Literature [7] The effectiveness of the construction of the training system for rural tourism personnel in colleges and universities directly determines the future development momentum and market competitiveness of rural tourism.

This paper addresses the problems that exist in training in the rural tourism industry,

proposes that industry training should establish a scientific and standardised training system, collates the ideas and principles for its construction, and lists the framework of the training system. It also elaborates on the various aspects of training at three levels: the training operation system, the training support system and the training management system. Thus, rural tourism continues to play its role as an economic promoter and requires practitioners with professional knowledge and high quality.

## **2. TRAINING SYSTEM CONSTRUCTION**

### **2.1 BUILDING THE PEOPLE MANAGEMENT SYSTEM**

In terms of the rural tourism practitioner industry, to establish a new concept of industry training, to see practitioner training as an important investment in human capital, and to innovate industry training as continuous, all-employee, and ahead-of-its-time lifelong training, the following aspects should be taken into account.

(1) Construct the concept of a learning organisation in the industry and raise industry training to a new level.

The concept of a learning organisation cannot remain merely in words, nor is it merely the responsibility of the competent departments of the industry, but requires the joint participation of management departments at all levels within the industry, various enterprises, training institutions and practitioners. Through a variety of channels and forms, it is appropriate to increase the dissemination of industry training and establish the concept of "big training", lifelong education and collective education.

(2) Integrating modern training concepts into industry training

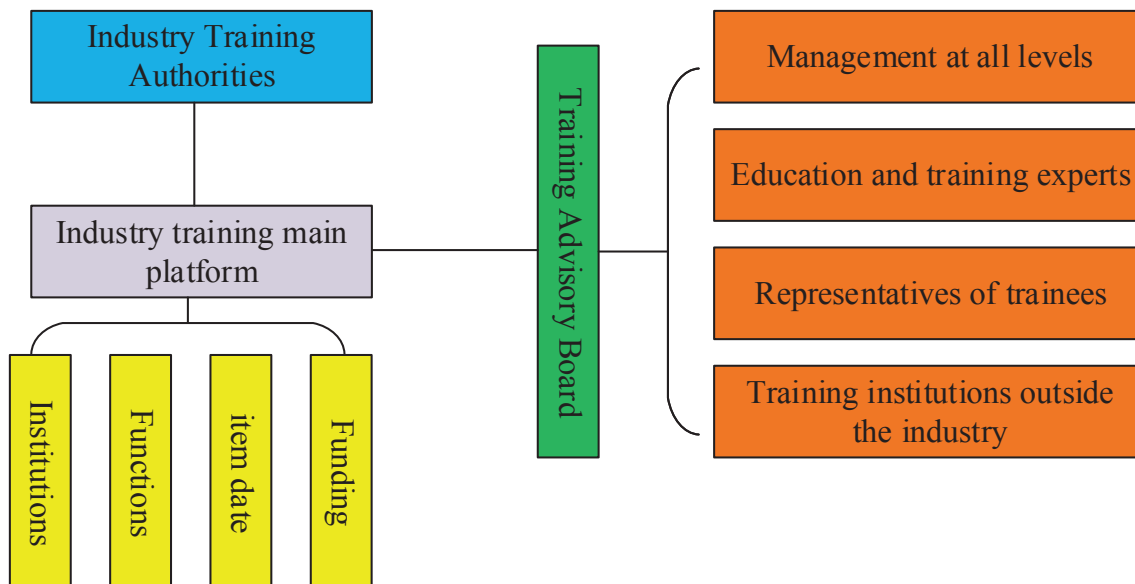

The modern training concept is a high-level conceptual understanding that training is an investment activity, and that the main purpose of training is to directly or indirectly improve labour productivity or work efficiency, and that the entire implementation process realises the function of transforming training content into employee work action.

(3) Establishing the concept of matching employee education and training with career planning

Industry training work does not exist in isolation, it is an important part of the whole talent team construction in human resources development. Ensure that employees with real potential are given training opportunities, closely combine training with promotion, advancement and rewards, and enhance the sense of honour for participating in training, thus strengthening the operational mechanism for converting training into output.

### **2.2 CONSTRUCTION OF THE PERSONNEL TRAINING SYSTEM**

The personnel training system constructed in this paper mainly promotes the training of rural tourism practitioners from the government and enterprises and schools, and the main system of the government and enterprises and schools is shown in Figure 1.

**Figure 1.** Training System Working Relationship after the Reform

(1) Government-led promotion

The government provides guidance and direction to rural tourism enterprises on a macro level by formulating policies, preparing training plans and providing training resources, while providing specialised training services to rural tourism enterprises by organising specialised training, providing training funds, promoting specialised publicity and introducing professional talents.

(2) Collaborative promotion by enterprises and schools

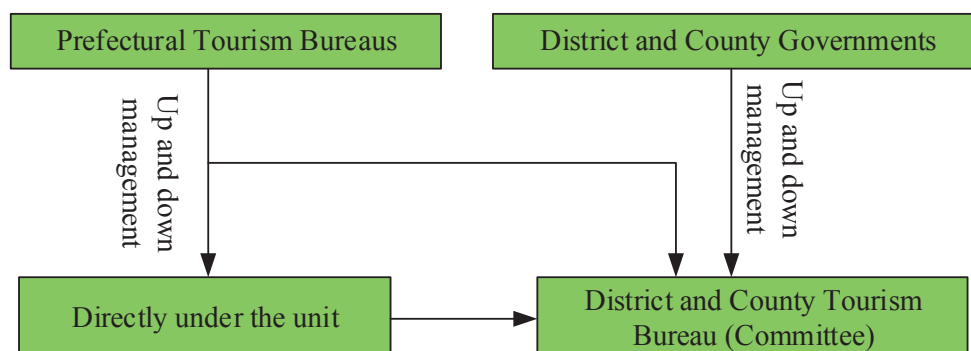

We will give full play to the advantages of enterprises in terms of talent, technology and other resources, and train rural talents through the establishment of industrial parks, demonstration bases and co-ordination platforms, so that villagers will have the business skills to develop tourism and create a team that understands operation, management and business. Strengthen the cooperation between enterprises and colleges, use the advantage of talent resources in colleges and universities, hire professionals from colleges and universities to provide guidance to villagers, and include college students in the training team, encourage college students to participate in rural projects, and build a group of professional teams with both practical skills and theoretical knowledge.

### 3. RURAL TOURISM INDUSTRY TRAINING

#### 3.1 INDUSTRY TRAINING MANAGEMENT STRUCTURE

Due to its self-administered municipal characteristics and geographical features, a two-tier rural tourism management system is adopted. The municipal tourism brigades as municipal rural tourism authorities, is the main decision maker in the management of the tourism industry in the city is the construction, maintenance, management of national and provincial roads, local waterways, integrated transport hubs of the matter of responsibility, is the province's tourism operation command and control and I-level emergency management of the organisers, is the guidance of the tourism business work of the districts and counties. The tourism brigade of each district and county, as the local management department, is the executor of the decision of the higher level, the person responsible for the construction, maintenance and management of the rural roads and the urban ports and integrated transport hubs at this level and the responsibility for the maintenance of the transport market order, and the organizer of the command and dispatch of the traffic operation and I-level emergency management in the

district and county areas. The grassroots-oriented advisory service provider is the organiser and leader of rural tourism affairs, and the training management structure is shown in Figure 2.

**Figure 2.** Management Structure of Chongqing Transportation

### 3.2 HUMAN RESOURCES SITUATION IN THE INDUSTRY

According to incomplete statistics, by the end of 2020, the total number of people working in the country's rural tourism industry was 3.526 million. Among them, 829,000 were managers, 105,200 were professionals and technicians, and 2,011,000 were skilled personnel. In terms of academic structure, 15,600 people have postgraduate degrees or above, and 2,871,500 people have college degrees or above, accounting for 87.15% of the total number of employees. In terms of the structure of titles, 34,800 people had professional and technical titles of associate or above, accounting for 0.27% of the total number of professional and technical personnel. There were 105,600 people with the rank of senior technician or above, accounting for 3.3% of the total number of skilled personnel. In terms of age structure, 394,500 people were under 35 years old, accounting for 17.7% of the total number of employees, as shown in Figure 3.

**Figure 3.** Talent Comparative Analysis

### 3.3 PRINCIPLES OF PERSONNEL TRAINING

The university training system should develop principles for the training of rural tourism personnel to meet the purpose of the training object to receive training.

(1) The principle of practicality. The purpose of the training is to acquire the skills and experience to get out of poverty and become rich, so it is necessary to carry out an in-depth

investigation and analysis of the training needs of rural tourism practitioners before carrying out the training, with a particular focus on the specific problems encountered by tourism practitioners in the course of their work or entrepreneurship.

(2) The principle of phasing. The rural trainees are not well educated and have a poor understanding of the text. For this reason, the training should be carried out in stages and the content of each stage should be different.

(3) The principle of operability. The training should be tailored to the type and scale of rural tourism enterprises in which the trainees are based, and should be delivered at different levels and in different ways, in accordance with the principles of practicality and adaptability, so that the training can proceed smoothly and achieve practical results.

#### **4. CONCLUSION**

This paper establishes a training assessment system, which should be based on the content and targets of the training, and develops a scientific and feasible assessment method that is highly operational and combines theory and practical operation, so as to promote the training work on an institutionalised and standardised track. At the same time, through the feedback mechanism, the training targets and tourists' opinions and suggestions on the effectiveness of training can be collected in time, so that the training plan can be adjusted and the rural tourism training work can be continuously improved. Rural tourism is fundamentally different from social welfare. To enable the rural tourism industry to develop healthily and steadily, to achieve the elimination of the best and the worst in the industry, and to improve the quality and level of the industry, it is also necessary for the government and the association, in conjunction with relevant institutions, to establish practice qualifications and standards of practice. Through the assessment of practice qualifications, the level of rural tourism practitioners will be thoroughly improved and the overall quality of rural tourism practitioners will be enhanced.

## ABSTRACT

This paper introduces the development of industrial design, and discusses the practical application problems and innovative application strategies of CAID based on the advantages of computer-aided systems in industrial design. With CAD technology as the core reliance of industrial design auxiliary system (CAID), the architecture of industrial design system is improved to promote the improvement and innovation of industrial design system. The results show that computer-aided applications in industrial product design can effectively improve the efficiency of technicians by 43.54%, and technicians can effectively analyse the prototype of industrial design and design concepts. Computer-aided systems applied to industrial design make it possible to solve data as well as analysis problems in the industrial design process, bringing all-round optimisation to product design.

## KEYWORDS

Industrial design; Computer-aided systems; CAID; CAD technology; System architecture; All-round optimization

## 1. INTRODUCTION

The rapid development of an information-based society and the widespread popularisation of humanistic concepts have given industrial products a new cultural connotation [1]. The production of traditional industrial products focuses on cost control and innovation of production technology, with the enhancement of production efficiency as the main objective [2]. With the expansion of aesthetics and environmental protection in the industrial field, the value of industrial products is no longer limited to product performance, but rather is a combination of performance parameters, appearance features and response to environmental protection [3-4]. The changing needs of society have led designers to apply computer-aided systems to industrial design, which must take into account the practicality and innovation of specific industrial products [5]. With the increasing competition in commodities and markets, not only are products required to shorten the cycle of renewal, but also to transform to more varieties, high quality and small batches, so the traditional manual design method cannot adapt to the requirements of this change [6-7]. At the same time, with the development of computer technology and electronic technology, there are many types of computer hardware and peripheral devices with good performance have been introduced one after another. Such as graphic display digitizer, light pen, automatic plotter and other varieties and functions of increasingly rich graphics processing devices, has gradually formed a reliable series of

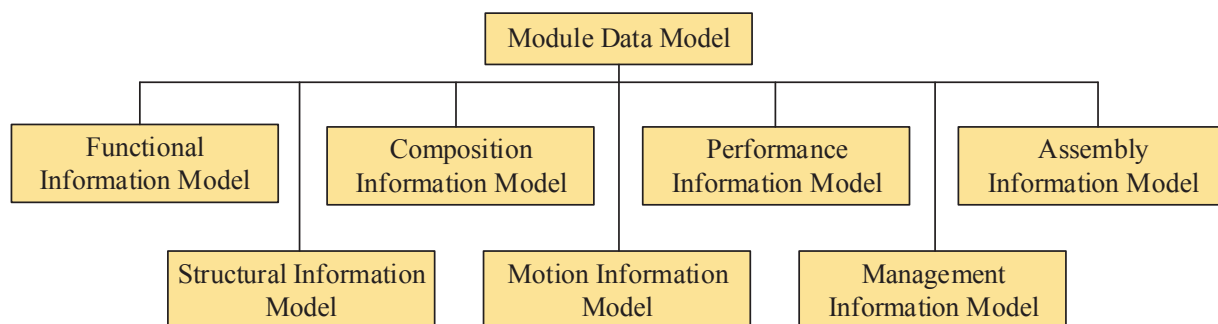

products, and has become a general device of CAD [8].

This paper is first based on the analysis of industrial design and the characteristics of design software related to computer-aided industrial design, the use of computer-aided design of industrial design. It also analyses and discusses the methods and means of computer-aided industrial design in tool development and design from several perspectives, such as computer-aided internal configuration design and expression of shape in tool design, in order to improve design accuracy and efficiency. Secondly, with the support of database, program library and graphics library, human-computer interaction methods are applied to optimize the design results in a short time. At the same time the best results are achieved in terms of product structure, energy consumption and materials. Finally the general framework of a computer-aided modular scheme design system for water pumps is established, taking water pump design as an example.

## 2. BASIC MODELS IN COMPUTER-AIDED MODULAR DESIGN

### 2.1 MODULAR DATA MODEL FOR INDUSTRIAL DESIGN

The module data model is the main model of the computer-aided modular solution design system, through which the modules in the system communicate and exchange data to achieve data sharing in the design process. In this paper, an object-oriented modelling approach is used to abstract the product and establish an integrated object-oriented module data model. The overall structure of the object-oriented module data model is shown in Figure 1.

**Figure 1.** General structure of the module data model

Functional information model: reflects the main functions of the module and is the main basis for module creation and module selection. Structural information model: reflects the main structure and characteristic dimensions of the module. Composition information model: It is the collection of information of sub-modules that compose the module, and the module is aggregated by sub-modules through certain spatial location description. Motion information model: It mainly expresses the motion information of the module and provides the corresponding data for the subsequent simulation design. The motion information includes motion form, motion speed, motion range, etc.

### 2.2 A MODULAR MODEL OF INDUSTRIAL DESIGN FOR DIGITISATION

The creation of modules consists of two parts: the schematic design of the module and the detailed design of the module. In order to meet the needs of the modular design of the pump, only the schematic design of the module is discussed in this paper, i.e. only the corresponding module model is created. The module model reflects the characteristics of the module as a whole. These characteristics include functions, performance parameters, overall structure shape, overall dimensions, external linkage structure shape and dimensions, etc. The module model creation process is shown in Figure 2. Various constraints and design parameters are input into the constraint solving model to find out the structural properties and corresponding structural parameters that meet the requirements, to establish the parametric module model,

and store it in the parametric model library. The parametric module model consists of a module solid model and a module data model. Specific parameters are entered to drive the parametric module model to produce a specific module model, which is the standard solid model for commercial CAD/CAM software.

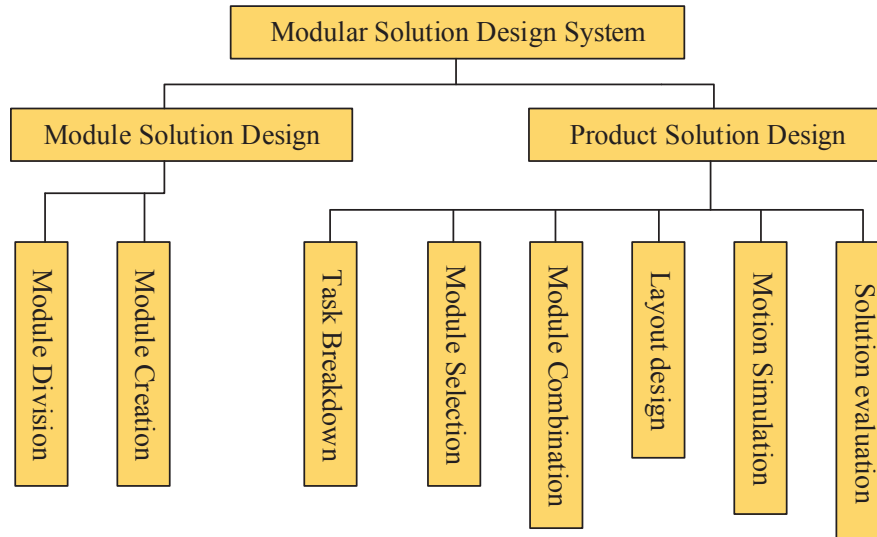

**Figure 2.** Module model creation process

### 3. APPLICATION OF COMPUTER-AIDED DESIGN IN INDUSTRIAL PRODUCT DESIGN

#### 3.1 GENERAL FRAMEWORK OF THE COMPUTER-AIDED MODULAR PUMPING SCHEME SYSTEM

Computer-aided modular concept design includes module concept design and product concept design. Module solution design includes module division and module creation. Product solution design includes design task decomposition, module selection, module combination, layout design, motion simulation, evaluation and redesign. The general framework is shown in Figure 3.

**Figure 3.** Modular design system framework

Module division: After the functional decomposition of a given design task, the product is divided into a series of modules that meet the requirements of modular design using certain division methods. Module creation: The divided modules are designed according to the requirements and stored in the module library. New modules are continuously used to replace obsolete ones in order to maintain the competitiveness of the product in the market and to extend the product life cycle. Task decomposition: according to the user's requirements, the total design task is defined and decomposed into a series of sub-tasks that can be implemented with modules. Module selection: Based on the requirements of the subtasks, modules are selected from a library of modules to form a combined solution for the product. If

---

the required module is not available in the module library, a design request for a new module is made and the new module information is then added to the module library in order to continuously enrich the module library. Module combination: After module selection according to sub-tasks, the modules are combined by certain combination algorithms, and the connectivity between modules is judged, resulting in various achievable overall solutions.

### **3.2 EVALUATION AND REDESIGN OF MODULAR DESIGN SOLUTIONS FOR WATER PUMPS**

The evaluation of the modular design of a water pump is both the basis for the selection of the solution and the prerequisite for deciding whether a redesign is required, evaluation plays a very important role in the design process. There are two types of evaluation of modular design solutions for water pumps.

Single-indicator evaluation: evaluation of the answer to the question of the degree of conformity with the requirements of the proposed problem, that is, whether the programme meets each of the requirements. Feasibility evaluation is relatively simple, its purpose is to exclude from the many design solutions those that are not feasible, leaving feasible solutions, effectively reducing the workload of the comprehensive indicator evaluation of the programme.

Comprehensive indicator evaluation: Based on the evaluation of individual indicators, a comprehensive evaluation of the indicator system is carried out to select some overall more satisfactory solutions.

## **4. CONCLUSION**

This paper takes water pump design as an example and establishes the general framework of a computer-aided water pump modular scheme design system. The advantages of computer-aided systems in the field of industrial design are promoted. Relevant designers need to achieve the benign development of the industrial industry by adhering to the principles of humanized design and environmental protection design in the product design process through the highlighting of industrial product conceptualization and the enhancement of product interactivity experience. At the same time, prototypes made using rapid prototyping technology can directly carry out assembly inspection, interference checking and some functional tests that simulate the real working conditions of the product, such as motion analysis, stress analysis, fluid and aerodynamic analysis, etc., so as to rapidly improve the structure and performance of the product, the corresponding process and the design of the required tooling.

## ABSTRACT

Based on marketing practice, this paper puts forward the marketing value chain theory, constructs a marketing value chain model, and uses the model as a theoretical basis to establish an enterprise marketing system, with a view to guiding the marketing work of enterprises. Secondly, an overview of marketing is studied, the importance of implementing customer relationship management mechanism in marketing is analysed, and a study of customer relationship management mechanism based on marketing is conducted in order to be able to promote the development of enterprises. The results show that: customer relationship in the marketing value chain is located in the proportion of 0.351, directly affect the development of enterprises, so the enterprise's products as long as there is a customer source, can be in the market. For enterprises to adapt to the marketing of the market, maintaining a good relationship between enterprises and customers is particularly important, and only by dealing with the relationship between the two sides can promote the sustainable development of enterprises.

## KEYWORDS

Marketing; Marketing value chain model; Marketing system; Customer relationship; Management mechanism; Sustainable development

## 1. INTRODUCTION

In the context of China's growing economy, competition between industries has become increasingly fierce and has raised the requirements of businesses in terms of marketing [1-2]. Any business that wants to gain a definite build up must pay for service to open and retain customers, and thoroughly study the development of thorough e-commerce, customer relationship management plans in order to minimise customer relationship management costs [3-4]. The main work of marketing is to provide customers with quality services, improve customer satisfaction with the products and services of power companies, increase customer

purchase of power products, thereby increasing the profits of power companies [5]. In the process of enterprise development, marketing-related theories help enterprises to obtain the maximum economic benefits and achieve their own development goals when input costs are certain [6]. Literature [7-8] according to China's market development as well as development environment to innovation, especially should focus on marketing concept innovation, strategy innovation, product innovation and management innovation several aspects of innovation and breakthrough.

This paper firstly analyses the company's current market segmentation, market selection and market positioning, and visits the company's technical, marketing and customer service departments to identify the company's current marketing problems and to find the direction in which the company should focus on solving them. Next, the KMV model was used to analyse the company's current customer profile and to determine where the company should improve its customer relationship management. Finally, the relationship between the antecedent, intermediate and outcome variables is analysed and the marketing mix is optimised according to the relationship between the variables.

## **2. MARKETING VALUE CHAIN MODELLING**

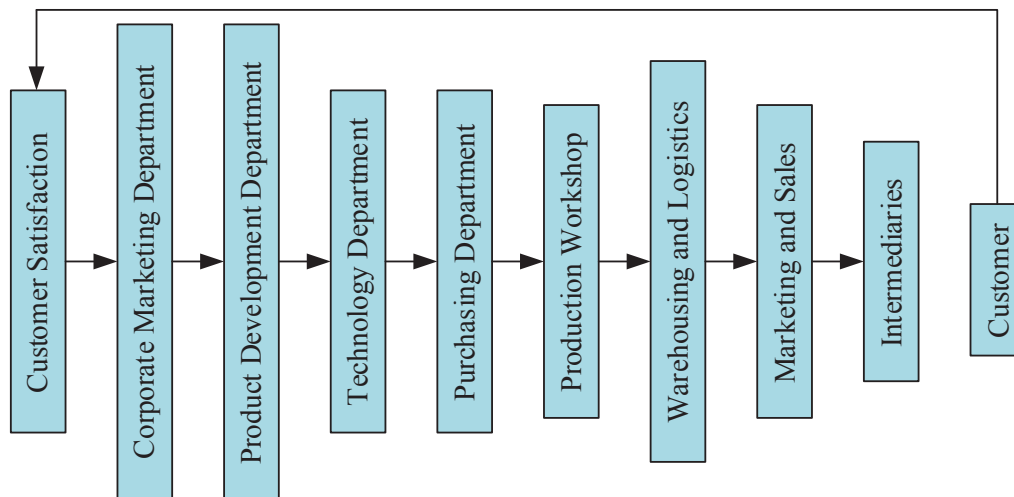

The important connotation of field marketing is value management, the purpose of enterprise marketing is to achieve value-added, in all aspects of the value chain to achieve value accumulation and efficient integration, in order to enhance the efficiency of enterprise value-added.

### **2.1 THE MARKETING VALUE CHAIN**

Compared with the traditional value chain theory, the marketing value chain is conceptually very different from it. In order to break through the limitations of the value chain theory, some researchers have proposed the marketing chain theory. By analysing the limitations and shortcomings of the value chain and marketing chain theory, this paper explains the marketing value chain which can better reflect the value-added of the marketing activities of enterprises.

In a value chain system, suppliers increase upstream value, companies add value to their products through internal value chains, channel distribution adds value to distribution by improving distribution efficiency, and customers buy products to achieve customer value, and the company's value chain ultimately determines the size of the company's customer value.

The marketing chain is based on the basic theory of marketing and the improvement of the enterprise value chain theory, the marketing chain In the market environment, starting from the market demand, enterprise marketers and customers as the core elements of the two main subjects, the marketing chain to customer satisfaction as the end point, constitute a simplified model of the marketing chain as shown in Figure 1.

**Figure 1.** Simplified model of the marketing chain

The above analysis shows that the value chain starts with the enterprise supplier, the end of the value chain is the value of customer relationship, the starting point of the marketing chain is customer demand, and the enterprise realises value identification, creation and transmission through production and management activities. Ultimately, the marketing chain is a two-way extension of the enterprise's value chain to achieve customer satisfaction. With regard to the understanding of customer value, both the value chain and the marketing chain have deficiencies in understanding:

(1) Failure to understand the double meaning of customer value, which includes the value of customer concessions provided by enterprises and the value of customer relationships provided by customers. Both the value chain and the marketing chain are one-way in their understanding of customer value, considering only the value given by the customer and ignoring the value given back to the company by the customer.

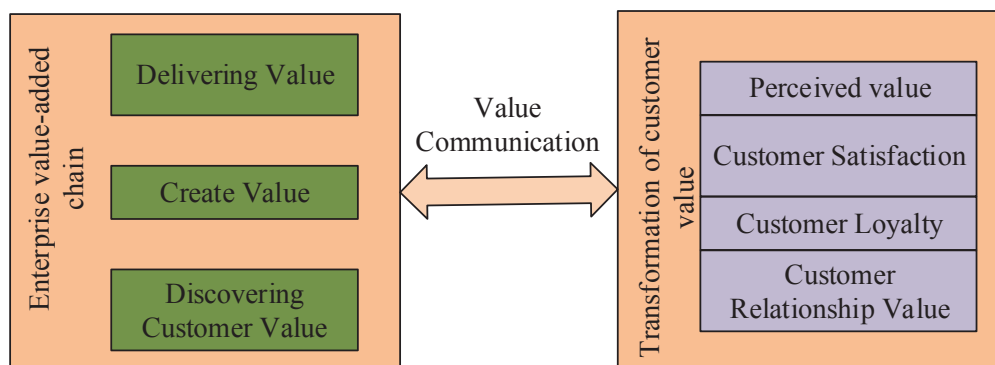

(2) The understanding of the connotation of customer value is too narrow, focusing on the value of physical objects but ignoring the value of relationships.

As both the enterprise value chain and marketing chain theories have deficiencies in the understanding of value, based on the research of the above two theories, this paper establishes a marketing value chain model.

## **2.2 MARKETING VALUE CHAIN MODELLING**

The marketing value chain is based on a broad customer value-added path as a connecting element, starting with customer needs, i.e. the discovery of customer value. Based on the value needs of the target customer, the enterprise integrates various functional departments to improve efficiency and collaborate to create the value needed by the customer, and by improving transaction efficiency, the customer value is efficiently delivered to the consumer and customer satisfaction is maximised. The marketing value chain is a value-added chain in

which both the company and the customer participate, forming a closed loop through value communication and value transfer, as shown in Figure 2.

**Figure 2.** Model of marketing value chain

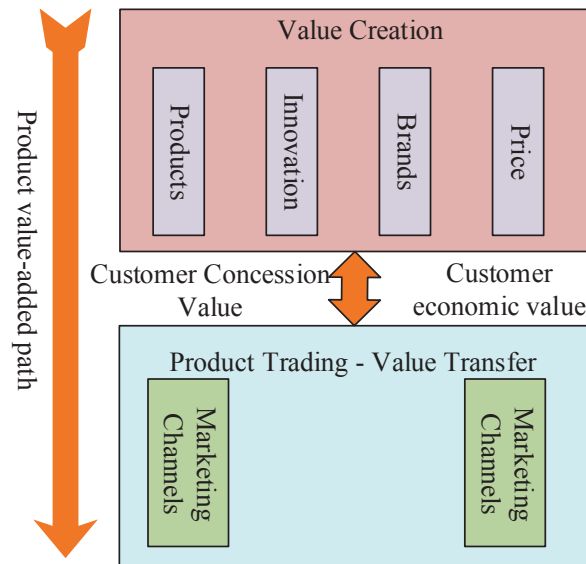

In the marketing value chain, the company is the main driver for value addition. With marketing as the strategic orientation, the company pays close attention to the customer's need for value, discovers the needs of the target customer through research and analysis, and determines the core value it can provide. The company integrates all functional departments and uses various resources to create higher customer yield value in an optimal way by improving the efficiency of the internal value chain, and transmits this value to the target customer through transactions. In other words, the company delivers customer value in exchange for economic value. The value of the customer relationship includes both economic and non-economic value. Efficient value communication in the marketing value chain is an essential tool for adding value.

### **3. CONSTRUCTION OF A CUSTOMER RELATIONSHIP MANAGEMENT MECHANISM BASED ON THE MARKETING VALUE CHAIN**

#### **3.1 THE CONSTRUCTION OF A CORPORATE MARKETING SYSTEM**

By examining the value-added path of the marketing value chain, this paper constructs a corporate marketing system. The various marketing elements in this system are interrelated and independent of each other. By integrating the subsystems of the enterprise marketing system through the value-added path of the marketing value chain, the enterprise marketing system will have functional integrity, the marketing practice of the enterprise will be systematised, and the marketing efficiency will exceed the sum of the effectiveness of the individual work of each subsystem, so that the enterprise can obtain a lasting competitive advantage as shown in Figure 3.

**Figure 3.** Marketing value chain-based enterprise marketing system model

### 3.2 APPROACH TO CUSTOMER RELATIONSHIP MANAGEMENT

#### (1) Improving customer satisfaction with power companies

Customer satisfaction is based on the effect that customers feel after using products or related services, and directly determines whether customer resources are lost. Therefore, in order to effectively maintain good customer relationship management, enterprises need to make their customers satisfied with the recognition of the enterprise's products and related services. Enterprises to enhance customer satisfaction with the enterprise, need to strengthen the service consciousness of marketing service personnel, innovative marketing service channels, to provide customers with better quality services.

#### (2) Improve customer relationship management system

In order to maintain a good cooperative relationship with customers in marketing, enterprises need to pay more attention to customer relationship management. So there is a need to improve the customer relationship management system. Enterprises should respect and understand electricity customers as a marketing principle, fully understand the relevant situation of customers, and then summarise and classify customer resources so that enterprises can obtain relevant information about customers at the first time. Managing customer relationships well is actually an emotional communication between marketers and customers, and only when marketers treat customers with a sincere heart can they connect the bridge between enterprises and customers.

## 4. CONCLUSION

Marketing value chain is a systematic enterprise marketing management thinking, marketing value chain expands the perspective of value chain management to the field of customer value transformation. This paper builds an enterprise marketing system based on

the marketing value chain is a new paradigm for marketing research by exploring the methods and approaches to achieve value-added enterprise value chain by marketing management, taking the direction of customer value addition as the path. Customer relationship management requires enterprises to manage the connections generated by mutual trust and interdependence with their customers. Customers directly influence the development of the enterprise, so the enterprise's products can gain a foothold in the market as long as they have customers.

## ABSTRACT

In this paper, different species of salt-tolerant sorghum were tested, different assays were selected to enable extraction of salt stress response data, and differential transcriptional analysis of the pooled data was performed using the Coyote Intelligence algorithm. The differential transcriptional analysis of different salt-tolerant sorghum types in response to salt stress was demonstrated by salt tolerance identification, transcriptome sequencing quality and differentially expressed genes. From the salt tolerance identification, sorghum possessed a better salt tolerance response when the  $K^+/Na^+$  value was  $2.06 \pm 1.75$  b. In terms of differentially expressed genes, the GO classification of differentially expressed genes for salt-sensitive and salt-tolerant materials showed approximately the same trend in distribution across annotated entries.

## KEYWORDS

Salt-tolerant sorghum; Salt stress response; Transcriptome; Differential analysis; Coyote intelligence algorithm; Differentially expressed genes

## 1. INTRODUCTION

Salt stress is an important class of abiotic stresses that severely restricts sustainable agricultural development. Under salt stress conditions, the osmotic ion concentration of the soil

solution increases and the osmotic potential is altered, leading to changes in cellular plasma membrane permeability, affecting the uptake of mineral elements by plant roots and the development of plant morphology, and inhibiting photosynthesis, respiration and material metabolism [1-3]. Salt stress is a complex physiological process, and the ability of crops to resist salt stress is mainly controlled by the genes of the plants themselves, and different crops respond to salt stress in different ways [4-5].

Sorghum, an important food and cash crop, has a high salt tolerance. It is known that sorghum seedlings are most sensitive to salt stress based on soil salinity patterns, and that good seedling growth affects sorghum maturity and yield [6-7].

In order to demonstrate the transcriptome differences between different salt-tolerant sorghum types in response to salt stress, this paper first selects different species of sorghum for test material preparation, gives the method of data determination, and uses the Coyote Intelligent Algorithm to implement data analysis, and then gives the results of transcriptome sequencing in response to salt stress under different conditions, including total RNA extraction and differentially expressed gene screening. Finally, the results were used to identify different salt-tolerant sorghum types for salt tolerance, transcriptome sequencing quality feasibility and differentially expressed gene analysis. The results showed that the transcriptomes of different salt-tolerant sorghum types differed in their expression of differentially expressed genes in response to salt stress.

## **2. MATERIALS AND METHODS**

### **2.1 TEST MATERIALS AND TREATMENTS**

Two sorghum varieties with different salt tolerance were initially screened for differences in germination rates under salt stress, and the sorghum seeds used in the trials were provided by the sorghum breeding group of an agricultural university.

Plant sorghum in vermiculite and water twice a week with nutrient solution. When seedlings reach the three-leaf stage, they are transferred to a plastic bucket (30cm x 50cm) containing Hoagland nutrient solution for hydroponic cultivation. Ten plants were grown in each bucket and the nutrient solution was changed every 3 d. Salt stress was started 1 week after transplanting and slowing down. Five treatments were set up with a NaCl concentration of 250 mmol/L for 2h, 4h, 6h, 8h and 12h, with sorghum seedlings that had not been treated with salt stress as the control (0h). The leaves that had just fully expanded were selected for the measurement of all physiological indicators and each treatment was replicated three times.

### **2.2 MEASUREMENT METHODS**

Soluble protein content was determined by the Komasa Brilliant Blue method and proline (Pro) content was determined by the ninhydrin colourimetric method. Total chlorophyll content was determined using the 80% acetone extraction method and malondialdehyde (MDA) content was determined using the thiobarbituric acid (TBA) method.

### **2.3 DATA PROCESSING - COYOTE INTELLIGENCE ALGORITHM**

Let the number of total populations be  $N$ ,  $N_p$  be the number of coyote subpopulations, and the number of coyotes in each coyote subpopulation be  $N_c$ . Initialize each coyote individual at random, with each coyote individual represented as a vector, so that the initial position of the  $c$ th coyote individual in the  $p$ th coyote subpopulation is represented as:

$$s_{c,j}^p = l_j + r \times (u_j - l_j) \quad (1)$$

where  $r$  is a random number between  $[0,1]$  and  $u_j, l_j$  is the upper and lower limit of dimension  $j$ , respectively. Let the dimension be  $D$ , then  $j = 1, 2, \dots, D$ . The ability of each individual coyote to adapt to society is called the degree of adaptation, which is expressed as an objective function as:

$$F = f(s_c^p) \quad (2)$$

The Coyote Intelligence algorithm was used to summarize the salt stress response data of salt-tolerant sorghum and then analyze the transcriptome sequencing results to understand the differential gene expression of salt stress on different salt-tolerant sorghum types.

### 3. TRANSCRIPTOME SEQUENCING

The data from the previous trials indicated that this was the most sensitive period for sorghum to respond to salt stress. In order to exclude the influence of extraneous factors and to ensure the accuracy of the data, three replicates were set up and the materials were selected in parallel. RNA extraction was performed separately for each sample for subsequent experiments.

#### 3.1 EXTRACTION OF TOTAL RNA

Total RNA was extracted using the TIANGEN RNA plant plus Reagent kit. RNA samples were tested for purity, concentration and integrity using 1% agarose electrophoresis, Nanodrop 2000, Qubit 2.0 and Aglient 2100 methods.

Digital gene expression profiling (DGE) library construction and transcriptome sequencing, sequencing data bioinformatics analysis cDNA library construction and transcriptome sequencing samples RNA was prepared by a biotechnology company. RNA samples were quality tested and entered the Illumina HiSeq 2000 platform for transcriptome sequencing.

#### 3.2 SCREENING FOR DIFFERENTIALLY EXPRESSED GENES

Differentially expressed genes were obtained by comparing the gene expression data from the sequencing of the salt-stressed samples with those from the control samples. The Benjamini-Hochberg correction method was used for this assay, with a screening criterion of difference multiplicity  $FC \geq 2$  and false discovery rate  $FDR < 0.001$ . Difference multiplicity  $FC = \text{expression of a gene in the treated group} / \text{expression of that gene in the control group}$ .

## 4. RESULTS AND ANALYSIS

### 4.1 SALT TOLERANCE IDENTIFICATION ANALYSIS

Table 1 shows the growth of sorghum seedlings after 15 days of salt stress treatment. The salt-tolerant material showed a fast growth rate and showed a high salt tolerance, while the salt-sensitive material showed shorter roots, lighter fresh weight and lower growth rate under salt stress and was more sensitive to salt stress. The performance of sorghum seedlings in response to salt stress was consistent with the growth performance of sorghum at later stages.

**Table 1.** Growth indices of sorghum seedlings

Material	Root length(cm)	Bud length(cm)	Plant fresh weight(g)	Growth rate(cm/d)
3562R	1.07±0.91 ab	0.95±1.25 b	0.35±1.01 a	2.52±1.34 a

678B	1.11±0.69 a	1.25±1.11 a	0.27±1.25 ab	2.48±0.79 a
------	-------------	-------------	--------------	-------------

Table 2 shows the effects of salt stress on K<sup>+</sup> and Na<sup>+</sup> concentrations and Na<sup>+</sup>/K<sup>+</sup> values in the leaves of GRL. Under salt stress conditions, the Na<sup>+</sup> content of salt-tolerant materials was less than that of salt-sensitive materials, and salt-tolerant materials could improve the selective uptake of Na<sup>+</sup> and its accumulation and distribution in the plant. The difference in K<sup>+</sup> content of sorghum leaves between salt-tolerant and salt-sensitive materials was not significant. When plants were exposed to salinity adversity, the salt-tolerant material had higher SOD and CAT activities and lower MDA content than the salt-sensitive material, suggesting that the strength of plant resistance to adversity is related to the strength of the ability to maintain higher antioxidant enzyme activity in the body.

**Table 2.** Effects of salt stress on K<sup>+</sup> and Na<sup>+</sup> concentration and K<sup>+</sup>/Na<sup>+</sup> in sorghum leaves

Material	K <sup>+</sup> (mg/g, DW)	Na <sup>+</sup> (mg/g, DW)	K <sup>+</sup> /Na <sup>+</sup>
3562R	5.51±0.87 a	2.71±1.17 a	2.06±1.75 b
678B	5.21±1.04 a	1.21±0.98 b	4.34±2.24 a

## 4.2 THE SORGHUM SALT-TOLERANT TRANSCRIPTOME

### 4.2.1 TRANSCRIPTOME SEQUENCING QUALITY FEASIBILITY ANALYSIS

The transcriptome sequencing results of all samples (12 in total) from the salt stress and control groups were screened by sequencing quality control and yielded a total of 90.07 Gb Clean Data, with each sample having more than 6 G of data and 21608654 and 30477687 clean reads respectively. The GC (guanine and cytosine) content of the 12 samples ranged from 55.19% to 56.85%, slightly higher than the AT (adenine and thymine) content, and the percentage of Q30 bases in each sample was not less than 94.40%.

### 4.2.2 ANALYSIS OF DIFFERENTIALLY EXPRESSED GENES

The number of differentially expressed genes was different between salt-sensitive and salt-tolerant materials under the same salt stress conditions. Analysis of the expression data of differentially expressed genes in different sorghum materials under salt stress for 12 h compared to 6 h of stress yielded the results shown in Figure 1.

**Figure 1.** Analysis of differentially expressed genes

From the analysis of differentially expressed genes in salt stress, N-1-1\_N-1-2\_N-1-3 (salt-tolerant material treatment 6h) vs N-2-1\_N-2-2\_N-2-3 (salt-tolerant material treatment 12h) differentially expressed 2270 genes, including 1218 up-regulated expressed genes (N-1-1 indicates salt-tolerant material salt stress treatment|replicate|, others analogous). y-1 -1\_Y-1-2\_Y-1-3 (6h salt-sensitive material treatment) vs Y-2-2\_Y-2-1\_Y-2-3 (12h salt-sensitive material treatment) 356 differentially expressed genes, including 181 up-regulated genes (Y-1-1 indicates salt-sensitive material salt stress treatment|replicates|, others by analogy). n-1-1\_N-1-2\_N-1-3 vs Y-1 -1\_Y-1-2\_Y-1-3 differentially expressed genes 1387, including 613 up-regulated genes. n-2-1\_N-2-2\_N-2-3 vs Y-2-1\_Y-2-2\_Y-2-3 differentially expressed genes 1239, including 535 up-regulated genes. y-1-1\_Y-1-2\_Y-1-3 vs Y-2-1\_Y-2-2\_Y-2-3 differentially expressed genes 2576, including 1345 up-regulated expressed genes.

In summary, the GO classification of differentially expressed genes for salt-sensitive and salt-tolerant materials showed approximately the same trend in distribution across the annotated entries, and the number of differentially expressed genes on each entry did not differ significantly and the enrichment was basically the same, indicating that the response pathways to salt stress are the same for salt-sensitive and salt-tolerant materials.

## 5. CONCLUSION

The expression of salt tolerance genes differed significantly between salt-sensitive and salt-tolerant materials of sorghum. The genes regulated in salt-tolerant materials were involved in phytohormone signaling, carbon metabolism, phenylpropanoid synthesis, starch and sucrose metabolism, and amino acid biosynthesis. Salt-sensitive materials up-regulated expression genes include cellular process up-regulated expression genes, single tissue process up-regulated expression genes, catalytic activity up-regulated expression genes, and binding function up-regulated expression genes.

In summary, the analysis of transcriptomic differences in the response of different salt-tolerant sorghums to salt stress, and thus the search for mechanisms of tolerance to salt stress in sorghum, can provide some physiological, biochemical and molecular theoretical basis for sorghum breeding and salt-tolerant cultivation.

## ABSTRACT

Exploring the development path of ideological and political theory work and mental health education of college students can solve the mental health problems of college students while conducting ideological and political education. This paper first analyzes the connotation of college students' mental health education, and then defines the integration course of ideological and political work and mental health education, i.e. psychology class. Finally, it is proposed that the development path of psychology class is to adopt the way of "three comprehensive education" to build the mental health education mode. The model of "three-wide education" can realize the effective development of the integration of psychological health education of college students through thinking and government work, and also provides a new research direction for college students' mental health education.

## KEYWORDS

psychology class; college political work; mental health education; development path; relevance

## 1. INTRODUCTION

When youth thrive, the country thrives; when youth are strong, the country is strong. As the progressive force among youth, college students shoulder the important task of achieving the great rejuvenation of the Chinese nation, which requires them to have not only firm ideals and beliefs and excellent professional skills, but also a healthy mind and sound personality [1-3]. However, college students in the period of rapid social development and transformation are under heavy pressure of thoughts and reality due to the impact of multiculturalism and the influence brought by the

intensification of social competition, which leads to the frequent occurrence of psychological problems and psychological crises [4-5]. These problems not only affect the healthy growth and comprehensive development of college students, but also seriously endanger the stability and unity of schools and the harmony and stability of society [6-7].

In order to study the integration path of the development of college ideological and political theory work and college students' mental health education, this paper analyzes from three parts. The first part focuses on defining the specific definition of the integration course of college ideological and mental health education, i.e., psychology class, and elaborates mental health education and curriculum. The second part analyzes the factors that restrict the development of psychology class in colleges and universities, including the educated, educators, and teaching evaluation levels. The third part analyzes the countermeasures to promote the development of psychology courses in colleges and universities in terms of education structure, teacher team construction, teaching evaluation system and the synergistic development of the "three whole educators".

## **2. THE INTEGRATION COURSE OF IDEOLOGICAL AND POLITICAL AND MENTAL HEALTH EDUCATION IN COLLEGES AND UNIVERSITIES**

Quality education requires schools to pay more attention to the cultivation of students' mental and moral quality, physical and psychological quality in addition to their learning ability.

### **2.1 MENTAL HEALTH EDUCATION FOR COLLEGE STUDENTS**

The connotation of mental health education is mainly reflected in two aspects, one is to reflect the standard of mental health, and the other is to reflect the function of educational development. Mental health education as an educational activity is to achieve the mental health and improve the psychological quality of the education target through the use of various educational tools and teaching methods such as measurement, dialogue and guidance, and also to equip the education target with relevant psychological adjustment skills through education to promote their coordinated physical and mental development.

In the mental health education, students should be able to assess and maintain their own psychological state through their own learning, so that they can prevent psychological crisis events. On this basis, it is necessary to cultivate good psychological quality of college students and build a sound personality. The evolution of mental health education model in Chinese universities is shown in Figure 1.

**Figure 1** The evolution of mental health education model

## 2.2 MENTAL HEALTH EDUCATION COURSE

The integration course of Civics and Mental Health Education in colleges and universities (referred to as psychology course in the latter part of the paper) is mainly for the education of Marxist general knowledge, character education and social science general knowledge for college students. It is an important part and way of moral education in universities and has important disciplinary, moral and ethical values.

The fundamental task of psychology class is to establish moral education, the fundamental purpose is to cultivate socialist core values, is to help students establish the correct political direction, improve the core quality of ideological disciplines, enhance social understanding and participation ability of a comprehensive, activity-based subject courses. University psychology courses do not exist in isolation; they complement each other with practical political education and cooperate with other disciplinary courses and moral education work to share the task of psychological education and moral education.

## 3. ANALYSIS OF FACTORS LIMITING THE DEVELOPMENT OF PSYCHOLOGY COURSES IN UNIVERSITIES

### 3.1 EDUCATOR LEVEL REASONS

Students are the masters of their own learning and are the central subjects of their learning activities. The purpose of psychology class is to help students establish the correct values and sense of responsibility. The special physical and mental stages of college students make the penetration of "psychological education" more difficult, and some students have more serious psychological problems because of their status as only children. In addition, the lack of family and social education increases the workload of "heart education", which also deepens the difficulty of penetrating "heart education" in the process of psychology class in colleges and universities to a certain extent.

### 3.2 EDUCATOR-LEVEL REASONS

The teacher is the dominant person in teaching activities and is an important player in teaching bilateral activities. The teacher of psychology class is the leader of psychological health education in psychology class, and he or she is an important

factor governing the penetration of psychological health education in psychology class.

For psychology teachers, good psychological quality is the basis of "infiltration" of psychological education, and the ability to explore psychology class materials is the premise of infiltration of "psychological education". Only when the teachers' own psychological quality is up to standard and they can make correct judgment among multiple contradictions and value choices, they can educate college students with healthy psychology. Moreover, the ability of psychology teachers to explore the teaching materials also affects the effectiveness of teachers' infiltration of mental health education.

### **3.3 REASONS FOR TEACHING EVALUATION LEVEL**

Teaching evaluation is the activity of making value judgment on the teaching process and its results according to the teaching objectives and serving for the teaching decision, and it is the process of making judgment on the real or potential value of teaching activities. Evaluation and assessment guide the way of teaching, and a scientific and perfect evaluation will scientifically guide the teaching process rationally, while an unscientific and incomplete evaluation will weaken the effect of teaching greatly and make it farther and farther from the educational goal.

In order to improve the effectiveness of psychology classes, it is necessary to make some corrections to the original assessment methods that focus only on examinations and do not include mental health education assessment. The number of evaluation methods and the mode of evaluation are important factors that limit the penetration of the concept of "mental education" in psychology classes.

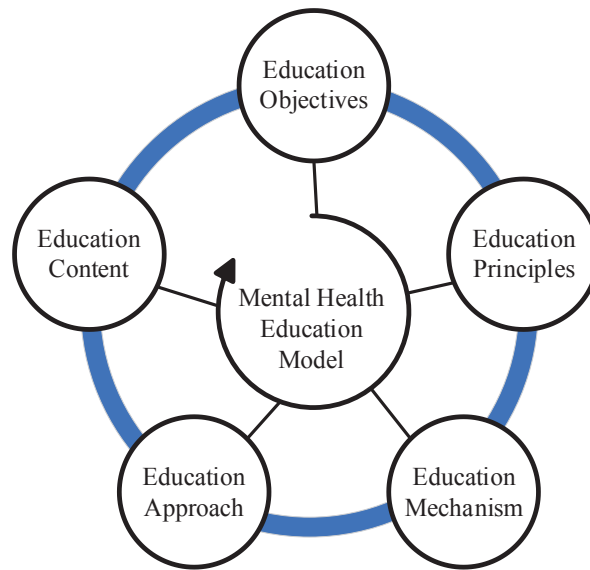

## **4. ANALYSIS OF COUNTERMEASURES TO ENHANCE THE EFFECTIVENESS OF PSYCHOLOGY CLASSES IN COLLEGES AND UNIVERSITIES**

### **4.1 IMPROVING THE EDUCATIONAL STRUCTURE OF PSYCHOLOGY CLASSES**

The psychology class in the new period is to establish moral education as the fundamental, and focus on cultivating the comprehensive development of moral, intellectual, physical and aesthetic, with ideals, skills and responsibilities of the new man of the times. Mental health education in colleges and universities in the new era should focus on the positive development of students, be based on value leadership, focus on the whole process, the whole staff and all-round participation, establish a new period of psychological education work system, highlight the value of the times of college education, and comprehensively promote the development of mental health education into a new era.

On the premise of scientific orientation, the model of college psychology class must also have a complete internal structure, which mainly includes five parts:

education goal, education principle, education content, education way and education mechanism, and its specific structure is shown in Figure 2.

**Figure 2** Internal structure of mental health education model

#### **4.2 STRENGTHENING THE FACULTY**

Teachers are the leaders of teaching activities, and they are also the people most closely related to improving the effectiveness of teaching activities. To enhance the effectiveness of "psychological education" in psychology classes in colleges and universities, we should start from the teacher level.

To enhance students' awareness of mental health in the process of teaching psychology classes, students are required to express their psychological needs. Teachers of psychology classes should be aware of the need to improve their teaching quality, to clarify the necessity of "psychological education" in psychology classes, and to strengthen their awareness of learning mental health education. Teachers should pay close attention to students' behaviors in their schedules and have a certain understanding of the common psychological problems of college students, so that they can have solutions when they encounter possible psychological problems of students.

#### **4.3 IMPROVE THE TEACHING EVALUATION SYSTEM**

Teaching evaluation has a guiding effect on teaching and learning, and scientific evaluation methods can promote the development of teachers and students, improve teaching quality, and promote classroom teaching reform. Different from the traditional single evaluation method, the teaching evaluation of psychology course emphasizes more on diversified evaluation methods.

Focus on the evaluation of mental health education so that teaching can be driven by evaluation. In order to clarify what psychological knowledge students have

mastered, what psychological problems they have solved, and what psychological problems still exist, the effectiveness of "psychological education" penetration in psychology classes can be improved. For the evaluation of psychology class, it is necessary to diversify the evaluation subjects, diversify the evaluation methods and multi-dimensional evaluation principles, so as to enhance the effectiveness of psychology class.

#### **4.4 REALIZING THE SYNERGISTIC DEVELOPMENT OF THE "THREE HOLISTIC EDUCATION"**

With the development of the times, big data technology should be effectively applied to the teaching of psychology class in colleges and universities, so as to realize the comprehensive development of psychological health education in colleges and universities. The practical measures of psychology class teaching in colleges and universities should go deeper into the concept of "three whole education", improve the psychological education ability of all staff, focus on the participation of the whole process of psychological education, form an all-round education pattern, and truly implement "whole staff education", "whole process education" and "all-round education", so as to better educate people. "In order to better play the role of college psychology class in enhancing mental health education, we should improve the ability of psychological education of all staff, focus on the participation of the whole process of psychological education, and form an all-round education pattern.

#### **5. CONCLUSION**

The report of the 19th Party Congress proposes to "cultivate the new man of the times who will assume the great responsibility of national rejuvenation". Such a new man of the times is ideal, capable and responsible, and should also have a rational, calm, positive and healthy mentality. Integrating mental health education into ideological and political education of colleges and universities can, on the one hand, cultivate healthy mentality of college students, solve psychological problems and realize the purpose of "educating the mind". On the other hand, it can enrich and develop the ideological and political education of colleges and universities with the educational contents, teaching methods and evaluation methods of mental health education, improve the scientificity, relevance and affinity of ideological and political education, and realize the purpose of "educating morality". Finally, we can realize the combination of "educating the mind and educating morality", and promote the comprehensive quality and comprehensive physical and mental development of college students.

## ABSTRACT

*The study of the integration mode of university thinking party construction is to pursue the innovative direction of university party construction work. In this paper, starting from the development opportunities and constraints of AI-empowered university thinking party construction, the intelligent party construction system is constructed using AI technology, and the performance analysis is conducted for the system. From the performance analysis, the average response time of the system in this paper improved by 2.43 times when the number of concurrent users increased from 10 to 50. This shows that the use of artificial intelligence technology can effectively achieve the integration of efficient thinking party construction and further innovation of party construction work in universities.*

## KEYWORDS

*Artificial intelligence technology; Intelligent party building system; University thinking party building; Development opportunities; Constraints; Performance analysis*

## 1. INTRODUCTION

In recent years, digital technology has developed rapidly, and digital technologies such as artificial intelligence, big data, cloud computing and pan-virtual reality technology are fully embedded in social life, which profoundly change people's way of thinking and behavior patterns, and have far-reaching influence on the party construction work of colleges and universities in the new era[1-2]. Digital intelligence is an important embodiment of using digital technology and digital means to carry out work, and the practical exploration of digital intelligence party construction has been carried out in some universities, which has become a new trend of party construction in universities [3-4].

To improve the quality of party construction, we should not only adhere to and carry forward the fine tradition and successful experience formed by our party in strengthening its own construction, but also vigorously promote reform and innovation according to the new situation and new problems faced by party construction, and use new ideas, measures and methods to solve new contradictions and problems [5-7].

In order to explore the integration mode of university thinking party construction, this paper firstly analyses and explains the development opportunities and constraints of university thinking party construction. It then uses artificial intelligence technology to build a smart party construction system, gives the specific architecture and operation system of the system, and evaluates the performance of the system. Finally, a practical strategy for AI-enabled university thinking party construction work is given, starting from the working concept and technical

foundation, which can realize the integrated mode of AI-enabled university thinking party construction work.

## **2. OPPORTUNITIES AND CONSTRAINTS FOR THE DEVELOPMENT OF AI-ENABLED UNIVERSITY THINKING PARTY CONSTRUCTION**

### **2.1 DEVELOPMENT OPPORTUNITIES**

The new generation of artificial intelligence mainly has key common technologies such as knowledge computing engine and knowledge service technology, cross-media analysis and reasoning technology, virtual reality intelligent modeling technology, new architecture and technology of hybrid augmented intelligence, intelligent technology of autonomous unmanned system, intelligent computing chip and system, natural language processing technology. Among them, the technologies of knowledge computing engine and knowledge service, cross-media analysis and reasoning, virtual reality intelligent modelling and natural language processing have strong relevance to the work of party building in universities, and can bring new development opportunities for the decision-making of party building in universities, and the construction of party organizations and party members.

### **2.2 CONSTRAINTS**

While artificial intelligence technology brings development opportunities to the work of university thinking parties, it also carries the risk of technological alienation. Problems such as “information cocoon”, privacy infringement and technical formalism are increasingly becoming important variables in AI-enabled university civic party construction. At the same time, despite the major breakthroughs in AI technology and application scenarios, it is still at the stage of weak AI, and its impact on society is both endogenous uncertainty and externally deferred uncertainty.

## **3. INTELLIGENT PARTY BUILDING SYSTEM BASED ON ARTIFICIAL INTELLIGENCE**

### **3.1 SMART PARTY BUILDING SYSTEM ARCHITECTURE**

Figure 1 shows the architecture of the intelligent party building system based on artificial intelligence technology, which is divided into five layers, and the specific functions of each layer are described as follows:

The first layer is the underlying environment, supported by an open source Linux system, embedded with neural networks and machine assembly language, to achieve support for the upper layer.

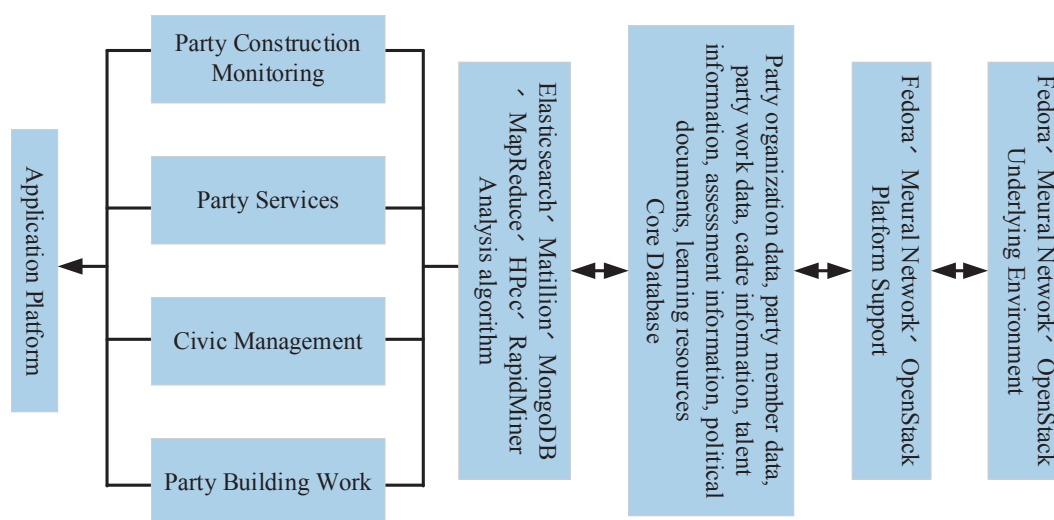

The second layer is the platform support, mainly including the basic database platform, using Service, Oracle Server Analysis as the data service platform, using VINCA, Atlasti and other data parsing technology, to achieve the mining and analysis of the upper layer database.

The third layer is the core database, collecting party organisation data, party member data, party work data, cadre data, cadre education and training data, etc. to form a cloud data centre supporting massive heterogeneous sensory data.

The fourth layer is the analysis algorithm, which takes the structured, semi-structured and unstructured data in the core database of the lower layer as the analysis object and selects the algorithm that finds a specific optimal solution among multiple optimization problems in order to achieve in-depth research and analysis of party organizations and individuals.

The fifth layer is the application platform, which mainly provides four service modules: party building work, thinking management, party services and party building monitoring, among

which party building work realises a series of functions such as “three meetings and one class”, theme party day, organisation and individual precision assessment and other functions of grassroots party organisation management.

**Figure 1.** Intelligent Party Building System Architecture

### 3.2 INTELLIGENT PARTY BUILDING SYSTEM OPERATION SYSTEM

c The intelligent party building system based on artificial intelligence technology should have strong data perception, collection, mining, learning and analysis, thinking and research, personalised recommendation, decision making as well as implementation capabilities, forming an intelligent party building management mechanism and path for strict management and governance of the party.

#### 3.2.1 BIG DATA TO SUPPORT THE CONSTRUCTION OF A “WISDOM LIBRARY

The data analysis and decision-making centre effectively integrates data on party building, party affairs and cadre work in schools through the xAPILRS library, OpenStack and IMS hierarchical database, and transforms it into a visual multi-dimensional data model of analysis objects, ensuring that the above data is presented in an intuitive graphic form. At the same time, through image recognition, voice recognition, semantic analysis and big data technology, the data will be gathered into a large database for party building, and then a “wisdom library” will be formed using programming algorithms, laying a solid foundation for the use of cloud computing technology and learning analysis technology to discover potential relationships and value orientations at all levels of party building, party affairs and cadre work.

#### 3.2.2 CLOUD COMPUTING SUPPORTS “SMART BRAIN” CREATION

The huge amount of data carried by the wisdom library needs to be mined, deconstructed and analysed in order to be of significant use. The rule base incorporates the idea of rule-based reasoning, focusing on aspects such as attribute synthesis and attribute value transfer, and digitally generalises a number of amendable and extensible ontological reasoning rules.

#### 3.2.3 LEARNING ANALYTICS TO SUPPORT ‘INTELLIGENT EYE’ FORMATION

The perceptual context acquires relevant information pre-defined by virtual entities or systems, supported by diverse embedded and integrated algorithms such as big data analysis and learning analytics technology as software. It is able to effectively analyse and drive the data in the wisdom repository to make accurate research and judgement while identifying

party building issues, providing intellectual support and automatic correlation services for party building practices.

### 3.2.4 ARTIFICIAL INTELLIGENCE SUPPORTS THE DEVELOPMENT OF “SMART PEOPLE”

Through artificial intelligence research and the development of rational value standards for party building wisdom people, based on the construction of intelligent digital model analysis system, can form the party building “wisdom people”. The core architecture of this module is call control, which consists of contextual data flows, configuration models and algorithmic modelling. The algorithm model defines conf identifiers, semi identifiers, contextual parameters, detection information values, etc.

### 3.3 PERFORMANCE ANALYSIS OF THE INTELLIGENT PARTY BUILDING SYSTEM

Load Rmmer 11 was used to stress test this system, focusing on the average response time and CPU utilisation for concurrent multi-user operations, and the performance test results are shown in Table 1.

**Table 1.** System performance test results

<b>Number of concurrent users (people)</b>	<b>10</b>	<b>20</b>	<b>30</b>	<b>40</b>	<b>50</b>
Average response time	0.23	0.42	0.55	0.63	0.79
CPU utilization (%)	42.31	46.12	51.35	55.26	58.11

The performance test shows that when the number of concurrent users of the system in this paper increases, the average response time also increases and the CPU usage also increases. In particular, when the number of concurrent users increased from 10 to 50, the average response time increased by a factor of 2.43 and the CPU occupation increased by 37.34%. This shows that the intelligent party building system constructed in this paper can achieve parallel pressure on basic users and can contribute to effective analysis in the field of artificial intelligence technology in the intelligent party building of universities.

## **4. PRACTICAL STRATEGIES OF ARTIFICIAL INTELLIGENCE TO EMPOWER PARTY BUILDING WORK IN UNIVERSITIES**

### **4.1 SORTING OUT A WORKING CONCEPT THAT COMBINES INNOVATION AND RIGHTEOUSNESS**

The establishment of correct conceptual thinking is the ideological prerequisite for promoting AI-enabled university party construction, which requires the main body of university party construction work to actively promote the integration of intelligent technology and university party construction, but also to stand firm on political stance and ensure the leading position of party construction work. In the process of promoting the intelligent development of university thinking party construction, university party organizations should always take the implementation of the fundamental task of establishing moral education and serving the growth and development of teachers and students as the footing point of their work.

### **4.2 CONSOLIDATE THE TECHNICAL FOUNDATION OF AI-ENABLED UNIVERSITY PARTY CONSTRUCTION**

To empower the construction of university civic parties with artificial intelligence, we must strengthen the research and development of intelligent technology and the collaborative sharing of data resources. It is necessary to strengthen technical research and development and promote the construction of digital infrastructure for the construction of university thinking parties. Digital infrastructure is the material basis of AI application scenarios, and the construction of digital infrastructure for party building should be supported by strong intelligent technology.

The interface between the university and the local community should be strengthened between the intelligent platform for party building and the construction of smart cities and the e-government party system, and the joint training of intelligent talents and the common research and sharing of intelligent technology should be realized between the university and the enterprises, so as to build up an all-round and all-linked pattern of collaborative sharing of data resources.

## **5. CONCLUSION**

This paper aims to effectively promote the digital management of grass-roots party construction, the intelligent management of grass-roots organizational life, the information upgrading of party affairs, and the digital modeling of cadres' portraits by constructing the basic platform of the intelligent party construction system and building the operation system of the intelligent party construction system. To this end, the following suggestions are put forward for the intelligent party construction of university thinking parties:

(1) Do a good job of top-level design at the level of platform and system, and improve the construction of intelligent party construction management system.

(2) To realize the scientific allocation of talents for intelligent party building, and incorporate excellent talents with Internet thinking and familiar with relevant technology into the party building work team, so as to effectively improve the professional work level.

# THE IMPACT OF INTEGRATING THE OVERALL NATIONAL SECURITY CONCEPT OF BIG DATA NETWORK EDUCATION INTO COLLEGE EDUCATION AND TEACHING

---

Zhenyu Wang\*

School of Marxism, Weifang Medical University, Weifang, Shandong, 261053, China

[wangzhyu2022@163.com](mailto:wangzhyu2022@163.com)

---

## ABSTRACT

The development of big data network education makes more possibilities for national security, and the core and essence of integrating the overall national security concept into college education and teaching is to carry out effective reform of curriculum. In this paper, the overall national security concept is used as a guide to reform the content of education and teaching in general colleges and universities. As an important initiative, in order to test whether the subsequent reform is effective, a scientific and open evaluation system including teachers' and students' dimensions is established, aiming to promote the reform by evaluation and continuously improve the content system of education teaching in general colleges and universities under the new situation, so that it can follow the national security situation and serve the national security strategy in the new era of socialism with Chinese characteristics.

## KEYWORDS

Big data; Online education; Overall national security concept; University education and teaching; Evaluation system; Curriculum reform

## 1. INTRODUCTION

Adhering to the overall national security concept is one of the basic strategies for adhering to and developing socialism with Chinese characteristics in the new era, which is of outstanding practical significance for coordinating the two major situations of domestic and international security and development, and achieving long-term national security [1-3]. The in-depth implementation of the overall national security concept cannot be achieved without strengthening national security education and organically integrating the contemporary values, important contents and policy requirements of the overall national security concept into society-wide publicity and education activities, so as to enhance the awareness of worries and to be prepared for danger in times of peace [4-6].

As a university that undertakes and implements the fundamental task of establishing moral education, it needs to be at the forefront in promoting the realization of national security education in schools, in teaching materials, in classrooms and in students' minds, and continuously improve the effectiveness of integrating the overall national security concept into education and teaching [7-8].

In order to explore the effective path of integrating the overall national security concept into college education and teaching in the era of big data network education, this paper firstly elaborates the overall national security concept, including its specific system structure and characteristics. Then, the index evaluation system is designed for both students and teachers according to the integration of the overall national security concept into college education and

teaching. Finally, the methods and paths of the new model of national security education are sought according to the index design, including the reform of teaching ideas, teaching objectives and teaching subjects, so as to promote the effective integration of the overall national security concept into university education and teaching.

## 2. OVERALL NATIONAL SECURITY CONCEPT

### 2.1 THE SYSTEM OF THE OVERALL NATIONAL SECURITY CONCEPT

The structure of the overall national security concept system is shown in Figure 1.

**Figure 1.** Overall national security concept system structure

The overall national security concept is a content-rich, open and inclusive, and constantly developing ideological system, the core elements of which can be summarized as five major elements and five pairs of relationships. The five elements are to take people's security as the purpose, political security as the root, economic security as the foundation, military, scientific and technological, cultural and social security as the guarantee, and the promotion of international security as the backbone.

### 2.2 CHARACTERISTICS OF THE OVERALL NATIONAL SECURITY CONCEPT

First, the overall national security concept is rich in connotation. For a country, development and security are indispensable, development is the basis of security, and security is the condition of development. The overall national security surface proposes the comprehensiveness of the national development system and the comprehensiveness of the national security system.

Second, the overall structural integrity in the layout of national security. This is mainly reflected in the fact that security at the national level is not a simple superposition of security elements in multiple fields, but the national security structure is like a large interconnected network, interlocking, influencing each other and closely connected.

Third, the pursuit of durability in the effectiveness of national security. It means that under the guidance of the overall national security concept, the relationship between national development and national security must be scientifically handled, and by giving equal importance to the relationship between development and security, seeking unity in both, and

implementing both in parallel to achieve a mutually reinforcing relationship between development and security.

### 3. THE OVERALL NATIONAL SECURITY CONCEPT IS INTEGRATED INTO THE EDUCATION AND TEACHING INDEX SYSTEM OF COLLEGES AND UNIVERSITIES

#### 3.1 SETTING OF STUDENT EVALUATION INDEXES

Students are one of the indispensable actors of teaching activities and the main audience of knowledge. Modern educational philosophy requires respecting and giving full play to students' subjective position in learning activities, stimulating their subjective initiative, independence, creativity and development. Therefore, students' status in the reform of relevant teaching contents is no longer just a single audience, but also a participant and evaluator. Transforming students from traditional objects of evaluation to subjects of evaluation requires proper guidance of their subjective role. From this, we can get the student evaluation index system for the integration of the overall national security concept into college education and teaching as shown in Table 1.

**Table 1.** Student evaluation index system

Primary Indicators	Secondary Indicators
Required Course Evaluation	Whether they are interested in the new content to be expanded
	Whether the expanded new content can enrich the knowledge system
	Whether the overall national security concept is established
	Whether they are satisfied with the reformed curriculum
Electives Course Evaluation	Are you interested in the content of the lectures?
	Whether it complements the content of the compulsory courses
	Whether the understanding of some new issues was deepened or not
	Whether the overall security concept has been strengthened
	Whether they are satisfied with the content of the course
Special Lecture Evaluation	Whether they are interested in the content of the lecture
	Whether the understanding of security concept is more concrete
	Did you gain anything after the lecture?
	Whether they were satisfied with the course

#### 3.2 SETTING OF TEACHER EVALUATION INDICATORS

Teachers are the subjects of curriculum development. The communication and evaluation among teachers is one of the ways of teachers' professional development advocated by the new curriculum reform, and also an important part of the quality evaluation of teaching reform. Accordingly, in the evaluation index system of the effectiveness of the reform of university education content under the guidance of "overall national security concept", the focus of "teachers' evaluation" should be on the teachers' grasp of the connotation of the overall national security concept, the connection between the new content and the original knowledge system, and the improvement of teachers' professionalism in the reform. The evaluation should focus on the teachers' grasp of the meaning of the overall national security concept, the connection between the new content and the original knowledge system, and the improvement of teachers' professionalism. The teacher evaluation index system of integrating the overall national security concept into university education and teaching is shown in Table 2.

**Table 2. Teacher evaluation index system**

Primary Indicators	Secondary Indicators
Educational Reform Content Design	Introduction of the general security concept overview
	Introduce the concept of each area of the Total Security Concept
	Presenting security issues in each area
	Presenting the latest developments in each area of security
	Discuss the views of others
	Compare and contrast various theories
	Present the sources of ideas and concepts
	Logical relationships between new content
Educational Reform Quality	Effectiveness of teaching in the classroom after the teaching reform
	Students' understanding of teaching reform knowledge
	Change in students' national security concepts
	Improvement of teachers' academic sophistication
Students Benefit	Increase interest in learning
	Enrich knowledge structure
	Expanding the mind

**4. METHODS AND PATHS FOR BUILDING A NEW MODEL OF NATIONAL SECURITY EDUCATION**

**4.1 CHANGE THE THINKING OF EDUCATION AND TEACHING**

Under the background of “strengthening and improving the ideological and political work of colleges and universities under the new situation”, colleges and universities should integrate the national security education with “overall national security concept” as the core meaning into the ideological and political education system of colleges and universities. With “socialist core values” as the leader, we focus on strengthening the all-round cultivation of national consciousness, legal consciousness and social responsibility consciousness of college students. It also focuses on tapping the implicit national security education function in the professional courses, promoting the reform and innovation of national security education, and realizing the synergistic effect of promoting national security education in the whole staff and the whole process.

**4.2 CLARIFY EDUCATION AND TEACHING OBJECTIVES**

In order to better cultivate college students' national security awareness, colleges and universities must clarify the objectives of education and teaching. The overall objective is to learn the Party and national security line, guidelines and policies, and gain a comprehensive understanding of the connotation of the “overall national security concept”. Through the analysis of hot events and major news at home and abroad, students can improve their objective thinking ability, learn to see the essence of the problem through the phenomenon and establish a scientific concept of national security. Students are guided to analyze various issues in national security with Marxist positions, views and methods, to think and judge with a broader perspective, and to consciously safeguard national security.

**4.3 CULTIVATE THE MAIN BODY OF EDUCATION AND TEACHING**

Teachers in colleges and universities as the main body of the implementation of teaching behavior, the quality of teachers directly affects the effectiveness of national security education teaching. Colleges and universities should focus on strengthening teachers' pre-service and

in-service training, formulating training plans for key teachers, focusing on training subject leaders, and vigorously improving teachers' theoretical level. Focus on problem-oriented thematic teaching, advocate collective lesson preparation under the leadership of famous teachers, and implement teaching attacks. Establish a resource pool of teachers and encourage party and government cadres, researchers in the social science and theoretical circles, and faculty members of military colleges and universities with high theoretical education and rich practical experience to participate in the teaching of national security education in schools.

## 5. CONCLUSION

The era of big data makes online education more closely connected with national security. Starting from the overall national view, this paper constructs an index system for the integration of the overall national education view into college education and teaching. It deeply analyzes the methods and paths for constructing a new model of national security education, and puts forward the following suggestions for realizing the integration of the overall national security concept into college education and teaching.

(1) Strengthen the construction of national security disciplines and enhance intellectual support. Promoting the discipline construction of national security is an important prerequisite for implementing the overall national security concept, strengthening national security construction and cultivating national security talents.

(2) Pay attention to innovation in education and teaching mode to ensure practical effects. With the overall national security concept as the guide, to strengthen national security education and teaching in colleges and universities, it is necessary to focus on exploration and innovation to ensure the actual effect.

(3) Consolidate the foundation of education and teaching practice and build a long-term mechanism. Efforts should be made to solve the problem of how to launch and create a number of fine courses of national security education teaching to realize the integration of the whole process of national security education.

## ABSTRACT

Under the background of big data, ideology and politic education in colleges and universities needs to find an innovative theoretical development path. Based on PageRank algorithm, this paper mines the big data of ideological and political-related behaviors of college students, analyzes the current problems mainly from the channels of information-based teaching and acquiring current political views, so as to propose corresponding innovative development paths. The use of slide teaching is the key means of current Civic and Political Science education, accounting for 92.3%. And the degree of using the emerging network teaching mode is very low, such as micro-class only accounts for 5.8%. on the basis of the analysis of big data, college Civic Education obviously lags behind the growth of the times, which requires colleges and universities to change their traditional education ideas.

## KEYWORDS

Big data; PageRank algorithm; Ideology and politic education; Information-based teaching

## 1. INTRODUCTION

Big data has a significant impact on the ideology and politic education work done in colleges and universities. As a result, the relevant work should conduct ground-breaking research with the aid of big data and improve services using big data [1-2]. The ideological and political work of colleges and universities must undergo significant transformations in the big data era. How to use big data to enhance the research has emerged as a key question [3-4]. The substance of ideology and politic education in higher education is enhanced by new media, which also increases educational materials, improves college students' learning processes, and increases the relevance and efficacy [5]. The basic education curriculum is crucial in helping colleges and universities build their systems of ideological and political concept courses, extensive literacy courses, and professional courses [6].

In addition, literature [7], using the core subjects of computer science as an example, the ideological and political curriculum creation program of professional courses was developed on the basis of mining and classifying the features of engineering courses. The literature [8] investigated the flipped classroom's contribution to the growth of ideology and politics as well as its reform and use as a teaching strategy. The literature [9] studied that cell phone dependence is very serious in ideological and political classes in higher education institutions.

Although college students are present, they are not actually in the classroom. Literature [10] proposed that the ideological education should be oriented to talent gathering, resource integration and system integration to realize the paradigm shift of humanistic education, the transformation of diversified educational subjects and the transformation of teaching diversity. The above studies are less involved in the study of students' behaviors, Hence, this study, based on the PageRank algorithm, explores the ideological and political actions of college students' daily actions, analyzes the issues they face, and suggests an original development route that complies with the big data era's features.

## 2. BIG DATA MINING OF STUDENT BEHAVIOR BASED ON PAGERANK

### 2.1 BIG DATA IDEOLOGY AND POLITIC EDUCATION

Big data has given birth to new ideas, new requirements and new methods for ideology and politic education work. Big data in ideology and politic education is a type of educational activity that successfully mixes big data, ideology, and politic teaching work in higher education institutions. It uses a variety of big data elements. In the big data era, network has become the most frequent necessity for young college students' daily contact, and college students contact and generate massive information data through network. The ideology and political education staff in higher educational institutions can better understand the way of thinking, values, and behavioral lifestyles of college students by gathering, summarizing, and analyzing information and data linked to the ideology and politics of university students. This can help us hold out more focused ideology and political education courses for college students.

### 2.2 STUDENT BEHAVIOR CLASSIFICATION BASED ON PAGERANK

#### 2.2.1 MODEL INTRODUCTION

For Figure  $G = (V, E)$ , each student is defined as a vertex  $V_i$  in the graph. If two students belong to the same version of the classroom forum or have the same assignment grade, then an edge is defined between these two vertices  $V_i, V_j$ .

This paper constructs a social network graph based on sample learning behavior data, which is a social network of learning behaviors containing 120 students. The points marked with numbers indicate the corresponding numbered students, and the edges between the points indicate the relationships between the students' learning behaviors.

#### 2.2.2 PAGERANK ALGORITHM

The PageRank algorithm is Google's proprietary web ranking technology, which takes the interlinked hyperlinks between web pages as one of the elements of web ranking, it evaluates a website's significance in comparison to other websites included in the index of search engines..

Assuming that user  $A$  is the average of all users on the Internet, the probability of  $A$  being on page  $W_i$  at  $n$  is  $\pi_i(n)$ , assuming that after enough online roaming, page  $W_i$  has  $N_i$  external links.  $A$  has no personal preference, so the probability of clicking on each external link is  $1/N$ . Based on the above assumptions, we can obtain:

$$\pi_i(n+1) = \sum_j \pi_j(n) \cdot p_{j \rightarrow i} / N_i \quad (1)$$

where  $p_{j \rightarrow i}$  is an indicator function describing the link structure, and  $p_{j \rightarrow i}$  takes the value 1 if page  $W_j$  has a link to page  $W_i$  and 0 vice versa. the probability of visiting each page on

user  $A$ 's  $n$ th visit is combined as  $p_n$  and its  $i$ th component is  $p_i(n)$ . The transfer probability matrix is  $P$  and its  $(i, j)$  element is  $p_{ij} = p_{j \rightarrow i} / N_i$ . So we have:

$$\pi_{n+1} = \pi_n P = \pi_0 P^n \quad (2)$$

If  $P$  there is a limiting distribution, then a smooth probability distribution can be found.

### 3. ANALYSIS OF COLLEGE STUDENTS' THINKING AND POLITICAL BEHAVIOR EXCAVATION

#### 3.1 ANALYSIS OF INFORMATION TEACHING OF CIVIC EDUCATION FOR STUDENTS IN HIGHER EDUCATION

Findings from new media technology mining based on PageRank algorithm are shown in Figure 1. Seventy college students used “micro-class”, having 5.8% of all pupils as its constituents. There are 294 college students using “mu-class”, being responsible for 24.5% of all students. 709 university students used “flipped classroom”, being responsible for 59.1% of all students in the study. A whole of 1108 university students used “slide teaching”, representing 92.3% of the overall number of research participants. A whole of 734 college students used “other new media teaching”, accounting for 61.2% of the respondents.

**Figure 1.** New Media Technology Mining for Ideology and politic education Use

#### 3.2 ANALYSIS OF STUDENTS' ACCESS TO CURRENT POLITICAL VIEWS

Figure 2 displays the distribution of routes used by college students to access current political opinions according to the mining of PageRank. There are 1129 college students who got the information from “microblog or WeChat activists”, accounting for 94.1% of the surveyed students. There are 560 college students who got the information from the official microblogs and weibo platforms of the university, accounting for 46.7% of the surveyed students. 353 college students got the information from “theory teachers, counselors and class teachers”, accounting for 29.4% of the surveyed students. 793 college students got the information from “family and dormitory members”, accounting for 66.1% of the surveyed students. The number of students who got the information from “traditional media (TV, radio, newspaper, etc.)” was 821, accounting for 68.4%. 292 students got the information from “other” channels, accounting

for 24.3%.

**Figure 2.** Distribution of channels to obtain current political views

### 3.3 THE INNOVATION PATH OF COLLEGE CIVIC EDUCATION IN THE ERA OF BIG DATA

Politics and ideological educators in higher educational institutions should make an effort to learn about big data in addition to acquiring their expert knowledge of politics and ideological education in order to increase their grasp of and proficiency with the technology, so as to better record, store, analyze and excavate more hidden meanings of data information, and more comprehensively and objectively understand the ideologic and ethical status of education targets. The instruction dissemination channels and contents in the “Internet+” environment have also changed, which requires us to build a good all-round collaborative education mechanism for ideology and politic education based on the integrated theory the original resources, in an effort to keep up with the evolution of modern young college students' thinking, so as to better serve and unite the youth. It should be noted that the traditional ideological and political education mechanisms in institutions of higher learning have had a difficult time adapting to the needs of the big data era. As a result, we must create a new ideological and political education mechanism, and while doing so, we must fully recognize the significant role that big data plays and then indicate on its prospective educational value.

## 4. CONCLUSION

In order to examine the political and ideological attitudes of college students, investigate the challenges facing school political education, and suggest a course of action, this research uses PageRank algorithms for data mining in big data. The research presented here draws the following findings:

(1) College ideology and politic education workers must understand big data with a forward-looking development vision and innovate college ideology and politic education by using the advantages of big data, in order to provide a new environment for college ideology and politic education.

(2) As part of the effort to encourage the deep integration of big data and ideology and politic education work, attention should be paid to strictly abide by the laws and regulations on personal information protection, scientifically and reasonably define the legal boundaries of data collection, data utilization and management, and avoid the occurrence of infringement on students' personal privacy.

## ABSTRACT

Studying entrepreneurship education and entrepreneurial activities of college students can better propose entrepreneurial guidance strategies. Based on the analysis of the impact of big data on college students' entrepreneurial process, this paper studies the current situation of entrepreneurship education in terms of both entrepreneurship education faculty and methods, and proposes targeted application strategies by analyzing the problems of college students' entrepreneurial activities. The full-time entrepreneurship teachers in colleges and universities only account for 0.65% of the entrepreneurship education faculty, and the entrepreneurship faculty has not been given enough attention. And the problem of inadequate policy implementation is the most serious in entrepreneurial activities, accounting for 24.67%. This study has guiding implications for entrepreneurship education innovation and entrepreneurial activities.

## KEYWORDS

Big data; Entrepreneurship education; Entrepreneurial activities; Full-time entrepreneurship teachers

## 1. INTRODUCTION

Entrepreneurship is a driving force and source of economic and social development, and an effective way to create jobs and relieve employment pressure. At present, the difficult employment problem of college students caused by the massification of higher education has made the entrepreneurial behavior of college students get high attention from the society [1-2]. However, in the context of a society with diverse interests, multiple values and contradictions, the problems of college students in entrepreneurial practice have gradually emerged, and the success rate of entrepreneurship is extremely low, so there is an urgent need to make effective education and value guidance for college students' entrepreneurial practice [3].

In recent years, with the vigorous promotion of the national innovation-driven strategy, entrepreneurship education for college students has been developed rapidly, and the curriculum, practice platform and institutional system of entrepreneurship education have been gradually established and improved [4]. However, due to the late start of entrepreneurship education, the social atmosphere of encouraging and supporting entrepreneurship is not yet strong, and other reasons, there are still problems in the practice of entrepreneurship education for college students, such as weak educational effectiveness, poor coordination and

guarantee mechanism, imbalance in curriculum construction and faculty structure, and weakened function of entrepreneurship education [5]. In the era of big data, for the entrepreneurial activities of college students, the literature [6], on the basis of summarizing and analyzing the previous research results, elaborated the current status and significance of the research on entrepreneurial risk assessment algorithms for college students, and described the development background, current situation and future challenges of big data analysis technology. The literature [7] constructed a model system suitable for college students' employment and entrepreneurship prediction guidance through artificial intelligence algorithm and fuzzy logic model. The literature [8], on the other hand, conducted a study on entrepreneurship education for college students, and explored the role of experiential entrepreneurship education in guiding entrepreneurship by taking a first-class undergraduate entrepreneurship program as an example. The literature [9] provides a preliminary analysis of entrepreneurship courses and curricula in Italian universities, comparing them with the needs of companies for entrepreneurial and managerial competencies.

This paper mainly focuses on the influence of big data on college students' entrepreneurship, and analyzes the problems in the current status of entrepreneurship education by selecting a college faculty as the research object, mainly pointing out the problems in it from the faculty and entrepreneurship education methods. At the same time, the distribution status of the problems faced by college students' entrepreneurial activities is analyzed, and the corresponding response strategies are proposed.

## **2. THE IMPACT OF BIG DATA ERA ON COLLEGE STUDENTS' ENTREPRENEURSHIP**

### **2.1 THE BUSINESS VALUE OF BIG DATA**

With the combination of big data and a new generation of information technology to use deeper and wider, "data-driven" to create enterprises to enhance the value of the factor contribution rate continues to rise. For example, by collecting and analyzing data on users' searches, browsing and eventual purchase of services, we can realize personalized segmentation of customer groups and needs, grasp market trends in real time, help businesses adjust their layout, ensure the accuracy and effectiveness of advertising and marketing, and thus form long-term management of customer relationships. This analysis advantage is clearly reflected in Taobao, Meituan and other shopping e-commerce.

### **2.2 ENTREPRENEURSHIP**

Entrepreneurial competencies refer to the psychological preparation, theoretical knowledge, professional skills and other comprehensive qualities that influence the development of entrepreneurial activities. Combined with the impact of big data in the economy and society, we can see that big data can not only provide us with the conditions and opportunities to develop these capabilities, but also penetrate into all aspects of entrepreneurship, such as market research, project decision-making, and management operations. The keen capture and analysis of big data is becoming a key factor for enterprises to compete and win.

## **3. ANALYSIS AND STRATEGY OF ENTREPRENEURSHIP EDUCATION FOR COLLEGE STUDENTS**

### **3.1 ANALYSIS OF ENTREPRENEURSHIP EDUCATION FACULTY**

The composition of teachers of entrepreneurship education in colleges and universities is shown in Figure 1. The composition of the staff structure of the teachers who carry out entrepreneurship education for college students is 31.2% for counselors, 25.7% for teachers of professional courses, 21.8% for teachers of public courses, 14.8% for teachers of elective courses, and 0.65% for full-time entrepreneurship teachers in colleges and universities.

Counselors are both specialized personnel of ideological and political education of college students and part-time teachers of entrepreneurship courses and career guidance courses, and they take up most of the entrepreneurship education courses in colleges and universities with a large proportion. And the proportion of full-time entrepreneurship teachers in colleges and universities is the smallest, which is due to the fact that few colleges and universities set full-time entrepreneurship course teachers alone, most of them are served by counselors and other class teachers, and the entrepreneurship teaching team has not been paid enough attention.

**Figure 1.** Composition of teachers for entrepreneurship education

Entrepreneurship education for college students has high requirements for teachers, it is a multidisciplinary cross-fertilization teaching process, which has certain requirements for both theoretical and practical experience of entrepreneurship teachers, only with good comprehensive multidisciplinary theoretical literacy and good practical experience in entrepreneurship can provide effective theoretical guidance and project support to college students.

### 3.2 ANALYSIS OF ENTREPRENEURSHIP EDUCATION APPROACHES

In response to the question "In which way did you receive entrepreneurship education during your school years?" 32.5% chose "lectures", 21.4% chose "online media publicity", 13.6% chose "social practice", 16.2% chose "classmates", 7.4% chose "extracurricular scientific and technological activities", and 7.4% chose "social practice". The proportion of those who chose "classmates" was 16.2%, the proportion of those who chose "extracurricular scientific and technological activities" was 7.4%, and the proportion of those who chose "family education" was 8.0%. Thus, it can be seen that the main way for college students to receive entrepreneurship education is still classroom lectures. At the same time, the rapid development of the Internet era and the interconnection of new media have made the information received by college students more diversified and diverse, which has promoted the timely delivery and effective propagation of college students' entrepreneurship policies, and the proportion of "online media propaganda" in entrepreneurship education has gradually increased. The lower proportion of "extracurricular science and technology activities" and "family education" in entrepreneurship education is probably due to the actual situation of schools and the difference in the atmosphere of college students' families. Therefore, it is the fundamental guarantee to carry out good entrepreneurship education for college students.

## 4. ANALYSIS AND APPLICATION STRATEGIES OF ENTREPRENEURIAL ACTIVITIES OF COLLEGE STUDENTS

### 4.1 ANALYSIS OF THE PROBLEM OF ENTREPRENEURIAL ACTIVITIES OF COLLEGE STUDENTS

The distribution of the main problems faced by college students' entrepreneurial activities

is shown in Figure 2. Among them, the problems of inappropriate policy implementation and obvious lack of material support account for 24.67%, and the policy system is gradually improved, but the dividends are not obvious. The problem of how to effectively connect with the overall development and needs of the region accounts for 24.33%, and there is an obvious lack of regional advantages in the development of entrepreneurial practice activities of school students, and, in reality, it shows that there are obvious incongruities and inconsistencies between the development of universities and the external environment. The problem of unsound mechanism of resource management and utilization of entrepreneurial practice and education accounts for 20.34%, and innovation and entrepreneurship education is gradually popularized, but the foundation is still weak. The positioning of entrepreneurship education in colleges and universities is not clear enough. The problem of insufficient conditions for the development of entrepreneurial practice activities accounts for 12.34%, and the so-called special funds in most schools are basically nominal, and some of them cannot even support the daily needs of teaching career planning of school students.

**Figure 2.** Distribution of problems faced by college students' entrepreneurial activities

#### 4.2 STRATEGIES TO IMPROVE ENTREPRENEURIAL ACTIVITIES OF COLLEGE STUDENTS

College faculties should always clarify the objectives of innovation and entrepreneurship education, combine the advantages of disciplines and majors, integrate majors with innovation and entrepreneurship, and create innovation and entrepreneurship education activities with characteristics. Under the guidance of clear objectives, colleges can set up innovation and entrepreneurship activity monitoring departments, which are composed of students and teachers involved in innovation and entrepreneurship activities, so that they have the interest to timely find out the problems that arise in the process of activity development and solve them.

The college can hold more exchange meetings and invite students and instructors who have achieved excellent results in science and innovation, Internet+ competition and professional practice and innovation competition to make presentations, which can be used to motivate other students to actively participate in innovation and entrepreneurship activities, while their rich and productive experience can also give some help and guidance to other students.

#### 5. CONCLUSION

This paper explores the influence of big data era on college students' entrepreneurship, and on this basis, through analyzing the current situation of college students' entrepreneurship education and entrepreneurial activities, gives the response strategies for the existing problems. Under the new economic situation, with the continuous improvement of socialist market economy system, society needs more and more entrepreneurs with innovative spirit

and change consciousness, which is the only way to effectively cope with the increasingly fierce international competition and enhance the economic strength of the country and the quality of entrepreneurs themselves. Of course, college students need entrepreneurship education in schools to encourage and guide students, so that they can understand entrepreneurship and then move towards it, and make certain contributions to the economic development and scientific and technological development of the country.

## ABSTRACT

The impact of informatization on higher education management can be better studied by analyzing its innovation path. Based on the basic characteristics of Internet information, this paper establishes a model of information-based management in higher education, analyzes and explains the key elements of information-based applications, and finally investigates the impact of information-based management on the efficiency and fairness of higher education management through empirical evidence. Compared with the traditional model, the management of informatization has improved on average 23.8% in administrative efficiency and 18.6% in educational fairness. This study proposes an innovative path for informatization of higher education management, hoping to provide some useful references for higher education management builders.

## KEYWORDS

Higher education management; Internet information technology; Administrative efficiency; Educational fairness

## 1. INTRODUCTION

As the national society requires higher and higher standards for talents, universities, as the main place for talent cultivation, need to constantly reform their education system so as to cultivate innovative talents that are more in line with the development of the information age [1-2]. Education system reform and higher education management model innovation are closely related, so finding out some current problems of higher education management model and realizing management model innovation on the basis of the existing ones are also the current educational issues that the society is more concerned about [3-4].

The literature [5] assessed the state of sustainability of management education as a field of study based on a literature analysis method, pointing out the lack of consistency in the concepts used and the fact that few studies integrate the three levels of the educational concept - teaching, curriculum design and learning. The literature [6] provides confirmation of the social experimentation approach in a virtual space that allows the identification of the main alternatives to the administrative tasks of developing and solving the problems of quality management in regional higher education through new automated information technologies. The literature [7] develops an integrated customer-centered educational quality management model through the use of multiple methods that allow to assess the quality of services and prioritize their improvement. The literature [8] states that university governance based on pluralistic governance and law is becoming the new normal in higher education management.

The new normal university governance will be transformed through philosophy, logic and methodology. The literature [9] explored the application of the balanced scorecard in higher education management, using Indonesian universities as a research subject.

Unlike the above studies, this paper focuses on the key elements of the application of information technology in higher education management from the perspective of Internet informatization. On this basis, the impact of Internet informatization on higher education management is analyzed by comparing the changes in efficiency and fairness before and after the study of university faculties.

## **2. INFORMATIONIZATION OF HIGHER EDUCATION MANAGEMENT**

### **2.1 CHARACTERISTICS OF INTERNET INFORMATIZATION**

The Internet + era advocates the synergistic development of the Internet and the traditional industries of society, through technological innovation of traditional models. The Internet + era advocates the synergistic development of the Internet and traditional social industries, through technological innovation of traditional models, mechanisms, systems and means, so that traditional industries have the characteristics of networking, informatization and intelligence. Internet+ is not a simple superposition of technologies, but a full integration of business values and thinking patterns. According to theoretical research, we can determine the following characteristics of the Internet+ era: First, cross-border integration. Cross-border integration mainly refers to the integration and reshaping, which can make the identity and market positioning of the people undergo profound transformation. Secondly, it is innovation-driven. Innovation-driven is to achieve self-revolution and innovation of traditional industries through Internet thinking.

### **2.2 ESTABLISHMENT OF INFORMATION MANAGEMENT MODE OF HIGHER EDUCATION**

The process of "Internet + education management" is the process of innovation, the process of structural reshaping and form optimization. In this process, education administrators should change the traditional education management concept, optimize the education management mode, and make the education management process more compatible with the basic characteristics of "Internet+", such as "respecting humanity", "reshaping structure", "innovation-driven" and "cross-border integration". The basic characteristics of "Internet+" are "respecting human nature", "reshaping structure", "innovation-driven" and "cross-border integration". It is true that the basic initiative of "Internet + education management" is the full application of computer network information technology, which is the integration of "Internet thinking" in the process of higher education management. However, this educational management innovation is only on the surface, that is, the application of network technology to achieve the innovation of the traditional educational management model. Network elements should be penetrated into different aspects of education management. In terms of education management methods, the traditional form of indoctrination and instruction should be changed, and passive management should be transformed into active guidance. That is, through prevention, analysis and guidance, students with problems should be educated.

### **2.3 CONSTRUCTION OF EVALUATION MODEL OF INFORMATION TECHNOLOGY IN HIGHER EDUCATION MANAGEMENT**

#### **2.3.1 ANALYSIS OF KEY ELEMENTS OF INFORMATION TECHNOLOGY APPLICATION IN HIGHER EDUCATION**

This study used the keywords "informatization" + "evaluation", "informatization" + "application" and "informatization" + "index" to retrieve 634 papers published between 2011

and 2019 from the CNKI journal database and the database of outstanding master's theses, and screen 154 articles about the assessment index of education informatization, including 31 articles on the application of informatization in higher education. By counting, analyzing and summarizing the influencing elements mentioned in the literature and combining the influencing factors of higher education informatization mentioned in the report, the key elements influencing the application of higher education informatization were summarized and counted, and the results are shown in Table 1.

**Table 1.** Key elements of information technology application in higher education

First level factors	Number	Secondary factors	Number
Human Factors	26	Faculty	12
		Students	1
		Administrators	3
Factors of information resources	23	Teaching Resources	5
		Research Resources	13
		Management Information Resources	12
Factors of the system	19	Teaching System	6
		Scientific Research System	12
		Management System	4
		Public Service System	6
Factors of software tools	8	Teaching Tools	14
		Learning Tools	13
		Digital Research Tools	9
Factors of business	12	Teaching Sessions	12
		Scientific Research	5
		Flow of Asian Affairs	7

### 2.3.2 EXPLANATION OF ELEMENTS

The human factors affecting the application of information technology in higher education mainly refer to teachers, students and managers. Teachers and students are the executors and beneficiaries of technology application in teaching, their ability to apply information technology is the prerequisite and guarantee of the development of teaching informatization, and their satisfaction with the application of information technology is an important feedback and reflection of the application of information technology. Only when teachers have good informatization ability can they better integrate information technology with all aspects of teaching and learning, and students can better apply information technology for learning.

The factor of information resources refers to the application of information resources in teaching, scientific research, management and public service, and as an important factor in the assessment of the application level of education informatization, it mainly includes the application of teaching resources, the application of scientific research resources and the application of management information resources. Among them, teaching resources mainly refer to multimedia courseware, online courses, etc. Scientific research resources mainly refer to the digital scientific research resources applied in the process of scientific research development. Management information resources mainly refer to personnel information, student achievement resources, etc.

The system factor here refers to the application of various systems in various businesses

such as teaching and management of the school, including the application of teaching system, the application of research system, the application of information management system, etc. Teaching system mainly refers to the system platform that assists teaching. Scientific research system refers to the system platform that assists scientific research projects, such as scientific research project management system, etc. Management system mainly refers to the system platform used for school affairs management. The public service system refers to the information system for faculty and student services.

### 3. ANALYSIS OF THE IMPACT OF INFORMATION TECHNOLOGY ON HIGHER EDUCATION MANAGEMENT

In this paper, different faculties of colleges and universities were selected as research subjects, and their efficiency and fairness before and after the adoption of information-based management methods were compared and analyzed, and the comparison results are shown in Figure 1. The information-based education management method has improved 23.8% on average in administrative efficiency compared with the traditional mode. Informatized management greatly improves the efficiency of information transmission and effectively saves communication costs. In the era of informatization, most school administration can be handled through the network platform, which leads to a scientific division of school administration resources through the network platform, thus allowing all administration departments to allocate reasonable administration resources.

In terms of fairness, the Internet-based information management has improved by 18.6% compared to the original. This is because the information-based management system can fully disclose the data, making the process transparent and the data-based management effectively avoids the human factor. By introducing information technology, university management workers can then disclose the main contents of management affairs and the way of handling them on the online platform, making the management work open and transparent.

**Figure 1.** Before and after comparison of information management methods

### 4. CONCLUSION

Based on the characteristics of Internet informatization, this paper analyzes the impact of informatization on higher education management in terms of both efficiency and fairness by studying the informatization process of higher education management. The informatization

management mode can reasonably allocate management resources, effectively improve management efficiency, optimize the organizational structure of university management, and make management transparent. With the increasing influence of information technology on people's production and life, reform and innovation of higher education in the era of informationization is the requirement of the times for colleges and universities to carry out sustainable development. Therefore, it is necessary for colleges and universities to explore the management methods of higher education in the information era, determine the management strategies that are more in line with the development of the schools themselves, and apply them effectively in higher education management so as to continuously improve the management level of colleges and universities.

# A PRACTICAL STUDY ON THE INTEGRATION OF CHINESE TRADITIONAL CULTURE INTO THE TEACHING OF MUSIC AND AESTHETIC EDUCATION IN COLLEGES AND UNIVERSITIES IN THE CONTEXT OF BIG DATA

---

Chenjie Hu\*

Nanchang Hangkong University, Nanchang, Jiangxi, 330063, China

[jaynie2022@163.com](mailto:jaynie2022@163.com)

---

## ABSTRACT

This paper firstly discusses the connotation of music aesthetic education and the function of music aesthetic education teaching in colleges and universities. Then it investigates the current situation of the integration of traditional culture and music aesthetic education teaching in Panzhihua Conservatory of Music by means of questionnaires, and studies the necessity of the integration of traditional culture and music aesthetic education teaching. Finally, the way of integrating music aesthetic education teaching with Chinese traditional culture in colleges and universities was analyzed. In the current situation of integration, close to 50% of teachers think it is necessary to offer traditional culture music teaching, still a higher percentage of teachers (39%) think it is not so urgent, which shows a large difference in the understanding of traditional culture. 42% people think it is not necessary to integrate traditional culture in music teaching, and the percentage of those who do not know is 25%. The teaching of music aesthetic education integrating traditional culture has not attracted enough attention, and the integration path should be innovated in order to adapt to the modern educational needs.

## KEYWORDS

big data; traditional culture; music aesthetic education teaching; integration path; modern education; cultural penetration

## 1. INTRODUCTION

The important role of music aesthetic education in quality education has gradually been recognized by the majority of educators [1]. The essence of aesthetic education is to improve people's aesthetic ability, and excellent music works bring people the feeling of beauty; therefore, music education appears as an important part of aesthetic education in the curriculum system of general education courses in the

talent training program of colleges and universities [2-3]. The literature [4] took music education for non-music majors in colleges and universities as the research object and proposed corresponding countermeasures and suggestions for the implementation of music education. Literature [5] analyzed the current situation of music education in ethnic minority regions and put forward the advantages and problems of implementing music education for ethnic minorities. The literature [6] investigated the current situation of music education pointed out the common problems in the development of public music education in colleges and universities, analyzed the main causes of these problems, and put forward the methods and strategies of using music education to implement aesthetic education, taking into account the new requirements of nurturing people in colleges and universities in the new era.

This paper mainly discusses the connotation of music aesthetic education, the function of aesthetic education teaching and the practical significance of traditional culture infiltration in music teaching. The current situation of the integration of traditional culture and music teaching in Panzhihua Conservatory of Music is investigated by means of questionnaires, as well as the necessity of teaching traditional culture and music aesthetic education is studied. Finally, the ways of transmitting Chinese traditional culture in music aesthetic education teaching in colleges and universities are discussed.

## **2. THE INTEGRATION OF TRADITIONAL CHINESE CULTURE INTO THE TEACHING OF MUSIC AND AESTHETIC EDUCATION IN COLLEGES AND UNIVERSITIES**

### **2.1 THE CONNOTATION OF AESTHETIC EDUCATION IN MUSIC**

Through different combinations of regular musical sounds, music is presented by the human auditory system as a complete artistic image from which emotions are expressed and moods are created, thus reflecting the content of real life and explaining the good wishes of the author. Music education can connect the two different systems of music and education, similar to the bridge and link between the two. Music education in a broad sense can not only integrate elements of intellectual and cultural education and art education, but also reflect ideological and political education and aesthetic education, which is indispensable for the overall development of the individual and is the main form of promoting music and culture and art in society and the state. In general, music education is indispensable for the overall development of the individual, whether it is for the cultivation of students' physical and mental health, artistic and moral qualities, or for the demonstration of the structure of professional musical knowledge, and it has an important role that cannot be ignored.

## 2.2 THE FUNCTION OF MUSIC AESTHETIC EDUCATION TEACHING IN HIGH SCHOOL

Aesthetic education refers to the form of aesthetic education that perfectly shapes the personality of individual college students through the integration of artistic and realistic beauty in the teaching process and scientific teaching methods and means. Undoubtedly, aesthetic education is of great significance to the all-round development of individuals, not only helping students to cultivate qualities of ideological and moral qualities such as beauty of mind and behavior, but also promoting the realization of aesthetic education goals of music education in colleges and universities.

### (1) Highlighting the function of music education to cultivate sentiment

From the essence of education and teaching, the fundamental characteristics of aesthetic education are reflected in its emotion. In the framework of quality education, the role of aesthetic education is mainly reflected through the word emotion. Many educators attach great importance to the role of aesthetic education, and Mr. Wang Guowei once mentioned that aesthetic education can promote the development of an individual's emotions and thus achieve perfection, which shows the important value of aesthetic education advancement. Therefore, the integration of aesthetic education elements in music education can highlight the basic function of music education to cultivate sentiment, and through music education can help students to nurture their sex and express their feelings, and then cultivate noble and pure sentiment, so as to enrich and develop the spiritual realm of college students.

### (2) Embodying the role of music education in beautifying life

College students are in the golden period of life and have abundant emotions. Teachers can present aesthetic elements such as natural beauty, social beauty and artistic beauty through various and diversified teaching methods, so that students can gradually form correct aesthetic concepts in participating in music education, and gradually feel beauty, appreciate beauty and achieve the teaching purpose of expressing and creating beauty through music education under the guidance of teachers. Therefore, the integration of aesthetic education elements in music education in colleges and universities can reflect the role of music education in beautifying life and have a subtle influence on the beauty of college students' mind.

### (3) Reflecting the value of music education to enhance aesthetics

Aesthetic education is a form of reflecting higher spiritual activities, in which individuals can feel the value of beauty and bring their subjective consciousness into full play when they participate in aesthetic education activities. For college students, whether or not they have built a correct aesthetic consciousness will affect their basic

judgment of right and wrong, good and evil, beauty and ugliness. Therefore, the integration of music aesthetic elements in college music education can reflect the important value of music education in enhancing aesthetics. In practice, the new model of aesthetic education adopted by teachers, which integrates online and offline, can not only help students gradually build a correct aesthetic consciousness, but also help them shape a perfect personality quality, which ultimately manifests the ultimate goal of music education.

### 3 THE CURRENT SITUATION OF INTEGRATING TRADITIONAL CULTURE AND MUSIC AESTHETIC EDUCATION TEACHING

In order to investigate the awareness of traditional culture and its integration with the teaching of music and aesthetic education in colleges and universities, a total of 50 music teachers from Panzhihua Conservatory of Music were selected as interview respondents for this study, and 90 students from different grades and classes were selected as questionnaire respondents. The questionnaires were filled out by the respondents themselves. A total of 50 questionnaires were distributed by the teachers, with 100% recovery rate and 100% efficiency; 90 questionnaires were distributed by the students, with 84 recovered, 93% efficiency and valid data.

In the survey on teachers' perception of traditional culture and its integration with music teaching, the results of the survey on whether it is necessary to offer courses related to traditional culture show that nearly half of the teachers think it is necessary, and still a higher percentage of teachers (39%) think it is not that urgent, which shows that there is a large difference in the perception of traditional culture, which may be related to the educational environment and the importance of traditional culture in schools. Figure 1 shows the survey of whether it is necessary to offer traditional culture courses.

**Figure 1** Survey on the need for traditional culture courses

In the study of whether it is necessary to integrate traditional culture in music teaching, the percentage of those who think it is not necessary is 42%, and the percentage of those who do not understand is 25%, which shows that most teachers do not pay enough attention to or even do not understand traditional culture. Figure 2 shows the necessity of integrating traditional culture into music teaching.

**Figure 2** The need to integrate traditional culture in music teaching

#### **4. WAYS TO PASS ON TRADITIONAL CHINESE CULTURE IN THE TEACHING OF MUSIC AND AESTHETIC EDUCATION IN COLLEGES AND UNIVERSITIES**

##### **(1) Appreciating traditional culture in song teaching**

Chinese traditional culture itself has a very close relationship with songs. The ancient people loved songs and dances, and they liked to express their emotions through music whether they were at work or on a journey, for example, many poems in the Book of Songs are depictions of the daily life of the ancient people. Therefore, in order to let students fully experience the charm of traditional culture, music teachers can take advantage of the music discipline to guide students to learn some of the more famous songs. This way of learning will not only make students feel that music lessons are very rich and interesting, but also learn the traditional culture that is rich in them, which is conducive to the cultivation of students' excellent qualities.

##### **(2) Perceiving traditional culture in appreciation teaching**

In the music courses of colleges and universities, many ethnic songs are selected, and when enjoying these songs, students can deeply perceive the charm of traditional culture. For example, when learning the Tibetan song "The Ballad of Lhasa", in order to make students sing the song well with emotion, students can first feel the ethnic

orchestral music by listening to "Beijing Joyful News to the Border Village", so that they can experience the ethnic styles of Miao and Yi. At the end of the lesson, students can talk about the background of the song and their understanding of the emotion of the song to further deepen their understanding of traditional culture.

### (3) Inherit traditional culture in teaching musical instruments

Since China has been a great nation of rituals and music since ancient times, music teachers can make full use of Chinese national musical instruments when motivating students to learn traditional culture. Music teachers can actively carry out activities to teach students the more distinctive national musical instruments in the actual teaching process. For example, starting from elementary school, students can choose their favorite musical instruments such as gourd silk, flute, guzheng, etc. In this way, they can ensure that each student can gradually deepen their understanding of the excellent Chinese traditional music culture and thus stimulate their love for traditional music culture.

## 5. CONCLUSION

This paper mainly studies traditional culture, the basic connotation of music aesthetic education teaching in colleges and universities, explores the current situation of integration of traditional culture and music teaching, as well as studies the way to inherit Chinese traditional culture in music aesthetic education teaching in colleges and universities. The following conclusions are mainly drawn.

1. In the current situation of integration of traditional culture and music teaching, the results of the survey on whether it is necessary to offer courses related to traditional culture show that nearly half of the teachers think it is necessary, and still a higher percentage of teachers (39%) think it is not that urgent, which shows that there are large differences in the understanding of traditional culture. In the research of whether it is necessary to integrate traditional culture in music teaching, the percentage of those who think it is not necessary is 42%, and the percentage of those who do not know is 25%.

2. Among the ways to inherit Chinese traditional culture in the teaching of music aesthetic education in colleges and universities, the main ways are to appreciate traditional culture in song teaching, to perceive traditional culture in appreciation teaching, and to inherit traditional culture in musical instrument teaching.

# THE APPLICATION OF TRADITIONAL SYMBOLS IN INTERIOR DESIGN WITH VIRTUAL REALITY TECHNOLOGY

---

Lichun Guo\*

Nanjing Audit University Jinshen College, Nanjing, Jiangsu, 210023, China

[glc2022713@126.com](mailto:glc2022713@126.com)

---

## ABSTRACT

This paper explores the development trend of virtual reality technology and analyzes the unique existence of the main symbolic elements in Chinese interior design from the perspective of semiotics, elaborates their role and significance in modern interior design, and focuses on the methods that should be used to deepen the study of traditional Chinese interior design elements with ornamental symbols, decorative symbols, Chinese characters and calligraphic art symbols, religious concept symbols, and traditional symbols of folk art. The study of traditional Chinese interior design elements should be deepened, so that they can become effective design languages, tools and entry points for grasping traditional Chinese culture and cultural lineage, and also provide directions for thinking about the organic combination of traditional and modern design for modern Chinese interior design. In 2019, the development of the integration of virtual reality technology and interior design reached its peak, with the index reaching 32 in March, an increase of 2 over 2018, and the lowest point in May, with the integration index at 10 in 2018 and 8 in 2019. The integration of traditional cultural symbols into interior design can reflect distinctive Chinese characteristics, so the research in this paper is of important significance.

## KEYWORDS

virtual reality technology; traditional symbols; interior design; fusion development; design language; design elements

## 1. INTRODUCTION

Traditional symbols are formed by the progressive summation and continuous accumulation of human beings in the history of speech and transmission thus [1]. Traditional cultural and artistic forms, for the design development culture, are the results of civilization accumulated in various aspects of life and production in a long history [2-3]. The literature [4] suggests that we should not be obsessed with the

transposition of traditional architectural decorative symbols, believing that as long as the traditional symbols are brought to play a role in the transmission of culture. The literature [5] proposes to study traditional Chinese architectural decorative symbols in the field of interior design today with a semiotic analysis.

This paper first introduces the development and characteristics of virtual reality technology and studies the integration of virtual reality technology and interior design, then explores the influence of traditional cultural symbols on modern interior design, and analyzes the ways of applying traditional Chinese symbols in modern interior design, mainly using ornamental symbols, ancient architectural decorative symbols, Chinese characters and calligraphic art symbols, religious concept symbols, and traditional symbols of folk art In the interior design.

## **2. VIRTUAL REALITY TECHNOLOGY**

Virtual reality technology is an important direction of simulation technology, which is a collection of simulation technology and computer graphics, human-machine interface technology, multimedia technology, sensing technology, network technology, and other technologies. It is a challenging cross-technology frontier discipline and research field. Virtual reality technology mainly includes simulation environment, perception, natural skills and sensing devices. The simulated environment is a computer-generated, real-time dynamic three-dimensional realistic image. Perception means that the ideal VR should have all the perceptions that people have. In addition to the visual perception generated by computer graphics technology, there are auditory, tactile, force, motion and other perceptions, and even smell and taste, also known as multi-perception. Natural skills refer to human head rotation, eye, hand gestures, or other human behavioral movements, which are processed by computers to match the participant's actions and respond to the user's input in real time and feedback to each of the user's five senses. Sensing devices refer to three-dimensional interaction devices.

### **2.1. FEATURES OF VIRTUAL REALITY TECHNOLOGY**

Virtual reality technology has the characteristics of immersion (resonating with human perception system and thinking as in the real world), interactivity (people enter the virtual space and interact with the surrounding environment), multi-perception (including visual, auditory, haptic, motion and other perception methods), conceptualization (in the virtual space can establish scenes that do not exist in reality can spread human thinking), autonomy (in the virtual space objects can move according to the laws of physics).

## 2.2 THE INTEGRATION OF VIRTUAL REALITY TECHNOLOGY AND INTERIOR DESIGN

Virtual reality technology experienced many setbacks when it was first promoted, especially in the mid-1990s, when the public was curious and expectant about this new thing, but the immaturity of the technology at that time led to bulky equipment, low imaging resolution and long delays, which limited its acceptance and application by the public. The speed of maturity evolution of various new technologies and the time required to reach maturity are divided into five stages, which are the promotion period of technology birth, the peak of excessive expectations, the trough period of bubbling, the bright period of steady climbing, and the peak period of substantial production, from 2013 to 2018 the trough period of bubbling of virtual reality technology is gradually moving towards the period of steady climbing, and in 2018 it is no longer classified as an emerging technology, which also indicates that In 2018, virtual reality technology has become a mature high-tech. Figure 1 shows the integration of virtual reality technology and interior design, and it can be seen that the integration in 2018 is better than that in 2019.

**Figure 1** Integration of virtual reality technology with interior design

## 3. THE INFLUENCE OF TRADITIONAL CULTURAL SYMBOLS ON MODERN INTERIOR DESIGN

Cultural symbols are the essence of culture accumulated through a long period of washing and precipitation, and they are originally complete systems that must respect the rules of social cognition in order to convey information accurately when they are actually applied. Traditional culture has obvious inheritance, and traditional cultural symbols are very important components of national culture, which are expressed by using graphics, colors, words and other traditional cultural connotations.

Cultural symbols can be penetrated into various products to give full play to the value of traditional culture, and through these products to let people recognize and identify with traditional culture. Traditional cultural symbols have been used in interior design since ancient times, with the Forbidden City and the Summer Palace being typical examples. The application of traditional cultural symbols in modern interior design is not only reflected in the level of interior decoration, but also in the style and cultural connotation of the space. In essence, interior design is a combination of social culture, and whichever design style it is, it is closely related to local cultural customs and can also showcase local folklore. At the same time, it can also reveal the Chinese style of the interior space and present a diversity of styles in combination with regional cultural differences. People in the new era, the interior design is not only the functional level of space requirements, but also emphasize the spiritual enjoyment, pay attention to the layout and decoration of space can make themselves feel happy. After years of innovation, traditional cultural symbols can now be flexibly applied in a variety of design styles without any sense of incongruity. The application of cultural symbols as independent elements in interior design can achieve better aesthetic effects and also make interior design have richer cultural connotations to meet people's aesthetic needs.

#### **4. APPLICATION OF TRADITIONAL CHINESE SYMBOLS IN MODERN INTERIOR DESIGN**

##### **4.1 APPLICATION OF ORNAMENTAL SYMBOLS**

Since ancient times there have been techniques to apply ornamental symbols to pottery, dyeing and weaving, furniture, painting and folk art. However, as interior designers, we cannot simply change some ornaments from patterns to patterns on decorations, but should also design them into furniture and decorative elements in our life, such as furniture design is to transform some patterns of Chinese ornaments into three-dimensional forms to make furniture with Chinese characteristics. In the application of traditional ornamentation symbols are first derived and then integrated into modern interior design.

##### **4.2 APPLICATION OF DECORATIVE SYMBOLS IN ANCIENT ARCHITECTURE**

Ancient Chinese architecture is known for its mortise and tenon building elements, and people in the Ming and Qing dynasties used the structure of architecture to create Ming and Qing furniture with Chinese characteristics. In modern times, we should summarize the architectural features with Chinese characteristics and make them not only into furniture, but also into our own decorative walls, furniture, lamps and other interior decoration components. For example, we can transform the outline of Jiangnan's architecture into graphics on our decorative walls, make the architectural

elements into graphics for lampshade ornaments to create "Chinese" lamps and lanterns, and also transform the carved beams and painted patterns into symbols for our design to be applied in every corner of interior design, so that the design is not only in color and furniture We can make the design not only present the "Chinese" style in color and furniture, but also make it have the culture of a certain historical period interspersed in the beginning and end, making the design more vital and historical.

#### **4.3 THE APPLICATION OF CHINESE CHARACTERS AND CALLIGRAPHIC ART SYMBOLS**

Words in interior design often play the role of the finishing touch, a pair of calligraphy and painting can reflect the owner's cultural literacy, a calligraphy and painting can change the flavor of the space, a calligraphy and painting can enhance the grade of the space. At the same time the printing technology of words - movable type printing technology is the most Chinese characteristics of the written symbols, Nanjing Audit Institute Pukou campus of the audit culture and education museum using movable type printing template enlargement as an image wall, not only to present to visitors the ancient history of Chinese printing, but also with this technology template abstract for the uneven wall with The light and darkness of the lighting enhance the sense of space.

#### **4.4 APPLICATION OF RELIGIOUS CONCEPT SYMBOLS**

By abstracting the religious magic tools or culture or legends into symbols, we can apply these symbols to interior design, with these symbols we can not only design Buddhist space with Zen, Christianity with ethereal, Catholic space with mythological colors. To create a religious space with Chinese characteristics, it is necessary to integrate religious symbols with Chinese characteristics into our design, abstracting religious ideas and magic tools with Chinese characteristics into symbols and designing them as interior design components or ornaments to express the interior design space with Chinese religion, and we can even add symbols with historical characteristics to create a religious space to make the interior design with a sense of history.

#### **4.5 APPLICATION OF TRADITIONAL SYMBOLS OF FOLK ART**

In China, a country with a long history, folk art has the same history as the country, such as paper cutting, embroidery, shadow play, New Year painting and other folk art.

For example, we can make a common wall between the living room and the dining room in interior design into a hollowed-out wall according to the form of folk art, exaggerating or moderately deforming them to express the user's preference, so that

the wall is ventilated and beautiful, and at the same time has the unique properties of each space. This way, the wall is ventilated and beautiful, but also has the unique properties of each space, so that the design is not repeated and cannot be copied, creating a Chinese wall with Chinese characteristics. In the same way we can use it in creating sculpted table tops, hollowed out chair backs, light and shadow staggered lighting, etc., so that the space is reshaped in a fun way.

## 5. CONCLUSION

This paper mainly explores the integration of virtual reality technology with interior design and the application of traditional Chinese symbols in modern interior design. The following conclusions are mainly drawn.

The modern interior design Chinese traditional symbols are applied in the following ways: the use of ornamental symbols, ancient architectural decorative symbols, Chinese characters and calligraphic art symbols, religious concept symbols, and the use of folk art traditional symbols.

In the case of the integration of virtual reality technology and interior design, the integration was better in 2018 than in 2019, probably because it was influenced by the epidemic situation in 2019, and the use of virtual reality technology in interior design was not as good as in previous years.

## ABSTRACT

This paper firstly studies the current situation of offering English major culture courses in colleges and universities, and explores the current teaching level of English culture courses in colleges and universities, the teaching level of teachers, the acceptance level of students, and the satisfaction of teaching. Then the problems of teaching English major culture courses are discussed, mainly the classroom teaching mode is old and monotonous, and the classroom is partial to theory and light on practice. Finally, the teaching optimization measures of innovating teaching contents and building faculty are proposed. In terms of teaching level in colleges and universities, the worst performance is in stimulating students' deep thinking and examination strategies, with an approval rating of only 44.9%, and adapting to students' acceptance, interaction with students and homework feedback, with an approval rating of 60.4%. There are still many problems in the current college English major culture course that need to be optimized and upgraded for the course teaching.

## KEYWORDS

big data; culture courses; optimization strategies; teaching innovation; English majors; teaching level

## 1. INTRODUCTION

With the ever-changing development of the world economy, English education professionals are increasingly valued by society [1]. But the relatively backward talent training mode is increasingly difficult to meet the needs of society [2-3]. It is practical

to improve the curriculum system to cultivate useful talents needed by the society [4]. The literature [5] points out that current junior high school English teaching places too much emphasis on written test scores and ignores the applicability of language. The literature [6] points out that cooperative learning in junior high school English classrooms is a formality, and some English classes appear from the surface to have high student motivation, active thinking, and many forms of activities, but in fact these activities are not integrated into the classroom, but are instead purely for the sake of activities, and cannot achieve teaching effects that meet expectations through truly effective activities.

This paper explores the current level of English teaching in colleges and universities, examining and evaluating aspects such as teacher recognition, satisfaction with teaching methods, and student adaptation. The problems of English teaching are discussed as well as the proposed measures to optimize the English education curriculum.

## **2. THE CURRENT SITUATION OF OFFERING CULTURE COURSES FOR ENGLISH MAJORS IN COLLEGES AND UNIVERSITIES**

### **(1) Teaching Levels**

In order to study the current teaching level of culture courses of university teachers, this paper conducted a survey on the teaching of courses to students of Sichuan Foreign Language. A total of 100 questionnaires were distributed, and 90 were returned. This paper measured the teachers' professional level by the level of "the teachers' English teaching process is standard and their expressions are fluent and natural". The survey found that 60% of the students who chose the level of conformity and very conformity indicated that the teachers' teaching level was high. The percentage of students who did not meet and did not meet very well was 18%, indicating that the teachers' English proficiency was low. The remaining nearly a quarter (26.9%) of the students thought that the teachers' English proficiency was average. This shows that the teaching level varies widely among teachers, and most of them are able to teach competently, but there are still a significant proportion of teachers who are not.

### **(2) Professional level**

This study measured teachers' professionalism by the degree to which the teacher's content is his/her area of expertise. The survey found that 82.6% of the students approved of the teacher's professionalism, while only 8.2% disapproved, and the remaining 17.2% thought the teacher's professionalism was average. It can be seen that the professional level of Cheng's lecturers is generally high, which is

consistent with the professional orientation of research universities.

### (3) Teaching methods

English proficiency and professionalism are concentrated on one actor, but teaching is a collaborative activity between teachers and students, involving two actors, which makes the evaluation of teaching level more complicated. Combined with related theories, this paper measures teachers' teaching level in three dimensions: systematic relevance, student-centeredness and stimulating deep learning. Table 1 shows the teaching level measurement question stems and results.

**Table 1** Teaching level measurement question stems and results

	Question stem	Mean value	Standard deviation
Systematic - Focus	The content of the teacher's lectures is well structured and well connected	4.88	964
	The teacher's presentation of the course content was focused and clear	384	940
	The teacher explained the difficult points very well.	4.75	976
Student-centred	The pace of the lessons was adapted to our needs	377	949
	The teacher had frequent interaction with the students in class.	4.71	1032
	Feedback on assignments was timely and effective	4.57	994
Stimulating deep learning	The teacher often stimulates us to think deeply	353	1047
	The exams are mainly memory based (reverse marking)	4.88	964

The survey results showed that most students recognized the teachers' teaching level, and the teachers performed the best in terms of systematic teaching and explanation of important and difficult points, with an approval rating of 68.2%. This was followed by adapting to student acceptance, interaction with students and feedback on assignments, with an approval rating of 64.4%. The worst performance was in stimulating students' deep thinking and test-taking strategies, with an approval rating of 45.9%. In other words, the teachers' teaching level decreases one by one on systemic-heavy, student-centered, and stimulating deep learning. Overall, the percentage of higher teaching level was 56.5% and the percentage of lower was 18.2%.

The results showed that teachers performed best on the foundational teaching competency of systematic repertoire, but only with 67.2% approval. Several studies have found a decrease in classroom teacher-student interaction. Our survey partially confirms this finding, but there are significant differences between teachers' and students' performance on teacher-student interactions. The survey found that ". The

survey found that "...the teacher has frequent interactions with students in class" with 61.0% approval, while "I often speak up in class" with only 18.9% approval. This indicates that teachers play a leading role in teacher-student interaction, while students are more passive, and that most English classes are still "teacher-centered" rather than "student-centered". Teachers' assessment strategies scored the lowest among the evaluation indicators. The mean score for "the course exam is mainly about memorization" was only 2.96 with a standard deviation of 3.158. 38.1% of the students did not meet the criteria, 38.2% met the criteria, and 27.7% of the students did not have a clear opinion. It is evident that there are significant differences in evaluation strategies among teachers, with more than one-third of them using an evaluation strategy that primarily examines memory. Teachers' assessment styles will influence students' learning strategies. Teachers who examine primarily lower-order cognitive skills such as memorization, recitation, discrimination, and citation on tests will have students choose shallow learning strategies accordingly. Conversely, teachers who examine students' higher-order cognitive abilities such as analysis, interpretation, argumentation, and comparison will have students choose deep learning strategies accordingly. In this sense, the more teachers focus on examining students' memory, the lower their instructional level is. Figure 1 shows the three-dimensional results of teaching level.

**Figure 1** Three-dimensional results of teaching levels

### 3 PROBLEMS IN TEACHING CULTURE COURSES FOR ENGLISH MAJORS

#### (1) Classroom teaching mode is old and monotonous

As an emerging course, the characteristics of the culture course are not fully revealed in the course teaching, often attached to other professional disciplines, not fully combined with their own vocational, cross-cutting and other characteristics to carry out. And the course is mostly set up as an elective course, which not only shows that the school does not pay enough attention to the culture course, but also the students ignore it because it is an elective course. Moreover, the overall teaching mode of the classroom is mostly "teacher" or "subject" oriented, without taking into account the future cultural level students need to demonstrate in the culture course, which makes the culture classroom teaching monotonous and boring in an invisible way. This inevitably makes culture classroom teaching monotonous and boring, and students cannot pay attention to it, and their learning initiative cannot be effectively stimulated.

#### (2) Theory over practice

The key to cultural education is to help students realize the "unity of knowledge and practice", which is also the concept that needs to be strictly followed in teaching cultural courses. However, at the present stage, most institutions tend to overdo it in the teaching process, that is, practice for practice's sake. On the surface, both teachers and students are performing "practice", teachers set many practical activities for students, and students work hard to complete "practice reports". It seems to be interlocking, but the teachers do not pay attention to the specific process and details of the practice in real time and give guidance, and the students are mostly formal, only looking at whether the written report is beautiful or not.

### **4 . OPTIMIZATION OF ENGLISH EDUCATION MAJOR CURRICULUM**

#### (1) Formulation of the objectives of the cultural quality education program

In the overall design of the cultural quality education curriculum, the determination of the objectives of the curriculum is the most important stage, and the realization of the three stages of curriculum content, curriculum implementation, and curriculum evaluation depends, to a large extent, on the determination of the objectives. Through the previous analysis, we can clearly see the influence of curriculum goals on curriculum content, curriculum implementation, and curriculum evaluation. Moreover, the stages following the curriculum objectives can be seen as means to achieve the curriculum objectives.

#### (2) Enhancing the depth and breadth of curriculum content

The focus of the course content of cultural quality education should be on

cultivating and improving the ability and quality of college students. Compared with the "mastery of systematic knowledge", the deeper learning objectives such as "intellectual skills" and "broad comprehension of concepts and values" should be achieved, and the learning activities of college students should be more demanding. The students' learning activities have higher requirements. The emphasis on the depth and breadth of the content of the cultural education courses does not require that the courses be based on cutting-edge, cutting-edge scientific research. On the contrary, as mentioned above, the principle of "basic, classical and comprehensive" should be implemented in the selection of course contents, and the knowledge and principles of the subject system should not be the main basis for selection. Knowledge is the basis for the formation of abilities and qualities, but knowledge is not equal to abilities and qualities. "The formation of abilities and qualities requires students to experience and understand the logic behind the hidden knowledge.

## 5. CONCLUSION

This paper mainly studies the status of English major culture courses and teachers' teaching level in colleges and universities, explores the problems in teaching English major culture courses, and proposes reformative measures. The main conclusions are as follows.

Teachers performed the best in terms of systematicity of lectures and explanation of important and difficult points, with an approval rating of 68.2%. This was followed by adapting to students' receptiveness, interaction with students, and feedback on assignments, with an approval rating of 64.4%. The worst performance was in stimulating students' deep thinking and examination strategies, with an approval rating of 45.9%.

The main problems are: the classroom teaching mode is old and monotonous, and teaching is theoretical and light on practice. The main measures are to formulate the objectives of the cultural quality education curriculum and strengthen the depth and breadth of the curriculum content.

## **ABSTRACT**

This paper uses path coefficients to generate direct learning effects through mediating effects through a multiple chain mediation model. The differentiated needs and student service system management are taken as a starting point and then explored for students' academic emotional behavior. The results show that the correlation coefficient between student training goals and major settings is 0.864, the significance probability of the test is  $0.000 < 0.01$ , and the mediating effect accounts for 22.08% of the total effect. Thus, it can be seen that the multiple chain mediation model has guiding significance for developing pedagogical research in higher education and helping students to improve their academic performance.

## **KEYWORDS**

Multiple chain intermediation; Path coefficient; Intermediation effect; Differentiated demand; Probability of significance

## **1. INTRODUCTION**

With the economic development and industrial transformation and upgrading, industry enterprises have higher and higher requirements for the comprehensive quality of workers, and higher vocational colleges and universities assume the responsibility of cultivating high-quality technical skills talents for the society. The "million expansion" of higher vocational institutions plays an important role in improving the quality of society, expanding the supply of technical skills talents, and solving the structural contradiction between supply and demand of technical skills talents, which is urgently needed by society [1-3]. To a certain extent, the technical skilled talents cultivated by the "million expansion" can meet the requirements of industrial restructuring and technological upgrading, thus promoting the development of social economy [4-5].

The "one million expansion" is an important task of the times to supplement the national shortage of high-quality technical and skilled talents, protect people's livelihood and stabilize employment, promote industrial upgrading and promote social and economic development. It is important for higher education institutions to deepen the reform of teaching, talent cultivation, and reform for the "million expansion" students to achieve the connotative

development of higher education. The main objective of the study in the literature [6] was to clarify which aspects of blended learning could improve students' knowledge, as measured by their final course grades. Principal component analysis and hierarchical clustering of variables were used to extract components describing the blended learning dimensions and to represent the explanatory variables in a multiple regression model with students' final grades as the dependent variable. The literature [7] identified group moderation as an important factor influencing student performance in project-based learning. Students who learn through facilitation mechanisms exhibit more positive learning behaviors. Integrating group regulation facilitation methods can be an effective means of improving student learning performance. Improving students' active regulatory learning behaviors warrants an in-depth study of students' regulatory learning behaviors in collaborative learning activities. To sum up, the research on student learning is still at the primary stage and does not combine the current characteristics of the development of higher vocational social recruitment students to propose new methods and strategies to adapt to the learning of single-college students.

Based on this, this paper designs a multiple chain mediation model in the context of million expansion. Firstly, the model is used to explore the factors influencing the learning commitment of senior social recruitment students, and the mediating effect is used to explore students' academic emotions from differentiated needs and student service system management. Secondly, in this process, the higher vocational students continuously strengthen and improve the management of learning service system, and finally, the model is proved to be effective in improving the enrollment rate of higher vocational social recruitment students' learning through experiments.

## **2. MILLION EXPANSION BACKGROUND OF HIGHER VOCATIONAL STUDENTS LEARNING INPUT**

### **2.1 STRENGTHEN SUPPORT FOR LEARNING SERVICE SYSTEM MANAGEMENT**

The functional theory of management proposes that the four basic functions of management include planning, organizing, leading, and controlling. The efficacy of management is reflected in whether academic support and non-student support can adequately and dynamically meet the differentiated needs of students. In order to guarantee the professional learning of higher education students in the context of millions of expansions, higher education institutions must establish a strong learning support service system [8-9]. First of all, the party and government leaders of higher education institutions must have the consciousness of serving students, and at the same time, they should be deeply familiar with the needs of diversified higher education students, and they should strengthen the training of learning support service providers to enhance their service consciousness and service skills. Management regulations and systems for student support services should be formulated so that managers of each functional department have standards to follow. Finally the learning support services for higher education students should be open and dynamic.

### **2.2 LEARNING ACADEMIC EMOTIONAL BEHAVIOR EXPLORATION**

Academic emotions are the various emotions that students experience in various learning situations such as classroom, extracurricular, and examinations, and can be classified into four types according to their structure-positive high arousal, positive low arousal, negative high arousal, and negative low arousal [10]. Self-efficacy is a subjective feeling of one's own abilities that affects an individual's regulation of his or her motivation, thinking, actions, and emotions. Self-efficacy positively predicts positive academic mood and negatively predicts negative academic mood. There is a significant positive correlation between positive academic mood and academic self-efficacy, a significant negative correlation between

negative low arousal academic mood and academic self-efficacy, and the dimensions of academic mood partially mediate the relationship between academic self-efficacy and academic adjustment.

### 2.3 CONSTRUCT OF MULTIPLE CHAIN INTERMEDIARY MODEL

The multiple mediator model containing only one independent variable and one dependent variable is the basic unit of multiple mediator effect analysis, on which the more complex multivariate multiple mediator model is developed. Multiple mediating variables exhibit sequential characteristics and form a chain of mediators. A multiple chain mediation model is one in which multiple mediating variables form a chain of mediators and act sequentially between the independent and dependent variables. In this paper, we construct a multiple-chain mediation model, which includes the learning mediating variables of higher vocational social recruitment and generates direct learning effects through the mediation effects of path learning coefficients.

## 3. ANALYSIS OF LEARNING OUTCOME TEST FOR HIGHER EDUCATION STUDENTS

### 3.1 CORRELATION ANALYSIS OF THE DIMENSIONS OF STUDENT DEVELOPMENT

In this paper, under the background of million expansion, we study the learning of social recruitment students in colleges and universities, and design a multiple chain mediation model to explore the correlation between talent training and training objectives, professional settings, curriculum, teaching content and methods, faculty and training evaluation through correlation analysis of each dimension of the questionnaire, and the correlation analysis of each dimension of student training is shown in Table 1.

**Table 1.** Correlation Analysis of the Dimensions of Student Development

	Training Objectives	Professional Settings	Curriculum	Teaching Content Methodology
Course Curriculum	0.856**	0.834**		
Teaching Content Methodology	0.838**	0.836**	0.853**	
Faculty Members	0.849**	0.845**	0.860**	
Training Evaluation	0.826**	0.846**	0.786**	0.839**

As can be seen from Table 1, the correlation coefficients of each dimension range from 0.782 to 0.866. The correlation coefficient between training objectives and professional settings is 0.864, the probability of significance of t-test is  $0.000 < 0.01$ , and the absolute coefficient value between the two is 0.746. The correlation coefficient between training objectives and teaching contents and methods is 0.831, the probability of significance of t-test is The absolute coefficient between the two is 0.691, which indicates that the higher vocational students are trained according to the principle of categorization, and the students are provided with targeted and personalized education to help expand the enrollment and improve the learning efficiency.

### 3.2 MEDIATING EFFECT TEST ANALYSIS

To analyze in depth the role of student academic emotion and academic self-efficacy on academic adaptation. The mediating role of academic emotion was examined by stratified regression analysis according to the multiple chain mediation model, and the specific data are shown in Table 2.

**Table 2.** Hierarchical Regression for Intermediate Effects Test

Access Steps	Independent Variable	Dependent Variable	Adjusted R2	F	$\beta$
First Layer	Sense of Efficacy	Learning to Adapt	0.645	1678.224***	0.859
Second Layer	Sense of Efficacy	Positive High Arousal	0.554	1256.759***	0.752
		Negative High Arousal	0.589	79.056***	-0.275
Third Layer	Positive High Arousal	Learning to Adapt	0.187	456.842***	0.608

As shown in Table 2, when the 4 dimensions of academic emotion entered the equation, self-efficacy was a significant predictor of learning adaptation ( $\beta=0.607$ ,  $p<0.001$ ), the mediating effect accounted for 22.08% of the total effect, and the mediating effect explained 20.50% of the variance variance of the dependent variable (learning adaptation). It indicates that the use of multiple chained mediation model for higher vocational social studies students learning allows students to become autonomous learners with high self-efficacy, possess positive emotions and better adapt to their academic life.

#### 4. CONCLUSION

In this paper, we actively explore the study of higher vocational social studies students in the context of the million expansion. In the process of exploration, a multiple chain mediation model is designed, and the feasibility of the model is verified by the multiple chain mediation model and through the analysis of experimental results. The results showed that the correlation coefficient between student training objectives and professional settings was 0.864, the significance probability of the test was  $0.000<0.01$ , and the mediation effect accounted for 22.08% of the total effect. It indicates that the multiple chain mediation model plays a positive role in the teaching research of higher education and helps students improve their academic performance.

## **ABSTRACT**

This paper firstly introduces the application method of BIM technology to describe the building through 3D model and to design, purchase, construct and maintain the data in engineering. Then the six modules of digital intelligent management platform are elaborated, including intelligent water and electricity management module, dust and noise monitoring module, solid waste management module, etc. Finally, the intelligent management process of building construction component progress is discussed and the application effect of intelligent management method of high-rise building construction using BIM technology is analyzed. In terms of the application effect, the project quality pass rate before application is basically about 40%, while the project pass rate after applying BIM technology increases month by month, basically around 90%, which is 50% higher. BIM technology can well improve the efficiency and quality of high-rise building construction.

## **KEYWORDS**

BIM technology; high-rise building construction; digitalization; intelligent management platform; project quality

## **1. INTRODUCTION**

With the progress of science and technology and the development of the times, building information modeling technology has a broad application prospect in the construction field [1-2]. At present, the application of BIM technology in China's construction industry is at the initial stage [3-4]. Literature [5] proposed that the information model in the design phase cannot be effectively transferred to the construction phase, which is a key factor hindering the development of BIM in China at present, so there is an urgent need for the national preparation of BIM standards to better coordinate the relationship between various phases and upstream and downstream. Literature [6] analyzed the current situation of BIM technology application in the construction industry and summarized how to apply BIM technology in the whole process of the project to improve productivity. The literature [7] constructed an information model integration framework system covering mainly the building and structural design stages, which can initially realize the integration of building and structural model information and lay a technical foundation for the development of the next-generation construction engineering software system based on BIM technology.

This paper firstly studies the method of using BIM technology to describe the building through 3D model, which also contains in engineering design data, procurement data, construction data, maintenance data, etc., thus constituting a complete engineering dynamic data chain. Then the six modules of digital intelligent management platform are introduced, including intelligent water and electricity management module, dust and noise monitoring module, dust monitoring and automatic spraying module and solid waste management module. Finally, the process and application effect of the digital intelligent management platform system are analyzed.

## **2. BIM TECHNOLOGY THEORY RESEARCH**

### **2.1 BASIC CONCEPT OF BIM TECHNOLOGY**

BIM is called Building Information Modeling, and the standard definition of BIM technology is "the expression of real data of building information and equipment functions in the form of virtual digital information technology simulation to simulate the physical manifestation of the building". control in terms of project schedule and cost,

realizing dynamic and whole process control of the building, and facilitating the creation, control and sharing of the whole life cycle of the building.

## **2.2 APPLICATION OF BIM TECHNOLOGY**

In the whole project construction process, it involves the whole life cycle of the project from planning to operation period, and the resulting BIM model can be used by all parties involved in the construction. The use of BIM model ensures the characteristics of data integrity, information relevance and resource unity. The integrity is mainly reflected in the fact that BIM technology in engineering project construction not only describes the building through 3D model, but also includes engineering design data, procurement data, construction data, maintenance data, etc., thus constituting a complete engineering dynamic data chain. Through the use of BIM technology, the core elements such as engineering cost can be effectively controlled to ensure the quality of the project while also ensuring that the project is completed within the expected time and cost, thus reflecting the advantages brought about by BIM technology.

## **3. DIGITAL INTELLIGENT MANAGEMENT PLATFORM FOR HIGH-RISE BUILDING CONSTRUCTION BASED ON BIM TECHNOLOGY**

Green construction management platform has been multi-functionally integrated after field trial and improvement, mainly including six functional modules such as intelligent water and electricity management, dust and noise monitoring, automatic sprinkler and liquor alarm, project drainage monitoring, solid waste management and renewable resource management. These functions and modules can also be displayed intelligently through BIM models, data collection, data viewing and downloading, abnormal alarms and application feedback, etc., and can be developed with modular functional interfaces according to the actual needs of the project.

### **3.1 SIX MODULES OF DIGITAL INTELLIGENT MANAGEMENT PLATFORM**

#### **(1) Intelligent water and electricity management module**

At the early stage of the project, when preparing the temporary water and electricity construction plan, the project construction areas should be fully considered and planned, and different types of water use plans should be planned and arranged for the office and living areas, and water-saving equipment and intelligent electricity system should be installed at the construction site to build an intelligent water and electricity network. When water and electricity use abnormalities occur, the background can receive alarms, protect the speed break, remote control, etc., to realize the full control of water and electricity use.

#### **(2) Dust and noise monitoring module**

The dust and noise monitoring instrument is mainly combined with the LED display and mobile terminal and computer terminal. The computer background can directly display the status of the monitoring instrument and the current environmental noise situation, and can automatically analyze the dust and noise situation. At the same time, the monitoring instrument is powered by solar panels, eliminating the tedious and complicated on-site wiring, and the environmental monitoring instrument can provide real and reliable data for project managers and governmental supervisors to grasp the environmental situation at construction sites.

### (3) Dust monitoring and automatic spraying module

Water spraying system is mainly pressurized tap water, sprayed by the nozzle, mainly by pressurized water pump, PPR pipe, nozzle and control box, site installation according to the regional terrain, dust distribution and other characteristics, reasonable distribution of spraying points and draw the spraying water system path, and then determine the various types of materials required to lay the pipe and install the nozzle. Automatic spraying water system can automatically spray dust removal according to environmental needs. When the on-site dust monitoring system monitors PM concentration reaches the set value, the spraying water system is automatically activated, and when the PM concentration is qualified, the spraying water system is automatically shut down.

### (4) Solid waste management module

The solid waste generated at construction sites is relatively large, and the traditional treatment method is relatively crude, relying mainly on manual disposal. Solid waste is inventoried on site and sorted according to type and weight for weighing, and then data is recorded and transmitted. The solid waste generated on site is precisely controlled, and the data on the total amount of solid waste, classification, recycling amount and outgoing amount can be queried through the solid waste module in the management background.

### (5) Recycling resource management module

In recent years, the industry has conducted a lot of research on the use of renewable resources. In order to calculate the efficiency of renewable energy equipment use, the site can be configured with special meters for measuring the consumption of renewable energy, combining the input cost of equipment, resource savings and turnover frequency, etc., to statistically analyze the economic benefits of renewable resources in order to guide the use program of renewable resources in construction projects.

### (6) Project sewage discharge monitoring module

On the project site, the living and office areas, as well as the sewage generated during the construction process are discharged into the city municipal network after treatment. Engineering sewage discharge monitoring module automatically real-time online monitoring of sewage water quality, engineering sewage water quality discharge must meet the requirements, real-time monitoring system to upload data to the green construction management platform, when the water quality monitoring structure does not meet the standard, the background alarm, to urge managers to take relevant sewage treatment measures, effectively realize the supervision of the discharge of sewage.

### 3.2 DIGITAL MANAGEMENT SYSTEM FOR HIGH-RISE BUILDING CONSTRUCTION

After the design of intelligent management method of high-rise building construction is finished, the perception management system of BIM technology is constructed to realize the goal of intelligent management of building construction in an all-round way. Firstly, using the hierarchical analysis method, BIM technology is divided into three specific layers: the perception layer as the main layer, combined with the supporting role of the network layer and application layer, together to help the intelligent management of building construction. RFID radio frequency identification technology and sensors are used to set the main functions of the perception layer, which includes information and data collection of high-rise building construction, so that the perception layer can achieve the goal of real-time collection of construction data and information. Table 1 shows the intelligent management process of the progress of building construction components.

**Table 1** Intelligent management process for the progress of building construction components

Stages	Job Description	Information Storage	Information Sources
Production phase	Production of machined components	RPIDTextbook Library	RPID Readers
	PID tagging of components into components		
Inventory stage	Division of the construction inventory into zones		
	Arrangement of stock management personnel in the different zones		
Transport phase	Determining the location of the component transport yard		
On-site stage	Arrangement of component yard managers		
	Scheduling of component entry and exit times		

In order to further make an objective analysis of the application effect of the intelligent management method of high-rise building construction based on BIM technology, the project team conducted the following experimental tests. Based on the principle of quality management, the construction process is taken as the quality control point, and the construction management control point is determined according to the construction responsible unit and type. Based on BIM technology, the construction period of the project is set to 6 months, and the primary acceptance rate of the building project with and without the application of the intelligent management method of building construction designed in this paper is obtained as shown in Figure 1.

**Figure 1** Comparison of quality of work

According to Figure 1, it can be seen that after the application of intelligent management method of high-rise building construction based on BIM technology in construction projects, the project quality primary acceptance pass rate has been significantly improved, and the overall construction quality of the project is more stable without substantial fluctuation. The project without the application of intelligent management method has a lower pass rate, and the overall pass rate fluctuates more, and there is a decreasing trend in a certain period of time, which is not conducive to the development of construction projects. Therefore, the intelligent management method of high-rise building construction designed in this paper is more effective and has better management quality.

#### **4. CONCLUSION**

This paper mainly studies the use of BIM technology in the digital intelligent management platform of high-rise building construction, briefly describes the six

modules of the digital intelligent management platform, and analyzes the quality passing rate of the project before and after the application. The study shows that the use of BIM technology can improve improve the efficiency and quality of intelligent management.

# INNOVATION OF TEACHING MODE COMBINING ARTIFICIAL INTELLIGENCE TECHNOLOGY AND COLLEGE CIVICS COURSE

---

**Xiying Liu\***

Henan University, School of Philosophy and Public Administration, Kaifeng, Henan, 450006,  
China

[liuxiying0214@163.com](mailto:liuxiying0214@163.com)

---

## **ABSTRACT**

In light of the transformative technological advantages of artificial intelligence, its introduction into the education of college Civics and Political Science class, over effective integration with ideologic and politic education big data, can facilitate the precise implementation of many teaching aspects such as student learning identification, teaching content customization, teaching activity design, teaching process tracking and prediction, teaching evaluation and decision making, and then realize the precise teaching of college Civics and Political Science class on the whole. Through the survey, teachers' role perception of teaching level under the submission of AI technology in college Civics class, more than 45% of teachers think that AI has a greater impact on the teaching of college Civics class at present. Only 8.06% of teachers think that the impact is less. Thus, it can be seen that the educational changes triggered by the application of AI technology in college Civics class have achieved a certain consensus among the group of college Civics teachers.

## **KEYWORDS**

Ideologic and politic theory course; Artificial intelligence; Learning recognition; Precise teaching; Teaching prediction; Teaching evaluation

## **1. INTRODUCTION**

An essential area of advancement in the field of education is the promotion of schooling and artificial intelligence integration as well as a high level of fit between educational resources and students' needs [1]. Promoting the thorough integration of AI and teaching in civics and political science classes is both a necessary trend in reaction to the technological developments and a self-need to increase teaching precision, effectiveness, and relevance[2]. Artificial intelligence's technological integration fuels the contradictory movement of the instruction in civics and political science courses, driving its internal elements to dovetail precisely and collaborate efficiently, and promoting the high-quality development of Civics and Political Science class education the path of accuracy, thereby offering a fresh perspective for resolving the practical issues in the instruction of civics and political science [3]. Research on artificial intelligence technology to optimize the way that civics classes are taught in colleges. Literature [4] argues that the application of artificial intelligence can effectively improve the affinity of ideologic and politic education, the precision of ideologic and politic education, and provide a more scientific, effective and fine working method for ideologic and politic education in decision-making and management. The literature [5] argues that to the supportive position of AI technology in the college Civic Science course, We should be aware of the possibility that artificial intelligence may become more prevalent as a result of its application in civic science

courses. The literature [6] believes that the future era of "precision education" profound combination of AI technology and education will define it, and it is necessary to promote the upgrading and transformation of teachers to intelligent teachers. intelligent construction of thinking class.

Six components make up the framework for the implementation of artificial intelligence-driven specific teaching of ideologic and political theory in colleges and universities: specific learning recognition and portrait, specific teaching content customisation options and attempting to push, specific teaching exercise design, specific learning monitoring and prediction, specific teaching evaluation, and specific teaching conscious choice. Building an all-weather, all-channel, all-coverage, and all-process big data archive and integration process of university ideologic and politic education, establishing and improving a guarantee mechanism for the specific teaching of university ideologic and politic theory class, and establishing an integrated technical support system for the precise teaching of university ideologic and politic theory are all necessary for artificial intelligence-driven specific teaching of university ideologic and politic theory.

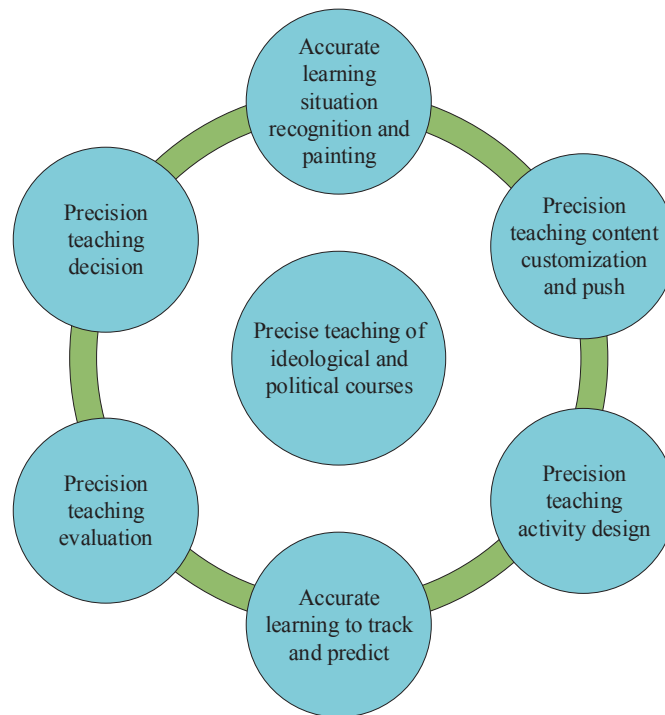

## **2. THE FEASIBILITY OF ARTIFICIAL INTELLIGENCE-DRIVEN PRECISION TEACHING IN COLLEGE CIVICS COURSES**

As a key component of accurate thinking and administration, accurate teaching in college Civics courses refers to precise design and customization of teaching contents and activities, precise tracking and prediction of teaching process, precise evaluation of teaching effects and precise teaching decisions, in order to specifically satisfy the individualized learning requirements of college students taking civics courses and to strengthen their mission duties.

According to their purposes, the information utilized for accurate instruction can be separated into three groups: the first one is basic student data, which is mainly used for accurate learning situation identification. The second category is process data, which is mainly used for accurate tracking, prediction and evaluation of students' learning process. The third category is the result data, which is mainly used for accurate teaching evaluation and decision making. Online teaching platform, independent learning platform, online assessment system and many other platforms have already gone to the actual ideologic and politic education teaching scene, and a large volume of teaching and learning data converge in these platforms, which provides the most fundamental information to ensure that civics and political science lessons are taught accurately.

## **3. ARTIFICIAL INTELLIGENCE-DRIVEN FRAMEWORK FOR THE IMPLEMENTATION OF PRECISE TEACHING IN COLLEGE CIVICS COURSES**

The implementation framework of AI-driven precision teaching in college Civics is shown in Figure 1. The six modules in the framework for AI-driven accuracy teaching in college civics are specific learning recognition and portrait, specific teaching content customisation options and push, specific teaching activity design, specific learning monitoring and prediction, specific teaching assessment, and specific teaching choice.

**Figure 1.** Implementation framework of precision teaching

### 3.1 ACCURATE LEARNING IDENTIFICATION AND PROFILING

The foundational task to support the effective teaching of college civics is the precise identification of students' learning circumstances. For a college civics course, it's important to accurately grasp not only the knowledge structure, learning preferences, and general learning status of the students, but also their thought demands and behavioral trends, as well as their thought demands and theoretical needs. It's also important to accurately identify their modes of acceptance and expression. To make accurate identification of students' learning conditions, we must first of all tap into the basic data of the student body. Secondly, we should dig and analyze students' preorder behavior data. Learning behavior data mainly refers to the historical behavior data left by students in the process of both online and offline education, and these data could directly reflect the characteristics of students' antecedent learning behavior. Daily behavior data refers to all kinds of data generated by students in their daily life behaviors, and these data can be used as an aid and reference for learning behavior analysis. Finally, students' thought data should be mined and analyzed. Thought data are scattered in discussions, assignments and student-related social media content, and semantic analysis and text sentiment analysis must be used to mine students' thought dynamics, emotional states and theoretical needs from these implicit texts.

### 3.2 ACCURATE TEACHING CONTENT CUSTOMIZATION AND PUSHING

The modification and distribution of content that accurately reflects the learning preferences of students is referred to as correct content modification and distribution. For example, the content can be customized and delivered at different levels of difficulty according to students' knowledge mastery, and the content can be delivered in different representations according to students' preference of teaching media. When customizing and pushing teaching contents, we should ensure the "three characteristics": firstly, we should ensure the matching of content pushing, accurately grasp the cognitive, ideological and behavioral characteristics of students through learning situation identification, and accurately customize teaching contents according to the characteristics of learning situation. Secondly, we pay attention to the relevance of content delivery, and carefully customize the teaching contents that can really improve students' theoretical knowledge and ideological, political and moral quality. Finally, enhance

the interest of the content itself, and infiltrate the teaching content into the center of teaching media expressions in a form that is pleasing to students.

### 3.3 ACCURATE LEARNING TRACKING AND PREDICTION

Precision education tracking and prediction is the process of accurately recording in real-time the level of learning achieved by both individuals and groups of participants as well as making predictions about their prospective performance and learning habits. An artificial intelligence era, there are a variety of tools and instruments available to capture the various information and data left behind during the teaching and learning process. In a physical classroom setting, data on student learning behaviors, motivations and attitudes can be captured using scales, questionnaires and other devices such as wearable devices and sensors. In the online teaching environment, students' login behavior, resource browsing behavior, question and answer behavior, discussion behavior, assignment submission behavior, etc. can be obtained from the backend system. These collected online and offline data can be statistically analyzed after pre-processing steps, which can present the whole picture of students' learning process in Civics class from different dimensions.

## 4. CURRENT STATUS OF TEACHING ROLES

The education of higher education Civics class is influenced by artificial intelligence technology. The advancement of education through the use of artificial intelligence is shifting to a "student-centered" teaching model, whether it is adaptive learning, intelligent classroom construction, all based on the learning needs of the educated. The implementers of political and ideological education in higher education institutions are civics instructors, thus teachers must adapt to the new educational paradigm. Therefore, the teaching role of the teachers with the application of artificial intelligence will certainly be influenced by the technology. Through the survey, the role perception of teachers on teaching level under the application of AI technology in college Civics class, as shown in Table 1, more than 45% of the surveyed teachers think that the current AI has a greater impact on the college Civics class teaching. Just 8.06% of college civics and political science instructors thought that the impact was less. It indicates that to a certain extent the teachers have clearly perceived the influence of AI technology application, Civics and Political Science at academic institutions are going to be increasingly influenced by AI technology as the interaction between AI technology as well as the design of the educational system gets closer and closer.

**Table 1.** Influence of artificial intelligence on ideologic and politic teaching

	<b>Very large</b>	<b>larger</b>	<b>In general</b>	<b>smaller</b>	<b>no</b>
At present	5.33	40.73	26.48	18.17	9.29
In the future	27.54	37.29	21.24	8.08	5.85

It can be seen that the educational changes triggered by the request of artificial intelligence technology in Civics class have achieved a certain consensus among college Civics teachers' groups. The request of artificial intelligence affects the development of teaching activities of college Civics class, and will also implicitly affect the role of Civics teachers. Therefore, teachers should grasp the development demands of the times of ideologic and politic education, recognize the request of AI technology in Civics class teaching to adjust their roles and promote professional development.

## 5. CONCLUSION

The innovation of Civic Studies under AI technology is different in nature from innovation of traditional Civic Studies. It has produced disruptive changes to educators, educated people, the teaching process, the educational environment and the educational system, which on the one hand has led to an innovation in the concept of teaching talent cultivation, delineating a new level of technological literacy and professional demand for Civics and Political Science education practitioners in Smart Connections era. Nonetheless, it also makes more sophisticated arguments, scientific and even more personalized requirements for the teaching classroom of Civics, thus making the practitioners of ideologic and politic education to re-examine the current teaching system of Civics. Therefore, college Civics should take the initiative to meet the changes of the times and explore the teaching innovation path of Civics in the new era of artificial intelligence.

## **ABSTRACT**

Developing community education under the guidance of the concept of lifelong education is conducive to building an education system that serves lifelong learning for all, promoting the construction of “lifelong learning communities” and the formation of “lifelong learning culture”. In order to promote the sustainable development of community education, it is necessary to practice the concept of lifelong education and lifelong learning, clarify the positioning of community education, realize the parallelism between “top-down” and “bottom-up”, and strengthen the “learning and researcher The construction of a team of “learning researchers”, “instructors” and “lifelong educators”, the promotion of urban and rural community education development with historical, systematic, subjective and differential thinking, the promotion of balanced and coordinated construction of community education experimental and demonstration zones In addition, we will further improve the supervision and evaluation mechanism of community education, and deepen the theoretical research of community education with the construction of community pedagogy as the grip.

## **KEY WORDS**

Lifelong education; Community education; Learning culture; Faculty development; Educational supervision; Educational evaluation

## **1. INTRODUCTION**

Community education has emerged with the needs of the times and has been promoted by the development of society. Especially in the context of today's emphasis on the importance of lifelong learning and efforts to construct a learning society, the concept of promoting lifelong learning has been put into practice and has become a basic way to build a learning society, etc. [1-3]. Obviously, there are still many problems in the development of community education, and there is a large gap between the development of modern urban and rural areas, community education is not practically developed in some areas, and there are not enough teachers and resources for community education, etc. [4]. From the trend of community development and the value of individual survival, the future society is bound to be a learning society, and community education plays an important role in promoting it, and the concept of lifelong learning is one of the important concepts guiding the construction of a learning society [5-6].

This paper conducts an in-depth investigation into the implementation strategies of community education under the concept of lifelong learning. (1) Emphasize the practical value of community education. Specific measures are to take the concept of lifelong learning as the

guide, deeply understand the value of community education, promote the whole society to establish the concept of lifelong learning, promote the lifelong education law, and form a system of community education laws and regulations with consistent values, etc. (2) Clearly delineate the types of community education. The main three types of community education are normative community education, non-normative community education and self-directed community education. (3) Clarify the teaching contents of community education. The content of youth community education, middle-aged and young people community education, and senior citizen community education will be clearly defined.

## **2. THE VALUE IMPLICATION OF COMMUNITY EDUCATION DEVELOPMENT UNDER THE PERSPECTIVE OF LIFELONG EDUCATION**

### **2.1 IT IS CONDUCIVE TO BUILDING AN EDUCATION SYSTEM THAT SERVES LIFELONG LEARNING FOR ALL PEOPLE**

Lifelong education runs through all stages of life development and encompasses all stages and junctures of education. Lifelong education emphasizes the lifelong, universal, comprehensive, compensatory, open and developmental nature of education, which is the mainstream trend of modern education development. The purpose of building a lifelong education system is to promote the integration of various types of formal, non-formal, formal and informal education horizontally and to realize lifelong education vertically to meet the educational needs of different people at different stages of development. As a part of the lifelong education system, community education plays a pivotal role in it. Community education is not an appendage of school education, but a new way of comprehensive educational activities, and to a certain extent, an expansion and extension of school education.

### **2.2 PROMOTE THE CONSTRUCTION OF “LIFELONG LEARNING COMMUNITIES**

Community education led by the concept of lifelong education focuses on the integration of education and life, the interaction between education and life, and the interaction between education and society, reflecting the dynamic balance between educational development and personal development and community building. Community education provides opportunities for non-working people, laid-off workers, and mobile people to re-engage in learning. Secondly, community education creates an open platform for community residents to carry out social interactions and positive interactions. Thirdly, community education plays an important role in the dissemination of scientific knowledge and technology, the improvement of the quality of community residents, the improvement of the physical environment of the community and the construction of the spiritual culture of the community. Finally, in the interaction with school education and family education, community education gradually moves towards lifelong education and integration, and promotes the construction of “lifelong learning communities”.

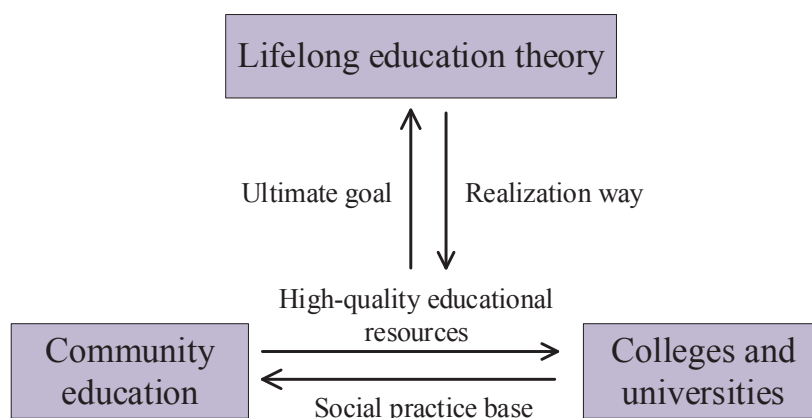

### **2.3 PROMOTE THE FORMATION OF “LIFELONG LEARNING CULTURE**

The formation of lifelong learning culture cannot be separated from the development of community education, and the prosperity of lifelong learning culture will also promote the development of community education. Community education is based on the community and oriented to all members in the community, aiming to promote the development of each member of the community and the benign operation of the community, and provide opportunities for the formation of lifelong learning culture, which is manifested in the formation of the concept of lifelong learning. In the process of community development, community residents are both the means and the purpose of community development, and whether residents have the awareness of lifelong learning depends on the effectiveness of community education, which in turn affects the pace of construction of the whole learning society.

## 2.4 PRACTICAL MODELS OF UNIVERSITY PARTICIPATION IN COMMUNITY EDUCATION

### 2.4.1 MANAGEMENT SYSTEM AND OPERATION MECHANISM OF UNIVERSITY PARTICIPATION IN COMMUNITY EDUCATION

The school is responsible for providing flexible and specific community education services for community residents as shown in Figure 1. Specific operational mechanisms include the establishment of special funds for community education in the district finances, forming a community education guarantee mechanism with government input as the mainstay and street input as a supplement. Strengthen the cooperation between community education and various social organizations and institutions, and form a mechanism of sharing educational resources with universities. Organized the National Lifelong Learning Activity Week and opening ceremony activities, carried out community education achievement display and practice propaganda, and formed a brand teacher and intensive effect. We have established an evaluation and incentive mechanism, and have selected a number of citizens' "learning stars", district-level model communities and experimental streets, model streets, to stimulate residents' enthusiasm and initiative to participate in community education and promote the balanced development of community education.

**Figure 1.** The relationship between colleges and community education

### 2.4.2 PHYSICAL CONSTRUCTION OF UNIVERSITY-ASSISTED COMMUNITY EDUCATION

The Community Education College, which integrates higher education, vocational education and adult education, is sponsored by the district government or educational administrative agencies and plays a leading role in community education. The college has a team of professional teachers and volunteers, and adopts an open and flexible mode of operation to provide residents with various learning activities for community residents, such as skills training for the disabled, skills training for laid-off workers, education for the elderly, leisure education, and education for infants and toddlers, in addition to school education, as shown in Table 1. since its establishment, it has achieved remarkable results and provided community residents with a full range of educational services.

**Table 1.** Community education work plan

Serial number	Job content
1	Complete the outsourcing budget of community education and training funds
2	Submit the outsourcing community education and training project for approval
3	Community education and training project bidding
4	Carry out community education joint supervision and guidance street characteristic project
5	Carry out community learning team incubation
6	Conduct community education lecture halls
7	Part-time teacher training class started
8	Start curriculum development
9	Community awareness programme training
10	Community education grand Prix
11	Community part-time teacher training
12	Collect and collate training and activity data

### **3. BREAKTHROUGH PATH FOR THE DEVELOPMENT OF COMMUNITY EDUCATION IN THE PERSPECTIVE OF LIFELONG EDUCATION**

#### **3.1 INSIGHT INTO THE CONCEPT OF LIFELONG EDUCATION AND LIFELONG LEARNING TO PROMOTE THE HIGH-QUALITY DEVELOPMENT OF COMMUNITY EDUCATION**

First of all, the government should play an important role in community education in terms of planning and guiding support, and make efforts to promote the practice of community education by introducing policies and regulations to promote community education, allocating funds for community education development, and calling for cooperation from other sectors. Secondly, schools should always clarify the position that “schools are schools of the community” and provide learning opportunities for the general public outside the school education system by opening up resources through social services, i.e., school-enterprise cooperation, school district cooperation, and school-school cooperation. Once again, the community should make it clear that lifelong education is initially a product of adult education practice, i.e., a supplementary educational activity for adults seeking careers, and the field of activity is the community. Finally, enterprises, institutions, social organizations and the general public should also take the initiative to participate in community education.

#### **3.2 DEEPEN THE REFORM OF COMMUNITY EDUCATION AND REALIZE THE DOVETAILING OF “TOP-DOWN” AND “BOTTOM-UP”.**

The combination of “top-down” and “bottom-up” community education management mechanism fully takes into account the multiple demands of community education developing countries, communities, schools, enterprises and residents, reflects the basic concepts of people-oriented, lifelong education and lifelong learning, enhances the acceptability, operability and effectiveness of various community education policies in the process of implementation and execution, and is the only way to promote the construction of lifelong education system.

#### **3.3 STRENGTHEN THE CONSTRUCTION OF “LEARNING AND RESEARCHER”, “GUIDE STUDENT” AND “LIFELONG EDUCATOR” TEAMS**

Enhance the awareness and ability of school teachers at all levels and types of schools to volunteer for community education and carry out lifelong educator qualification assessment

and recognition to seek the path of community education teacher team building. School teachers at all levels and types should have the awareness and ability to volunteer for community education. Schools of all levels and types should encourage teachers to carry out scientific research in the field of community education and actively engage in the practice of community education, and account for teachers' community education scientific research and practice into job performance to guarantee the long-term and stability of the partnership.

#### **4. CONCLUSION**

As a new mode of education development, community education is an important form of lifelong education to meet the material civilization and spiritual culture needs of community residents, to guarantee their right to lifelong learning, to promote the role of residents as subjects, and to promote the construction of a harmonious society. It has the characteristics of education for all, comprehensive education and full education, and with the development of practice, its connotation has been enriched, and the content of community education has become more diversified and personalized. Universities, as part of the community, rely on their teaching equipment resources, human resources, cultural resources and other educational resource advantages to actively participate in community education and develop their own community education practice models through continuous practice summaries.

## ABSTRACT

Internet literacy is an important influencing factor of online culture ecology, and it has become an inevitable and important proposition for higher education institutions to strengthen college students' information quality cultivation and guide them to use the Internet correctly. This paper takes college students as the research object, discusses the problems of college students' Internet use based on the analysis of college students' online behavior big data, and proposes clear requirements and educational guidance programs from the perspectives of curriculum design, management services, Internet culture, assessment mechanism and educational philosophy, so as to provide theoretical support and experience reference for the cultivation of college students' Internet literacy in colleges and universities. Analyzing the overall level of youth Internet literacy, the average score of each dimension exceeds the passing mark of 3. Among them, the Internet norms application dimension and the critical and dialectical literacy dimension have exceeded 4 points, which are relatively close to the good level. Thus, the enhancement path has a practical effect.

## KEY WORDS

Network literacy; Big data; Curriculum design; Management services; Network culture; Assessment mechanism

## 1. INTRODUCTION

Network literacy is an individual's ability to creatively solve complex problems in the real world with the help of network tools, which emphasizes both the individual's cognitive level and ability to use the network, and also focuses on people's moral cultivation and behavior in the process [1-2]. With the advent of the Internet era and the increasingly close connection between the Internet and society, network literacy has become a basic literacy that everyone should have, and colleges and universities have a great responsibility in improving college students' network literacy [3]. The big data of college students' online behavior, i.e. the information data generated by college students' activities on online platforms, is precisely the objective expression of college students' thoughts and feelings, values and behaviors [4-5]. Literature [6] proposed to explore flexible and diverse learning methods, build a multi-level learning carrier platform, give full play to the role of the second classroom in network security

education, use multimedia means to carry out network security publicity and education activities, use typical cases to do network security theme meetings, invite experts in network security to carry out expert forums, and implement diversified forms of network security education.

In order to provide powerful support for universities to grasp college students' Internet literacy and formulate improvement strategies. This study adopts distributed deep web crawler technology, combined with data mining technology crawling plus manual sorting and coding, to obtain a total of 31684245 data from internet sites, news and information APPs, WeChat public numbers, microblog accounts, etc., and strives to outline the current situation of college students' online literacy scientifically and objectively through the in-depth insight of college students' online behavior big data The "digital picture".

## **2. STRATEGIES TO IMPROVE COLLEGE STUDENTS' INTERNET LITERACY**

As the main place of college students' education, colleges and universities should give full play to the nurturing function of curriculum design, management service, network culture and assessment mechanism to form a nurturing pattern for the healthy development of college students' network concept and behavior, and promote the network literacy training of college students on the ground.

### **2.1 SYSTEMATIC CONSTRUCTION OF NETWORK LITERACY EDUCATION CURRICULUM SYSTEM TO PROMOTE THE COGNITION AND PRACTICE OF CORRECT USE OF THE INTERNET**

Cognitive education plays an irreplaceable role in network literacy education. In view of the lack of judgment and participation of some college students in the face of network public opinion events, colleges and universities need to establish a network literacy education curriculum system to promote network literacy education. Integrating network literacy education into public courses has high popularity and operability. Themed class meetings and lectures can be combined with the courses of ideological and moral cultivation and legal foundation, computer foundation, etc. Teachers can promote students' deep understanding of the phenomenon of network misconduct through vivid forms such as cases and seminars, and promote their compliance with Internet usage norms. School network literacy education cannot be separated from the compilation of systematic professional teaching materials. Colleges and universities can purposefully and systematically explore the compilation of Internet literacy education course materials adapted to different stages of college students.

### **2.2 STRENGTHEN THE ROLE OF OPINION LEADERS' NETWORK LITERACY ROLE MODELS AND ORGANIZE COMMUNICATION ACTIVITIES TO ACHIEVE POSITIVE GUIDANCE**

As an authority on the Internet, the views and evaluation of opinion leaders will become the gate map of the direction of public opinion. Colleges and universities cultivate opinion leaders to publish various rational and diversified information on the Internet to attract the attention and interaction of college students, which can help guide the public opinion sentiment in a positive direction by making objective analysis based on the event itself and multi-dimensional and all-view interpretation when the college students are unaware of the truth or the group is outraged. The current college student group has a high sense of discernment, so colleges and universities can provide a place to express their opinions by carrying out book clubs and thematic meetings, so that students can have a dialogue of opinions in reality. At the same time, colleges and universities can invite teachers who have good evaluation in student groups to participate in exchanges, guide students to think and discuss rationally, and remind students

of the precautions of expressing opinions on the Internet when concluding speeches to realize positive guidance.

### **2.3 IMPROVE THE NETWORK SUPERVISION AND EMOTIONAL DIVERSION MECHANISM, SO THAT THE EXPRESSION OF DEMANDS AND VIEWS TEND TO RATIONAL AND STANDARDIZED**

Students' words and actions on the Internet are the mapping of their thoughts and real problems. Universities should pay great attention to students' mentality and demands, and grasp the psychological changes of students. Colleges and universities should build psychological guidance mechanism, set up psychological commissioners in classes, find out ideological problems at an early stage and provide psychological comfort and care, and coordinate the life and study problems faced by college students in special periods and help them with precise measures. By building a platform for expressing the interests of college students, college students can have the opportunity to express their needs and release their negative emotions through normal channels. By building a platform for expressing the interests of college students, college students can have the opportunity to express their needs and release their negative emotions through normal channels, so that the Internet will not become a place to vent their extreme opinions. Colleges and universities should improve the utilization of information data, analyze the hot topics that college students care about and their online participation behavior, and improve the perceived relevance of students' online behavior.

### **2.4 CONVEYING THE VALUE OF NETWORK EMPOWERING REALITY AND ENCOURAGING THE CREATION AND DISSEMINATION OF EXCELLENT NETWORK CULTURAL WORKS**

The Internet is an extension and refraction of the real society, and college students should have boundaries for their words and actions on the Internet, and should not vent their emotions freely. In order to enhance college students' network subject consciousness and improve students' motivation of using network, colleges and universities should pay attention to guiding college students to correctly understand the relationship between network and society, establishing the incentive mechanism of "promoting construction by network", guiding college students to be more rational and civilized in "network practice". Use the Internet to understand and spread information. Colleges and universities can make a convention on Internet civilization, guide students to pay attention to the value judgment and critical use of information, encourage students to express their opinions or views objectively and with evidence, and cultivate "four-haves" Internet users with high security awareness, civilized Internet literacy, law-abiding behavior habits and necessary protection skills. Students are encouraged to share or write positive and valuable online comments through online communication on social hot topics and online creation activities, so as to build a clear and clean campus online culture and play the role of peer role models to create a civilized, healthy and orderly online environment.

### **2.5 DEVELOP A DYNAMIC EVALUATION PROGRAM FOR THE CURRENT SITUATION OF INTERNET USE TO PROMOTE INNOVATION IN INTERNET LITERACY EDUCATION.**

Internet literacy of college students is a development process, with the change of Internet environment, as well as the growth of college students' knowledge degree, media demand and change of Internet habits, new characteristics and new needs will be formed in stages. Therefore, the cultivation and improvement of college students' Internet literacy is not temporary and static, but long-term and dynamic, and is a process of continuous development and improvement in practice. Evaluation is the means to test the effect of network literacy education, and it is also a powerful measure to promote the standardization of network literacy

education of college students and continuously improve the level of network literacy education. In order to improve the ability of network education, universities need to strengthen the coordination, establish the systematic and long-term cultivation goal of network literacy education, continuously expand and deepen the angle of data analysis, and more accurately. In order to improve network literacy education, universities need to strengthen the coordination, establish systematic and long-term cultivation goals, expand and deepen the angle of data analysis, more accurately grasp the situation of students' Internet use, examine the effectiveness of network literacy cultivation, continue the beneficial experience and break the path dependence with the times, research and develop more targeted and precise cultivation methods, and gradually form a joint mechanism of education guidance and students' self-improvement.

### 3. ANALYSIS OF COLLEGE STUDENTS' INTERNET LITERACY

As shown in Table 1, the overall mean score of the Internet Literacy Scale for college students was 3.91. Among the four dimensions of the scale, the mean score of the Internet Basic Knowledge dimension was 3.72, the mean score of the Internet Norms Application dimension was 3.98, the mean score of the Social Interaction and Collaboration dimension was 3.75, and the mean score of the Critical and Dialectical Literacy dimension was 4.27. The average score of the application dimension was the highest and the average score of the basic knowledge dimension was the lowest. If the median is used as the evaluation criterion, the results are similar to the mean, and the ranking of the dimensions does not change. This indicates that the standard deviation of the sample data is within a reasonable range and the data can effectively reflect the real situation. The Internet literacy questionnaire for college students uses a 5-point Likert scale with a minimum score of 1 and a maximum score of 5 for each question item. If the more accepted value of 60% is used as the passing standard, then the passing line of the questions should be 3 points. Based on this criterion, it can be seen that the overall average score of youth Internet literacy as well as the average score of each dimension exceeds the passing mark of 3. The higher scores for the Internet norms and critical and dialectical literacy dimensions exceeded 4, which is close to the good level.

**Table 1.** Average score of Internet literacy scale for college students

name	Sample size	Minimum value	Maximum value	Average value	Standard deviation	median
Adolescent Internet literacy	964	1	5	3.91	0.66	4.10
Basic knowledge of network	964	1	5	3.72	0.70	3.19
Network specification application	964	1	5	3.98	0.90	4.31
Social interaction and collaboration	964	1	5	3.75	0.81	3.78
Critical and dialectical literacy	964	1	5	4.27	0.68	4.10

### 4. CONCLUSION

Based on the analysis of college students' online behavior, this paper explores the problems of college students' online use and proposes clear requirements and educational guidance programs from the perspectives of curriculum design, management services, online culture, assessment mechanism and educational philosophy, so as to provide theoretical support and experience reference for the cultivation of college students' online literacy.

In the analysis of college students' Internet literacy, the average score of college students' Internet basic knowledge dimension is 3.72, the average score of Internet normative application dimension is 3.98, the average score of social interaction and collaboration

dimension is 3.75, and the average score of critical and dialectical literacy dimension is 4.27. Among them, the average score of Internet normative application dimension is the highest and the average score of Internet basic knowledge dimension is the lowest.

## ABSTRACT

In the context of big data, the article makes a relevant feasibility analysis from the bottleneck of the development of personalized information service in colleges and universities. Further, it proposes the personalized information service model of college libraries, and also suggests that the process of personalized information service of college libraries needs to pay attention to the problems of users' privacy and data source constraints, which requires the application of Web data mining technology to target the target group at the technical level. College libraries should learn from the experience and lessons of domestic and foreign libraries in carrying out socialization services, combine their own advantages and characteristics, and actively promote the practice and exploration of their socialization services.

## KEYWORDS

Big data; University library; Feasibility analysis; Personalization; Information service system; Advantages; Data mining

## 1. INTRODUCTION

In recent years, domestic university libraries have devoted themselves to the development of personalized information service, which has been widely praised by teachers and students in universities as an emerging service mode with clear information orientation, strong service targeting and convenient use [1-2]. With the widespread promotion of personalized information service, how to adjust the information service strategy in real time according to the changing information demand situation of users and better reflect the "personalized" characteristics of information service has become an urgent problem for the development of personalized information service [3-4]. Through the targeted mining and analysis of these massive data, the current information situation of users can be truly reflected, and then provide reference for libraries to carry out personalized information services [5-6].

The paper [7] investigated 39 "985 Project" university library websites, and investigated the personalized information service of libraries in three aspects: library network interaction, library recommendation service and mobile library service. The paper [8] analyzed the problems of university library informatization construction from the current situation of university library informatization construction and proposed countermeasures based on big data informatization theory.

This paper analyzes the feasibility of establishing personalized information service system in college libraries under the big data environment, constructs a model of personalized information service system in college libraries and elaborates the functions of the model in view of the shortage of personalized information service in college libraries at present. It

ensures that the library information service system meets the access needs of school users, conforms to the objective logic of long-term development of library informationization, and improves the satisfaction of student groups.

## **2. FEASIBILITY ANALYSIS OF BUILDING PERSONALIZED INFORMATION SERVICE SYSTEM**

### **2.1 EXISTING SYSTEMS ARE INADEQUATE IN ANALYZING USER REQUIREMENTS**

#### **2.1.1 NON-REAL-TIME NATURE OF USER MODELING**

The existing personalized information service system obtains users' needs in a traditional way, and the results obtained will inevitably have certain deviations, because the existing personalized information service system obtains information needs by questionnaire or online interview, which itself is subject to whether the design of the questionnaire is reasonable, whether the user's expression is clear, and whether the user will be reluctant to cooperate for the protection of their privacy. This is subject to whether the design of the questionnaire is reasonable, whether the user's expression is clear, and whether the user is unwilling to cooperate out of privacy protection. The implementation of personalized information services based on these biased information demand results by university libraries is difficult to achieve the expected results.

#### **2.1.2 LACK OF SERVICE TARGETING**

Looking at the existing personalized information service system of university libraries, there are generally problems of disconnection with users' demands and low accuracy of service. The root cause is that the existing personalized information service system of university libraries cannot obtain users' information demands at any time, so it cannot adjust the service strategy anytime and anywhere according to the real-time users' demands. Unlike public libraries, university libraries mainly serve university teachers and students. Many factors lead to the inability of university libraries to obtain users' demands in real time and adjust the service contents according to the changes of teaching, learning progress and research tasks of teachers and students, which directly affects the relevance of personalized services of university libraries.

## **2.2 THE NEED FOR A PERSONALIZED SYSTEM THAT ANALYZES USER NEEDS**

### **2.2.1 REAL-TIME PERCEPTION OF USERS' INFORMATION NEEDS**

For university teachers and students, university libraries play the role of "information hub". When they have information needs in scientific research, teaching and study, they often use libraries and network for self-service of information resources. In the process of borrowing books, searching bibliography and downloading electronic resources, teachers and students in universities will generate a large amount of information behavior data, and library personnel can easily obtain the real-time information needs of users through in-depth mining and analysis of these behavior data. These data have very important reference value for personalized system to accurately analyze real-time user information needs.

### **2.2.2 HIGHLY DIFFERENTIATED TARGET GROUPS**

The primary challenge facing the personalized information service system of university libraries is to identify the target users. The system needs to track users' changing information needs and information acquisition behaviors at any time and anywhere, and analyze them, so as to target the target group and make accurate information pushing, which requires the application of Web data mining technology in the technical level. Due to financial constraints, the main service targets of university libraries are students and teachers, and the target group

is generally easy to identify, because most students and teachers have completed personal registration procedures in the library, and even if they use the intranet to access network resources outside the library, their computer IP addresses have been recorded in the campus network center.

### **3. PERSONALIZED INFORMATION SERVICE SYSTEM CONSTRUCTION**

#### **3.1 SYSTEM CONSTRUCTION OBJECTIVES AND MODELS**

The personalized information service system is based on the information service platform of university library, acquiring user usage traces and user retrieval records through different data warehouses, and applying Web data mining technology to obtain relatively accurate user information demands at this moment so as to complete the push service of university library information resources in a targeted manner. The goal of the personalized information service system model is to obtain users' real-time information needs, and its functions include integration and standardization of data, data analysis and information pushing.

#### **3.2 PERSONALIZED INFORMATION SERVICE SYSTEM MODULE FUNCTION**

##### **3.2.1 DATA INTEGRATION MODULE**

This module is mainly to prepare for the next step of data normalization. At the logical level, this module centralizes systematically the data records obtained from various sources with different formats and meanings. The information behavior data of university teachers and students are scattered in the information system of university library, the database of electronic resources in the collection and the campus network, etc. The data integration module is to finish the work of linking all these scattered data.

##### **3.2.2 DATA NORMALIZATION PROCESSING MODULE**

The flowchart of this module is shown in Figure 1, and the main purpose is to standardize the processing of the data integrated in the previous step to make it suitable for data analysis related algorithms.

###### **(1) Synthesis of records**

The automated systems used by university libraries are provided by various software developers, and the format and form of data representation in the databases of the systems to which they each belong are different, so it is necessary for university libraries to synthesize accordingly.

###### **(2) Data statute**

The purpose of this function is to unify the data with the same meaning but different identification names, in order to maximize the clarity of data management and remove obstacles for accurate data analysis.

###### **(3) Data cleaning**

The purpose of this module is to achieve the removal of noisy data, contaminated data, and incorrect or inconsistent data.

###### **(4) Data Transformation**

This module mainly transforms data in various formats into the data format required for the next information analysis algorithm in a unified manner.

**Figure 1.** Data normalization processing module flow

### 3.2.3 INFORMATION ANALYSIS MODULE

In the process of acquiring and utilizing information resources, students and faculty in higher education produce three formats of information: structured, semi-structured, and unstructured information.

#### Structured information

When users receive information services provided by university libraries, the corresponding database will store the relevant records in a tabular form, i.e. in a structured data format, in the process of the library's response to user information inquiries and feedback on the services submitted by users, and then this part of data is handled by the structured data analysis module.

#### Semi-structured information

When a user sends a request for information to a social network such as WeChat's circle of friends through a mobile terminal, this part of the data is processed by the mobile information analysis module. The purpose of the structured information analysis module is to refine the data into "granular" units according to different user information behaviors, so as to accurately distinguish the differences in information needs between different users' approximate information behaviors.

#### Unstructured information

Figure 2 shows the flow of web log analysis module. When users send information requests to social networks such as WeChat friend circle through mobile terminals, this data is processed by the mobile information analysis module. The web log analysis module analyzes the usage traces of users' access to the Internet to obtain their real-time information needs. After processing, the model yields user access logs as shown in Table 1. The user information behavior of the Internet has certain characteristics, if a user visits a page more frequently or stays longer, it reflects from one side that the page is very important to that user. To complete the effective docking of university library information resources and users' mobile terminals for users' hobbies.

**Figure 2.** Network log analysis module process

**Table 1. User Access Log**

Field name	Field value (example)	Comment resolution
Cookie	XXXXXX	Cookie Relevant information recorded in
Visit Frequency	36	Statistics of visit frequency of a page
Time taken	5M	Time spent by the user on the relevant page
channel	CET	Client
Time	5/36/2016	Access time
CRI inquire about	XXXXXX	The string used by the client to search
Access page	/lib/html	Page information visited
Response code	300	Status code returned when accessing the page
IP	196.1.XX.XXX	Locating users through computer IP

#### 4. CONCLUSION

Under the big data environment, the university library information service has generated a huge amount of user information behavior data. The author has designed a personalized information service system model for this purpose and completed the preliminary research work from the theory, but how the university library can coordinate deeply with the relevant network operators and reach an agreement on privacy protection with the users needs to be revised in practice many times in the future work to finally improve this personalized information service system.

# THE CONSTRUCTION OF EVALUATION SYSTEM IN COLLEGE HYBRID ENGLISH TEACHING MODEL BASED ON BIG DATA PLATFORM

---

Ying Yang\*

Tianping College of Suzhou University of Science and Technology, Suzhou, Jiangsu,  
215000, China

[Jemma\\_only@126.com](mailto:Jemma_only@126.com)

---

## ABSTRACT

In the traditional college English teaching model, there are many problems in the evaluation system, such as ignoring students' subject status in learning, the lack of scientificity and flexibility in assessment and inadequate evaluation of learning process, etc. These factors reduce the effectiveness of teaching evaluation to some extent. Based on the big data platform, this paper actively explores and constructs an evaluation system in college hybrid English teaching model, in the hope of helping promote the overall development of students and the reform of college English teaching. To help teachers and students improve their work in college, the evaluation of English teaching must be multi-perspective and diversified in both online and offline classes. The evaluation should also be formative and summative in hybrid English teaching model, which is conducive to cultivating autonomous learners.

## KEYWORDS

hybrid English teaching model; evaluation system; multi-perspective; diversified evaluation; summative evaluation; formative evaluation; evaluation indicators

## 1 INTRODUCTION

College English teaching is now facing new challenges based on big data platform. Massive open online courses and micro-lectures are shared on the Internet, mobile learning applications for English springing up like mushrooms and almost every student in college owns a smart phone or a tablet computer. This situation makes it possible for students to learn English anytime and anywhere. The hybrid teaching model or the blended learning model, which organically combines network information technology and traditional classroom teaching, has become the new trend of college English teaching in this background [1]. Scholars home and broad have researched

on the model from various perspectives. Hu Jiehui probes into the evolution of Blended Language Learning (BLL), analyses the multi-layer BLL construct and points out that the future research needs to adopt an evidence-based approach to address key issues of learning mechanism, evaluation and system design, aiming to promote the development of BLL with Chinese characteristics [2]. Yang Fang, Wei Xing and Zhang Wenxia explore the practical use of blended teaching approach in EFL teaching and analyzes the unique characteristics of the teaching model in the course—English Communication in Daily Life [3]. Yen and Lee present a blended learning environment combining mobile learning, web-based learning and classroom teaching to provide realistic and practical opportunities for learners and teachers to engage in problem solving activities [4]. Among all the researches, the evaluation system in hybrid teaching model, however, hasn't received much attention. Evaluation, as is known, is a critical factor in learning and teaching. A comprehensive, objective, scientific and effective evaluation system helps both teachers and students improve their work. Therefore, to explore the learning evaluation system in the college hybrid English teaching model is urgent and pressing.

## **2 THE MAIN PROBLEMS IN CURRENT COLLEGE ENGLISH TEACHING EVALUATION SYSTEM**

The evaluation system is a crucial part in the promotion of college English education. There are still problems, however, in today's college English teaching evaluation system.

### **2.1. IGNORING STUDENTS' SUBJECT STATUS IN LEARNING**

In the traditional college English teaching evaluation system, one of the biggest problems is that students' principal status hasn't received enough attention and the evaluation of learning is mostly from teachers' perspective. The learning theory of Constructivism emphasizes that knowledge is not taught by teachers, but by learners in certain situations through the way of meaning construction with the help from teachers and companions. Students play a central role in the management of their language study. Their own reflection on study combined with teachers' guidance and the interaction with their partners play an important role in promoting their own knowledge construction [5]. The evaluation from teachers alone ignores students' principal role and thus should be replaced with multi-perspective appraisal.

### **2.2. THE LACK OF SCIENTIFICITY AND FLEXIBILITY IN EVALUATION**

In current college English education, the evaluation system is mostly result-oriented, in which English test scores are most important indicators. Many teachers consider the scores of periodical achievement tests as the only criterion in evaluation. For example, the scores of the final exams in each semester, the scores of College

English Test (Band 4 and 6) and the scores of Test for English Majors (Band 4 and 8) are the most valued. The evaluation of test scores, however, is a quantitative way to assess student learning, while the qualitative method is often ignored. Taking scores as the only indicator for evaluation is not reasonable and flexible, which is simple and not conducive to students' individual development, for students' performance and participation in class cannot be reflected truly. To be scientific in assessment, it is necessary to adopt both quantitative and qualitative means.

### **2.3. INADEQUATE EVALUATION OF LEARNING PROCESS**

In college English learning, students show individual differences and thus their English level varies. In the learning process, each learner shows his or her individual character, emotion, attitude, interest and learning efficiency, which cannot be totally manifested in test scores. Scores of the final exams cannot fully indicate students' hard work in the whole semester. Result-oriented evaluation gives poor feedback for the process of learning, which will not only reduce learners' enthusiasm, but also discourage them in English learning. On the contrary, the full assessment of individual learning process can well reflect learners' effort and exertion in their exploration of knowledge and construction of meanings. From this perspective, diversified evaluation methods can effectively mirror learners' performance in study and thus encourage them to be autonomous learners.

## **3 THE EVALUATION SYSTEM IN COLLEGE HYBRID ENGLISH TEACHING MODEL BASED ON BIG DATA PLATFORM**

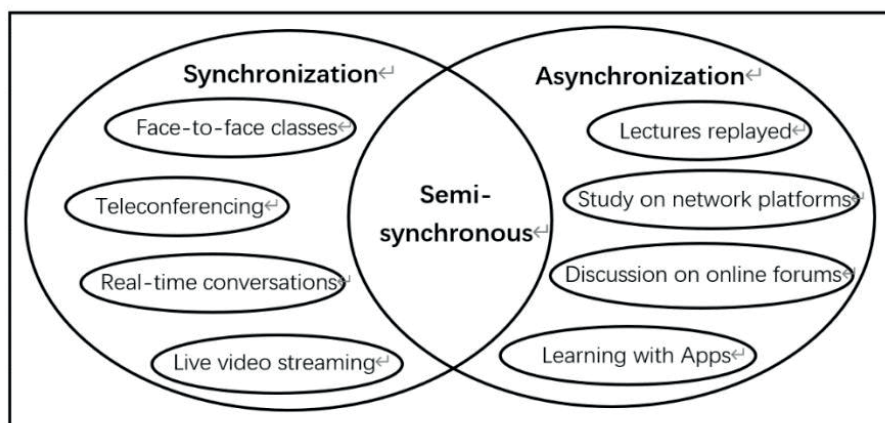

To construct effective evaluation system in hybrid English teaching model, it is necessary to learn the features of the hybrid teaching model in terms of time. Also, the exploration of different assessments is necessary.

### **3.1. TEMPORAL CHARACTERISTIC OF HYBRID TEACHING MODEL**

The hybrid teaching model or the blended learning model, being intermediate between traditional face-to-face teaching and online teaching, is both synchronous and asynchronous. Anders Norberg holds the view that blended learning is a combination of modern media, communication modes, times and places in a new kind of learning synthesis in place of traditional classrooms and technology with the teacher serving as a facilitator of a collective learning process. He proposes a new model of blended learning in which physical teaching environments give way to time. Time and synchronicity become the primary elements of the learning environments. [6].

Figure 1 shows the time and synchronicity in blended learning model. The blended learning model divides time into two main dimensions: the synchronous (face-to-face classes, live video streaming and real-time conversations online, etc.) and the

asynchronous (watching lectures replayed, study in network platforms and learning with Apps, etc.).

**Figure 1.** Synchronization and asynchronization in blended learning model

### 3.2. FORMATIVE AND SUMMATIVE EVALUATION

Since it is synchronous and asynchronous in the blended learning model, the formative evaluation and summative evaluation are necessary in hybrid teaching model, which consist of the evaluation system in teaching [7]. Formative evaluation focuses on students' learning process, which is a comprehensive assessment of students' performance, the results of students' tests, the development of students' emotion, the attitudes and strategies of students in learning. The information from formative assessment provides teachers and students feedback on their work, being helpful and effective both in teaching and learning [8]. Summative evaluation, however, usually comes after a period of study. The mid-term examination and the final examinations both belong to summative evaluation. Summative evaluation let teachers know students' learning achievements after a period of study. Students' performance in the learning process, however, cannot be provided in summative evaluation.

In hybrid teaching model, students attend class on and off the line, taking part in different learning activities, synchronously or asynchronously. In this situation, the combination of both formative and summative evaluation is more reasonable and logical.

### 3.3. THE CONSTRUCTION OF EVALUATION SYSTEM IN COLLEGE HYBRID ENGLISH TEACHING MODEL BASED ON BIG DATA PLATFORM

Today, lots of network learning platforms and some English leaning applications are well applied in college English teaching. The hybrid teaching model is widely accepted in college education, but the problems in traditional college English teaching also exist in hybrid English teaching, which calls for higher request in evaluation. To

construct a scientific evaluation system, comprehensive, multi-perspective and diversified evaluation methods should be adopted and taking advantage of the big data platform is instrumental.

### **3.3.1. EVALUATION IN STUDENTS' PREPARATION FOR NEW LESSONS**

Preparation for new lessons is an important link in college English teaching. Teachers could assign students different tasks to preview a new lesson. In the preparation for the new lesson, students can improve their autonomous learning ability. Based on the Flipped Class Model, students are usually provided with videos focusing on key points and difficulties in the texts to learn. They are required to study the texts by themselves with the help of the videos and then they come to the classroom with their own understanding and questions of the texts, to join in the interaction and discussion in class. [9] The preparation, in this way, is asynchronous and the evaluation must be formative. Teachers could take full advantage of the big data platform to help construct effective evaluation system. Diversified evaluation methods could be adopted for different learning tasks in this step. Students' learning activities on network platforms can be examined and evaluated online. The data collected make it possible for teachers to supervise and assess students' learning process. The network learning platforms and various learning applications are useful since almost all of them can provide channels for teachers to communicate with students. This makes it possible for teachers to give evaluation and gain the feedback from students, which in turn helps teachers to find out students' problems in the learning process and adjust the teaching plan timely.

### **3.3.2. EVALUATION IN OFFLINE FACE-TO-FACE CLASSES**

Evaluation in synchronous classes like traditional face-to-face class is an important part of students' comprehensive assessment. Teachers ought to effectively evaluate students' whole classroom performance instantly, while students need to give their feedback immediately. In this way, the learning and teaching process can be evaluated together, which enable both the teachers and the students to find out their deficiencies in class and correct them in time. To make the assessment efficient, teachers should adopt comprehensive and multi-perspective evaluation methods for various learning activities in class, which includes English presentations, public speeches, interviews, debates, dramas and so on. In carrying out these activities, the evaluation must be multi-perspective. Self-assessment is the first step, which helps students find the gap between English learning status and goals. Peer assessment is also crucial. In group work and pair work, students can get feedback from their partners, which is another way to help students find out the problems in learning English. Teachers' evaluation is at the core of evaluation system. Immediate and high-quality

feedback from teachers is conducive to the cultivation of autonomous learners.

### **3.3.3. EVALUATION IN REFLECTION AFTER CLASS**

Reflection after class is critical for students in English learning. By reflecting on what they've done and how they've performed in classes, students can evaluate how much they've learned in class. The big data platform makes the reflection more efficient and valid since almost all the activities can be recorded on the network platforms. With the data provided from the platforms or some learning Apps, students can write their own learning journals, in which they can effectively assess their study in a phase. The data could help them spot their learning problems and adjust the learning strategies. The teachers could also analyze the data provided, read students' journals and make digitalized learning portfolios for students. In this way, the evaluation system is more reasonable and scientific.

### **3.3.4. EVALUATION INDICATORS IN COLLEGE HYBRID ENGLISH TEACHING MODEL**

Since both formative and summative evaluations are necessary in hybrid teaching model, appropriate evaluation indicators for college English teaching model are needed. Table 1 shows the evaluation index system of the hybrid English teaching model. In the index system, class attendance, class participation, presentation, completion of assignments, quiz, the scores of mid-term exams and final exams are all important indicators in different proportions. Except the scores of the exams, the indicators can be evaluated in both online and offline classes and belong to the category of formative evaluation. Methods of summative evaluation, of course, are essential here. Scores of periodical achievement tests belong to the category of summative evaluation, accounting for 50% in the whole evaluation system. The new evaluation index system of the hybrid English teaching model is rational and logical, which will motivate students' interest and enthusiasm in learning English, encouraging them to be efficient and active learners.

**Table 1.** The evaluation index system of the hybrid English teaching model

Item	Class attendance	Class participation	Presentation	Completion of assignments	Quiz	Mid-term exam	Final exam
Percentage (100%)	5	10	10	15	10	10	40
Types of classes	Online/ offline class	Online/ offline class	Online/ offline class	Online/ offline class	Online/ offline class	offline face-to- face class	offline face-to- face class
Time and synchronicity	Synchronous/asynchronous	Synchronous/ asynchronous	Synchronous/ asynchronous	Synchronous/ asynchronous	Synchronous/ asynchronous	Synchronous	Synchronous
Category of evaluation	Formative evaluation	Formative evaluation	Formative evaluation	Formative evaluation	Formative evaluation	Summative evaluation	Summative evaluation

#### 4 CONCLUSION

The rapid progress in computer network technology today has brought new opportunities for college English teaching. The hybrid teaching model, in which the evaluation system should be emphasized, contributes to the fast development of English education. In construction of the evaluation system, both formative and summative evaluation should be adopted, quantitative and qualitative assessment included. Multi-perspective and diversified appraisal measures as well as various evaluative indicators should all be considered. The evaluation methods adopted, however, ought to be based on the features of classes and the learning platforms to meet individual need in learning. It is not easy to construct a comprehensive evaluation system in practice, and to work on it needs every effort. With the development of hybrid English teaching model, the evaluation system is to be intellectualized and systematic.

[zjyaoy@126.com](mailto:zjyaoy@126.com)

---

## ABSTRACT

In the background of the era of artificial intelligence, information technology has to a certain extent promoted the development of educational innovation mechanism of ideological and political courses in colleges and universities, however, there are also more problems in the practical application, such as over-reliance on technology and chasing technical equipment and other phenomena. In order to avoid the phenomenon of alienation and promote the deep integration of the ideology and politics curriculum with information technology, we must comprehensively improve teachers' information technology literacy and optimize the design of teaching methods. Ensuring that information technology can accurately dovetail with course content fundamentally enhances the effectiveness of teaching Civics courses. This study promotes the innovative development of the integration of the teaching of Civics and Modern Information Technology in colleges and universities in the new era, enhances the affinity and relevance of ideological and political education, and meets the needs and expectations of the growth and development of college students in the new era.

## KEY WORDS

information technology; educational innovation mechanism; college students; Civics course; deep integration

## 1 INTRODUCTION

The 19th Party Congress made a major judgment that socialism with Chinese characteristics has entered a new era, which opened a new journey to accelerate the modernization of education and build an educational power [1-2]. The Education

Informatization 2.0 Action Plan released by the Ministry of Education in April 2018 states: Education informatization is the basic connotation and distinctive feature of education modernization, and the Education Informatization 2.0 Action Plan is an effective way to accelerate the realization of education modernization [3-4]. Education informatization has the unique advantages of breaking through time and space limitations, rapid replication and dissemination, and rich presentation means, which will definitely become an effective means to promote educational equity and improve educational quality, and will become a powerful support to build a ubiquitous learning environment and realize lifelong learning for all people, and will bring about a significant improvement in scientific decision-making and comprehensive governance capacity of education [5-6].

The literature [7] summarized the characteristics and shortcomings of the current research on curriculum thinking and government, and then proposed four innovative paths in terms of strengthening the internalized research on curriculum thinking and government, expanding the multidisciplinary perspective of curriculum thinking and government research, promoting the systemic nature of curriculum thinking and government research, and innovating the practical application of curriculum thinking and government research results.

In the literature [8], under the guidance of "three comprehensive education", the information technology-based "curriculum thinking politics" in university English builds an ecosystem of foreign language curriculum thinking politics from the aspects of teaching concept, teaching mode and strengthening of thinking politics, and realizes the three elements of curriculum, thinking politics and information technology. This paper focuses on cultivating students' ideological and political literacy.

The main purpose of this paper is to promote the development of the innovative mechanism of the integration education of students' thinking and politics courses and information technology with the orientation of cultivating students' ideological and political literacy, mainly to meet the requirements of society and enterprises on the ideological and political values of talents, to highlight the main position of students in teaching based on the scientific attributes of students' thinking and politics courses and information technology, to implement the practical teaching link into each course, and to improve students' ideological and political quality and ability. political quality and ability.

## **2 STRATEGIES FOR THE DEEP INTEGRATION OF EDUCATION AND TEACHING IN HIGHER EDUCATION CIVICS AND MODERN INFORMATION TECHNOLOGY**

### **2.1 HIGHLIGHTING THE CONNOTATION AND LEADERSHIP OF TEACHING IDEAS**

The high degree of integration of college Civic and Political Science courses with modern information technology must adhere to the people-oriented concept and effectively deal with the relationship between the subject and carrier, the whole and the part between the integration of the two. It can show the content of college Civic and Political Science education through information technology. By applying modern information technology, it can enhance the infectious and expressive power of teaching contents, however, the charm of Civic and Political Science theory will directly affect the effect of the integration of Civic and Political Science education and modern information technology. The content of Civic and Political Science teaching not only includes theoretical knowledge, but also should focus on the transmission of mainstream values. Focus on value leadership in the process of knowledge teaching, deal with the relationship between systematic learning and fragmented learning, and reasonably control the application of real classroom and virtual classroom.

### **2.2 INSIST ON THE TEACHER'S CLASSROOM LEADERSHIP AND GUIDANCE**

Teachers should give full play to their leading and guiding roles in carrying out teaching activities, and the above factors are factors that have an important impact on the integration of Civic and Political Science courses with information technology. Under the background of information technology development, teachers should always carry out teaching activities around students and improve their ideological and moral level and cultural literacy comprehensively. Teachers not only need to impart theoretical knowledge in teaching activities, but also should design and organize teaching tasks that can gradually guide students to participate in teaching activities. In the process of rapid development of artificial intelligence technology, the challenges facing the education of Civic and Political Science courses are mainly fast food and fragmented knowledge, which can help improve students' thinking and discernment ability through emotional communication between teachers and students.

### **2.3 IMPROVING TECHNICAL SKILLS AND OVERALL LITERACY IN THE CLASSROOM**

By improving the technological literacy of educational product development and management personnel, it helps to promote a high level of integration between college and university civic education programs and information technology. Since technology

has social and natural attributes, users cannot change the physical structure of technology, however, they can realize social functions through technological creativity. Information technology can not only change the original educational environment, but also establish a new educational ecology, so the constructive and deconstructive ability of information technology must be given full play, so that the positive value of information technology can be brought into play. Technology can not only play the role of a medium, but also has certain educational functions. So it is that we should actively participate in the training activities of modern information technology design and application capabilities, comprehensively strengthen teachers' awareness of the integration of curriculum education in the field of information technology, and enhance the effectiveness of Civic and Political Science curriculum education through modern technology.

#### **2.4 OPTIMIZING THE PROCESS OF INNOVATIVE TEACHING METHODS**

Modern information technology has the concept of openness and sharing, and enhancing the popularity of modern information technology can help enrich the content of Civics and Political Science teaching. Therefore, classrooms should innovate the content and teaching methods of Civics courses through mechanical technology, enhance students' interest in learning through a variety of teaching modes, and also avoid the negative effects of information technology on teaching effectiveness. It is that you can develop corresponding education programs in accordance with the physical and mental development characteristics of different students as a way to enhance the effect of Civics education, but rather the need to promote students' independent learning through information technology. So to explore and analyze the path of integration of the two, we need to start from ways and means to effectively combine ability cultivation and perceptual experience to bring into play the positive effects of information technology.

#### **2.5 ENHANCING STUDENT ENGAGEMENT**

In the process of rapid development of modern information technology, the information acceptance ability and literacy of students have been enhanced accordingly. Through the deep integration of information technology and Civic Education, it helps to enhance students' sense of teaching experience and active participation in teaching education, which can play an enriching role in teaching content and form and establish good teacher-student relationship. So classrooms should look for ways for students to participate in multimedia teaching as well as in blended teaching mode, and by improving students' modern information technology literacy, they can effectively eliminate the problems of learning passivity and blindness.

### 3 THE CONSTRUCTION OF INNOVATIVE MECHANISM FOR CURRICULUM THINKING AND POLITICAL SCIENCE COURSES IN COLLEGES AND UNIVERSITIES

#### 3.1 THE FOCUS OF THE CIVICS CURRICULUM IN HIGHER EDUCATION

Figure 1 shows the ratio of the focus of carrying out curriculum thinking politics. The construction and implementation of curriculum thinking and politics requires the strength of all parties, and the focus of carrying out curriculum thinking and politics should be carried out from many aspects. Forty-four percent of the teachers think that schools should pay attention to curriculum thinking and politics, do a good job in top-level design, and organize activities such as model curriculum thinking and politics teaching courses. 56% of the teachers think that teachers should improve their own thinking and politics awareness and ability, and learn to dig deeper into the suitable thinking and politics elements in the teaching materials. 42% of the teachers think that curriculum thinking and politics should be carried out by reforming teaching methods and making the curriculum thinking and politics "more interesting". The teachers think that they should reform the teaching methods and integrate the course Civics into the curriculum in a "silent" way; 35% of the teachers think that they should also establish a corresponding evaluation mechanism for the course Civics.

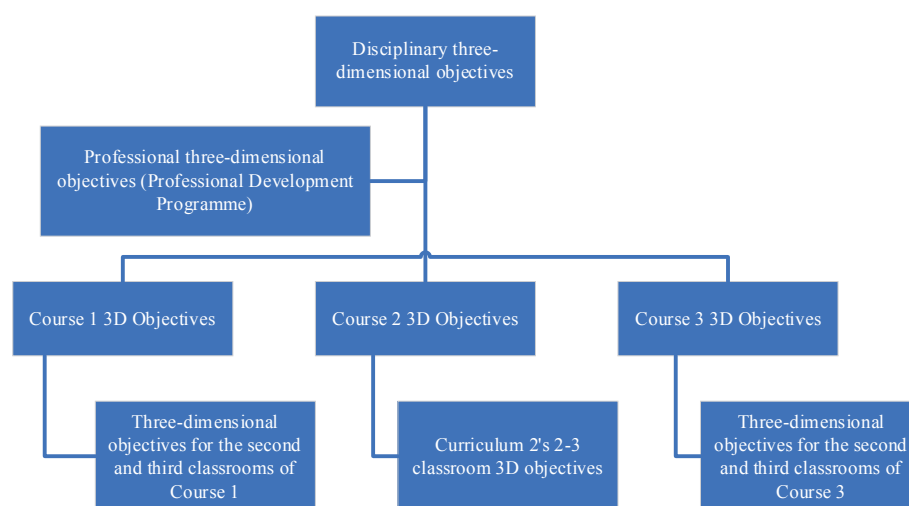

Figure 1 Percentage of focus on conducting curriculum thinking

#### 3.2 INTEGRATING THREE TYPES OF CLASSROOM IDEOLOGICAL AND POLITICAL EDUCATION OBJECTIVES

Figure 2 shows the three-dimensional goal-integrated design of the three types of classroom ideas. The professional teachers of the first classroom should consider the general objectives of the course and the subobjectives of the class time, how each objective can be reached through the first classroom narration and the second classroom practice, and also how to respond to the various voices on the network of

the third classroom. The second classroom should consider the purpose of the activity, whether it can integrate the knowledge of the first classroom into the design of the activity, whether it meets the psychological characteristics of students, whether it meets the development requirements of the times, and whether it is feasible, etc. Attention should also be paid to combining the hot issues of students' concern in the third classroom, so that students can perceive and experience them in practice; the third classroom should grasp students' interests and hobbies and take the initiative to The third classroom should hold on to students' interests and hobbies, take the initiative to open relevant self-media and public numbers, express in students' favorite language, expressions and ways, and respond well to the first and second classrooms. We can also use the knowledge, ability and value gained in the second and third classrooms to support what we learn in the first classroom, so as to truly realize a comprehensive and three-dimensional curriculum of Civic Science.

**Figure 2** Three-level 3D goal-integrated design

#### 4 CONCLUSION

Continuously promote the deep integration of information technology and education, and promote the improvement of two levels. Promote the higher-order evolution of education informatization from integration application to innovation development, and the deep integration of information technology and intelligent technology into the whole process of education to promote improvement of teaching, optimization of management and performance enhancement. Comprehensively improve the information literacy of teachers and students, promote the expansion from technology application to competence quality, make them have good information thinking, adapt to the requirements of the development of information society, and the ability to apply information technology to solve problems in teaching, learning and life become the essential basic quality. This points out the general direction for the integration and innovative development of the teaching of college Civics and modern

information technology in the new era. The curtain has just been drawn, and there is still a long way to go.

# STUDY ON THE DEVELOPMENT STRATEGY OF CROSS-BORDER E-COMMERCE AND LOGISTICS SUPPLY CHAIN INTEGRATION BASED ON SCOR MODEL

---

Chaohong Li\*

Changchun Polytechnic, Changchun, Jilin, 130000, China

[cvitteacherli@163.com](mailto:cvitteacherli@163.com)

---

## ABSTRACT

Relying on SCOR model, cross-border e-commerce and logistics supply chain are integrated and developed, and the general process of fresh agricultural products logistics supply chain is analyzed. Through the analysis of the existing problems of each participating body of the cross-border e-commerce logistics supply chain, suggestions are made that cross-border e-commerce sellers should establish logistics supply chain thinking, logistics enterprises should establish domestic and international logistics alliances, and strengthen information construction, in order to bring some contributions to the development countermeasures of cross-border e-commerce logistics supply chain.

## KEYWORDS

SCOR model; cross-border e-commerce; agricultural products; logistics supply chain; development countermeasures

## 1 INTRODUCTION

In recent years, the problems of excessive circulation links, long circulation chains and high operating costs in China's fresh agricultural products supply chain have been widely concerned, and the state has repeatedly issued relevant policies and measures on the integration and optimization of agricultural products supply chain [1-2]. The rapid development of the Internet has brought new opportunities to the development of fresh agricultural products supply chain, and various places have also introduced relevant policies to promote the rapid development of "Internet + logistics" [3-4]. In order to provide continuous and high-quality energy for cross-border e-commerce transactions, it is necessary to study the optimization of cross-border e-commerce logistics supply

chain [5-6].

The literature [7] investigated the path of integration development of cross-border e-commerce and logistics in China based on the perspective of supply chain stability. The core idea is to build internal stability mechanism and external stability mechanism based on the integration of cross-border e-commerce and logistics in technical business and operation. The literature [8] addresses the cross-border e-commerce logistics supply chain, which is the backbone of accelerating the development of cross-border e-commerce and providing comprehensive benefits for the cross-border circulation of commodities, while policy support is the key way to promote its synergistic development.

In this paper, from the perspective of the SCOR model logistics supply chain, both for cross-border e-commerce and logistics supply chain process operation, have evolved into a chain to match. Based on the SCOR model logistics supply chain, the smooth operation of the chain can be ensured through the full combination of many requirements. Obviously, a brief analysis of cross-border e-commerce logistics supply chain synergy development has a positive role in promoting the sustainable development of cross-border e-commerce.

## **2 AGRICULTURAL LOGISTICS SUPPLY CHAIN PROCESS AND SCOR MODEL**

### **2.1 LOGISTICS SUPPLY CHAIN PROCESS**

Figure 1 shows the agricultural logistics supply chain process. The participants of fresh agricultural products in China mainly include agricultural suppliers, fresh agricultural products producers, origin distribution centers, wholesalers at all levels, terminal retailers and consumers. Among them, origin distribution centers generally consist of origin markets and buyers, and terminal retailers generally consist of supermarkets and community farmers' markets.

The concentration of production of fresh agricultural products in China is low and shows a high degree of non-standardized characteristics, while with the improvement of living standards. People's demand for fresh produce is gradually increasing, and the end retailers need stable quality, high standardization and diversified products. This "small farmer". The contradiction of big market makes it need a huge circulation link to play the role of collection and distribution of fresh agricultural products, which makes the flow speed of fresh agricultural products decrease, thus leading to a decrease in sales efficiency and logistics flow speed. As a result, product loss increases and quality decreases, while the excessive intermediate chain levels and information asymmetry will aggravate the problem.

**Figure 1** Agricultural logistics supply chain processes

## 2.2 SCOR MODEL

The SCOR model, the Supply Chain Operations Reference Model, is published by the American Supply Chain Association. The third layer is the process element layer, which is a refinement of each process in the second layer and defines the required inputs and possible outputs of each process element.

## 3 CROSS-BORDER E-COMMERCE AND LOGISTICS SUPPLY CHAIN OPTIMIZATION MEASURES

### 3.1 CROSS-BORDER E-COMMERCE LOGISTICS INDUSTRY DEVELOPMENT HISTORY

Table 1 shows the development history of the cross-border e-commerce logistics industry. With the increase of China's foreign trade activities, the logistics industry, as an important part of the cross-border e-commerce logistics supply chain, has also developed and grown. Its development has gone through three main stages, namely, the start-up stage, the optimization stage and the evolution stage.

**Table 1** Cross-border e-commerce logistics industry development history

Time	2004-2007	2007-2016	2016- Now
Industry Developments	Start-up phase	Optimisation phase	Evolutionary Stages
Industry features/typical events	Some traditional freight forwarders transformed into cross-border logistics service providers	2011 China Post launches international e-bao products: China-European train opens	UPU terminal fee increases have prompted service providers to launch new businesses such as "dedicated" logistics products

### 3.2 CROSS-BORDER E-COMMERCE SELLERS SHOULD ESTABLISH LOGISTICS SUPPLY CHAIN THINKING

Cross-border e-commerce sellers should establish logistics supply chain thinking, to fully understand the importance of the logistics supply chain, not only to pay attention to the logistics and transportation process after the transaction is reached, but also to understand that procurement, inventory, distribution is a whole set of systems, as far as possible from the source to control the amount of goods laid, to play the purpose of reducing inventory.

### **3.2.1 PLATFORM SELLERS**

If it is a platform seller, then the decision should be made in conjunction with the logistics companies that the platform cooperates with. For example, if stationed in the speed sell platform, most of its parcels through the Chinese post or foreign postal direct, and every e-commerce holiday, postal logistics network will be paralyzed, so such sellers should pay more attention to logistics network stability and channel security.

### **3.2.2 SALES ITEM TYPE**

To see their own sales categories, with the development of cross-border e-commerce, many sellers began to sell from the sale of cheap small goods to sell some large categories, then the logistics channels should also be upgraded, choose more suitable for the existing categories of logistics companies to transport.

### **3.2.3 DESTINATION ITINERARY**

The tariff barriers brought by trade frictions between China and the U.S. will make the cost of sellers higher, so some enterprises will choose to use direct commercial express or postal parcel to export to the U.S., which is a good way to avoid local consumption tax and tariff by turning the whole into zero. In addition, many scholars have researched and established criteria and methods for logistics service provider selection and logistics mode selection, which provide reference for cross-border e-commerce sellers' decision making.

## **3.3 LOGISTICS SERVICE INTEGRATORS SHOULD IMPROVE THEIR ORGANIZATIONAL CAPABILITIES**

As a core member of the cross-border logistics supply chain, the logistics service integrator needs to have the ability to "take the overall picture and coordinate all parties", and the selection of logistics service providers, the setting of the overall logistics plan, the handling of unexpected events in the process, and the coordination among members all need to be completed under the leadership of the integrator. The integrator's organizational capability should be strong. The integrator can take the following measures to improve the organizational capability.

### **3.3.1 BUILD LOGISTICS INFORMATION NETWORK**

The integrator should build an information network consisting of all parties in the logistics supply chain to strengthen information sharing among members so that the integrator can understand the operation status of the supply chain in a timely manner and facilitate immediate communication among members to improve the quality of supply chain management. Second, the integrator can introduce management talents.

### **3.3.2 INTRODUCTION OF MANAGEMENT PERSONNEL**

Integrators can bring in management talent. "Professional things need professional people to do, although this will increase certain costs, but will improve the core competitiveness of the organization. Integrator enterprises can cooperate with universities to train cross-border e-commerce logistics supply chain management talents. Third, develop a good cooperation program. The cooperation program is the guide and constraint of each member's operation, once the cooperation program reached agreement, then each member should act according to the agreement. The cooperation program should be especially elaborate for the part of breach of contract, specifying the responsibilities of all parties and the penalties after breach of contract, so as to facilitate the management of integrators afterwards.

### **3.4 PERFORM QUALITY CONTROL OF LOGISTICS SUPPLY CHAIN SERVICES**

In this logistics supply chain, the cooperation between logistics service integrators and logistics enterprises is the most important, the two share the benefits and risks, if they can cooperate well, the quality of the logistics supply chain will be greatly improved. At present, there are more situations between the two is the quality of control of the integrator for the supplier and the logistics enterprise breach of contract. In the process of cooperation, there is often a situation that one party pursues its own interests to maximize the interests of other cooperative members at the expense of the other, which shows that quality management is still weak. To solve the above problems, the following suggestions are made.

(1) Some problems can be solved at the root by strengthening the inspection of the qualification of cooperative enterprises, choosing those with a strong sense of cooperation and responsibility to cooperate, and taking measures such as performance management.

(2) Enhance the professionalism of the part on breach of contract disputes in the contract, and establish a corresponding accountability mechanism to prevent the two from shifting responsibilities to each other.

(3) The first one formulates a reasonable responsibility-sharing contract. Cross-border e-commerce logistics supply chain involves a variety of complex links and many participating subjects, so clarifying the scope of responsibilities of each participating subject is conducive to restraining the behavior of all parties.

## **4 CONCLUSION**

This paper analyzes the current situation and problems of the development of each main body of cross-border e-commerce logistics supply chain and puts forward some development strategies. First, as the core members of the cross-border logistics

supply chain, cross-border service integrators should improve their own organizational capacity and supervision of logistics enterprises. Second, cross-border e-commerce enterprises should make good planning for laying goods at the source, establish supply chain thinking, and not overly rely on integrators. As the last implementer of logistics and transportation solutions, the service quality of logistics enterprises is related to the quality of supply chain services, and logistics enterprises should improve the level of information technology, pay attention to the construction of logistics infrastructure in underdeveloped areas and strengthen cooperation with foreign logistics suppliers. Thirdly, the quality of supply chain services should be controlled and punished for the "inaction" of the integrator and the breach of contract of logistics enterprises.

---

## ABSTRACT

This paper first introduces the relationship between contemporary Chinese art and traditional culture, and puts forward the argument that traditional culture is the humanistic foundation of contemporary art as well as contemporary art has enriched the connotation of traditional culture. Then it analyzes the cultural sources of art education in colleges and universities in the new era, mainly Chinese excellent traditional culture, revolutionary cultural tradition and advanced socialist culture. Then the current situation of traditional culture in contemporary Chinese art is studied, as well as the effective path of integrating Chinese culture into college art education is explored. In the integration path, the main methods are: organizing teaching contents, reasonably conducting curriculum, infiltrating art culture, expanding cultural literacy and cultural infiltration according to the characteristics of the curriculum.

## KEYWORDS

big data; art education; cultural heritage; traditional culture; cultural sources

## 1. INTRODUCTION

Under the background of multiculturalism, art education in colleges and universities in the new era is faced with many value choices, and a variety of cultural elements intervene in art education, which enriches the cultural connotation and expression form of art education in colleges and universities, expands cultural boundaries and international vision, while also brings a certain degree of challenges to art education in colleges and universities [1-2]. As an art, the teaching content of art is rich in humanistic connotations and bears the responsibility of cultivating students' ideological and moral qualities and cultural self-confidence [3-4]. The literature [5] proposes that art and design education is a product of recent social development and

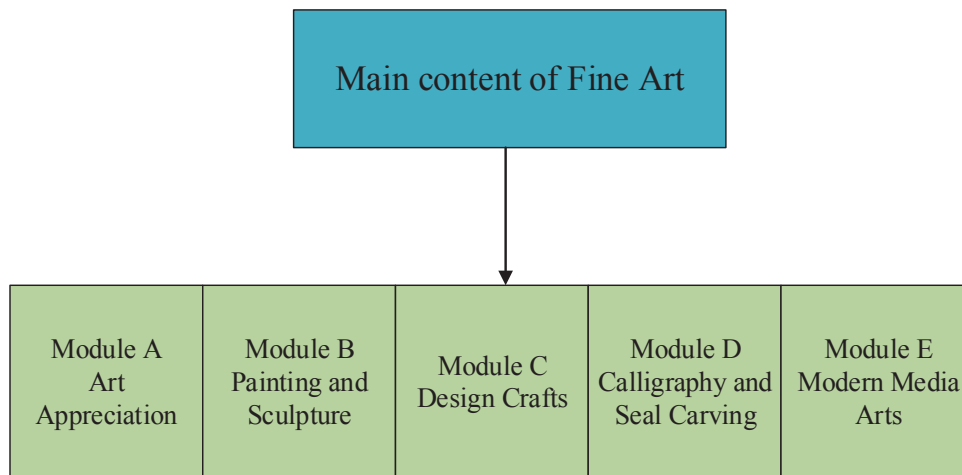

a special form of training this talent. The literature [6] proposes that art is a creative activity of using certain material materials and techniques, applying certain artistic means, and conceiving and planning in accordance with the laws of beauty to transform them into practical objects with specific use functions, external forms, human-machine relationships, and cultural meanings.

This paper first introduces the relationship between Chinese art and traditional culture, and proposes that contemporary art enriches the connotation of traditional culture and that traditional culture is the humanistic foundation of contemporary art. Then it explores the current situation of traditional culture in art and the effective path of integrating Chinese traditional culture into art education in colleges and universities.

## **2. THE RELATIONSHIP BETWEEN CONTEMPORARY CHINESE ART AND TRADITIONAL CULTURE**

### **2.1. TRADITIONAL CULTURE IS THE HUMANISTIC FOUNDATION OF CONTEMPORARY ART**

The source of humanistic flavor and cultural heritage in art creation is China's traditional culture. Without cultural heritage, art creation is soulless and is only an empty reproduction of shapes and objects, so in the process of art creation, creators need to fully draw on the essence of traditional culture and enrich the cultural connotation of art creation in order to improve the discourse of contemporary Chinese art in the international arena. In this era of rapid changes, we need to fully learn, understand and utilize traditional Chinese culture and apply it to art creation, which is an innovative form and an important method to improve the humanistic value of contemporary Chinese art, as well as a prerequisite for the development of contemporary Chinese art. This is not only conducive to the diversified development of contemporary Chinese art, but also to its finding its own niche in the historical context of globalization and having its own nationalized art language. Figure 1 shows the main contents of art education.

**Figure 1** Key elements of art education

## **2.2. CONTEMPORARY ART ENRICHES TRADITIONAL CULTURAL CONNOTATIONS**

These new and active elements inject fresh blood into contemporary culture and art, making it burst into vigorous life, and also promote China's traditional culture to adapt to the development of the times and make corresponding additions and improvements. Culture is epochal, and the culture of any period is the accumulation of culture in previous historical changes, and has the spirit of the times and historical language corresponding to the times, which plays a role of reference and guidance for future generations.

## **3. THE CULTURAL SOURCE OF ART EDUCATION IN UNIVERSITIES IN THE NEW ERA**

Literary artists should create and produce more excellent works that spread contemporary Chinese values, embody the spirit of Chinese culture, reflect the aesthetic pursuit of Chinese people, and have an organic unity of ideology, artistry and ornamentation. This is the noble mission and value of literary artists in the new era, and it is also the directional guidance for art education in colleges and universities in the new era to clearly cultivate what kind of talents. This requires that in the process of innovation and development, art education in colleges and universities in the new era is always rooted in the fertile soil of Chinese culture, contains the essence of revolutionary culture, and follows the development law of advanced socialist culture with Chinese characteristics.

### **(1) Excellent Chinese traditional culture**

Art education in colleges and universities in the new era, both at the material level

and at the spiritual level, is always shining with the light and wisdom of the excellent Chinese traditional culture. Firstly, art education in the new era inherits and develops traditional Chinese art forms, such as paper-cutting, embroidery, sculpture and so on. These art forms have a long history and contain the reverence and worship of the ancestors for life and nature, showing the unique spiritual quality and cultural tradition of the Chinese nation. The art education of colleges and universities in the new era fully inherits the art forms in the excellent Chinese traditional culture and injects the new spirit of the times, which is the embodiment of inheriting the excellent culture of the Chinese nation and also shows the inherent need of the Chinese and national characteristics of the art education of colleges and universities in the new era. Secondly, the art education of colleges and universities in the new era inherits and develops the way of thinking of traditional Chinese aesthetic education. Table 1 shows the classification of traditional culture.

**Table 1** Classification of traditional cultures

Category	Contents
Philosophy of Thought	Cultural awareness of Confucianism, Buddhism, Miscellaneous, Zongheng, Taoism, Mohism, Legalism, and Bing.
Traditional Literature	The Book of Songs, Chu's Analects, Journey to the West, Dream of the Red Chamber
Food	Tea ceremony, wine culture, Chinese cuisine, eight major cuisines, etc.
Martial Arts	Taijiquan, Wing Chun, Wudangquan, etc.
Traditional Festivals	Mid-Autumn Festival, Qingming Festival, Dragon Boat Festival, etc.
Drama	Beijing Opera, Yue Opera, Qin Opera, Chao Opera, Kunqu, Xiang Opera, Huizhou Opera, Hebei Bangzi, Shadow Play, Beijing Opera, Yue Opera, Qin Opera, Chao Opera, Kunqu, Xiang Opera, Huizhou Opera, Hebei Bangzi, Shadow Play
Chinese Music, Chess, Calligraphy and Painting	Erhu, Guzheng, Chinese chess, Chinese Go, Chinese calligraphy, seal carving seals, Four Treasures of Literature, Chinese painting, landscape painting, etc.
Architecture	Pavilions and pagodas, gardens and temples, bell towers and temples, pavilions and pavilions, etc.
Medicine	Chinese medicine, Chinese herbal medicine, the Yellow Emperor's Classic of Internal Medicine, and the Acupuncture and Moxibustion Classic, etc.
Folk Crafts	Chinese medicine, Chinese herbal medicine, the Yellow Emperor's Classic of Internal Medicine, and the Acupuncture and Moxibustion Classic, etc.

## (2) Revolutionary cultural tradition

Classic revolutionary art works are the epochal representations of art creation in the revolutionary era, with strong educational functions and politicized tendencies, and are one of the important contents of the art education curriculum in the new era of colleges and universities, and also provide a model for strengthening the creation of

revolutionary themes for art students in the new era of colleges and universities. The classic images of the revolutionary era are examples of art serving the cause of the Party and the country, and their qualities of reflecting the characteristics of the times and spreading political concepts with national independence and people's liberation as the main line are useful references for art education in new-age colleges and universities to clarify "for whom to train people. The integration of revolutionary culture tradition into the art education of new era colleges and universities is conducive to highlighting the party and people's nature of education, shaping students' "people-centered creation, promoting the main theme, expressing the will of patriotic struggle, and exerting the guiding power and influence of mainstream ideology.

### (3) Advanced Socialist Culture

Advanced socialist culture enhances the cultural confidence and self-awareness of art education in colleges and universities in the new era. In the context of increasingly close international art exchanges and dialogues, the art education of colleges and universities in the new era should grasp its own cultural character and symbolic meaning in the depth of history, shape its character internally and cultivate the essence of the culture of the times, learn from the advanced educational experience of others externally, actively study the excellent cultural concepts of foreign countries, and at the same time tell the story of Chinese college art education to the world, enhance the status of China's college art education in the world. In addition, we should realize the communication, intermingling and exchange of higher art education in the cultural level.

## **4. AN EFFECTIVE PATH FOR INTEGRATING CHINESE CULTURE INTO COLLEGE ART EDUCATION**

### (1) Organize teaching content and rationalize curriculum

In the teaching process, teachers should consciously integrate teaching into the relevant cultural background and make full use of the art curriculum to infiltrate culture, thus exerting a subtle influence on students. A variety of forms should be adopted to integrate cultural quality education into the classroom, such as work seminars on canal culture, work observation, masterpiece appreciation, and perusal of art works, in order to continuously improve students' cultural literacy. In addition, in order to cultivate students' humanistic consciousness and improve their cultural quality, teachers must first improve their own humanistic consciousness and cultural quality. If teachers do not have deep cultural cultivation, they cannot integrate more cultural background knowledge into art teaching, much less provide effective humanistic quality education to students.

## (2) Infiltrating art culture and expanding cultural literacy

Infiltrate humanistic spirit into the art curriculum, and view art as a kind of cultural learning rather than simple skill training. In teaching, teachers should pay attention to the introduction of art culture so that students can consciously recognize humanistic knowledge inside and outside this subject and continuously improve their level of artistic cultivation. It is also necessary to combine art with a rich humanistic background so that students can have a comprehensive understanding of what they are learning and thus better promote their artistic creation. Therefore, in the teaching process of elementary school art, students should be actively guided to reasonably analyze the painting techniques of famous paintings and also understand the stories behind the works.

## (3) Cultural infiltration according to the characteristics of the curriculum

In order for elementary school students to understand the profound connotations of culture and achieve good results in art learning, it is important to select content that is compatible with students' lives and learning, which is interesting to them and easy to understand and accept. When teaching "color" in elementary school, first of all, we should talk about the knowledge of color use. Art teachers can introduce students to traditional Chinese colors, such as crab shell green, lead white, honey, azure, moon white, bamboo green, water green, navy blue and so on. In ancient times, the literati and scholars recited poems, painted, tasted tea, drank wine, and played chess, and always enjoyed the elegance, even the names of the colors were poetic. In elementary school art education, Chinese painting has always been an important teaching content, which is directly related to the development of students' creative ability. If students are detached from the creation technique of Chinese painting itself, they cannot do well in creating excellent Chinese paintings, thus making their artistic creation level drop greatly. Therefore, strengthening the teaching of Chinese painting creation techniques is the current focus of elementary school art education, which means that certain key techniques and methods of Chinese painting should be infiltrated so that students can create Chinese paintings on their own. It also enables students to gain a sense of accomplishment in the learning process and stimulates their interest in learning Chinese painting.

## 5. CONCLUSION

This paper mainly explores the current situation of cultural heritage in art education as well as studies the relationship between contemporary Chinese art and traditional culture, and proposes an effective path for the integration of Chinese culture into college art education. It is concluded that the main paths of integration are: organizing teaching contents, rationalizing curriculum, infiltrating art culture,

expanding cultural literacy, and infiltrating culture according to the characteristics of the curriculum.

## ABSTRACT

In order to objectively grasp the educational effect of mental health courses in colleges and universities. This paper constructs an evaluation model of the educational effect of mental health courses in colleges and universities based on big data analysis technology, and establishes evaluation indexes of the educational effect of mental health courses by summarizing and sorting out the behavioral data of students and teachers through data collection and analysis technology. The simulation practice results show that the accuracy and efficiency of the evaluation model are as high as 92% and 97%, respectively, with five primary indicators as well as several secondary indicators. It can be proved that the evaluation model constructed in this paper has formed a set of reasonable evaluation index system, which makes the teaching of psychological courses get a more fair, objective and comprehensive evaluation.

## KEYWORDS

Big data technology; Data collection; Effect evaluation model: evaluation metrics; Accuracy

## 1. INTRODUCTION

With the advent of the era of big data, big data technology, which is an important force of the fourth industrial revolution, is becoming more and more mature and applied in various fields. It opens a new field for the further development of mental health education evaluation in colleges and universities, and moreover helps to promote the continuous optimization of the evaluation standards, methods and mechanisms of mental health education in colleges and universities [1-2]. With its ability of analyzing and mining huge amount of data, big data technology embodies the characteristics of immediacy, correlation, equality and biphasicity in data analysis [3-5]. Thus, it provides a new technical support to effectively play the diagnostic function, guidance function, regulation function and motivation function of mental health education evaluation in colleges and universities.

Under the development trend of big data, the evaluation of mental health education in colleges and universities is also changing gradually. Literature [6] proposed a fuzzy evaluation method for teaching quality, gave the basic principles and implementation methods, and developed an index system. The Gaussian function is used to determine the index affiliation, and the fuzzy decision method is applied to calculate the evaluation results quantitatively. The literature [7] introduced Markov chain model into the evaluation of students' teaching effectiveness of mental health courses through example analysis, and explained the whole process of the method to evaluate the teaching effectiveness and to predict the teachers' teaching effectiveness. The literature [8] applied the basic steps of the weighting method to evaluate the teaching effectiveness of mental health courses and designed two examples of evaluation calculation methods to evaluate the teaching quality and learning effectiveness of mental health courses by the weighting method. The methods in the above literature are one-sided, all belong to the evaluation of process and conditions, not the evaluation of higher education quality, and are not a real evaluation of teaching effectiveness.

Based on this, this paper constructs an evaluation model for the effectiveness of mental health course education in colleges and universities based on the background of big data analysis. In the design process, big data collection techniques are used to make a diagnosis of the quality of mental health course teaching in colleges and universities. Based on this, five primary indicators as well as several secondary indicators are established through the analysis of students' and teachers' behavioral data. And the practical effect of the model is verified through simulation practice, which illustrates that the evaluation model of mental health course education effect constructed based on the background of big data can examine the output results of college education and teaching from different levels, reflecting different evaluation orientations and values.

## **2. BIG DATA ANALYSIS TECHNOLOGY AND EVALUATION MODEL**

### **2.1 BIG DATA ANALYSIS TECHNOLOGY**

**Data collection and cleansing:** The basic data needs to be extracted from the information management system to establish multiple assessment indicators. In order to ensure data quality, data cleansing is required for the collected fragmented data. A unified data storage format is established first, and then the data is proofread and verified, with the aim of removing duplicate information and merging intersecting data sets. Errors that exist are corrected to guarantee the correctness, consistency and integrity of the data.

**Data storage and sharing:** The cleaned data is finally stored in the data center according to a uniform format. These data are only used for data exchange to realize data sharing between each independent management system. Each management system can only add, delete, change and check operations on its own basic information base, and call the basic data of other management systems with parallel relationship, and only have query authority.

**Data analysis and management:** Firstly, by sorting, classifying and summarizing the data obtained through extraction and integration, relatively independent data subject domains are organized. Then data trend analysis is conducted to establish a reasonable model for evaluating the educational effectiveness of mental health courses, projecting data similarity, and verifying data patterns and hidden correlations. Thus, statistical predictions and judgments are provided for teaching managers. Finally, a corresponding early warning mechanism is formulated for mental health teaching contents with low evaluation grades, so that improvements can be made in subsequent teaching, thus achieving the goal of improving the teaching effectiveness of mental health courses.

## 2.2 CONSTRUCTING AN EVALUATION MODEL FOR THE EFFECTIVENESS OF MENTAL HEALTH COURSE EDUCATION

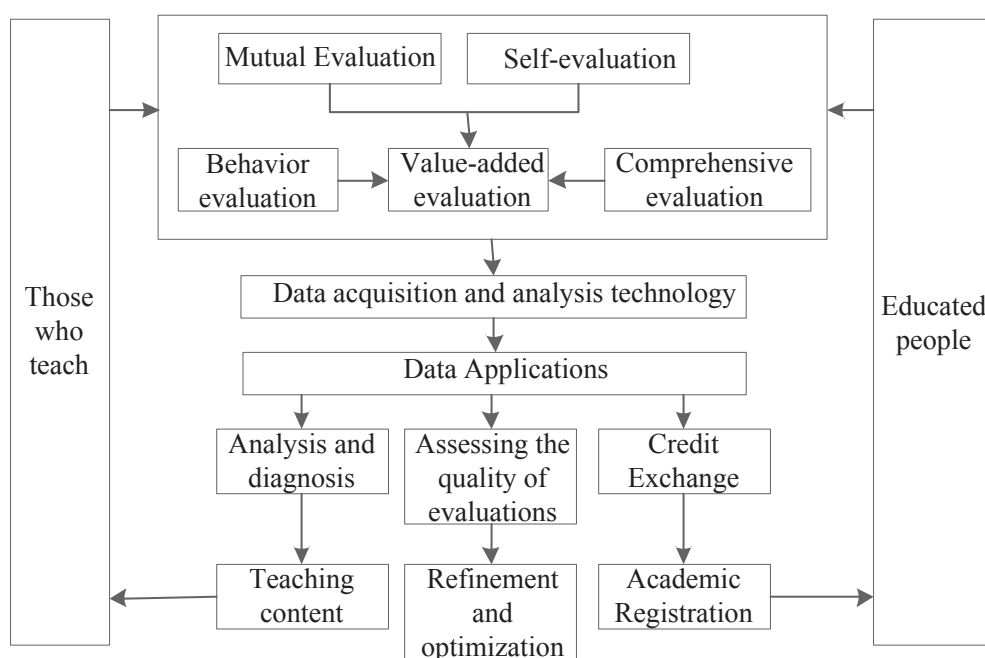

In this paper, five primary indicators as well as several secondary indicators are established through data collection techniques, as shown in Table 1.

**Table 1.** Weighting table of indicators at each level

Level 1 indicators	Organizational management and institutional set-up	1.Target setting 2.System improvement 3.Work planning
	Faculty Development	1.Full-time teachers 2.Teacher Training
	Educational activities and research	1.Psychology Foundation Course 2.Placement in public foundation courses Mental health education content 3.Teaching staff to conduct Training
	Advice and Counselling	1.Measure and create a psychological profile of the student 2. Online consultation 3. Establishing a mental health treatment system
	Security of Conditions	1.Workplace 2. Instrumentation

As can be seen from Table 1, this paper first decomposes each secondary index to form specific contents, and determines the evaluation criteria of each index with reference to some provincial and municipal index systems, relevant regulations of the Ministry of Education and feedback from two expert questionnaires. The existing indicators are clustered according to certain criteria, and further categorized and organized through big data analysis technology on the basis of the proposed indicator system to form a set of system after it is organized. At the same time, through big data sharing technology, the actual work structure of a group of colleges and universities with better mental health education work is decomposed level by level, and the main factors decomposed are used as evaluation indexes by combining the statistical data of the Ministry of Education.

Mental health education evaluation is an important means to test the quality of mental health education and a difficult part of mental health education [9-10]. The evaluation model of mental health course education effect constructed in this paper, and the model structure is shown in Figure 1.

**Figure 1.** Structure of evaluation model

Analysis of Figure 1 shows that the evaluation model implements evaluation analysis through the analysis of student and teacher behavior data and constant monitoring of the process, and each higher education institution can truly achieve accurate governance based on big data analysis, process monitoring, trend prediction and risk warning. At the same time, the early warning process of the platform is used to build an evaluation cycle and realize the flow of process data step by step. It encourages teachers and students to participate in the teaching diagnosis and improvement work together.

### 3. SIMULATION PRACTICE OF EVALUATION MODEL

In this paper, based on the background of big data, we constructed an evaluation model for the effect of mental health course education and established evaluation indexes by using big data collection and analysis technology. In order to verify the effectiveness of the model, we selected universities for practical analysis and compared with the traditional evaluation methods, and the specific data are shown in Table 2.

**Table 2.** Information comparison results

Evaluation methods	Evaluation indicators	Evaluation techniques	Average evaluation accuracy rate	Evaluation efficiency
Traditional evaluation methods	4	Questionnaire	44%	33%
Big Data Technology Evaluation Model	5+Several	Big Data Analytics Technology	92%	87%

Analyzing the comparison results in Table 2, we can see that the traditional way of evaluating the effectiveness of mental health course education uses questionnaires, and the accuracy rate of this evaluation method is only 44%, which does not accurately reflect the evaluation of mental health course education. Moreover, there are only four evaluation indexes in the traditional way, and the effective rate is only 33%, which is not in line with the actual evaluation work and does not achieve a reasonable and effective evaluation effect. In contrast, the evaluation model of mental health course education effectiveness constructed in this paper based on the background of big data uses big data collection technology to build evaluation of five primary evaluation indicators, as well as several secondary indicators. The evaluation accuracy rate of the model is as high as 92%, and the efficiency rate is also 87%.

### 4. CONCLUSION

This paper takes the evaluation of the educational effect of mental health courses in colleges and universities as the starting point, uses big data analysis technology, constructs an evaluation model of the educational effect of mental health courses, and verifies the application effect of this evaluation model in practical application. For the traditional evaluation method, the evaluation model constructed in this paper has evaluated five primary evaluation indicators, as well as several secondary indicators, with accuracy and efficiency rates of 92% and 87% respectively. It proves that the evaluation model constructed in this paper can better optimize the education work of college students' mental health, and then promote the development of college students' mental health education work.

## ABSTRACT

To recognize the effectiveness of the implementation of Stalin's ethnic policy. This paper analyzes the value orientation and impact of Stalin's ethnic policy in Central Asia based on big data analysis. In the process of big data analysis, data collection is used to standardize the policy value data. Combined with machine learning algorithms, information on the value impact of ethnic policies in the value data is mined. The simulation results show that the accuracy of its value orientation classification is above 94.8% on average, and that big data analysis has a positive effect on the analysis of the impact of Stalin's ethnic policy. Thus, it can be seen that big data analysis is beneficial for dynamic judgment of the orientation-related impact of Stalin's national policy.

## KEYWORDS

Big data analysis; Stalinist national policy; Machine learning algorithms; Data collection; Classification accuracy

## 1. INTRODUCTION

The theoretical sources of Stalin's national policy are pluralistic, and its content contains three principle policies of equality, unity, and prosperity and three target policies of anti-separatism, advocacy of centralization, and politicization [1-2]. Stalin's national policy has an obvious duality, and it has important theoretical and practical significance as an important part of the Stalinist socialist Soviet model [3-4].

Currently, there is a growing body of research on Stalin's national policy. For example, the literature [5] examines the value of Soviet civic life based on Stalin's preferences. The preferences of Stalin's national policy were modeled and illustrated to structurally estimate the accepted value of Stalin's willingness to reduce the risk of death of citizens. The literature [6] expands on international policy under Stalin through Stalin's national policy. The development trajectory of a region is viewed through the lens of Stalin's terror and marginalization. The literature [7] explains the sudden revival of Stalinism in practice, in its historical form and style, as a reactionary shift in the Soviet temporal culture, i.e. across all spheres of social and political life. Its expression of Stalinism as a timeless, utopian self-description. In summary, the Stalinist national policy studied so far has remained only in terms of policy content and direction of implementation, without interpreting the policy in

terms of value orientation and impact, and in the process of research, lacking the support of information technology.

Based on this, this paper analyzes the value orientation and impact of Stalin's ethnic policy in Central Asia based on big data analysis. In the process of big data analysis of ethnic policies in Stalin's Central Asian region, firstly, data collection is used to obtain normative data on policy implementation and unify the data types and formats of the value impacts of Stalin's ethnic policies. Secondly, several machine learning algorithms are selected and trained on the training set to mine valuable information on ethnic policy orientations. Finally, the practical effectiveness of the analysis methods in this paper is tested experimentally. The results demonstrate the positive effect of big data analysis on the analysis of the value orientation and impact of Stalin's national policy.

## **2. THE WORKING MECHANISM OF BIG DATA ANALYSIS**

### **2.1 DATA ACQUISITION**

Data collection is the process of collecting, filtering and cleaning data from data warehouses or various databases [8]. In the process of big data analysis of the ethnic policy of Stalin's Central Asian region, the purpose of data collection is to obtain normative data that can be directly used for data analysis [9-10]. Therefore, applying big data analysis to the value orientation analysis of the ethnic policy in Stalin's Central Asian region requires, first of all, data generation, listing various types of data generated in the process of policy value orientation analysis, such as policy orientation data and impact data. Secondly, the various types of data are explored, and the data of low data quality are discarded, and the positive ethnic policy data are selected as much as possible. The ethnic policy value orientation data are examined according to the rules, and the low-quality data are processed in a corresponding way. In addition, it is necessary to unify the data types and data formats of the value impact of Stalin's ethnic policy and standardize the data to meet the legitimacy and authority of the data and obtain the normative data to be analyzed.

### **2.2 DATA VALUE CREATION**

Data value creation is mainly to take the normative data to be analyzed, combine with machine learning algorithms, analyze the valuable key information from the massive normative data, and dig out the value information of ethnic policy impact implied in the data. In the process of data analysis, various types of machine learning algorithms are evaluated, firstly, the performance indexes of machine learning algorithms need to be defined, and usually different algorithmic models correspond to different performance indexes. Then the data set is divided into a training set and a test set, and multiple machine learning algorithms are selected to be trained on the training set. Finally, based on the performance indexes of each machine learning algorithm, the machine learning algorithm with the top ranking in each performance index is selected as the optimal method to ensure the algorithm has high stability and generalization ability.

### **2.3 DATA VALUE REALIZATION**

The purpose of data value realization is to develop global, accurate, and long-term strategic decisions for the value impact of Stalin's national policy, thereby providing a sustainable impetus for Stalin's national policy. Data value realization requires a combination of strategic decision modeling, strategic decision analysis, and strategic decision refinement, and each stage needs to be based on data analysis to obtain valuable policy impact information.

## **3. DATA-BASED RESULTS ANALYSIS OF POLICY VALUE IMPACT**

Based on big data analysis, this paper collects and analyzes data on the value orientation and influence of Stalin's ethnic policy in Central Asia, and compares this analysis method with traditional methods to verify its analytical effect.

### 3.1 ACCURACY OF VALUE ORIENTATION CLASSIFICATION

Based on big data analysis, this section collects 1000 data on the value orientation of ethnic policies in Stalin's Central Asian region. The results of their classification accuracy compared with traditional data collection methods are shown in Table 1.

**Table 1.** Comparison results of value orientation

	Big Data Analytics	Traditional analysis methods
National Unity and Unity	96.2%	76.2%
Ethnic Area Development	94.8%	81.9%
Concentration of ethnic power	97.8%	78.3%

From the accuracy comparison results in Table 1, it can be seen that the classification accuracy based on big data analysis reached 96.2% on the value orientation of national unity and unity, which improved the classification accuracy by about 20% compared with the traditional data collection method. The value orientation of Stalin's ethnic policy based on big data analysis has a classification accuracy of 94.8% on the value orientation of regional development of Central Asian ethnic groups. In the value orientation of ethnic power concentration, the classification accuracy is 97.8%, which is 12.9% and 19.5% higher than the traditional data collection method, and has a better classification accuracy of orientation.

### 3.2 STRENGTH OF POLICY INFLUENCE

The data value analysis of the impact of Stalin's ethnic policy in Central Asia based on big data analysis was conducted, and the statistical results obtained are shown in Table 2.

**Table 2.** Strength of influence of Stalin's national policy

Factors	Policy Impact Strength
Ethnic Region Economy	13.2%
Ethnic Culture and Education	1535
Number of ethnic minority cadres	697
Affiliate System	Yes
Social Stability	3

Analysis of the strength of the policy impact in Table 2 shows that the value impact of Stalin's national policy in Central Asia after its implementation includes five aspects. Using big data analysis, it can be concluded that Stalin's ethnic policy has a positive impact on the regional economy, which has increased the economic growth rate of Central Asia by 13.2%. The impact of Stalin's policy on ethnic culture and education is also significant. The analysis of big data shows that after the implementation of Stalin's ethnic policy, the number of primary education schools in Central Asia increased by 1,535, the number of ethnic minority cadres increased to 697, and a union system with ethnic characteristics was established. Thus, it can be seen that the impact of Stalin's ethnic policy can be analyzed more comprehensively based on big data analysis, which is conducive to the interpretation of the expected effects of the policy.

#### 4. CONCLUSION

Based on big data analysis, this paper analyzes the value orientation and impact of Stalin's ethnic policy in Central Asia from the perspectives of data collection, data value creation and realization, and verifies the analytical effectiveness of the method in the process of practical application. Compared with the traditional method, the classification accuracy of the value orientation of Stalin's ethnic policy based on big data analysis is over 94.8% on average, which improves the classification efficiency by nearly 12.9%. Moreover, using big data analysis, it can be concluded that Stalin's ethnic policy has a positive impact on both regional economic and ethnic cultural development. It indicates that based on big data analysis, the content of Stalin's ethnic policy can be understood more precisely and comprehensively, and it has certain generalizability in the field of policy analysis.

## ABSTRACT

This paper firstly introduces the feasibility and methods of combining English reading and writing teaching, through the input of "reading", building the foundation of "writing", and using the combination of reading and writing to cultivate students' habit of writing and stimulate students' interest in writing. Then the implementation path of English reading and writing integration is introduced. Then we compared the results before and after the experiment of the integrated teaching method and analyzed the effect of the integrated teaching on students' motivation to write. 70% of the students agreed with the integrated teaching model and expected to improve their writing skills through this teaching model. After the experiment, the average score of the experimental class was 25.6, and that of the control class was 21.1. The average score of the experimental class was significantly higher than that of the control class, so the effectiveness of the teaching mode on writing improvement could be confirmed.

## KEYWORDS

big data technology; college English; integrated reading and writing; intelligent teaching; teaching mode

## 1. INTRODUCTION

At present, the teaching of English in high schools is basically input-based, i.e., listening and reading are emphasized, while speaking and writing are neglected, which leads to the unsatisfactory writing skills of many high school students. With the rapid development of global economic integration and the increasing demand for spoken English, English learners and teachers have started to pay attention to and improve English learning and teaching methods [1]. The literature [2] argues that the process models of reading comprehension can be broadly classified into three

categories, namely, bottom-up models, top-down models, and interaction models. The literature [3] argues that the process of reading is not a precise perceptual process, a series of processing processes, but a process of selection, a process of making tentative decisions, and a process of anticipation. The literature [4] argues that readers need both low-level skills (recognizing letters and words, etc.) and high-level knowledge (common sense and knowledge of the topic) to understand a text. The literature [5] argues that reading is a process of using the knowledge schema already in the brain to interpret local language, in which the reader first finds the best matching mental schema bottom-up based on the cues provided by the text, then makes expectations about the content of the subsequent text based on that schema, and then adjusts the expectations based on the cues of the subsequent text.

## **2. THE NECESSITY AND IMPLEMENTATION PATH OF ENGLISH LITERACY INTEGRATION**

### **2.1. THE NEED FOR INTEGRATED ENGLISH READING AND WRITING INSTRUCTION**

It is necessary to teach reading and writing together. Through the input of "reading", we can build the foundation of "writing". In students' minds, the ability to write is important, but because they "can't write" and are "afraid of writing", they are more and more intimidated by writing, so they can't love writing. However, the development of writing skills cannot be achieved by imitating a few model essays. With the input of reading and more imitation on the basis of reading, students will not be afraid of "writing". By combining reading and writing, we can cultivate students' habit of writing and stimulate their interest in writing. The teachers' teaching and evaluation methods for writing also prevent students from experiencing the joy of "writing". In the classroom, writing training, students feel the need to take the test, although the test is an important ability, but as mentioned above, it is not the whole composition teaching. Writing is also the expression and communication of ideas, emotions. Therefore, through reading, stimulating students' willingness to express their ideas, and then falling into writing, such regular writing training should be combined with daily teaching. Thus, students will develop the habit of writing.

### **2.2. THE IMPLEMENTATION PATH OF "READING AND WRITING" COURSE**

First of all, colleges and universities can offer reading and writing courses from the first semester to the fourth semester, the first semester mainly teaches the more basic knowledge of reading and writing such as the characteristics of various genres and chapter layout, focusing on the "input" of reading and writing knowledge. The second semester and the third semester are combined with different themes of reading materials to carry out "read-write combination" teaching activities, focusing on the

combination of "input" and "output". The fourth semester focuses on writing training, with emphasis on improving students' writing skills and "output". The reading and writing course should form the teaching mode of "imitation - proficiency - innovation" to improve students' reading and writing ability.

Secondly, in terms of teaching content, there are no good teaching materials suitable for reading and writing courses, partly because most colleges and universities have not yet integrated reading and writing courses. Therefore, colleges and universities should actively try to integrate reading and writing into one course and pay attention to the combination of reading and writing.

Again, in the teaching process, teachers should use information technology flexibly and extensively in order to improve the teaching effect of reading and writing courses. On the one hand, teachers should provide more valuable reading materials for college students through multimedia equipment and network technology, and integrate these materials and show them to students for memorization.

Finally, in terms of teaching evaluation, teachers need to evaluate not only students' reading ability, but also their writing ability. In the process of evaluation, teachers need to adopt scientific and reasonable evaluation methods and diversified evaluation activities. In addition, the teaching goal of the combined reading and writing course is to improve students' creative writing ability through a lot of reading input. Therefore, teachers should strengthen the process assessment and urge students to increase the amount of reading input and writing output. The teaching assessment should have diversity and evaluate students' reading and writing ability from a multidimensional perspective.

### **3. THE IMPACT OF READING AND WRITING INTEGRATION ON STUDENT LEARNING**

After questionnaire distribution and data analysis using spss software, the results of the analysis are as follows: this questionnaire was distributed to the experimental and control classes before and after the experiment, respectively, and the questionnaire design included 32 questions. The study was conducted between two parallel classes. During the study one of the two classes was used as the experimental class and one as the control class with a total of 72 students. The experimental class was taught by applying mind mapping and using the teaching model of reading and writing integration, and the control class was taught by using the traditional teaching model. Figure 1 shows the subjects of the investigation.

**Figure 1** Survey respondents

### 3.1. COMPARISON OF PERFORMANCE BEFORE AND AFTER THE EXPERIMENT

Two sets of English writing tests with comparable difficulty coefficients were administered to the experimental and control classes before and after the instructional model intervention, and the papers were scored out of 40. The same marker was used to ensure consistent marking standards.

**Table 1** Results of the pre-test and post-test in both classes

	Pre-test average	Post-test average	Comparison of pre and post-test averages.
Experimental Classes.	21.4	25.8	4.4
Control Classes	20.8	21.1	0.3

As can be seen from Table 1, before the experiment, the average scores of the two classes, the control class and the experimental class, were basically the same and could

as the control class, and after the experiment, the average performance of the experimental class was significantly higher than that of the control class, so the effectiveness of the teaching mode on writing improvement could be confirmed.

### 3.2. THE EFFECT OF READING-WRITING TEACHING MODEL ON STUDENTS' MOTIVATION TO WRITE

As can be seen from Table 2, in November 2015, there was little difference between the experimental class and the control class in terms of motivation and confidence level in writing at the beginning of the experiment of the integrated reading and writing teaching model. 60% of the students thought that writing in English was a burden. 70% of the students agreed with the integrated reading and writing model and

expected to improve their writing through this teaching model. 60% of the students thought that the biggest obstacle to writing was not knowing how to organize language in English. 70% of the students did not feel confident in improving their writing. 90% of the students thought that the writing session needed teacher's evaluation to help improve their confidence in writing. 95% of the students wanted positive evaluation from the teacher. 75% of the students felt lost about the mistakes made in their compositions. 75% of the students thought that the writing template served to open up their ideas. 55% of the students wanted writing to be discussed in class and review of essays. Only 20% of the students were satisfied with the current writing instruction. Pre-experimental questionnaire findings: Students perceive writing as a burden and have low self-confidence because they do not know how to organize their language. Expectation of teacher's evaluation, approval and peer's help. Students have low recognition of the current writing teaching and hope to make progress by trying to integrate reading and writing teaching mode.

**Table 2** The impact of reading and writing integration on students' writing

	Serial No.	Grade 1		Grade 2		Grade 3		Grade 4		Grade 5	
		Experimental classes	Controlled Classes	Experimental classes	Controlled Classes	Experimental classes	Controlled Classes	Experimental classes	Controlled Classes	Experimental classes	Controlled Classes

Satisfaction	12	12	9	27	15	18	12	18	24	6	9

#### 4. CONCLUSION

This paper explores the feasibility and specific measures of integrating English reading and writing, as well as the effect of realizing the integration of English reading and writing on students' achievement and writing motivation. Through the integrated teaching of reading and writing, students' performance was obviously improved, with 25.6 in the experimental class and 21.1 in the control class. the integrated teaching of reading and writing had a facilitating effect on students' motivation to write.

## ABSTRACT

This paper extracts facial feature points from the captured oral data, establishes the connection between low-level facial feature points and high-level expression semantics using digital twin technology, and realizes the animation generation method for virtual character oral teaching using forward kinematic method to establish virtual human model with topological skeleton structure. The results show that the real-time animation generation based on digital twin technology applied to dental anatomy teaching video has an animation generation delay of 0.5s and can respond to the outside world in real time to generate interaction with students in real time. And the teaching performance achieved by the combination of traditional teaching and laparoscopic anatomy video teaching materials was the average student score ( $84.51 \pm 4.51$ ). The combination of traditional teaching and laparoscopic video teaching materials is better than traditional classroom lectures and can effectively promote the teaching reform of anatomy classroom.

## KEYWORDS

digital twin technology; forward kinematics; topological skeletal structure; video teaching; animation generation; oral anatomy

## 1. INTRODUCTION

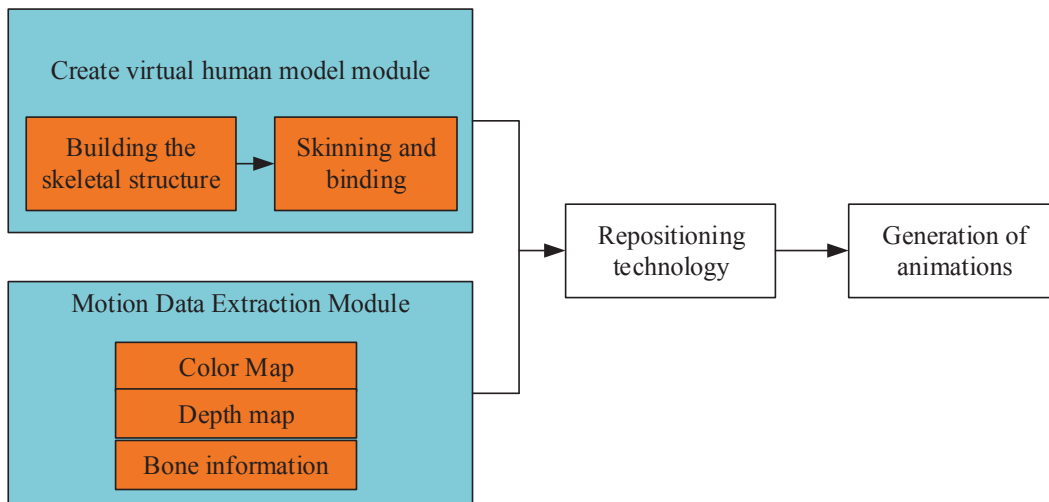

Anatomy is an important and fundamental course in medical science, and human anatomy is also a subject with a long history and tradition, which is a necessary

prerequisite for learning good clinical practice [1-2]. However, many students are not interested in this course because the content of anatomy is tedious and boring and difficult to memorize and the visceral specimens have irritating odors, so the simple lectures will make students feel mentally exhausted, thus affecting the teaching quality of anatomy courses [3-4]. In order to improve the quality of teaching and promote teaching reform, we need to start from classroom teaching [5-6]. The literature [7] argues that to stimulate students' interest in anatomy courses, then introducing laparoscopic video teaching materials into classroom teaching combined with traditional teaching is an attempt to reform anatomy teaching, which is the recording of laparoscopic surgical procedures into videos.

In this paper, 100 college students in the class of 2018 were selected as the study subjects and randomly divided into 50 each of observation group and control group, and the control group was taught anatomy by traditional teaching method, while the experimental group used real-time animation of dental anatomy teaching video based on digital twin technology to teach while watching laparoscopic video teaching materials, and analyzed and compared the influence of the two teaching methods on teaching effect.

## **2. VIRTUAL ANIMATION GENERATION BASED ON DIGITAL TWIN TECHNOLOGY**

The system is divided into functional modules based on the execution process for the system in order to carry out the software development work as shown in Figure 1. It can be divided into the following steps for implementation: (1) Virtual human geometry model creation module. This module consists of building the skeleton part and the skeleton skin binding part. (2) Kinect real-time motion skeletal data capture module. It includes the 3-dimensional coordinates and orientation information of 20 joints under the skeletal coordinate system. (3) Using repositioning technology to map the motion data captured by Kinect to the virtual human model, which in turn drives the virtual human. (4) The translation compensation mechanism and distortion processing method module to ensure the plausibility of the virtual human in the virtual scene.

**Figure 1** Execution flow of the system

## 2.1 REDIRECTIONAL TECHNIQUES FOR POSITIVE KINEMATICS

Bone motion update is mainly related to two matrices, as shown in Figure 2. The former represents the initial position of the skeleton, while the latter is mainly used to calculate the various motions of the skeleton, and the two together realize the update of the skeleton position. According to the principle of skeletal motion animation, the frame-by-frame rendering of the virtual human model requires updating each skeletal joint point every frame. Using the hierarchical nature between the bones upper parent node motion is passed to the child joints in motion. Forward kinematics uses a given deterministic state vector to calculate the position of each joint according to the forward kinematic equations. The forward kinematics is solved by applying only translation and rotation matrices to update the state for the transformation of the root node, while for the child nodes the rotation matrix is traversed from the root node to the target child node step by step to calculate the 3D position and rotation of each joint in the model coordinate system.

**Figure 2** Joint structure in model coordinates

Mathematically, the model space pose ( $j \rightarrow M$ ) of a joint can be calculated by

traversing from that joint to the root node and multiplying its local pose ( $j \rightarrow P(j)$ ) at each joint. Taking the mid-level order as an example, the parent node of the root node is defined as the model space, i.e.,  $M(0) = M$ . the model space pose of joint  $j_2$  can then be written as:

$$M_{2 \rightarrow M} = M_{2 \rightarrow 1} M_{1 \rightarrow 0} M_{0 \rightarrow M} \quad (1)$$

Similarly, the joint  $j_5$  model space pose can be written as:

$$M_{5 \rightarrow M} = M_{5 \rightarrow 4} M_{4 \rightarrow 3} M_{3 \rightarrow 0} M_{0 \rightarrow M} \quad (2)$$

The global pose of any joint  $j$  can be written as:

$$M_{j \rightarrow M} = \prod_{i=j}^0 M_{i \rightarrow p}(i) \quad (3)$$

In the bone update, the transformation of the joint  $j$  is simply multiplied by  $M_{j \rightarrow p}(j)$  from the initial matrix.

## 2.2 REAL-TIME ACQUISITION OF ORAL PARAMETERS

Oral parameters with semantic information are associated with facial feature points and facial expression units, so real-time acquisition of expression parameters is the key to drive the animation of expression-based generation. Existing algorithms for acquiring oral expression parameters generally require learning a priori knowledge from the user's pre-captured expression sequences to decouple the user's head pose and oral cavity. Therefore, the universality and ease of use are poor, and the user must have expertise in acquiring expressions and setting up the system. In contrast, the biggest advantage of an unsupervised approach to capture the user's facial expressions in real time is that it does not require any supervised training of the user to be captured. The user's facial expression parameters can be extracted by automatic data analysis which makes the facial animation generation algorithm based on this approach more universal and easy to use.

## 3. RESULTS AND ANALYSIS OF THE APPLICATION OF ORAL ANATOMY TEACHING VIDEOS

### (1) Experimental methods

The cadavers provided by the anatomy teaching and research department were used for experimental dissection, and the laparoscopic video teaching materials

consisted of surgical videos of laparoscopic cholecystectomy, laparoscopic choledochotomy with "T" shaped tube drainage, laparoscopic appendectomy and laparoscopic splenectomy from Qujing First People's Hospital, all of which were produced according to the teaching needs using All the videos were processed and produced with the computer software Photoshop and Echo, so that they could meet the needs of classroom teaching.

The total learning time of the control group was 150 min, and the total learning time of the control group was 150 min, and the content of anatomy knowledge was exactly the same as that of the experimental group.

## (2) Experimental results

The mean score of the control group was (67.12±6.21), while the score of the observation group was (84.51±4.51) by the combination of traditional teaching method and laparoscopic video teaching material. 1 shows.

**Table 1** Comparison of academic performance achieved by students in the two groups

Group	n	Achievement
Control group	54	67.12±6.21
Observation group	52	84.51 ± 4.51
P		P<0.05

The above findings show that the teaching method combining traditional lecture anatomy teaching with laparoscopic animated video teaching materials has good teaching effect, while the teaching effect of pure traditional lecture anatomy teaching in the control group is relatively poor.

## 4. CONCLUSION

In this paper, we propose a real-time animation generation algorithm for teaching oral anatomy using digital twin technology based on reorientation technique of forward kinematics and color images to achieve real-time extraction of feature points inside the oral cavity. The feature points are then geometrically measured and stored as a geometric metric sample set, and the sample distribution is automatically analyzed in an unsupervised manner to infer the change interval of each expression unit to achieve real-time oral parameters extraction. By combining traditional teaching with oral anatomy animation video teaching, the teaching method of combining traditional lecture anatomy teaching with oral anatomy animation video teaching was effective. And the teaching effect of the control group of pure traditional lecture anatomy teaching is relatively poor, which can effectively promote the teaching reform of oral anatomy classroom.

## ABSTRACT

A key strategy for the sustainable growth of the Chinese nation is the establishment of ecological civilisation. This paper takes the view that "big data+" provides advantages for the structure of ecological civilization that are difficult to be compared with small data, and its rich data sources make the information boundary blurred, and the diversification, convenience and intelligence of data collection help information integration become more orderly. Secondly, the influence factors of "green finance+" about the development of ecological sustainability in economic growth are explored. The findings demonstrate that the development of an ecological sustainability through the dual drive of "big data+" and "green finance+" improves per capita GDP by 84.14% and reduces energy ingesting per unit of GDP by 73.15%. This paper improves the integration mechanism of green finance and economic growth, improves the guidance mechanism of green low-carbon development, and increases green finance to support the development of an ecological civilisation through economic growth.

## KEYWORDS

ecological civilization construction; big data+; information integration; green finance+; double drive; GDP

## 1. INTRODUCTION

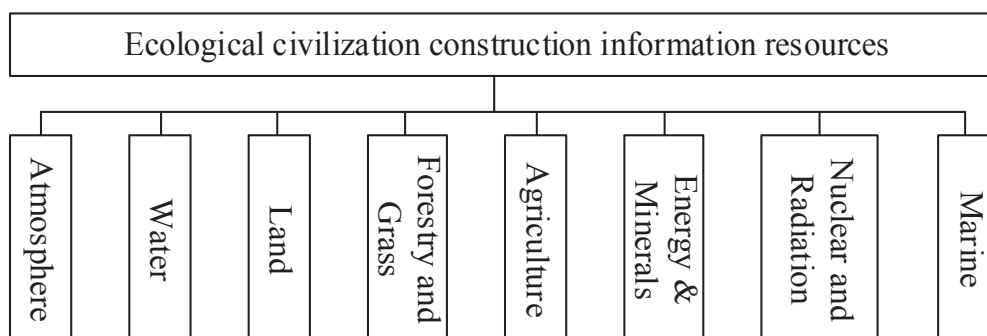

In recent years, ecological civilization study has increasingly drawn the interest of people from all walks of life due to the dire circumstances of tightening resource limits, substantial environmental contamination, and ecosystem destruction [1-3]. Literature [4] emphasizes the need to promote the development and application of ecological and environmental big data and establish an ecological and environmental data integration and sharing mechanism. It promotes the integration and interconnection of information resources and data open sharing to provide data support for ecological environmental protection decision-making, management and law enforcement [5]. These focus on the high importance that the state attaches to the use of big data in the development of ecological civilisation, and provide a guarantee for the de-siloing of information resources and the open sharing of data for ecological civilization creation [6]. The creation of ecological civilization requires huge amounts of capital, and the required funds are far from enough to rely on government financial support and social contributions alone, and cannot be separated from financial support and participation. Vigorous support for green development and ecological civilization construction is not only the proper duty and purpose of the Chinese financial sector, but also a successful strategy for advancing the sector's long-term growth [8].

In this paper, we first analyze the formation mechanism of collaborative governance of multiple subjects, and focus on the systematic construction of five aspects, including the interaction mechanism of subjects, resource integration mechanism, interest coordination mechanism, supervision and punishment mechanism and institutional guarantee mechanism. It also systematically designs the realization path of collaborative governance of multiple subjects in ecological civilization construction from three levels of concept, mechanism and action, and proposes the construction of "big data +" and "green finance +" double-driven mode to promote ecological civilization construction.

## 2. "BIG DATA+" ELIMINATES INFORMATION SILOS IN THE CONSTRUCTION OF ECOLOGICAL CIVILIZATION

The traditional Internet new media built by computer technology and fixed network technology, and the mobile Internet new media built by mobile Internet smart terminals and wireless network technology have given rise to Big Data in the contemporary sense. Big data's primary impact is that it creates a common world for us, a world that we can only share together anyway. A world where there is no outside, no exit, no other. The significance of big data technologies, the establishment of big data dissemination carriers and big data sharing platforms has made it possible to eliminate information silos.

Figure 1 illustrates how data and knowledge on the development of ecological civilization have been separated and isolated over a long period of time based on categories, industries, agencies, and regions, and the natural correlation and coupling between various types of data and information belonging to the same spatio-temporal object has been cut off and forgotten, with serious information siloing, duplication of construction and waste of resources, leading to high administrative costs, hindering the performance of government functions, affecting administrative efficiency, and destroying organizational Cohesion.

**Figure 1** Ecological civilization construction information resources and their sectors

## 2.1 DIVERSIFICATION OF "BIG DATA+" COMMUNICATION SUBJECTS AND CARRIERS

In the diversified data dissemination carriers, the data sources of ecological civilization construction are more abundant, and every actor such as government, enterprises, social organizations and individuals may become the subject of data collection, publication and sharing. Different data dissemination carriers will have different forms of expression. Under the mobile Internet, the media dissemination carrier is no longer a pure website form alone, but becomes a diversified form such as independent APP, news client, microblogging and weibo.

Using new technologies such as Internet of Things and mobile Internet, national ecological environment basic database can be established, such as population basic information database, legal person unit resource database, natural resources and spatial geography basic database and other different forms of national basic data resources, in order to improve the ability of universal perception and real-time monitoring of multiple environmental elements and various pollution sources. In addition to official data carriers, civil society organizations also provide new channels for ecological civilization construction data sources.

## 2.2 APPLICATION OF BIG DATA PROCESSING TECHNOLOGY

The use of technology for big data analytics makes data acquisition more diversified, intelligent, convenient and low-cost, which can greatly improve

management efficiency and bring about significant changes in environmental management and environmental decision-making.

The development and maturity of technology for big data analytics has accelerated the flow of data, increased the frequency of interconnection and interoperability, and the use of a large number of sensing devices can realize real-time, accurate and comprehensive monitoring and collection of various data and information related to the creation of ecological civilization, while emphasizing the capture of dynamic information, so that environmental monitoring data, enterprise pollution emission data, meteorological data, ecological governance data and other environmental data and related natural is greatly shortened.

The growth of the Internet, Internet of Things, cloud computing, mobile Internet and other knowledges has made the data carrier of ecological civilization construction more diversified, more convenient dissemination, more three-dimensional storage space, data access beyond the previous time and space limitations, through the Internet can obtain relevant data and information. The establishment of the big data platform has brought the various functional departments of ecological civilization construction closer together, with more frequent information exchange and sharing, and more timely data collation and transmission.

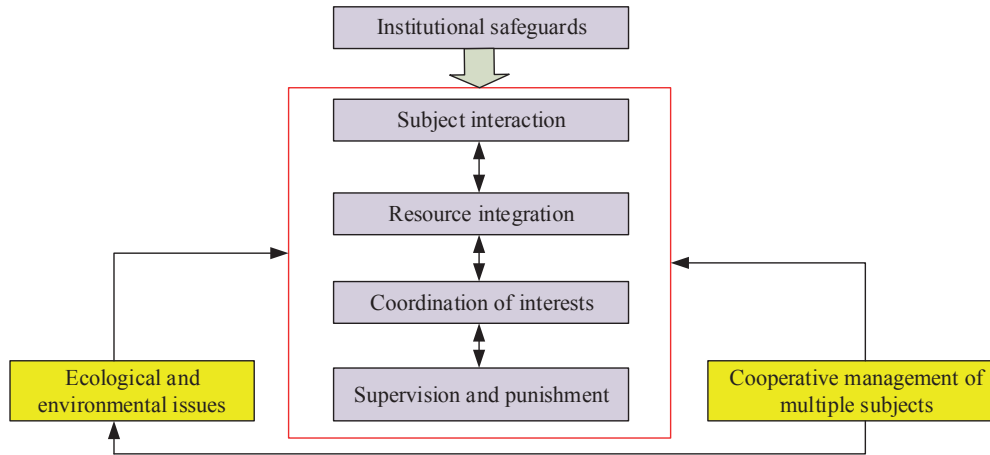

### **3. "GREEN FINANCE+" TO PROMOTE ECOLOGICAL CIVILIZATION CONSTRUCTION**

Green finance is a key tool for resolving the conflict among the preservation of the environment and economic advancement with its features of allocation of resources, environmental risk management, and green investment advice. It also plays a significant role in advancing ecological protection and the development of an ecological civilization.

#### **3.1 "GREEN FINANCE+" AND ECOLOGICAL GOVERNANCE AND PROTECTION MECHANISM**

The main goal of green finance is to become capable of directing and optimize the use of financial resources in order to maximize their Pareto potential for advancing ecological conservation, economic growth, and social advancement. Green finance can guide the flow of capital and optimize the efficiency of capital allocation. The strict implementation of environmental protection clauses by financial institutions in credit approval and loan issuance can promote the flow of social capital from high-pollution and high-energy-consuming industries to green, clean, energy-saving and pollution prevention and control policy-supported areas. At the same time, it can reduce the investment in high pollution and high carbon emission energy-consuming projects and

inhibit the start-up and production of polluting projects. Subject interaction, resource integration, interest coordination, supervision and punishment, and institutional protection are important formation mechanisms for the collaborative governance of multiple subjects in ecological civilization construction as shown in Figure 2.

**Figure 2** Green finance+ formation mechanism for ecological civilization construction

### 3.2 THE ENGINE MECHANISM OF "GREEN FINANCE+" TO PROMOTE THE DEVELOPMENT OF GREEN INDUSTRY

"Green finance+" is an important financial booster for transforming green mountains into silver mountains. The green economy, with "low energy consumption, low pollution and low emission" as its typical characteristics, has become an unavoidable choice for China's industrial structure to alter from rough and loose to intensive, and to realize the linked economic and ecological development. Green industries are usually a collection of knowledge-intensive and asset-intensive industries, which require large amounts of capital and scientific research support and are highly dependent on financial services. Green finance can influence the growth of green industries and the rationalization and modernization of industry sector from two perspectives by realizing the efficient deployment of funds and through value discovery function.

First, green finance boosts the growth of emerging green industries. The incorporation of green finance and advanced technology can identify and locate core and leading green technologies, screen out green industries that represent the future development direction, and guide the transfer of capital and resources from backward industries to advanced green industries. At the same time, green finance will raise and gather funds from multiple channels and parties for energy preservation and environmental safety, clean energy, green transportation, green construction and other developing green businesses with high technological content and environmental

degradation and minimal resource use, which will support the growth of green industries, as well as the improvement and modernization of industrial structure.

Second, green finance promotes the transformation of traditional industries into green. Under the influence of green development concept, the development of traditional industries with serious pollution and backward technology will be restricted in all aspects, and the pressure of survival promotes such traditional industries to accelerate technological research and development and green transformation.

#### **4. CONCLUSION**

As a higher stage of information technology development, "Big Data+" has to a certain extent made up for the absence of technical conditions of small data, and plays a significant part in fostering the development of ecological civilisation, breaking "departmental fragmentation" and eliminating "information silos" It plays a significant part. The rapid growth of "green finance +" is a major highlight of China's financial reform, and an essential lever for the financial sector to support supply-side structural transformation and more effectively support the development of ecological civilisation. In order to promote national development objectives, battle pollution, advance green economic and social growth, and advance the establishment of an ecological civilization, green finance is essential.

---

## ABSTRACT

Rural financial reform is characterized by obvious government exogenous push, and its own modification energy is insufficient. This paper uses artificial intelligence and blockchain to significantly change the traditional financial industry information collection, risk pricing model and investment decision-making process, improve the accuracy, accessibility and sustainability of financial services, and empower rural financial reform at three levels: operational foundation, financial products and business model. The results show that rural financial institutions can use artificial intelligence, blockchain and other technologies to achieve 41.25% matching time between financial service demand and supply, significantly reduce transaction costs by 23.6%, and further expand the boundaries of financial services. This paper provides the maximum scope of rural finance to achieve real-time information sharing, enhance financial credit, and prevent financial risks.

## KEYWORDS

rural financial reform; artificial intelligence; blockchain; traditional financial industry; investment decision making; financial services

## 1. INTRODUCTION

The key link and basic step of rural revitalization strategy lies in revitalizing rural industries and promoting agricultural modernization, focusing on strengthening village and township construction, improving rural infrastructure and promoting rural industrial development, which naturally gives rise to a huge demand for capital [1-2]. Financial services are the source of power for economic development, and to realize

the rural revitalization strategy, we must enhance financial support for agriculture and benefit agriculture, broaden the channels of rural financial services, and innovate rural financial services, while rural financial reform is the fundamental way to achieve this goal [3-4]. According to literature [5], China's rural financial system has gone through three stages: restoration and reconstruction, embryonic appearance, and gradual improvement. At present, a rural financial system with mutual coordination among policy-based finance, commercial finance and cooperative finance has been initially established [6]. However, in general, the reform is not effective enough, and there are still problems that need to be solved, such as incentive incompatibility and multi-objective conflict, in rural financial reform [7].

This paper firstly uses artificial intelligence, big data, cloud computing, and blockchain to empower the reform of rural finance through three levels of operational foundation, financial products, and business models, so as to improve the accuracy, accessibility, and sustainability of financial services. Secondly, four directions for deepening rural financial reform are proposed: deepening market-oriented reform, realizing the match between rural development paradigm and rural financial paradigm, designing incentive-compatible power mechanism, and using financial technology.

## **2. THE ENABLING ROLE OF ARTIFICIAL INTELLIGENCE FOR RURAL FINANCIAL REFORM**

The core of the problem of lack of momentum facing rural financial reform is the issue of transaction costs. If we can reduce transaction costs and improve risk identification, the corresponding problems will be solved. In recent years, technology has been deeply integrated with financial business, and the resulting fintech has brought solutions to the dilemma of traditional finance. Through the use of fintech tools such as artificial intelligence and blockchain, the traditional credit collection, risk pricing and investment decision-making processes of financial institutions can be substantially changed, empowering rural financial reform at three levels: operational foundation, financial products and business models.

### **2.1 ARTIFICIAL INTELLIGENCE ENABLES LOWER TRANSACTION COSTS FOR RURAL FINANCIAL SERVICES**

First, fintech uses mobile Internet technology to complete real-time interconnection of all locations, all times and all objects. Financial service demanders can directly log into the interconnection platform and release their financial demands. Financial service providers screen directly on the platform and provide credit services. This makes financial services free from the restrictions of the geographical distribution of physical outlets, greatly expanding the scope of services and reducing operating costs. Second, fintech, through the use of blockchain technology, can not only

significantly enhance data security, but also effectively reduce clearing costs between financial institutions and significantly improve transaction processing efficiency. Finally, the use of artificial intelligence in the financial industry can effectively reduce human repetitive work and make financial business realize process batching and automation, thus enhancing work efficiency and further reducing transaction costs.

## **2.2 ARTIFICIAL INTELLIGENCE MAKES INFORMATION NETWORKED AND TRANSPARENT**

Information production in the financial system is carried out in two main ways: it is information disclosure by market players themselves in accordance with laws, regulations or mandatory requirements of relevant government departments, such as accounting standards and auditing requirements. It is professional information producers such as securities companies and credit rating agencies that collect, collate and evaluate information on the production and operation status, asset and liability levels and investment value of capital demanders. Then it is provided to the capital suppliers for a fee. The high cost of information acquisition, information asymmetry and insufficient matching of information demand and supply are problems that are difficult to avoid in the traditional information system. By using big data analysis, blockchain and other technologies, FinTech can fully collect information and then analyze it intelligently by using cloud computing technology, which not only broadens the sources of information, but also incorporates people's interests and behavioral habits into the analysis. At the same time, the use of blockchain realizes the selective real-time sharing of effective information among transaction stakeholders, which greatly increases the efficiency of effective information acquisition by users and makes information networked and transparent.

## **2.3 ARTIFICIAL INTELLIGENCE RECONSTRUCTS THE FOUNDATION OF RURAL FINANCIAL OPERATION**

(1) Integrate rural fragmented financial markets through online interconnection platforms to reduce the cost of financial services.

Financial institutions use financial technology to develop online banking, mobile banking and other convenient financial services interconnection platforms. It can effectively break through the limitations of geography and distance, integrate the fragmented financial market in rural areas, and allow many agricultural producers in areas previously not covered by physical outlets to enjoy financial services conveniently and quickly. At the same time, financial institutions can use artificial intelligence and blockchain technology to achieve timely and effective matching between financial service demand and supply, making the transaction process more transparent, significantly reducing transaction costs and further expanding the

boundaries of financial services.

(2) Using big data, cloud computing and blockchain technology to improve and perfect the rural credit information system.

At present, there are still shortcomings and blank areas in the construction of information system platforms in rural areas, and there are problems of difficulty and high cost in acquiring credit information. In the context of financial technology, financial institutions can use big data technology to extensively mine and integrate the scattered credit information of agricultural producers from their daily life transactions and performance information, and realize effective rating of credit status through artificial intelligence technology. By using blockchain technology to form an open, transparent and untamperable credit database, and by exchanging data information through blockchain, they can break through information silos and realize real-time information sharing to the maximum extent, enhance financial credit and prevent financial risks.

### **3. ANALYSIS OF THE EFFECTIVENESS OF ARTIFICIAL INTELLIGENCE ON RURAL FINANCIAL REFORM**

Various types of rural financial institutions have carried out market-oriented reforms to meet the needs of rural market economy construction. In the case of agricultural credit cooperatives, first of all, the problem of excessive baggage left by history has been solved. Since 2005, when agricultural credit cooperatives turned losses into profits, by the end of 2020, the national agricultural credit cooperatives had made a cumulative profit of 1168 billion yuan. Secondly, the quality of assets and operating financial situation has been improved. As of the end of 2020, the balance of non-performing loans was 1,501.8 billion yuan, the non-performing loan ratio was 7.15%, and the capital adequacy ratio was 10.71% compared with 2008, a decrease of 841.7 billion yuan, a decrease of 16.17 percentage points and an increase of 11.17 percentage points, respectively, as shown in Figure 1. Further is the size of the funds and credit allocation increased significantly, its various loan balances, agriculture-related loans to farmers and farmers loan balance, respectively, increased to 24.57 trillion yuan, 9.27 trillion yuan and 4.57 trillion yuan. Finally, the reform of the property rights system has been steadily promoted. By the end of 2016, 2,704 county-based unified corporate agricultural credit cooperatives, 4,244 agricultural commercial banks and 50 agricultural cooperative banks were built.

**Figure 1** Trend of Non-Performing Loan Ratio and Capital Adequacy Ratio of Rural Credit Unions

In terms of large commercial banks, Agricultural Bank has actively explored an effective model for large commercial banks to serve the three rural areas, and has carried out the reform of the Three Rural Finance Division since 2010, releasing operating rights to county branches and strengthening its status as the main business entity in the three rural areas, and has achieved significant results through the reform. Figure 2 shows the analysis of the non-performing loan rate after the reform of the three rural finance departments since 2010, and it can be found that as of the end of 2020, the balance of county loans reached 7.52 trillion yuan, which is 2 percentage points higher than the growth rate of the whole bank's loans, and increased by 243.2112 billion yuan compared with the end of 2010. The changes in the deposit to loan ratio in counties of Agricultural Bank's Three Rural Finance Division can be seen that the overall deposit to loan ratio is on an upward trend, indicating that the efficiency of its rural financial services is gradually improving. The non-performing loan ratio of the entire county financial business was on a downward trend. the non-performing loan ratio was 4.1% at the end of 2020, 5.2 percentage points lower than that in 2010.

**Figure 2** Agricultural bank county non-performing loan ratio and county deposit to loan ratio

#### 4. CONCLUSION

Through the use of fintech tools such as artificial intelligence, big data computational analysis, cloud computing, and blockchain, this paper can significantly change the traditional credit collection, risk pricing, and investment decision-making processes of financial institutions, empowering rural financial reform at three levels: operational foundation, financial products, and business models. The results show that through the real-time interconnected data analysis provided by fintech, the market feedback of various financial products can be grasped in a timely and accurate manner, so that financial products and financial services can be improved and adjusted in a more timely manner, making rural financial services more dynamic in the market.

## ABSTRACT

In the era of big data, artificial intelligence technology has been greatly developed and widely used in many fields of society, and has achieved remarkable application results. In this paper, we analyze the policies related to G college entrance examination, analyze and compare the content and question types of higher mathematics examination, propose the review method of higher mathematics examination, and give the articulation strategy and review suggestions of specific college entrance examination through artificial intelligence technology. The results showed that the articulation optimization strategy of college entrance exam based on artificial intelligence technology improved students' average score by 12.5% and saved 23.5 revision time. This shows that the AI technology-based adaptation and optimization of college talent training program makes the college talent training more suitable for social needs and students' own learning situation.

## KEYWORDS

big data; artificial intelligence technology; college entrance examination; higher mathematics; articulation optimization strategy; talent cultivation

## 1. INTRODUCTION

Lu Xin, former Vice Minister of Education, said at a press conference on "Reform and Development of Vocational Education" at the State Information Office in 2014 that the reform of vocational education will be further promoted to open up the pathway for students from middle school, college, undergraduate to graduate school [1-2]. Innovative vocational education models of all levels and types will be implemented in the process of education and teaching, innovation of curriculum and teaching materials,

internship and practical training, and cultivation of professionalism and vocational skills in the cultivation of diversified talents [3]. Build a bridge for everyone to achieve success and strive to give everyone the opportunity to excel in life [4]. Therefore, students who are willing to enter applied undergraduate institutions for professional upgrading should be encouraged. The examination for excellent college graduates from general colleges and universities to enter the undergraduate level (hereinafter referred to as college education) has been carried out for more than ten years, and a large number of excellent college students have entered higher-level institutions for further study, which has cultivated a large number of high-quality technical and skilled talents for society [5-6].

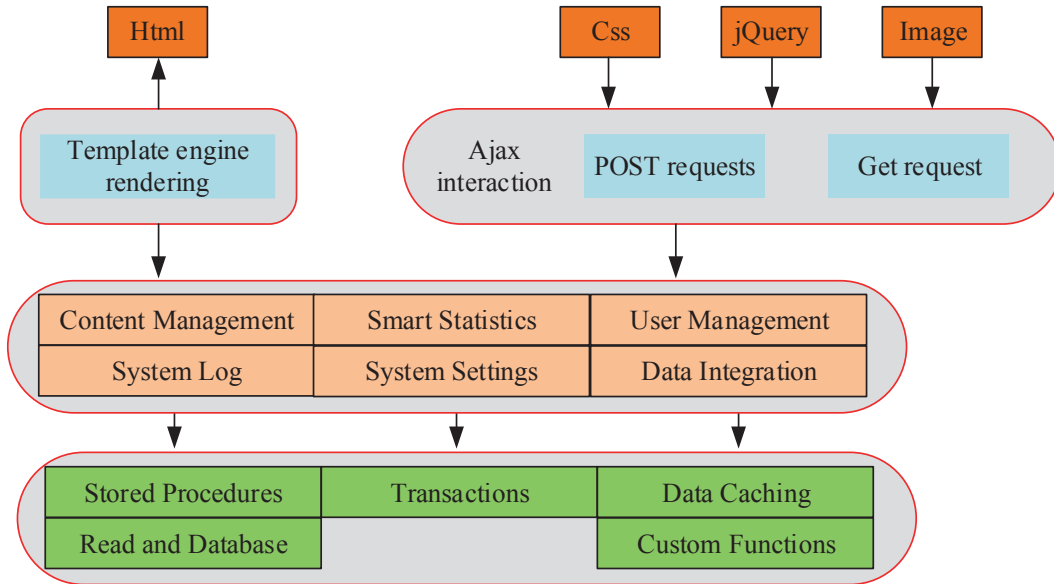

In this paper, for the purpose of improving the quality of file management and analysis, combined with the actual business of the author's unit of work, the analysis of various files management of self-study examinations is used as an example to explore the problems of various types of file management in the development of self-study examinations. Speaking with data and oriented with intelligence, it aims to provide a more intelligent, convenient and accurate service for file management and analysis. Thus, it makes a comprehensive simulation analysis for the further improvement of candidates' learning and provides decision support for the further development of the college entrance examination.

## **2. APPLICATION OF ARTIFICIAL INTELLIGENCE TECHNOLOGY IN COLLEGE ENTRANCE EXAMINATION**

### **2.1 IMPLEMENTATION OF BIG DATA STORAGE, STATISTICAL ANALYSIS**

Artificial intelligence is an intelligent technology that imitates human memory, recognition and processing, and its main purpose is to use machines to perform various complex tasks instead of humans. The main purpose of AI is to replace humans with machines that can perform complex tasks and achieve convenience, efficiency and intelligence. Artificial intelligence technology is a new technology resulting from the reproduction of computer information technology. It is a network information processing technology that imitates people's recognition, storage, calculation and processing by putting a set programming language into intelligent machines. The file management system of self-study examinations in higher education in the context of big data is combined with the search and memory system and intelligent data processing system of artificial intelligence, and the big data of candidates' files are logically analyzed by artificial intelligence. Thus, we can conclude to realize intelligent management of candidates' files and explore new ideas, directions and dynamics more suitable for contemporary self-study examinations in higher education for the higher education self-study examination function. Explore new ways to enable candidates to

use their time after school to gain more knowledge and acquire more skills while receiving school education. The system architecture of web-based management and analysis of higher education self-study examination files using artificial intelligence technology in the context of big data is shown in Figure 1.

**Figure 1** System architecture of file management of college entrance examination

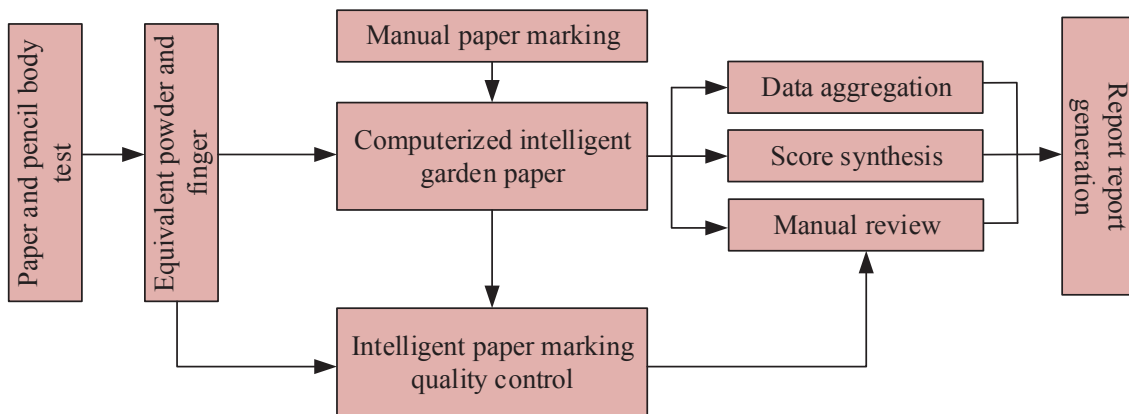

This model not only allows you to achieve a higher level of education while you are in school, but also to learn something and better train and export talents for society, as an opportunity to provide a convenient way for three-year college students to take the graduate school. To achieve these purposes and goals, it requires a lot of big data as support, using artificial intelligence technology for analysis, and through the efforts of all parties to progress and improve together.

## 2.2 THE REALIZATION OF A NEW MODEL OF ARTIFICIAL INTELLIGENCE MANAGEMENT

According to the steps of registering for the examination, the first thing to see is whether the candidate meets the conditions for applying for the Higher Education Self-Study Examination Intensive Practical Ability Training Test, that is, whether the candidate's school is a pilot institution approved by the provincial examination authority with the qualification of student assistance. Candidates can apply for the examination only if they meet the conditions, otherwise they can only register for the higher education self-study examination as social candidates. The pilot institutions will collect and report the information of eligible students to the local and municipal examination institutions, and the local and municipal examination institutions will integrate and process the information of eligible candidates from the pilot institutions and report it to the provincial examination institutions, and the provincial examination institutions will store and file the examination registration information to form the examination

registration file of candidates as shown in Figure 2.

**Figure 2** Flow chart of computerized intelligent marking of subjective questions

After candidates have passed all the courses in all professional programs, those who meet the graduation conditions can declare their graduation through the Internet. After the successful declaration, the pilot institution will instruct the candidates to fill out the graduate identification form and collect it and deliver it to the local municipal examination institution to which the university belongs in a unified manner, and the local municipal examination institution will be based on the candidates' online declaration. Use big data technology to retrieve candidates' grades, electronic test papers and other information, and then organize staff to compare the handwriting, grades and courses of the graduate identification forms filled out by individual candidates, and to query and extract the old files of candidates who need to retrieve their old files in the early days.

### 3. OPTIMIZATION STRATEGY FOR THE CULTIVATION OF TALENTS BASED ON ARTIFICIAL INTELLIGENCE TECHNOLOGY FOR POST-SECONDARY EDUCATION

There is still a certain dilemma in the cultivation of talents in general undergraduate colleges and universities, and there is an urgent need for effective design and reconstruction from different aspects such as training program setting, subject system construction, curriculum content selection, teaching materials selection and evaluation methods. Finally, we return to the common sense and reality of talents cultivation for college education and build a talent cultivation model suitable for the school situation, learning situation and professional characteristics.

(1) To set up talent training program oriented to the cultivation of application-oriented talents

Although there are many colleges and universities with different specialties, the goal is to cultivate high-quality applied talents who can directly face the society,

production, management, service and other front-line needs. Therefore, the training of talents should be built "application-oriented" talent training program and curriculum system support. Talent training program as a whole should show its application characteristics, to adapt to the needs of society, the market as the main goal. In this regard, the choice of enrollment majors should be biased towards application-oriented majors and avoid academic majors as much as possible. In the organization of the curriculum system, we should consider the comprehensiveness and integration of the students' knowledge system, to the degree of "can use" and "enough", and have the conditions to jointly develop courses with enterprises, to carry out talent co-education and implement mutual recognition of school-enterprise credits. In the curriculum, to follow the logic of application, to enhance students' social practice ability for the purpose, theoretical courses should be closely linked to the cultivation of students' practical skills.

(2) To cut the subject content and optimize the faculty by taking the practical value as the measure

In general, the cultivation of talents in college emphasizes more on practicality and application, and pays attention to the close combination of disciplinary theoretical knowledge and social practice, and uses disciplinary theory to guide practice. To a certain extent, this determines the practical value orientation of the cultivation of talents for college education. Although different disciplines have different professional characteristics and disciplinary logic, some focus on application, some focus on theory, but ultimately need to return to the logic of practical value.

(3) Change education evaluation methods and focus on students' academic value-added evaluation

Under the traditional teaching paradigm, the evaluation of talent cultivation quality is mainly centered on schools and teachers, and the achievement of teaching objectives is emphasized, but the "value-addedness" of students' learning results is often neglected. It is especially important to pay attention to the value-addedness of students' learning outcomes.

#### **4. CONCLUSION**

This paper analyzes, retrieves, compares and simulates human thinking patterns through artificial intelligence technology to give the final analysis results needed by candidates and the most data-driven suggestions to guide users to make judgments, and then through a new round of instructions, big data analysis is conducted inside the device drawing on other factors to make the best optimization strategy for post-secondary candidates that ultimately simulates human logical thinking. By speaking

with data and guiding with intelligence, it aims to provide more intelligent, convenient and accurate services for file management and analysis. Thus, it makes a comprehensive simulation analysis for further improvement of candidates' learning and provides decision support for further development of self-study exams.

## ABSTRACT

In order to test the feasibility of an eco-museum design approach that combines rural industrial integration with original cultural preservation. This paper takes the ancient village as the research object and uses the coding technique in the rooting theory which analyzes the relevant diary interview data on the website to establish a conceptual model between the five main factors affecting the tourism of the ancient village: historical resources, cultural preservation, peripheral linkage, tourism development, and tourism experience. Combined with the latest successful third-generation eco-museum construction study, it was found that the functional value, emotional value, cultural value, aesthetic value, and artistic value scored 4.7, 4.23, 4.63, 4.57, and 4.43, respectively, through the tourists' evaluation of the eco-museum survey, and the evaluation results were all more satisfactory and achieved the expected results. It can be shown that the application of big data analysis to eco-museum design is more helpful to the sustainability of rural development as well as cultural continuity.

## KEYWORDS

rural industrial integration; ecological museum; rooting theory; coding technology; big data analysis; sustainability

## 1. INTRODUCTION

Eco-museums are the protection and preservation of cultural heritage in the original ecological environment, bringing cultural museums to life in local social life,

and maintaining good sustainability between tangible heritage, intangible heritage, natural ecological environment, and tourism and economy, resulting in open environmental areas regarded as eco-museums as a whole [1-3]. Since the 1980s, when the eco-museum concept was brought to China through the journal *China Museum*, edited by Su Donghai, it has undergone three theoretical iterations, and in each iteration of the development of eco-museums in China, it has continued to improve its suitability for the tourism industry in an attempt to use this as a viable set of models for tourism development [4-5]. The literature [6] considers this as a fortuitous event in the decade-long development downturn of eco-museums. The literature [7] argues that China has a different rural context than Europe, where the creation of ecomuseums was based on environmental destruction due to economic development, while rural areas in China are accompanied by deep-rooted poverty and backwardness. The current stage of development requires it to consider the economic purpose of poverty alleviation and face a new development model.

This paper creates an ecological museum combined with cultural preservation through the design of spatial scenes under multiple perspectives and strengthening the experience of display scenes. In order to explore the feasibility of applying the eco-museum model for tourism development in natural villages represented by ancient villages, the rooting theory is adopted to analyze the characteristics it possesses in the real tourism development. Finally, according to the big data processing capability and reasonable architecture, the online natural ecological museum is constructed to provide a completely realistic visiting experience, simulating the real exhibits from the multi-dimensional sensory perspectives of sight, sound, touch and smell, giving visitors a visiting experience that is different from that of offline museums.

## **2. ECOLOGICAL MUSEUM DESIGN BASED ON ROOTING THEORY CODING TECHNOLOGY**

In order to explore the feasibility of applying the eco-museum model to the tourism development of natural villages represented by ancient villages, the rooting theory is adopted to analyze its characteristics in the real tourism development. Root theory is mainly applied to social research, aiming to systematically obtain and analyze data to discover the most scientific and qualitative research method of theory. The first step is to break up the original data in the substantive coding stage and to conceptualize the semantic understanding of the data. That is, open coding is performed to form preliminary abstract categories after multi-layer conceptualization. The second step of selective coding sorts out the initial categories and then establishes the core categories and the various connections between them. Finally, in the theoretical coding stage, the different interrelationships implied by the core categories are clarified, and a well-

founded and fully developed theoretical construction is constructed. It is then verified in the primary sources and explained in real-world problems.

## 2.1 SELECTIVE CODING PHASE

In the next step of selective coding, we need to analyze the association between each category in internal nature and external environment, categorize them into 4-8 main categories, and establish the logical relationship between main categories and sub-categories. Finally, this paper outlines five main categories: historical resources, tourism development, cultural preservation, tourism experience, and peripheral linkage, and the connotations of each main category and corresponding categories are shown in Table 1.

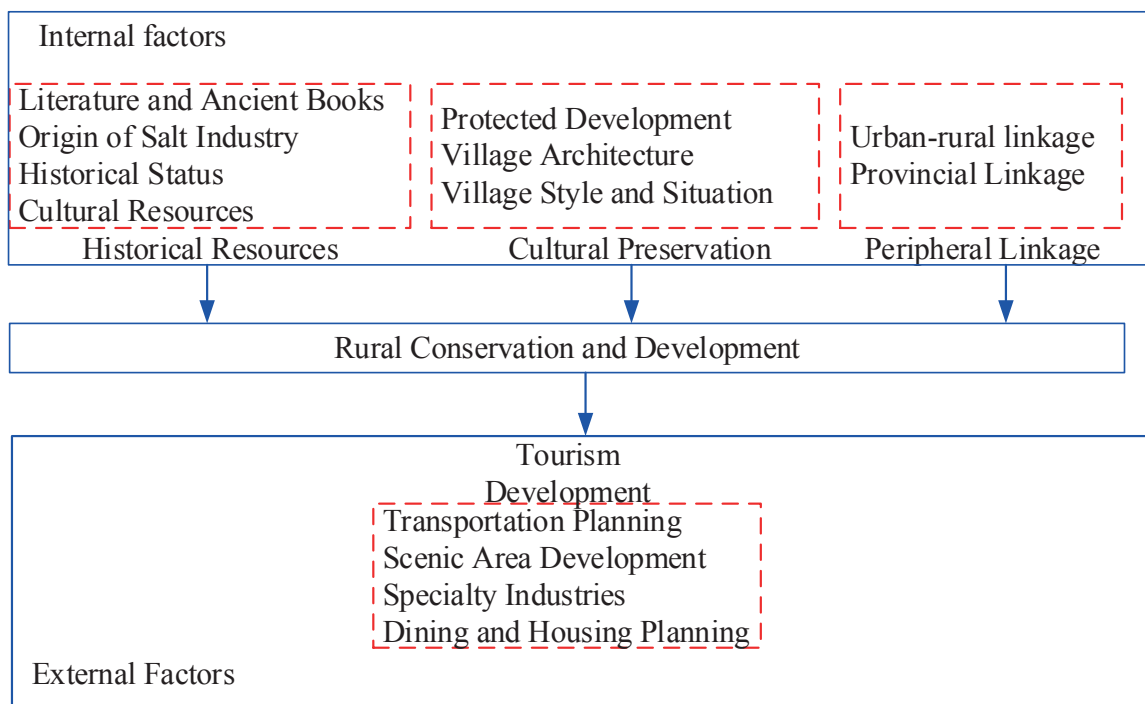

**Table 1** Main categories and their corresponding connotations

Main Category	Preliminary scope	Main Category	Preliminary scope
Historical Resources	Literature and Antiquities	Tourism Development	Protective development
	Origin of Salt Industry		Village Style and Situation
	Historical Status		Tourist Portrait
	Cultural Resources		Tourism Access
	Transportation Planning		Destination Image
	Scenic Area Development		Tourist Expectations
	Special Industries		Urban-Rural Linkage

Narrative and space are often closely linked, and the use of three-dimensional space to record the plot and tell the story of the narrative form is called spatial narrative. In the field of design, spatial narrative due to the depth of the three-dimensional space itself, the narrative form of the story is not limited to the spatial content of the chronological, there will be a variety of forms of expression to show the scene and its spatial spiritual properties.

## 2.2 THEORETICAL CODING STAGE

The above five main categories basically cover all the necessary internal and external elements affecting rural conservation and development, and thus enter the theoretical coding stage. Based on the clear lineage between the main categories, the study constructed a "theoretical model of rural conservation and development model" as shown in Figure 1. It has several components: historical resources, cultural preservation and peripheral linkages mainly act as internal factors for the conservation development of the countryside, while tourism development acts as an external factor for the countryside from the outside to the inside, and the level of development of the countryside will be reflected in the tourism experience. At the same time, the tourism experience as an independent element acts on the conservation and development of the countryside, forming a situation of mutual influence.

**Figure 1** Theoretical model of rural conservation and development model

Finally, the saturation test of the constructed conceptual model was performed, and the coding of the four saturation test materials set aside showed that no new categories or relationships emerged. The developed theoretical model can explain the factors influencing rural conservation and development in the information, so the conceptual model is judged to be theoretically saturated.

### 3. INTERACTIVE DESIGN OF DIGITAL MEDIA ART FOR ECO-MUSEUMS

In the era of artificial intelligence, the form of information dissemination has changed a lot. New information platforms supported by the Internet and digital media have greatly improved the efficiency of information processing and information dissemination. The information data carrying capacity, analysis and processing efficiency, and dissemination range of emerging digital media have been greatly enhanced, and have changed the way people receive information and learn.

With the help of specific computer programs, visitors can even visit and see exhibitions in the cloud without leaving home, through the official media of the Museum of Nature and Ecology, supported by multifunctional interactive technologies. Through the systematic study of digital media technology on the traditional museum information presentation form and the use of model innovation of the ecological museum digital media art interactive design is summarized as follows.

(1) Keeping up with the times and exploring the integration of digital media and natural ecological content.

The positioning of the natural ecological museum is to transmit natural ecological knowledge to the public, reveal the current state of the ecological environment, and show the achievements of ecological and environmental protection technology development, ecological civilization construction achievements.

(2) Based on practice, show the strength of information interactive technology cultural communication.

Digital interactive technology can extend the human visual and audio sensory capabilities, through advanced virtual technology equipment for special processing of information, is the basic form of the current intelligent visit to the Museum of Nature and Ecology.

(3) excellence, to explore the future direction of the digital nature and ecology museum.

With the support of a large number of digital technologies such as virtual technology, human-computer interaction and 3D technology, the current content presentation of nature and ecology museums has been greatly changed, thus also revolutionizing the dissemination of ecological culture and greatly enhancing the efficiency of ecological culture dissemination.

#### **4. CONCLUSION**

In the context of cultural and tourism integration, it brings new development opportunities for eco-museums' cultural and creative products, in order to improve the cultural connotation and regional characteristics of museums' cultural and creative products, as well as consumers' satisfaction with them. This paper takes consumers' value perception as the starting point to evaluate the cultural and creative products of ecological museums. We propose optimization strategies and conduct case studies to verify the feasibility of the strategies in terms of functional, cultural, emotional, aesthetic and artistic values. It will provide reference for the development and innovative design of other ecological museums' cultural creations, further promote the transmission and dissemination of national culture, and contribute to the preservation of the diversity of Chinese excellent traditional culture.

## ABSTRACT

The study of the communication of city brand image is of great significance to the comprehensive development of cities. Based on the characteristics of city brand image, this paper proposes the method of constructing city brand image based on CIS system. On this basis, through the analysis of the current situation of Changsha city brand communication, the corresponding communication strategy is proposed. The most urgent problem of Changsha city brand image is the lack of communication implementation and brand synergy, which accounts for 26.92%, and the implementation of Changsha city brand communication activities also presents the problem of scattering and disorder. This study has guiding significance for the communication of Changsha city brand image.

## KEYWORDS

Changsha city brand; image communication strategy; CIS system; brand synergy

## 1. INTRODUCTION

In the competition of cities, sociologists have proposed the concept of city brand image in order to distinguish the uniqueness of different cities [1-2]. In order to gain a favorable position in the competition, cities must carry out good city image shaping and communication. A good image is the most valuable intangible asset of a city, reflecting a city's connotation, development status and civilization [3-5]. The added value brought by city image will become an excellent bargaining chip for city development.

The concept of city branding has become increasingly popular among domestic and international marketing scholars and urban management practitioners, although there is an increasing number of studies involving the field of city branding [6-7]. However,

in general, the research on city branding in academia is still in its initial stage, and relevant studies are mainly scattered in the theoretical studies of city marketing and city branding. The literature [8] suggested that social media promoting word-of-mouth has become the most influential city branding communication channel. The literature [9] proposed a method to measure the effectiveness of city branding based on insights from personal interviews with international experts. The paper [10] proposed the concept of "slow city" and used an empirical method to investigate the influence of its brand association type on the behavioral intention of potential tourists. Based on the above research, this paper analyzes the communication dilemma of Changsha city brand image and discusses the communication strategy under the framework of CIS system.

## **2. CITY BRAND IMAGE AND COMMUNICATION STRATEGY**

### **2.1. CITY BRAND IMAGE**

#### **2.1.1. BRAND IMAGE**

The original meaning of brand image refers to the personality characteristics of a brand in the market and in the mind of the public, which reflects the evaluation and perception of the public, especially the consumers of the brand. Brand is an objective thing, while image is the impression of the thing in people's mind. Brand image and brand are inseparable, and brand image reflects the strength and essence of the brand, so image is the foundation of the brand. Brand image is produced by consumers in the process of long-term contact with the brand, and is strengthened by consumers' brand association. The ultimate goal of brand management is to establish the brand image desired by its company in the minds of target consumers.

#### **2.1.2. CHARACTERISTICS OF CITY BRAND IMAGE**

City brand image is an intangible asset that cities try to create in order to gain advantages in the competition. With the intensification of urbanization, the competition among cities for social resources is becoming increasingly fierce, and the city brand and city brand image born under such circumstances naturally need to reflect the special characteristics of the city in order to gain advantages in the competition. In other words, the implementation of city brand image shaping and communication must be based on the marketing perspective, taking city brand image shaping and communication as an important means to improve the competitiveness of the city, discovering and refining the unique attractiveness of the city, creating unique brand assets for the city, and making the city have a unique resource.

### **2.2. CIS-BASED CITY BRAND IMAGE CONSTRUCTION**

All communication activities are aimed at spreading certain contents, so the

content of communication is the basis for communication to happen. The first problem that needs to be solved when studying the communication of city brand image using communication science approach is the definition of communication content. The core task of city brand communication is to establish a city brand image that reflects the unique core value of the city. In order to accurately express the city brand image, a comprehensive and accurate theoretical positioning and system framework is needed. For this reason, this paper introduces the CIS system framework and optimizes this system so as to adapt to the requirements of city brand image communication.

CIS is the city characteristic image recognition system. With the development of cities towards a high degree of informationization, it has become extremely common for cities to use information communication media to participate in fierce market competition and improve the overall effectiveness of cities. The city identity image is an important intangible asset of the city, and in order to make the city identity image occupy a place in the minds of a larger public, it is necessary to establish a city identity system and implement CIS strategy. the contents of city brand communication under CIS are shown in Table 1.

**Table 1** City brand communication content

Content of city brand communication	Behavioral Identity of City Branding	Overall quality of citizens
		Industry organization regulation
		Government Regulations
	Conceptual identity of the city brand	City Core Values
	Visual Identity of City Brand	City Natural Landscape
		City Signs
		Urban Public Facilities

### 3. CHANGSHA CITY BRANDING AND COMMUNICATION STRATEGY

#### 3.1. CHANGSHA CITY BRAND IMAGE

Changsha is the capital of Hunan province and the center of politics, economy, culture, education, science and technology, transportation, communication and finance of the province. In the cultural accumulation and economic development, Changsha presents its unique characteristics from city economic strength to appearance scenery, from city culture to city spirit, which has accumulated rich resources for the construction of Changsha city brand.

Based on the integration of many elements such as city brand resources and brand personality, Changsha city policy makers have proposed "Central Leisure and Entertainment Culture Capital", "Regional Consumption Center", "International Cultural City ", "entrepreneurial capital, livable city, happy home" and other development visions, and accordingly established for Changsha "great man's

hometown", "mountainous continental city ", "Landscape with lots of love and sparkling star city", "Leisure Changsha, cultural capital", "Journey of civilization, charming Changsha", "Happy capital, mountain and water", "Happy city, cultural capital". City brand positioning such as "Happy City, Mountainous City of Continents".

### 3.2. ANALYSIS OF THE CURRENT SITUATION OF CHANGSHA CITY BRAND COMMUNICATION

The main problems faced by Changsha city brand communication are shown in Figure 1. The problems of lack of management planning and weak brand awareness account for 24.01%, the planning of the city brand image and the communication of the city brand have not been given enough attention. The problem of variable development mode and vague brand personality accounts for 26.69%, the development demands of the Changsha municipal government on Changsha city do not actively meet these qualities, and the concept of demands changes with the situation and environment. The problem of missing image identification and similar communication strategy accounts for 3.74%, the identification system of Changsha city brand is basically missing, there is neither core clear city concept positioning nor unified clear city behavior construction. The problem of weak communication implementation and insufficient brand synergy accounts for 26.92%, and the implementation of Changsha city brand communication activities also shows a scattered and disorderly problem. The problem of insufficient effect monitoring and slow brand value-added accounts for 18.64%, Changsha's current city brand communication activities still mostly use mass media, with simple one-way publicity and promotion, and lack of specialized agencies to actively monitor the communication effect, and the feedback on the image perception of the audience, i.e., the city's stakeholders, is not timely.

**Figure 1** The main problems facing Changsha city brand communication

### 3.3. CHANGSHA CITY BRAND COMMUNICATION STRATEGY

Each brand should have a unified name, logo and image concept, so that the

brand can play a role in marking and differentiation. If the brand image is not unified, the more brand communication activities, the more fragmented the brand image will be, and the more scattered the brand power. A unified city image comes from a unified image positioning, and depends on a unified "voice". As analyzed in the previous chapter of this paper, Changsha does not have a unified city logo, let alone a unified city image positioning, and the concept of image appeal is still complicated and diverse. To carry out effective city brand communication activities, Changsha should start from accurate positioning of city brand image, unified city brand message, and scientific planning of Changsha's city brand strategy.

City branding and communication is a long-term, holistic task, which is related to the competitive strength and long-term development of a city, and there should be corresponding regulations, policies and systems to ensure the comprehensive development of this work. This requires city decision makers in Changsha to have a clear understanding of city branding, and to set up a special city brand management organization based on strengthening brand awareness, and to formulate a city brand development plan and a city brand management manual and other related policies and systems.

#### **4. CONCLUSION**

Based on the CIS system framework, this paper analyzes the current situation of the communication of Changsha city brand image and proposes communication strategies in the era of big data in view of the existing problems. The folk construction of the city image is given by the pluralism of the current media environment, and the official discourse should pay attention to the growing folk power in the process of constructing the city image by timely incorporating new symbolic carriers to achieve the purpose of constructing a unique city image from a small to a large level. If Changsha can integrate city resources, accurately position the city image, and adopt integrated strategies to implement city brand communication scientifically and effectively, the city brand with unique Hunan charm and modern core competitiveness will be forged, and the continuous value-added of the city brand will be realized.
