In the context of the rapid development of big data technology, along with the rapid improvement of China's economic level, people's lives have undergone radical changes. Under the concept of three-wide education, aviation safety officers should continuously improve their physical reserves in their daily training. Therefore, it is especially important to improve the current situation of physical training and strengthen the physical fitness level of safety officers. Then, based on the data mining of big data technology, we analyze the physical characteristics of aviation safety officers and the necessity of aviation safety officers' professional physical training and research. This study provides more targeted and scientific guidance for the professional physical fitness training of aviation safety officers, and provides theoretical and practical support for the construction of professional curriculum resource base.

## KEYWORDS

three comprehensive education concept; data mining; aviation safety officers; physical quality; physical fitness characteristics

## 1. INTRODUCTION

One of the job responsibilities of aviation security officers is to be able to effectively

respond to terrorist attacks and other sudden security incidents in case of emergency, thus effectively reducing economic losses and safeguarding people's lives and property [1-2]. In practice, the physical fitness of aviation security officers and their mastery of appropriate fighting skills have a positive effect on improving the quality of security officers' work [3-4]. As the basis of all skills, energy has also become a top priority in the training and assessment of wardens, and good physical fitness is the basis for wardens to be able to perform their defense work effectively and is one of the necessary conditions for their professional competence [5-6].

The literature [7] used scientific research methods such as literature, expert consultation, and mathematical statistics to analyze the performance of aviation safety officers' physical fitness assessment by statistical processing. The literature [8] analyzed the current situation of aviation safety officer physical fitness training by pointing out that there are problems such as poor physical quality foundation of the participants, tight time and heavy task of physical fitness training, and low achievement rate of physical fitness training, and further analyzed the misconceptions of aviation safety officer strength quality, based on which countermeasures to improve aviation safety officer strength quality training were proposed.

This paper analyzes the current situation of aviation safety officers' physical fitness training by using data mining of big data technology under the concept of three-wide education, studies the causes of insufficient safety officers' physical fitness training, and puts forward suggestions for improvement in response to the problems. This study is conducive to the physical fitness of aviation safety officers to fit the professional, to enrich the form and means of practice, and to improve the enthusiasm of practitioners in training. Only by improving the practicality of physical fitness training can the value of physical fitness training be better reflected.

## **2. CURRENT SITUATION AND IMPROVEMENT OF PHYSICAL TRAINING OF AVIATION SAFETY OFFICERS UNDER THE CONCEPT OF THREE-WIDE EDUCATION**

### **2.1. ANALYSIS OF THE CURRENT STATUS OF PHYSICAL TRAINING FOR AVIATION SAFETY OFFICERS**

In the process of daily management, scientific and reasonable physical training is an important condition to strengthen the physical condition of aviation safety officers and ensure that they have good physical quality. At the present stage, there are still some shortcomings in the process of carrying out physical fitness training for safety officers.

### **2.1.1. THE PHYSICAL FITNESS BASE OF SAFETY OFFICERS PARTICIPATING IN PHYSICAL TRAINING IS GENERALLY WEAK**

At the present stage, a large proportion of the initial training personnel for aviation safety officers are fresh graduates, in addition to veterans and those who have regained their initial training qualifications after having their licenses revoked. In general, veterans have a greater advantage in terms of physical condition and can demonstrate good physical condition in the initial training stage. However, recent and former graduates are weaker in terms of their physical foundation. This is mainly due to the heavy workload during their studies and the lack of physical training. This also makes it difficult to carry out the physical training of aviation safety officers.

### **2.1.2. LOW COMPLIANCE RATE OF PHYSICAL TRAINING**

In the process of physical training for aviation safety officers, instructors need to develop the training content according to the assessment items of the Civil Aviation Administration. The assessment items for safety officers are pull-ups, long jump, 3,000-meter run, sit-ups, jump rope, folding run, 100-meter run, bench press, squat, and bent-arm reach. Each assessment has a standard. However, at this stage, the pass rate of some trained safety officers is relatively low, which also makes it more difficult to improve the physical fitness of safety officers.

### **2.1.3. PHYSICAL TRAINING TIME IS TIGHT AND THE TASK IS HEAVY**

The physical fitness training of aviation safety officers has a certain time limit, and it is necessary to improve the physical fitness of safety officers within a limited period of time, so as to enhance the physical fitness state of safety officers. At present, in the process of carrying out physical fitness training, the self-exercise awareness of some aviation safety officers needs to be improved, and there are negative emotions during normal training.

## **2.2. IMPROVEMENT MEASURES OF PHYSICAL TRAINING FOR AVIATION SAFETY OFFICERS**

### **2.2.1. INTENSIVE SPEED AND STRENGTH TRAINING**

The ultimate goal of physical training is not only to improve the physical reserves of the safety officer and strengthen athletic endurance, but more importantly, to effectively improve the speed and strength of the safety officer through scientific and reasonable physical training subjects, so that he or she can better fulfill the responsibility of ensuring aviation safety. In the process of training to improve speed, instructors should clarify the source of human speed. The speed of muscle contraction is accelerated, which can significantly improve the motor unit in the same unit of time. In the process of training, the relevant staff should analyze the safety officer's own

physical conditions and achieve a progressive training effect by adjusting the training content.

### **2.2.2. GRASP THE PRINCIPLES AND METHODS OF GOOD PHYSICAL TRAINING**

Whether aviation safety officers have a good physical reserve or not has a positive effect on ensuring aviation safety. At the stage of carrying out physical training, the current stage of training should be analyzed in depth and the existing deficiencies should be identified. So as to better improve the way of physical training, make it scientific and efficient. For example, in the mechanical training, instructors should ensure that the machinery is easy to operate and can make the safety officer's muscle level improve to a certain extent; while in the confrontation training, physical training items such as push-ups and pull-ups should also be adjusted.

### **2.2.3. REASONABLE ARRANGEMENT OF PHYSICAL TRAINING SUBJECTS**

By adjusting the physical training subjects for aviation safety officers, the benefits brought by physical training can be effectively enhanced, thus enabling the safety officers to reach a higher level of physical reserve. According to the author's experience, in the process of conducting physical fitness training, instructors can adopt phased subject training to enhance the training effect.

## **3. BIG DATA-BASED TECHNOLOGY IN PHYSICAL TRAINING**

### **3.1. AVIATION SAFETY OFFICER CAREER PHYSICAL CHARACTERISTICS**

#### **3.1.1. COMBINATION OF BASIC AND SPECIAL PHYSICAL FITNESS**

Physical training is the basis of combat training, and for aviation safety officers physical training generally includes basic physical fitness and special physical fitness. The combination of basic physical fitness and professional physical fitness in the training process is conducive to the professionalization of aviation safety officers' physical fitness, the enrichment of practice forms and means, and the improvement of practitioners' training motivation.

#### **3.1.2. A COMBINATION OF PRACTICAL AND EASY AND EXTENSIVE**

Physical training is a complex process, in order to make physical training better for professional services, the training process needs to be more combined with the actual battle. Only by improving the practicality of physical training, can the value of physical training be better reflected. At the same time, too complex forms of exercises are not easy to promote, so simple and extensive physical training has more practicality and promotability.

## 3.2. AVIATION SAFETY OFFICER PROFESSIONAL PHYSICAL TRAINING METHODS

### 3.2.1. STRENGTH QUALITY

Table 1 shows the strength quality training methods. Strength quality refers to the ability of the human neuromuscular system to overcome or confront resistance during work. According to the characteristics of the strength quality required to complete different sports activities, can be divided into maximum strength, rapid strength and strength endurance, respectively, mainly corresponding to the aviation safety officer physical fitness assessment items in the weighted bench press, standing long jump and 2-minute deep squat stand.

**Table 1** Strength training methods

Strength qualities	Training method	Number of repetitions	Number
Maximum Strength	85% - 100% of maximum deadlift	1-3 times	6-10 groups
Rapid Strength	65%-80% of maximum deadlift	5-15 times	4-6 sets
Strength endurance	40%-60% of maximum deadlift	15-30 repetitions	2-4 groups

### 3.2.2. FLEXIBILITY QUALITIES

Figure 1 shows the flexibility quality training method. Flexibility quality refers to the ability of human joints to move in different directions and the ability to stretch muscles, ligaments and other soft tissues. Flexibility training generally uses the stretching method, including the power stretching method and static stretching method, as well as active and passive stretching. Generally speaking, when the external temperature is 18 °C flexibility quality performance is best.

**Figure 1** Flexibility training methods

## 4. CONCLUSION

In the background of the concept of three-wide education, based on the data

mining in big data technology to fully analyze and understand the physical fitness of aviation safety personnel, through physical training to effectively strengthen the physical fitness reserves of safety personnel, so that they can effectively respond to possible aviation safety accident problems. In the process of physical training, should pay attention to the principle of from shallow to deep, and grasp the scientific rationality of training, in the process of gradual progress, effectively strengthen the physical training effect of the safety officer, better play the safety officer's work responsibilities. Aviation warden physical training needs to start from the "teaching, training, competition, examination" link, according to the aviation warden physical fitness assessment items for targeted training, mainly divided into strength, flexibility and so on.

## **ABSTRACT**

This paper proposes a supply chain management model based on blockchain technology under 5G-related technologies. Running a supply chain management under 5G requires a new management model that optimizes the process of information management and sharing based on cooperation mechanism and trust mechanism to make financial, personnel, and information exchange and sharing transparent. This model requires the implementation of handheld supply chain management based on 5G networks, through 5G network slicing technologies and applications. The new model will change the relationship of supply chain partners, improve the security and management efficiency of the supply chain, and make the supply chain management more open, transparent, and convenient.

## **KEYWORDS**

5G; blockchain technology; information management; information exchange; transparency; supply chain

## **1. INTRODUCTION**

U.S. anti-globalization policies have had a dramatic impact on global supply chains, and the impact of U.S.-China relations has further expanded the trade frictions faced by Chinese exporters - ZTE and Huawei's global supply chains have been plagued by U.S. intervention, and global supply chains have been adversely affected by the outbreak of COVID-19 in the spring of 2020 [1-3]. The restructuring of the global supply chain and non-contact production collaboration during the outbreak has placed higher demands on supply chain management. In this situation, it is imperative to enhance the trust between upstream and downstream supply chain entities, producers

and consumers, achieve production collaboration, and improve the transparency of supply chain management, and "blockchain technology" provides technical support to enhance the transparency of supply chain[4-6].

The ultra-high speed of 5G network will increase the speed of information transmission between supply chain companies by 100 times, which will create favorable conditions for information transmission between supply chain partners. PTZ devices are equipped with ultra-high definition cameras and automatic control devices that can automatically track (rotate, scale, stretch) moving targets and obtain and analyze information about moving targets [7-8]. With the support of 5G, PTZ and blockchain technologies, supply chain management is expected to be enhanced.

In order to explore how 5G + blockchain technology can promote supply chain management innovation, this paper first analyzes the problems of supply chain management and gives the corresponding hypotheses for the problems. Then it discusses the supply chain management mode under the new technology environment, and uses the cooperation mechanism and trust mechanism to realize the innovation of management mode. Finally, a technical framework of supply chain management model based on 5G+blockchain technology is given, using 5G network slices to realize information exchange and transparency and promote the innovation of supply chain management.

## **2. PROBLEMS AND ASSUMPTIONS OF SUPPLY CHAIN MANAGEMENT WITH 5G+BLOCKCHAIN TECHNOLOGY**

### **2.1 SUPPLY CHAIN MANAGEMENT ISSUES**

It is found that the following problems have emerged in the current supply chain management in the context of new technologies.

First, there is insufficient awareness of the application of new technologies. In recent years, 5G network slicing and PTZ ultra-high definition video automatic target capture technologies have developed rapidly. Blockchain technology applied to supply chain management has already had successful cases. The application of the three technologies can upgrade the supply chain and may become a new means, method, model, approach and kinetic energy for improving supply chain management. However, this possibility has not yet attracted widespread attention from the industry, and the awareness of 5G technology combined with PTZ technology and blockchain in supply chain management has yet to be raised.

Second, the management mechanism to adapt to new technologies needs to be innovated. The explosive growth of mobile terminals is driving the development of computer networks from wired Ethernet to 5G mobile ultra-high-speed networks. the

automatic capture capability of PTZ ultra-high-definition video and the operation mode of blockchain technology will change the organizational structure and operation mode of the supply chain system, thus leading to changes and updates in its working mechanism. Supply chain management mechanisms need to change and innovate to adapt to this new change.

Third, the application level of supply chain management information system adapted to the new technology needs to be improved. Entering the 21st century, the supply chain information system developed in the early years began to gradually "age" and lag behind. In recent years, 5G technology, PTZ, blockchain and artificial intelligence have been well applied in many industries. The technological transformation of the supply chain will drive the upgrade of supply chain information systems. A few examples of this are network acceleration, monitoring system upgrades and management changes.

## **2.2 ASSUMPTIONS OF SUPPLY CHAIN MANAGEMENT**

Based on the above reasons, this paper will study supply chain management under 5G blockchain-related technologies and put forward the following hypotheses.

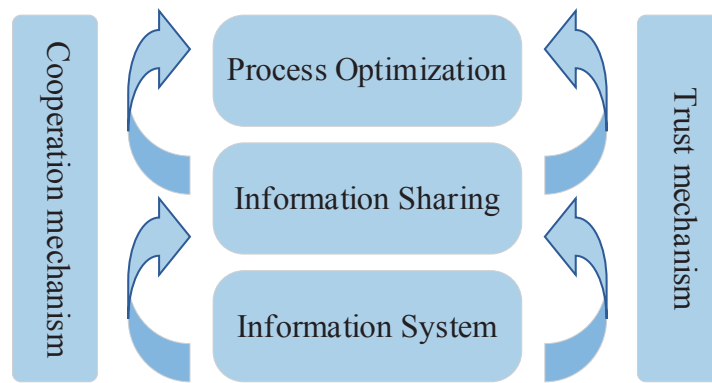

**Hypothesis 1:** Supply chain management can be realized by 5G network slicing technology, blockchain technology, PTZ technology and APP software to realize handheld supply chain management and open a new management model.

**Hypothesis 2:** Under 5G+PTZ+blockchain technology environment, supply chain management is based on cooperation and trust mechanism and information system as a platform to realize collaborative business, planning, production and marketing process, logistics, etc. through information sharing, which makes material supply and transportation, capital exchange and credit, and information exchange transparent. This model can change the relationship between supply chain partners and improve the security and management efficiency of the supply chain.

## **3. SUPPLY CHAIN MANAGEMENT MODEL IN THE NEW TECHNOLOGY ENVIRONMENT**

Optimizing the supply chain process, the supply chain management process should rely on cooperation and trust mechanisms through computer information systems (e.g., network, hardware and software) to achieve information resource sharing. Figure 1 shows the basic model of 5G supply chain management model.

**Figure 1** 5G Supply Chain Management Model

For a supply chain to operate efficiently, its production, sales and service processes need to be optimized, a process that involves information flow optimization. Information flow optimization in the supply chain utilizes an information system platform that integrates, shares and exports data with the organization as well as with partners. Partners exchange and share information across multiple information system platforms by acquiring, exporting and sharing information.

### **3.1 COOPERATION MECHANISM**

Under blockchain, the supply chain is a decentralized cooperative mechanism characterized by a federated blockchain model, with multiple subjects (enterprises) acting as information recorders. Pre-selected subjects (enterprises) (group decisions) jointly decide on the generation of each block. Other access nodes (enterprises) can participate in the transaction but do not ask about the bookkeeping process, and other enterprises can use the blockchain's open API (application programming interface) for eligibility queries. Supply chain cooperation here is a smart contract, based on a trusted blockchain mechanism that cannot tamper with data at will and can automatically enforce pre-defined rules.

### **3.2 TRUST MECHANISM**

For a long time, the supply chain has adopted a third-party-centered trust management model. With blockchain technology, companies can conduct transactions without knowing basic information about each other, enabling "trustless trust". Blockchain is a trust mechanism, which uses blockchain consensus mechanism to establish a mutually beneficial coordination and trust mechanism among multiple participants (enterprises) in the supply chain system. Under this mechanism, each entity operates independently and automatically forms a dynamic block supply chain alliance, which avoids the risk of trust crisis while realizing common value addition.

#### 4. TECHNICAL FRAMEWORK OF SUPPLY CHAIN MANAGEMENT MODEL IN NEW TECHNOLOGY ENVIRONMENT

We believe that the technology application of the new model should be carried out in the following aspects. First, 5G network slicing, aiming to build a 5G supply chain network. Second is 5G network slicing for supply chain business, which aims to build 4 slices of 5G network processes including production and sales, financial management, personnel management, and information exchange and sharing. The third is the APP software, which aims to realize handheld supply chain management.

##### 4.1 5G NETWORK SLICING DESIGN

The 5G end-to-end slice lifecycle management architecture is shown in Figure 2. The 5G end-to-end slice lifecycle management architecture includes the following main functions: First, it converts the service requirements of the supply chain into end-to-end network slices. Second, it responds to the request of communication service management for network slicing, generates slicing instances, converts them into requests for network subslicing, and then sends them to network subslicing management in order to realize network slicing. Third, it receives the network slice management requests and converts them into network subslice management requests.

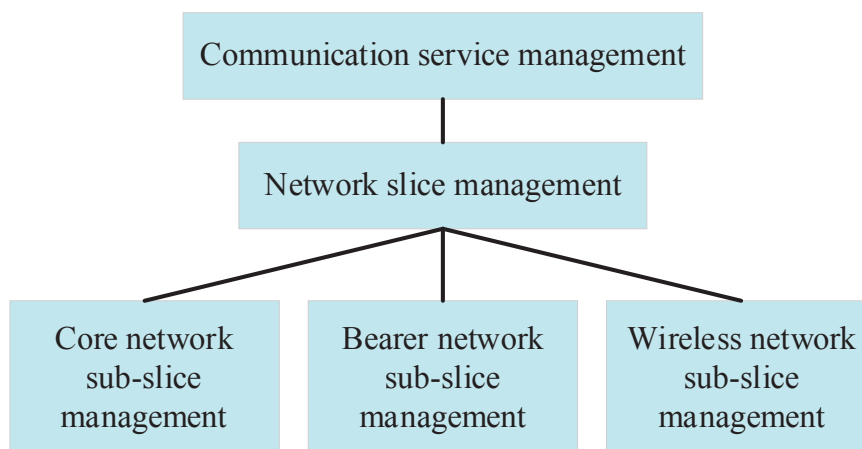

Figure 2 5G end-to-end slice lifecycle management architecture diagram

##### 4.2 SUPPLY CHAIN BUSINESS 5G NETWORK SLICING

The supply chain management process consists of four main areas, namely production and sales process, financial management, personnel management, and information sharing and exchange. Based on these four aspects, a four-layer 5G slicing architecture is used to deploy a "personalized around the individual" supply chain service model under 5G fog computing. 5G slicing provides an "on-demand" application model. It provides an "on-demand" application model for supply chain networks, where each supply chain can adjust its own hierarchy and network structure

according to its own needs.

### **4.3 SUPPLY CHAIN MANAGEMENT INFORMATION SYSTEM**

Supply chain management information system includes 5G network, PTZ, 5G cell phone, web server and software system. 5G network is the operating environment of supply chain information system and the medium of information transmission between cell phone and PTZ. 5G cell phone communicates with the server that manages information through 5G network. At the manager side, the hardware requirement is 5G cell phone, the software is APP software, and at the information system side, it is the computer software inside the information system.

### **5. CONCLUSION**

Under the 5G platform, new supply chain management models and increasing requirements for supply chain management will open up new frontiers for the development of supply chain management in the new era as new technological conditions change. 5G ultra-high-speed mobile network deployment will change the tools and means of supply chain management, as traditional supply chain management is usually done through desktop computer operations to achieve management activities. Under 5G ultra-high-speed mobile network conditions, managers can use 5G cell phones for "palm of your hand" supply chain management, no longer limited to desktop computers. The 5G ultra-high-speed capability and ultra-high-definition shooting capability of smartphones will make supply chain management more convenient, which is not only a new supply chain management tool and means, but also a new supply chain management method.

## ABSTRACT

Based on the data of 31 eco-industrial demonstration parks in China from 2005 to 2020, a system dynamics model was constructed to explore the synergistic mechanism and performance study of industrial chain, innovation chain, service chain and capital chain in the development of eco-industry in China. The simulation results of the model, taking Tianjin Ziya Economic and Technological Development Zone as an example, show that adopting measures to optimize the industrial chain, increase innovation investment, improve service capacity and increase capital investment has a significant positive impact on increasing per capita industrial value added and solid waste disposal and utilization capacity. In turn, it has significant economic and social benefits by increasing public awareness of eco-industry and winning public satisfaction with the environment.

## KEYWORDS

eco-industry in China; circular economy; solid waste disposal and utilization; industrial chain, innovation chain, service chain and capital chain synergy; synergy mechanism; performance study

## 1. INTRODUCTION

The development of industry and service industry has promoted economic development and made the material life of residents increasingly abundant, and the consequent increase in industrial waste and domestic waste has exceeded the carrying capacity and dissipation capacity of nature, and the human living environment is under unprecedented threat, requiring human measures to reduce the pressure of environmental dissipation of waste [1-2]. At the same time, the rapid development of

industry has accelerated the consumption of various non-renewable resources, the human living environment is deteriorating, and economic development is facing the double pressure of resources and environment [3-4].

Under such circumstances, the development of circular economy and the search for ways to reuse and recycle waste are effective measures to solve the two major problems of resource shortage and environmental pollution, and are of strategic importance to the establishment of a "two-type" society. In the circular economy, the process of converting waste into resources and products constitutes the waste recycling industry chain, and technological innovation and management innovation around waste utilization constitutes the waste recycling innovation chain [5]. The service chain around the waste recycling constitutes the waste recycling service chain, and the government and enterprises form the waste recycling capital chain around the recycling activities. The industrial chain, innovation chain, service chain and capital chain influence each other, and only with the synergy of these four chains can China's intravenous industry develop with high quality in this complex system [6-7].

Most of the existing studies only focus on the supporting role of one or two factors for the development of circular economy, but seldom incorporate these four chains into one framework to explore their synergy and their impact and mechanism of action on the development of circular economy. To this end, this study uses a system dynamics approach to explore the synergy of industrial, innovation, service and capital chains and their impact and mechanism of action on the development of circular economy.

## **2. THEORETICAL BASIS**

### **2.1 THE RELATIONSHIP BETWEEN RESOURCES, ENVIRONMENT AND SUSTAINABLE DEVELOPMENT**

On the one hand, it ensures that the natural environment (such as the atmosphere, soil and water) on which human beings depend will not continue to be polluted and will be gradually restored through self-healing ability. On the other hand, it ensures that all kinds of renewable and non-renewable resources are not exploited in transition, and that the exploited resources are recycled and fully utilized. Save resources for future generations, leave a good development environment, and ensure the intergenerational sustainability of economic and social development. Therefore, resource recycling and environmental protection are the prerequisites for sustainable economic and social development. Based on the theory of the relationship between resources, environment and sustainable development, the circular economy activities, which collect waste in categories and seek ways to repeat and recycle, not only save a large amount of resources and energy, but also effectively reduce environmental pollution, which is an effective measure to solve the two major problems of resource shortage and environmental pollution.

### **2.2 CIRCULAR ECONOMY SYSTEM BASED ON INTRAVENOUS INDUSTRIAL ACTIVITIES**

Vein industry is to protect environmental safety as the premise, to save resources

and protect the environment as the purpose, the use of advanced technology, the production and consumption process generated waste into reusable resources and products. The industry that realizes the reuse and resourcefulness of all kinds of wastes includes the conversion of wastes into recycled resources, the processing of recycled resources into products, and the process of harmless disposal of final wastes.

Based on this, the activities of the intravenous industry in this study include not only production and service activities specializing in waste collection, transportation, storage, sorting, regenerative transformation, processing and utilization, etc. And waste disposal activities, but also include the arterial industry system within the direct reuse of waste links, and then form a circular economy system based on the activities of the vein industry.

### **2.3 THE ROLE OF INNOVATION, SERVICES AND FUNDING TO SUPPORT ECO-INDUSTRIAL DEVELOPMENT**

Regarding the role of innovation on industrial development, some scholars believe that in the process of China's economic shift to a new normal, the development of an industry needs to shift from factor, investment and export-oriented drive to innovation drive. Both non-R&D innovation and R&D innovation in manufacturing can promote industrial development, but there are regional and industry differences. Regarding the supporting role of services for industrial development, some scholars argue that productive services can change the structure of industrial chain and the level of division of labor, prompting the fission of global value chain into global manufacturing chain and global service chain. Regarding the integration of capital chain and innovation chain, an empirical study on Zhejiang's wisdom and health industry shows that the wisdom and health industry needs the support of industrial funds and more importantly, the guiding role of financial major science and technology special funds investment.

## **3. ECO-INDUSTRIAL FOUR-CHAIN SYNERGY MODEL**

### **3.1 DATA SOURCE**

The preliminary research found that the provinces and cities in the eastern coastal region of China have the largest number of applications for setting up eco-industrial parks, followed by the central region and the western region again. Using random sampling, the paper selected 31 eco-industrial parks, and further collected data on these 31 eco-industrial parks by means of telephone interviews, visits and research, and public information collection. Among them, the public information collection includes news reports on the establishment or construction of the parks released by the governments of the cities where the eco-industrial demonstration parks are located, information on the parks' websites, the parks' annual reports, and the verification and acceptance worksheets of the parks' information publicly released by the Ministry of Environmental Protection. data before 2016 are used for testing, and data after 2016 are used for prediction.

### **3.2 COLLABORATIVE MODEL BUILDING**

(1) Model of the change amount of comprehensive utilization capacity of solid

waste

The comprehensive utilization capacity of solid waste is the maximum capacity of the eco-industrial demonstration park to process and utilize solid waste, which is governed by the scale of assets of the eco-industrial park; the larger the scale of assets, the stronger the comprehensive utilization capacity of solid waste. The scale of assets is the result of gradual accumulation of capital, therefore, the comprehensive utilization capacity of solid waste is also the result of gradual accumulation. The amount of change in solid waste comprehensive utilization capacity is quantitatively equal to the product of the change in assets and the solid waste processing and utilization capacity per unit of assets, which reflects the change in solid waste comprehensive utilization capacity.

#### (2) Eco-industrial asset change volume model

The assets of eco-industrial park may come from seven aspects such as investment and scale of liabilities and other accumulation of the state, collective, legal person, individual and foreign sectors. The algebraic sum of the change values of these seven aspects during the solid waste cycle forms the amount of change of eco-industrial assets. According to the availability of data, this study uses the data of accumulation of state capital, collective capital, corporate capital, individual capital and foreign capital to calculate.

### **4. MODEL SIMULATION ANALYSIS**

This chapter discusses the policy optimization adjustment paths for each of the five different scenarios, using the Tianjin Ziya Eco-Industrial Demonstration Park as an example. The baseline scenario is the current scenario, which is a reference for simulation experiments by extrapolating the system development scenario according to historical data without all parameters being changed. The optimized industrial chain scenario is the adjustment scenario 1, the increased innovation input scenario is the adjustment scenario 2, the increased productive service input scenario is the adjustment scenario 3, and the increased capital input scenario is the adjustment scenario 4. The simulation analysis is conducted for the industrial value added per capita and solid waste disposal capacity, and then the synergistic mechanism and performance of the four chains of Chinese eco-industry from the perspective of solid waste recycling is derived.

#### **4.1 ANALYSIS OF INDUSTRIAL VALUE ADDED PER CAPITA**

Under the established system structure, the model parameters are adjusted to observe possible future scenarios, compared with the traditional method of extrapolating the future predictions based on historical trajectory trends. In this section, the quantitative data analysis of the model is performed for the industrial value added per capita of the park, and the results of the analysis are shown in Figure 1.

**Figure 1** Analysis of industrial added value per capita

In terms of the results of industrial value added per capita, overall the adoption of measures to optimize the industrial chain, increase innovation investment, measures to improve service capacity, and measures to increase capital investment has an increase rate of about 10-20% per year for increasing industrial value added per capita. In local years, between 2006 and 2009, the value added per capita of industry decreased rather than increased after the four options were adopted, because of the rapid development of real estate in China during this period, which generated a large amount of construction solid waste. It was not until the end of 2009 that the government promoted construction waste reuse technology in order to solve the problem of construction waste occupying a large amount of land that construction waste was gradually turned into treasure and generated greater economic benefits, and the simulation results were very much in line with reality.

#### 4.2 SOLID WASTE DISPOSAL AND UTILIZATION CAPACITY ANALYSIS

This section analyzes the data on the solid waste disposal and utilization capacity of the park, and the results of the analysis are shown in Table 1.

**Table 1** Solid waste disposal and utilization capacity analysis

Years	Current Program	Adjustment option 1	Adjustment option 2	Adjustment option 3	Adjustment option 4
2005	98	114	125	131	133
2008	121	137	148	164	169

2020	201	217	228	254	255
2023	264	280	291	317	319
2026	298	314	325	351	354

From the viewpoint of the solid waste disposal and utilization capacity of the park, improving the solid waste disposal and utilization capacity and comprehensive utilization rate can effectively enhance the solid waste disposal and utilization capacity,

which in turn can promote employment, increase public awareness of eco-industry and win public satisfaction with the environment, with significant economic and social benefits. From the predicted results, the solid waste disposal and utilization capacity of the park gradually increases with the increase of years, with an average annual growth of about 15%~20%.

In summary, the construction of the four-chain synergistic model of eco-industry can effectively improve the per capita industrial value added and solid waste disposal and utilization capacity, and then promote the increase of industrial economic benefits.

## 5. CONCLUSION

In order to explore the synergistic mechanism of the four chains of eco-industry in China from the perspective of solid waste recycling, this paper analyzes the synergistic relationship of the four chains of eco-industry, the causal relationship among the variables in the complex system composed of the four chains, and the system characteristics, and constructs a synergistic model of the four chains of eco-industry. Taking Tianjin Ziya Eco-Industrial Demonstration Park as an example, the simulation results show that the model fits well with reality, thus indicating that the synergistic mechanism of the four eco-industrial chains in China can promote each other and enhance economic benefits.

## ABSTRACT

Starting from class management, this paper puts forward the idea of moral education based on the concept of Civic Education and points out the subject and object of moral education work in class management. By explaining the necessity of moral education teachers' participation in class management, it then leads to the innovative thinking of moral education in class management. The integration of moral education into class management requires a good moral education environment, and the innovation of class management is realized by strengthening the construction of moral education work team.

## KEYWORDS

class management; thinking education; moral education work; teachers; innovation; environment

## 1. INTRODUCTION

Moral education is the foundation of education, the soul of education, the leading factor of students' personality development, and the guide, motivation and guarantee of intellectual education and sports development [1-2]. In recent years, Chinese higher education has been developing vigorously. Under the premise of "educating people and moral education first", colleges and universities take the concept of ideological education as the basis, update the concept of moral education in colleges and universities, enrich the content of moral education in colleges and universities, innovate the methods of moral education in colleges and universities, and improve the evaluation mechanism of moral education in colleges and universities, so as to realize the effective management of college classes [3-4].

As the grassroots organization of college students, college class not only has the management role of organizing and regulating college teaching activities and the connection role of teacher-student interaction, but also plays an important role in the moral education of college students [5-6]. College class management is the sum of class norms and spiritual culture that college students in the class cultivate together in their study and life, and it is not only an important part of campus culture, but also a concrete embodiment of campus culture in the class. It can be said that the ideological and moral level, academic talk, values and spiritual outlook of students in each class directly reflect the school philosophy and school style of that school [7-8].

In order to explore the innovative development of integrating the concept of ideological education into classroom management, this paper first analyzes classroom management for moral education integration, and explains the subject and object of moral education work in moral education ideology and classroom management. Then the necessity of moral education teachers' participation in class management is introduced, including the goal of moral education, refining professional ethics and the main innovative college management. Finally, the innovative thinking of moral education in class management is given, which should start from creating a good moral education environment and strengthening the construction of moral education work team.

## **2. MORAL INTEGRATION IN CLASSROOM MANAGEMENT**

In school, class is the main activity place for students. Teachers can use class to get a comprehensive understanding of each student's learning situation, physical and mental development and ideological and moral level, and to understand the internal and external factors that affect students' ideological and moral development. Teachers mainly use the class as a unit to manage students, educate them and nurture them. Reasonable class management helps to achieve the goal of nurturing people.

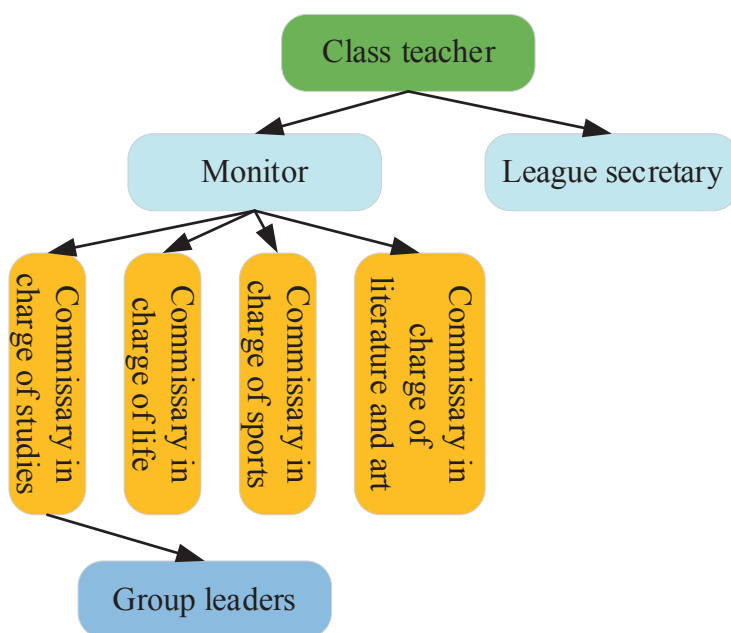

### **2.1 CLASS MANAGEMENT**

Class management is a dynamic process whose fundamental characteristics lie in clear educational goals, efficient and reasonable class management levels, clear and scientific class class rules setting, so that students can correct their learning attitudes and ideological attitudes, clearly work towards their goals, get along harmoniously with their classmates and teachers, and complete their class work efficiently. With the overall development of students as the fundamental purpose, the fundamental goal is to achieve educational goals and help students to get full and comprehensive development.

Teachers tend to rely too much on class rules and discipline and management

authority in the daily class management process, and some of them are also keen on making class rules and discipline, making detailed plans for all aspects of students and setting up reward and punishment mechanisms. However, too many rules make classroom management inefficient or even ineffective, which leads to conflicts and even confrontation between students and teachers. This also shows that moral education should be the first priority in classroom management, and classroom management can be made more reasonable through patient education and positive guidance.

The basic structure of classroom organization and management is shown in Figure 1.

**Figure 1** Basic structure of class organization and management

## 2.2 MORAL EDUCATION IDEAS BASED ON THE CONCEPT OF CIVIC EDUCATION

There are two main schools of thought on the positioning of "moral education," one of which advocates that moral education should be regarded as synonymous with moral education and refers to the education of cultivating students' moral character, while the other advocates the concept of "moral education," which advocates that moral education is an educational activity that transforms the ideological views, political codes, and moral norms of a certain society or class into individual ideological character. The other is the concept of "moral education", which advocates moral education as an educational activity that transforms the ideological views, political codes and moral norms of a certain society or class into individual ideological and moral values.

Moral education can also be called character education, which is also customarily called ideological and moral education. Under the concept of Civic Education, moral education refers to the educator's purposeful, planned and systematic influence on the educated person in terms of ideology, politics and morality in accordance with certain social or class requirements. And through the active cognition, experience and practice of the educated, in order to make them form the moral activities required by a certain society and class, that is, the educator purposely cultivates the moral activities of the educated.

### **2.3 SUBJECTS AND OBJECTS OF MORAL EDUCATION WORK IN CLASSROOM MANAGEMENT**

In the 1980s, the research of subjectivity moral education theory was applied in the process of moral education, which established the subjectivity status of moral education subjects. However, due to various reasons, the subjectivity of moral education object has not been paid attention to, and the moral education work in colleges and universities has been suffering from one-way indoctrination, single educational means and poor effectiveness of moral education. In today's diversified value and complicated situation, it is of great practical significance how to give full play to the enthusiasm and initiative of moral education subjects, solve various problems of moral education and improve the effectiveness of moral education work.

The development of moral education theory is predicated on the development of Marxist philosophy, so the exploration of the subject and object of moral education work and its relationship in college class management. To explore the subject and object and their relationship in Marxist philosophy, Marxist philosophy emphasizes that human being is the subject engaged in practical and cognitive activities, and human purposeful and planned labor practice is the basis of the existence and development of human society.

In the process of moral education work in classroom management, the educator, after mastering the moral norms required by a certain society or class, exerts ideological, political and moral influence on the educated through a purposeful, planned and systematic way. And through the active cognition, experience and practice of the educated, they form the moral norms required by a certain society and class.

### **3. THE NEED FOR MORAL EDUCATION TEACHERS TO PARTICIPATE IN CLASSROOM MANAGEMENT**

In the context of moral education, the participation of moral education teachers in classroom management is a requirement of the times. For students, it helps to guide them to correct values and realize the goal of moral education, for teachers, it helps to

refine their professional ethics and change their teaching philosophy, and for schools, it helps to carry out effective management. For this reason, it is necessary for moral education teachers to participate in classroom management.

### **3.1 HELPING TO ACHIEVE THE GOAL OF CULTIVATING MORAL CHARACTER**

Facing the problems related to the weak sense of social responsibility, unswerving beliefs and ambitions, and distorted values of college students nowadays, moral education teachers should firmly grasp the class as a basic teaching unit, penetrate the concept of moral education through participating in class management, and cultivate excellent future builders and successors of the motherland.

The participation of moral education teachers in classroom management means that they should exert value guidance on students through their own words and actions, just as a small tree grows to remove crooked thorns and make it grow straight and smooth. Among all teachers, moral education teachers embody the most comprehensive quality, many aspects of other teachers do not have, in many quality sort, political requirements should play a traction role, although all courses have the function and responsibility of nurturing people. But in the implementation of the principle of "moral education", the guidance of students to the correct values, moral cultivation, ideological education, etc., moral education classes play an irreplaceable role, the role of moral education teachers is indisputable.

### **3.2 IT IS CONDUCIVE TO REFINING THE PROFESSIONAL ETHICS OF TEACHERS**

Moral education teachers are classroom managers, educators, communicators and communicators. While fulfilling their duties as teachers and leading by example, they should be diligent in reflection, be reflective practitioners, and organize students in a variety of activities to regulate their behavior by planning time wisely, they can effectively and efficiently refine the professional ethics of moral education teachers.

In classroom management, moral education teachers can go into the students, have more contact with them, allow themselves to experience and implement teaching concepts inside and outside the classroom, and constantly change outdated educational concepts. Therefore, participating in classroom management allows moral education teachers to constantly update their teaching philosophy on the classroom as the anchor point, thus enabling teachers to develop their professional skills in leaps and bounds.

### **3.3 FAVORABLE TO THE INNOVATION MANAGEMENT OF UNIVERSITIES**

Teaching and educating people is the soul and backbone of university education work. The participation of moral education teachers in class management can make

ideological and political education integrated into the overall teaching system of the school, so that the goal and task of educating people in the school will no longer be accomplished only by moral education teachers and moral education management departments, but by all school staffs together.

Classes are the main position of teachers' educational management and the basic unit of school organization. The participation of moral education teachers in classroom management helps promote the progress of overall school management, laying a good foundation for school management and making the school a real place for teaching and educating people. Moral education teachers carry out ideological and political education management in their work according to the leadership of the educational goals, and form a complete school education management system together with the existing school moral education management department and all the teaching staff. The educational goals of the school can be achieved through this more scientific management system, from the division of labor in different disciplines and the efforts of different channels, thus promoting the overall management of the school and achieving the cultivation goals of the school.

#### **4. INNOVATIVE THINKING ON STRENGTHENING MORAL EDUCATION IN CLASSROOM MANAGEMENT**

##### **4.1 EFFORTS TO CREATE A GOOD MORAL EDUCATION ENVIRONMENT**

Class management should pay attention to the construction of moral education environment, constantly strengthen the construction of the hard and soft environment of class moral education, improve publicity and education, and establish a good class and academic style. Take advantage of the superior campus environment created by the school, fully exploit the favorable components in the social environment factors and actively use them to create a good class and school spirit and enhance the cohesion of the class.

##### **4.2 STRENGTHENING THE MORAL EDUCATION WORKFORCE**

The classroom teacher team should be strictly managed, and practical regulations should be established for the examination of ideas and political concepts, and the duties and responsibilities of classroom teachers should be clearly defined. We should formulate a special "management method for full-time and part-time class teachers", improve the rating ratio of moral education effect in the process of class management, increase the rating ratio of students to class teachers, and better penetrate into the actual life of students. Use their own personality charm, moral quality and practical actions to influence the students in their class and enhance their trust in the class teacher. Classroom teachers are made aware of the importance of strengthening

communication with students and enhancing their ability to penetrate moral education in the classroom management process.

## 5. CONCLUSION

In order to explore the innovative direction of integrating the concept of ideological education into class management in colleges and universities, this paper takes the concept as the basis, and then elaborates on the idea of infiltrating moral education in class management. The necessity of moral education teachers' participation in class management is analyzed, and it is pointed out that the innovation of moral education integration class management needs to create a good moral education environment. The construction of moral education workforce is strengthened as a way to achieve the innovative development of moral education integration class management.

## ABSTRACT

In order to explore the construction of the theoretical system of educational psychology courses in colleges and universities in the context of information technology, this paper analyzes the necessity of the theoretical reform of educational psychology courses in colleges and universities in terms of objectives, teachers, learning psychology and interaction psychology. By constructing a knowledge tree system of educational psychology, giving full play to the leading role of college teachers and creating a psychological soft environment to improve college students' psychological learning motivation, the theoretical system of educational psychology in colleges and universities is realized.

## KEYWORDS

information background; efficient; educational psychology; system construction; tree of knowledge; reform

## 1. INTRODUCTION

In order to thoroughly study and implement the spirit of the National Education Conference and China Education Modernization 2035, fully implement the spirit of the National Conference on Undergraduate Education in the New Era and the fundamental task of establishing moral education, and strictly implement the requirements of "focusing on the foundation and the four returns" [1-2]. Under the background of informationization, colleges and universities should take the concept of "New Liberal Arts" as the leader, focus on teaching innovation and start a learning revolution. It should guide the teachers in colleges and universities to concentrate on teaching and educating people, form the value pursuit and conscious action of teaching excellence,

create the vane of teaching reform in colleges and universities, and promote the "quality revolution" in higher education [3-4].

The necessity of the theoretical reform of the discipline of educational psychology. The discipline of educational psychology mainly studies the basic laws and principles of educational psychology and its application in school practice, focusing on improving students' theoretical level and application ability of educational psychology, which is a course with both theoretical and strong applicability[5-7].

Starting from the necessity of theoretical reform of educational psychology curriculum, this paper analyzes the objectives of efficient educational psychology, including the impact of teachers, college students and teacher-student interaction on psychology curriculum. Then, it discusses the effective path of the reform of efficient educational psychology curriculum, which is to enhance the learning motivation of college students by constructing the tree system of educational psychology knowledge, giving full play to the leading role of efficient teachers, and building a good psychological soft environment.

## **2. THE NEED FOR THEORETICAL REFORM OF EDUCATIONAL PSYCHOLOGY COURSES**

Educational psychology is an important educational content aiming at cultivating a good state of mind among college students, helping them to establish a correct learning concept, effectively cope with various pressures faced in life and study, alleviate their bad emotions, and then improve their adaptability and actively develop themselves. The work of educational psychology in colleges and universities should take the prevention of problems and the promotion of psychological quality as the main teaching objectives, adopt mental health education to cultivate the psychological quality of college students, promote their comprehensive development, and then realize the cultivation of high-quality comprehensive talents.

### **2.1 OBJECTIVES OF EDUCATIONAL PSYCHOLOGY IN HIGHER EDUCATION**

Talent cultivation in colleges and universities is not only professional education, but also ideological education, and college graduates should be high quality talents with qualified politics, advanced ideology, professional proficiency and high moral character, and be comprehensive and excellent builders of socialist country. Therefore, colleges and universities need to pay attention to the character education of college students in talent cultivation, and raise it to the same importance as professional knowledge, or even better status. Throughout the years, the state has continued to pay high attention to the psychological education work in colleges and universities, attaching importance to the role played by teachers in the education of various

disciplines. Educational psychology plays a pivotal role in the process of cultivating comprehensive and integrated quality of college students in colleges and universities, so strengthening the reform of educational psychology courses in colleges and universities is an effective way to improve the mental health of college students.

## **2.2 TEACHERS' EDUCATIONAL PSYCHOLOGY AFFECTS THE EFFECTIVENESS OF TEACHING**

teaching

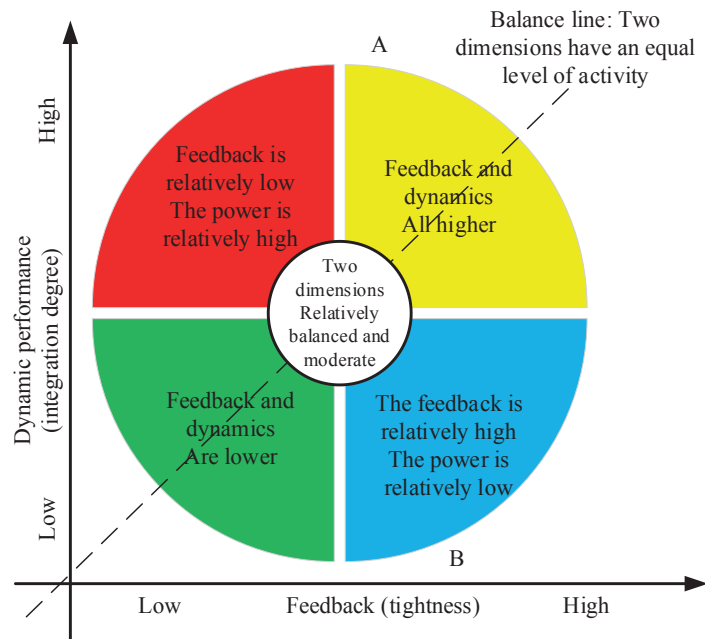

As the main body of psychological education in colleges and universities, teachers' personal characteristics such as their image, morality, learning and character will form the teachers' imprint in the process of interaction with college students and become possible imitation targets for them. Teachers' assessment of their own teaching ability includes feedback on college students' test results and assessment results, in addition to their knowledge of their own educational level. A reputable teacher whose academic standards and personality are recognized by college students will thus have an amplified role model effect. It is easier for college students to accept the ideological culture of teachers and improve their teaching effect by offering some lectures on theories and knowledge related to mental health, which in turn will help college students master the corresponding analysis methods and skills and improve their professional knowledge and psychological knowledge.

## **2.3 COLLEGE STUDENTS' STUDY PSYCHOLOGY AFFECTS LEARNING OUTCOMES**

The university stage is a critical period of psychological development for college students, when their self-awareness has been realized and developed, and their self-cognition and emotional experiences are gradually formed. During this period, the transition from "carefree" family life to independent group life, the discomfort and growth anxiety in the transition process will have certain influence on their psychology and reduce the learning effect.

Through appropriate psychological construction for college students, it can effectively improve their own quality, ability and cognitive ability to the outside world, effectively transform the contradiction between "reality" and "ideal", adjust college students' psychological state of learning, improve learning initiative and optimize learning effect. Optimize the learning effect. Through some appropriate psychological counseling methods, we can improve the psychological quality of college students and promote the sound development of personality.

The basic contents of college students' psychological awareness activities are shown in Figure 1.

**Figure 1** A basic model of mental conscious activity

## 2.4 THE PSYCHOLOGY OF TEACHER-STUDENT INTERACTION AFFECTS THE EFFECTIVENESS OF EDUCATION

Ideas need to be agreed upon and thus be intertwined, so the teacher-student relationship influences teaching and learning activities. The process of communication should be permeated with Marxist educational emotions and strong humanistic concerns, so that the act of teacher-student communication and interaction is effective and achieves the teaching objectives of the educational psychology course.

Psychological communication between teachers and students can effectively solve the problems that arise in learning in order to ensure the learning effect of college students, improve their expression ability and strengthen their self-confidence. Teaching psychology in a harmonious and relaxed teaching atmosphere and environment can better enhance the good psychological state and positive and healthy lifestyle of college students, and deepen the degree of mutual trust, sincere treatment and mutual respect between teachers and students.

## 3. EXPLORING THE PATH OF REFORMING EDUCATIONAL PSYCHOLOGY COURSES IN COLLEGES AND UNIVERSITIES

### 3.1 PLAY THE LEADING ROLE OF UNIVERSITY TEACHERS

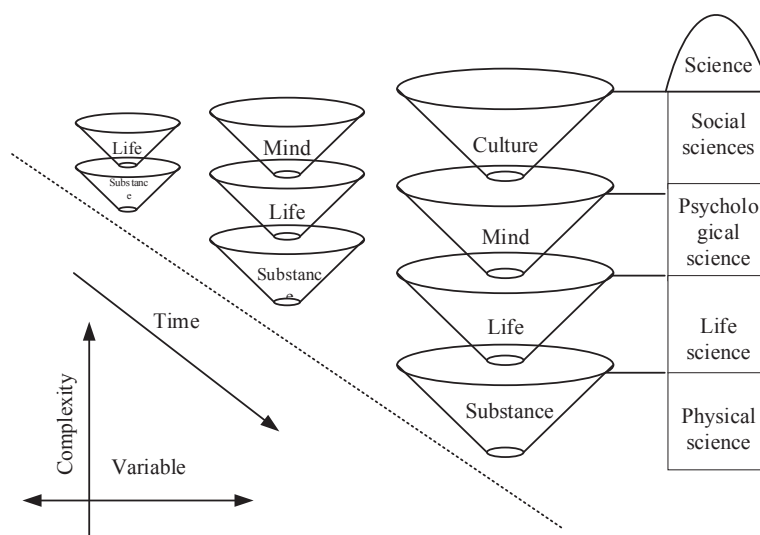

The process of teaching psychology can be seen as a spiritual communication activity that increases the motivation of university students to learn and meet the needs of teachers' lectures. University teachers should be good at applying it discriminately, making full use of its advantages and overcoming its negative effects to continuously

improve their teaching. In the process of impression formation, the first impression is crucial, and this psychological phenomenon is known as the first-cause effect. When teachers first come into contact with college students, their appearance, demeanor and speech will leave a deep first impression on them. The first impression is both the teacher's attitude and an important way of psychological education for college students. In order to make college students accept teachers better and make the teaching of psychology courses more in-depth, teachers must pay attention to the first impression effect of college students.

### 3.2 BUILDING THE TREE OF KNOWLEDGE SYSTEM OF EDUCATIONAL PSYCHOLOGY

By bringing the core ideas of each discipline into a whole and making connections between all disciplines, it is more beneficial to see educational psychology from a holistic perspective.

For students, the Tree of Knowledge system is a new unified theory of knowledge that maps the parts of science in a new way, connecting efficient disciplines and sociological processes, and the parts in between, into a logical whole. Educational psychology in higher education is certainly in this whole, which means that if the whole science is unified, then the psychological sciences must be unified, and perhaps this is a superficial understanding that students and teachers will hopefully gain more insight from. The Tree of Knowledge system structure of educational psychology is shown in Figure 2.

**Figure 2** The tree of knowledge system

### 3.3 BUILDING A PSYCHOLOGICAL SOFT ENVIRONMENT

Starting from the psychology of college students, it is considered that subconsciousness is an effective teaching method of educational psychology. In order

to create a good educational psychology teaching atmosphere in the learning process of college students, we should focus on establishing a good teacher-student interaction with college students and understanding their thoughts, psychology and learning achievements through communication with them. College education should be done to care about college students, not only to pay attention to the shortcomings of excellent college students, but also to be good at finding the advantages of poor students, to achieve the true sense of teaching equality, to achieve a democratic, fair and harmonious teacher-student relationship.

The educational psychology course should establish a correct view of classroom behavior and respect the individual independence of college students in the teaching process. Teachers need to give full play to teachers' initiative in the daily teaching process and create a cheerful classroom atmosphere so that college students can actively participate in classroom learning. By building a psychological soft environment, we can effectively improve the initiative of college students' learning, help mobilize their enthusiasm for learning, realize the transformation from "listening" to "speaking", and deepen the theoretical and practical research results of mental health education.

#### **4. CONCLUSION**

It is the duty of teachers to analyze the mental health status of college students from the perspective of psychology, provide them with appropriate psychological guidance and solve their psychological problems in time. The introduction of educational psychology courses and the tree of knowledge system enables college teachers to achieve "transpersonal thinking" and "congruent guidance" in the process of daily education and teaching, helping college students to establish correct life goals and shape good thinking styles. Through the continuous reform of educational psychology, the research on its application and function will be deepened, providing useful reference for China to cultivate qualified and comprehensive high-quality talents.

**ABSTRACT**

Exploring the improvement and innovation of college education management (CEM) system below the background of big data is the necessary way to understand modern education management. Starting from proposing the drawbacks of the development of CEM, this paper draws out the inevitable trend of the expansion of CEM from the essence of CEM. Based on this, the innovative strategies of CEM informatization are proposed, i.e., establishing expansion concept, strengthening top-level design, improving system construction and creating education management platform. Multiple directions are taken together to jointly encourage the improvement and novelty of CEM system.

**KEYWORDS**

college education management; innovation; informatization; big data; system construction; management platform

## 1. Introduction

In currently world, big data is penetrating into every aspect of human society, not only varying people's way of intelligent, working and living, altering the production and construction relations of society, but also becoming the "new oil", "new gold mine",

"new resource" and "new engine" of innovation in the future [1-2]. "New resources" and "new engines" of innovation [1-2]. The government must ally with creativities, universities and research establishments, mobilize all people and participate extensively to meet the challenges in the era of "big data", and universities will be the participants and promoters of this big data wave [3-4].

With the promulgation of the National Medium and Long-term Education Reform and Expansion Plan, the status of education informatization has been raised to the level of national strategy, and the reform of higher education informatization has become an inevitable trend [5-6]. Of course, the expansion and existence of colleges and universities not only depend on first-class education, but also on first-class management. Consequently, as a significant care for the action and expansion of colleges and universities, education management must be the "leader" and "main force" of this change [7-8].

To explore the improvement and innovation of CEM system, this paper debates the essence of traditional CEM from the disadvantages of college education expansion, and then draws out the expansion tendency of modern CEM. According to the drawbacks, the corresponding innovation strategies are proposed to comprehend the improvement and innovation of CEM by establishing expansion concept, strengthening top-level design, improving system construction and creating teaching management platform.

## 2. Educational management expansion drawbacks and trends in colleges and universities

### 2.1 THE ESSENCE OF EDUCATION MANAGEMENT IN HIGHER EDUCATION

The fundamental interest of higher education management is to make students more excellent by educating and nurturing, inculcating and imbuing, cultivating and empowering them with the ability to notice happiness, generate happiness and practice happiness. It could be said that brilliance and gladness are the value of all educational management in colleges and universities.

Colleges and universities are a kind of special social organization that cultivates highly educated talents with coordinated physical and mental expansion. There are three key businesses of colleges and universities; teaching, scientific research and management, and scientific management is essential to attain the goals of teaching and scientific research, and scientific management is even more indispensable to achieve the goals of education.

The eventual good of university education management (UEM) is to expand the

state of all kinds of school fundamentals and their grouping, and to serve together to encourage common universal capacities with ridiculous soul, noble morality, independent thinking, good feelings and prettiness. Educational management of colleges and universities is a significant process and resources to organize the relationship among various elements within colleges and universities and between internal elements and external elements, to reasonably allocate the restricted possessions and make them extra compatible with the environment, so as to better achieve the goals of running schools. The level of CEM and UEM is one of the rudimentary measures of the modernization of education. The level of CEM and UEM directly affects the level and quality of education and teaching in colleges and universities, and the realization of the objectives of running colleges and universities. The basic content of CEM and UEM is shown in Figure 1.

**Figure 1** The basic content of CEM

## 2.2 THE DRAWBACKS OF TRADITIONAL UEM

Peder Drucker, a famous American management scientist, once said, "The roots of management are deeply rooted in culture, society, values, traditions, customs, beliefs, government and institutions." The traditional CEM mode is influenced by Chinese traditional culture hierarchy, obedience culture and western scientific management theory, which presents rigid management in management concept, management system, management content and method. There are many problems in traditional CEM, treating group as a static construction, over-emphasizing management institutionalization, pattern and correction, highlighting inflexible management ignoring elastic management, accenting submission and obedience and ignoring human autonomy, all of which are mismatched with modern management and unfavorable to the expansion of college students and teachers' professional expansion.

## 2.3 TRENDS IN THE EXPANSION OF MODERN UEM

Entering the 21st century, the level, characteristics and mode of CEM and UEM have undergone great changes, and the modernization of CEM and UEM is its inevitable trend. The modernized education management concept of colleges and universities is the pioneer, the modernized education management technical facilities are the foundation, and the modern faculty is the key. Modernization of education management has the following characteristics.

(1) The people-oriented education management modernization advocated by colleges and universities is to take people as the purpose and value of education management. The subject and object of school education management are both people, and its ultimate goal is also for people. It manages the management object through the management subject to finally achieve the purpose of educating, developing and perfecting people.

(2) Informatization is the inevitable trend of CEM and the most basic feature of modernization, which is supported by computer and Internet technologies. Technology provides the possibility to expand the superiority of CEM and solve the problems existing in traditional education management. As a place of knowledge production and concentration, colleges and universities should be the place of utilization of information technology, and the use of modern information technology in the field of CEM has developed an predictable tendency.

(3) More scientific and democratic, more interactive and different. Scientific management is the basis of democracy and equality. In the process of CEM, it is also essential to realize the manifestation of individual differences in education and to do a good job of interactive communication between teachers and students, so as to improve the modernization ability of CEM in decision-making.

## 3. Innovative strategies for informationization of education management in higher education

From ancient empirical management to modern scientific management to modern education management, higher education management has gone through three stages of expansion and has slowly matured. Modern CEM is divided into three progressive levels, namely, information-based education management, big data education management and intelligent education management. And wisdom education management can be said to be the highest level of CEM, with the characteristics of ecology, wisdom and humanism. This chapter focuses on the improvement and innovation strategies of informatization of CEM, so as to realize the innovative

expansion of CEM system.

### **3.1 ESTABLISHING THE CONCEPT OF EDUCATIONAL MANAGEMENT EXPANSION IN THE INFORMATION AGE**

The current information age is no longer the information age that we used to talk about, this new information age has become the age of "cloud", "network" and "number". What is needed in this era is not data and information, nor cloud computing technology or big data technology, but data-based thinking and concept. The expansion of UEM informatization in this era no longer simply relies on the infrastructure of informatization or many information technologies, but depends on the growth of possessions, the application of data and the formation of new thoughts and concepts. Consequently, establishing the concept of open sharing and cross-border collaboration is the premise of transformation of CEM informatization.

### **3.2 STRENGTHENING THE TOP-LEVEL DESIGN OF EDUCATION MANAGEMENT INFORMATION TECHNOLOGY**

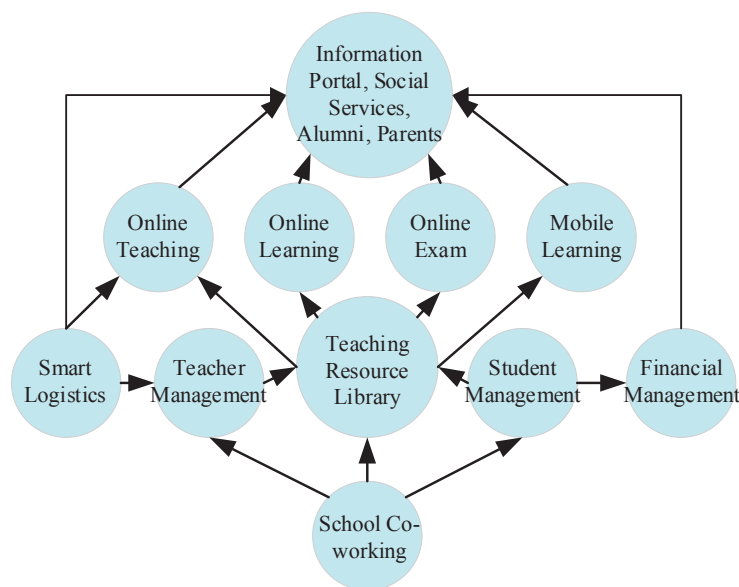

Top-level design is a top-down rational design and planning with the characteristics of long-term, strategic and scientific, which is to think about the structure, function and elements of a work and a task from the overall perspective to reach the project goal quickly and effectively. To develop educational management informatization and realize the transformation of educational management in the new information era, universities need to formulate a perfect informatization expansion mechanism, scientific expansion planning and democratic educational governance model, which has great guiding significance for educational management informatization in all universities.

### **3.3 IMPROVE THE SYSTEM CONSTRUCTION OF EDUCATION MANAGEMENT INFORMATION TECHNOLOGY**

From the early stage of education management informatization construction to the present stage with certain achievements, colleges and universities have invested a lot of energy in the creation of research and expansion of teaching management information system, but the system construction that goes with it is still not perfect, which causes various undesirable phenomena in the operation of information system. The authenticity and validity of the data are damaged, which affects the effective operation of the teaching management information system. For this reason, it is necessary to improve the relevant system in the process of continuing to promote the informationization of education management.

### **3.4 CREATING A DATA SHARING PLATFORM FOR EDUCATION MANAGEMENT INFORMATION**

The data sharing platform of education management informatization is an important part of education management informatization construction. Through a unified access interface, it integrates and applies network technology, storage technology and cloud computing technology to create an independent platform system that enables the transmission, synchronization and sharing of data among independent systems. Its basic structure is shown in Figure 2.

**Figure 2** Education management information data sharing platform

With the data sharing platform, all the basic data of the systems between colleges and universities in the process of operation, including the operation results for the basic data, will be saved in the central repository of the data sharing platform. When this data is to be used again, it only needs to be extracted from the data sharing platform. This ensures the unification and standardization of all kinds of basic data, and also promotes the communication and interaction among universities and accelerates the expansion of education management informatization.

#### 4. Conclusion

The change of times brings the renewal of various information technologies, and in the field of higher education, the scale of most colleges and universities is showing an increasing trend. In such an era of background and challenges, it is especially important to promote both quality and efficiency of education management through efficient education management information construction. Based on this, this paper proposes a new path for the improvement and innovation of education management system in colleges and universities from the aspects of expansion concept, top-level design, system construction and management platform.

# RESEARCH ON THE FINANCIAL MANAGEMENT SYSTEM OF SMART HOSPITALS IN PUBLIC HEALTH EMERGENCIES FOR BIG DATA PLATFORM

---

Manxue Tang\*

The First People's Hospital of Nanning, Nanning, Guangxi, 530022, China

[tcm1231230@163.com](mailto:tcm1231230@163.com)

---

## ABSTRACT

The frequent occurrence of international public health emergencies in recent years has posed a serious challenge to medical institutions at all levels. This paper develops a corresponding discussion on the emergency financial management approach of smart hospitals under public health emergencies. Firstly, risk prevention and emergency management are effectively integrated, thus forming a model for emergency management of risk in public health emergencies. Then the emergency financial management measures are described. The results show that the average speed of hospital financial management under the big data platform reaches more than 90% in public health emergencies. It can be seen that further clarification of emergency financial management points can play an important role in improving the level of handling of public health emergencies.

## KEYWORDS

Public health event; Smart hospital; Big data platform; Financial management system; Emergency governance model

## 1. INTRODUCTION

A public health emergency is a major infectious disease outbreak, mass unexplained disease, major food and occupational poisoning, and other events that seriously affect public health that occur suddenly and cause or may cause serious damage to the public health of the society [1-2]. It presents characteristics of suddenness, publicness (mass), severity, urgency, and complexity. The new era constantly improves the ability to prevent and resolve major public health risks and does a good job in emergency management of public health emergencies [3-4]. Under public health emergencies, the hospital side should do a good job in emergency financial related management, scientifically match and use hospital emergency materials, fully maintain the stable operation of the hospital, timely assist in handling public health emergencies, and improve the effect of hospital related emergency financial management [5-6].

Currently, academic research on public health emergencies is mainly from a public health and medical perspective. The literature [7] proposes that risk communication is the basis for ensuring public participation in public health emergencies. RC in four epidemiological, socio-political and geo-economic settings were compared and key structural factors that can lead to effective RC in public health emergencies were identified. The literature [8] provides a systematic presentation for the detection of CoVs (novel human infectious coronaviruses) in various environmental matrices, comprehensively covering methods and techniques for sampling, pre-treatment and analysis. The literature [9] proposes that evidence-based

decision making is at the heart of public health. hta (health technology assessment) can address the link between scientific evidence and decision making in public health emergencies and overcome the major challenges faced by public health experts in providing advice to decision makers, and hta can be used as a tool to bring evidence-based actions in public health emergency preparedness and response. What is proposed in the above literature is that research on public health emergencies is more scattered and the interactions between risk prevention and emergency governance are not studied in sufficient depth.

Therefore, this paper, oriented to the big data platform, firstly collates and merges risk prevention and emergency disposal, and constructs a risk emergency governance model for public health emergencies. Then the emergency financial management measures are analyzed, including building a financial organization framework, constructing a budget management platform, improving the level of hospital economic control, and using information management tools. Finally, the timeliness and effectiveness of smart hospitals in risk prevention and emergency disposal in public health emergencies are demonstrated through experiments to improve the governance of public health emergencies.

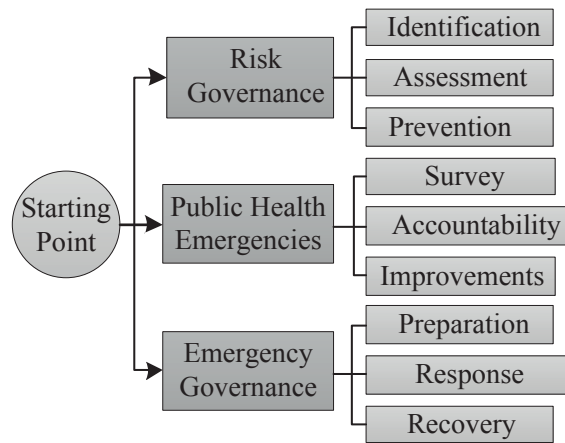

## **2. BIG DATA AND PUBLIC HEALTH EMERGENCY WARNING SYSTEM**

### **2.1 BIG DATA PLATFORM**

Big Data refers to the collection of data that is analyzed and managed on the Internet based on the full use of database software tools. When the data platform provides a viable solution to the problem of lack of effective means to grasp data on the supply and demand of emergency medical resources. On the supply side, the big data platform can carry out dynamic collection of production and deployment data of key emergency medical resources, help manufacturers predict changes in the demand for materials from medical institutions, and realize intelligent on-demand production. On the demand side, the big data platform can realize cross-departmental emergency data sharing and data sharing among relevant departments, health care committees and medical institutions to ensure that relevant departments can obtain real-time and accurate demand data of key materials, especially the docking of core data such as demand, receipt and inventory of epidemic prevention and control materials in hospital information systems and other systems.

### **2.2 RISK AND EMERGENCY MANAGEMENT MODEL FOR PUBLIC HEALTH EMERGENCIES**

Risk in a public health emergency is the possibility of potential harm to human health and safety, as well as the possibility of adverse effects brought about by the occurrence of a public health emergency [10]. For example, in order to reduce or minimize the loss and harm caused by the event in a public health emergency, it is necessary to carry out identification of unknown disease or infection risk sources, infection risk prevention, and infection risk assessment, etc. This series of processes essentially involves the risk management of public health emergencies. Figure 1 shows the risk emergency governance model for public health emergencies.

**Figure 1.** Risk emergency governance model for public health emergencies

The analysis of the governance model in Figure 1 shows that risk management and emergency management are the "two wings" of public health emergencies, on the one hand, to prevent, predict and assess the risks arising from public health emergencies, and on the other hand, to deal with the event itself. The overall goal is to effectively prevent, timely control and eliminate the hazards of public health emergencies, to protect public health and life safety, and to maintain normal social order.

### **3. FINANCIAL MANAGEMENT MEASURES OF INTELLIGENT HOSPITALS UNDER PUBLIC HEALTH EMERGENCIES**

#### **3.1 BUILDING AN ORGANIZATIONAL FRAMEWORK FOR EMERGENCY FINANCIAL MANAGEMENT**

The efficiency and quality of financial management work to meet the standard requirements under the public health emergencies, the hospital should pay more attention to the construction of the emergency organizational framework, which can be started from the following points.

(1) The hospital should determine the size of the emergency finance office for the level of the emergency.

(2) Hospitals should make accurate judgments on the actual implementation of the organizational framework within a limited period of time, and strengthen the connectivity of each link in the framework based on the emergency financial management guidelines to avoid the inability to interface when implementing the financial management process.

(3) Each department within the organizational framework should clarify its own occupation and obligation, and unite the strength of each department to play the coordinating function of the financial management organizational framework.

#### **3.2 BUILDING AN EMERGENCY BUDGET MANAGEMENT PLATFORM**

In order to ensure the effective use of internal funds in the event of a public health emergency and to save budget costs, the hospital's finance department should build a diversified budget management platform based on its own operational characteristics and emergency financial plans. Firstly, it is necessary to grasp the budget management principles, adjust the emergency approval system based on budget approval process and constraint characteristics, and improve the implementation of budget costs by simplifying the approval process. Secondly, the reasonable setting of emergency budget accounts can help improve the standardization and comprehensiveness of the management platform, such as the budget management of basic materials, emergency scientific research and personnel subsidies, and

also pay attention to the construction of medical observation areas and other costs, so as to improve the value of the utilization of budget costs. Finally, in the process of implementing the budget, the hospital should combine the emergency financial planning to improve the budget declaration management system, and flexibly adjust the budget management mode according to the number and distribution of clinical diseases of public health emergencies, so as to realize the scientific management of emergency financial work.

### 3.3 SCIENTIFIC USE OF INFORMATION-BASED FINANCIAL MANAGEMENT TOOLS

Bringing a variety of possibilities to improve the quality of people's work. The integration of information technology into emergency financial management work can not only largely relieve the pressure brought by high-intensity work to financial personnel, but also play an important role in ensuring the accuracy and security of financial data. With the support of the information management system, the finance department can use the computer terminal or mobile terminal to understand the dynamic situation of materials and personnel, and carry out budget cost control and cost accounting according to the timely uploaded information, which not only improves the timeliness of emergency financial management, but also saves a lot of time costs.

## 4. VALIDATION OF FINANCIAL MANAGEMENT SYSTEM OF INTELLIGENT HOSPITAL BASED ON BIG DATA PLATFORM

In this paper, based on the big data platform, a systematic analysis of the financial management system of a smart hospital in a public health emergency was experimented, and the speed of financial management improvement of the built platform is shown in Table 1.

**Table 1.** Speed of financial management in smart hospitals

Whether to use	Total Budget Financial Management	Emergency medical services price control	Performance Evaluation
Using the platform	96%	93%	97%
Not Applicable Platform	81%	78%	80%

Analyzing the results of Table 1 whether to use the built platform or not, it can be seen that the average speed of each system of financial management of the hospital in case of sudden public health time under the big data platform can reach more than 90%. When the platform is not used, the average speed is about 80%, which is a more obvious improvement. In summary, under sudden public health events, hospitals should improve the price management system of emergency medical services, ensure the quality of emergency financial management, and improve the allocation standards in terms of hospital emergency resources. Further enhance the hospital's specific response and solution capabilities to public health emergencies, to ensure that the hospital can operate normally and stably during the disposal of public health emergencies. Through the process transformation of financial operations in the process of smart finance construction, reasonable control of costs to ensure the smooth and healthy economic operation of the hospital.

## 5. CONCLUSION

Big data platform can provide support and guarantee for smart hospital financial management. Based on big data technology, this paper establishes an organizational framework for emergency management in unexpected public time, a budget management platform, and scientific information-based financial management tools to achieve real-time monitoring, analysis, and prediction of financial information and provide a more scientific and accurate basis for financial decision-making. The results of the experimental analysis show that the average speed of each system of hospital financial management under the use of the

built management system is derived to reach more than 90%. When the platform is not used, the average speed is about 80%. It is verified that the proposed system can provide a reference for hospitals to improve their public health emergency response capability.

## ABSTRACT

To improve the detection accuracy of gynecologic tumors. In this paper, the pathology image recognition technique is improved with the support of smart education technology. In the improvement process, the features of gynecological tumor pathology images are extracted in different color spaces and texture spaces to obtain more comprehensive classification and recognition information, and voting is used to make decisions on the detection results. The simulation results show that the detection accuracy of the designed technique in this paper on seven gynecological tumor pathology images is 95.65%. It can be seen that the pathology image recognition technology supported by intelligent education technology can better detect gynecological tumors and has good application prospects.

## KEYWORDS

Smart education technology; Image recognition technology; Texture space; Tumor detection; Classification recognition

## 1. INTRODUCTION

Gynecologic tumors have more tumor types, and their pathological images have small differences under the microscope, which are very easy to judge, so doctors need to rely on experience or repeated observation from multiple angles to make judgments [1-3]. There are many uncertainties in manual analysis and large errors in the diagnosis of different experts, so improving the pathological image recognition technology of gynecologic tumors is an urgent matter to be solved.

In recent years, many experts and scholars have improved the image recognition of tumor pathology. For example, the literature [4] used artificial intelligence techniques to mimic renal pathologists and extract relevant pathological diagnoses from kidney biopsies, improving the reproducibility of renal pathology results for certain parameters and demonstrating their application in renal pathology. The literature [5] used image segmentation techniques for 3D airway reconstruction to reveal detailed tomography of organs, tumors and nerves, parallelized the algorithms for image segmentation and improved the quality of tumor detection in surgical pathology. In summary, the above-mentioned research methods have the problem of complex processes in extracting features and their simple classification of tumors no longer meets the needs of actual physicians during diagnosis.

Based on this, this paper improves the pathological image recognition technique of gynecological tumors with the support of smart education technology. Firstly, the pathological images of gynecological tumors mapped in different color spaces and texture spaces are preprocessed, and the features extracted in each space are concatenated. Secondly, the pathological image features of gynecological tumors are selected, the filtered features are fed into the classifier, and the majority of the results are output as the final recognition results. Finally, the practicality and accuracy of the techniques designed in this paper are verified by the analysis of simulation results.

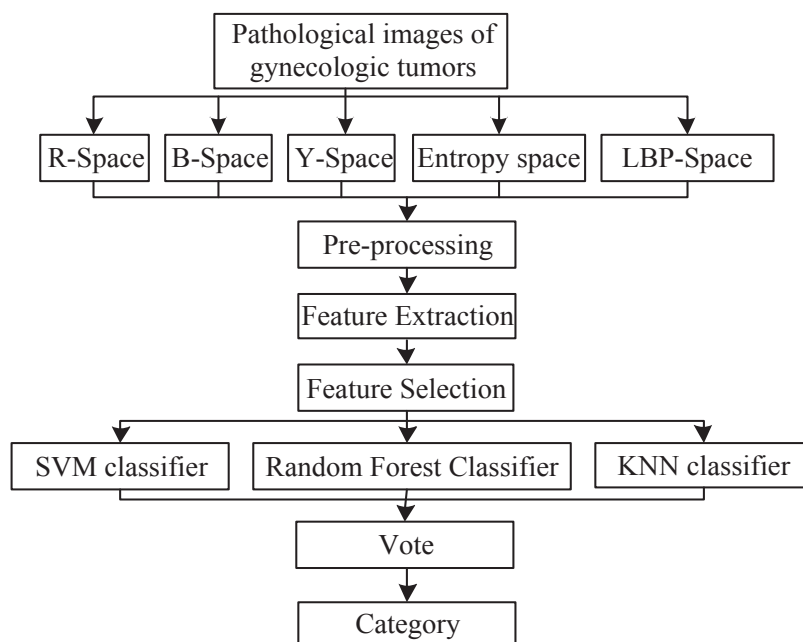

## 2. IMAGE RECOGNITION TECHNOLOGY FOR SMART EDUCATION

### 2.1 SYSTEM ARCHITECTURE OF SMART EDUCATION TECHNOLOGY

Smart education is an intelligent educational information ecosystem created by a new generation of information technologies such as the Internet of Things, cloud computing, big data, and wireless communication, and is an advanced development stage of digital education [6-7]. It aims to enhance the wisdom of the existing digital education system, realize the deep integration of information technology and mainstream education business, and promote the wisdom nurturing and sustainable development of education stakeholders. Smart education is not an isolated system, therefore, the architecture of smart education technology needs to be connected with other smart systems in smart cities through standard interface specifications to share basic data [8-10]. Based on this, this paper improves the pathological image recognition technology with the support of smart education technology to improve its efficiency in detecting gynecological tumors.

### 2.2 SMART PATHOLOGY IMAGE RECOGNITION TECHNOLOGY

Due to the variation of gynecologic tumor tissues in pathological structure, the traditional pathology recognition technology is no longer able to accurately recognize the pathology images. Therefore, in this paper, the pathological image recognition framework of gynecological tumors is improved with the support of smart education technology, and the improved pathological image recognition framework is shown in Figure 1.

**Figure 1.** Gynecologic tumor pathology image recognition framework

As can be seen from Figure 1, with the support of smart education technology, the gynecologic tumor pathology image recognition technology firstly maps the original gynecologic tumor pathology images into different color spaces and texture spaces, which include R-space, B-space and Y-space, and texture spaces include entropy space and LBP space. Next, the gynecologic tumor pathology images after mapping in each space are preprocessed separately, including enhancement with restricted contrast, adaptive histogram and equalization methods. Then the enhanced gynecologic tumor pathology images are feature extracted in five spaces, including texture features based on grayscale covariance matrix, improved LBP features, improved LDP features, and improved HLAC features. The features extracted in each space are then concatenated, feature selection is performed with KPCA, and the filtered features are fed into the classifier. Voting is performed with SVM classifier, random forest classifier and KNN classifier, and the majority result is output as the final recognition result.

### 3. SIMULATION RESULT ANALYSIS OF INTELLIGENT PATHOLOGY IMAGE RECOGNITION TECHNOLOGY

This section presents a simulation analysis of gynecologic tumor pathology image recognition technology supported by smart education technology. The pathological images used in the experiments are gynecological tumor pathological tissue images in marker image file format, and the acquired images contain healthy images, benign tumor pathological images, malignant tumor pathological images, epithelial tumor pathological images, mesenchymal tissue tumor pathological images, naive tissue tumor pathological images and junctional tumor pathological images. The detection results are shown in Table 1.

**Table 1.** Gynecologic tumor pathology image recognition results

Gynecologic tumor pathology image categories	Number of test set data	Detection accuracy
Health Images	80	98.79%
Images of benign tumors	92	94.65%
Malignant tumor images	76	96.38%
Pathological images of epithelial tumors	92	99.34%
Mesenchymal tissue tumors	107	91.36%
Pathological images of naive tissue tumors	59	95.39%
Cross-sectional tumor images	68	96.35%

As can be seen from Table 1, the gynecological tumor pathology image recognition technology supported by intelligent education technology has a high accuracy in the recognition of the above seven pathology images, and the average detection accuracy reached 95.65%, which has a good detection accuracy. The detection accuracy of 80 healthy images reached 98.79%, 92 benign tumor pathology images reached 94.65%, 76 malignant tumor pathology images reached 96.38%, 92 epithelial tumor pathology images reached 99.34%, 107 mesenchymal tissue tumor pathology images reached 91.36%, 95.39% for 59 naive tumor pathology images, and 96.35% for 68 junctional tumor pathology images. It indicates that the pathology image recognition technique designed in this paper has a high accuracy rate and has a good recognition and detection performance for pathology images of gynecological tumors.

### 4. CONCLUSION

In this paper, the pathological image recognition technique for gynecological tumors was improved with the support of smart education technology, and the detection effect of the

technique was verified in the process of practical application. The simulation results show that the detection accuracy of the gynecologic tumor pathology image recognition technology supported by smart education technology is 95.65% on seven gynecologic tumor pathology images, including 94.65% on 92 benign tumor pathology images and 96.38% on 76 malignant tumor pathology images. It is fully proved that the pathology image recognition technique designed in this paper has high accuracy and operability in the detection process of gynecological tumors.

# DESIGN AND APPLICATION OF A COMPREHENSIVE EVALUATION SYSTEM FOR ONLINE LITERACY OF SCHOOL STUDENTS

---

Qi Liang\*

Mianyang City College, Mianyang, Sichuan, 621000, China

[liangqi6550@163.com](mailto:liangqi6550@163.com)

---

## ABSTRACT

Network literacy is an important part of the comprehensive quality of college students. In this paper, a model of comprehensive evaluation system of network literacy is constructed, and the functions of the system are realized through requirement analysis, design, implementation and testing of the comprehensive network literacy evaluation system of college students, which includes basic information management, comprehensive literacy management, and query statistical module. The experimental results show that after three experiments, the evaluation index scores of experimental group A and group B are above 8 points, and the evaluation is excellent. The system has a catalytic effect on the future cultivation of college students' network quality education.

## KEYWORDS

Network literacy; Comprehensive evaluation system; Evaluation index; Basic information management; Query statistics module

## 1. INTRODUCTION

With the development of science and technology and the progress of network technology in the new era, college students have become an important user group of network users [1-2]. At present, various types of cultural exchanges, intermingling and encounters, facing the redundant ideas and concepts, the college students group is often at a loss, which has put forward higher requirements for the work of college students' network literacy education. Network literacy usually refers to the network quality and moral code that should be possessed in the basic human literacy. It is mainly divided into the knowledge and skills of using network, the dialectical thinking ability of understanding, analyzing and evaluating network information, and the legal and ethical cultivation in network communication [3-4]. Internet literacy education for college students is an educational activity aimed at college students' knowledge and skills of using the Internet, their ability to judge Internet information, and their legal and ethical cultivation in Internet use.

The design of evaluation system a more complex process. The literature [5] proposes to explore the level of web literacy skills of first year undergraduate students of Punjab University, Lahore, Pakistan. Data were collected from 180 from science, social science, arts and humanities. A theoretical model is proposed which may help in designing an efficient and effective web literacy module/subject to help students to improve their skills related to web usage. A comprehensive evaluation system and model for ecological vulnerability of coastal wetlands was constructed and applied in the literature [6]. The results showed that the ecological vulnerability score of the Yellow River Delta wetlands was 0.49, which was

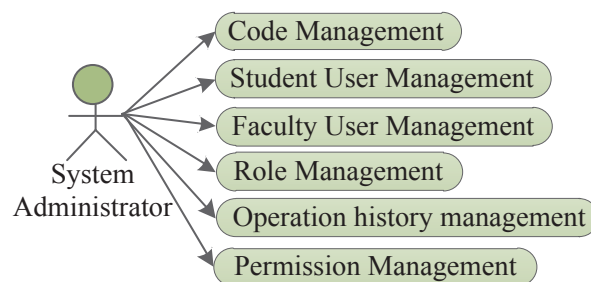

generally at a medium vulnerability level. The effect of "terrestrial influence" gradually decreases with the vulnerability of population and economic agglomeration areas. In the literature [7], a comprehensive evaluation system of customer index data in the power industry was developed for the development of lean marketing strategies. The system evaluates indices from customer data such as renewable energy, carbon emissions, energy efficiency and customer credit. The comprehensive evaluation system proposed in the above literature is difficult to apply to the comprehensive evaluation of online literacy of school students.

Therefore, this paper analyzes the requirements of the comprehensive evaluation system of college students' Internet literacy from the perspective of users, including the analysis of functional requirements and the analysis of performance requirements. In the functional analysis, the system use cases including teachers, users and system administrators are described, and the basic student information management, query and statistics module management, system management and comprehensive literacy management are described respectively, and finally the effectiveness of the system is verified by conducting experiments on student evaluation indexes.

## 2. GENERATION OF ONLINE LITERACY EVALUATION SYSTEM FOR COLLEGE STUDENTS

### 2.1 NETWORK LITERACY COMPREHENSIVE EVALUATION SYSTEM MODEL

The core module of the comprehensive evaluation system of university students' Internet literacy is the system administration, and the user is the system administrator [8-9]. Once the system administrator has successfully entered the system, he/she can operate the management functions as well as maintain the data information. The teacher can change as well as upload student data, and students have the right to view the information and are given the right to change only some of the information. When students provide feedback and other information that does not belong to the individual change authority, they can report to the administrator and collaborate to change it. Figure 1 shows the model of the comprehensive evaluation system of Internet literacy built.

**Figure 1.** Comprehensive evaluation system of network literacy

From the evaluation model in Fig. 1, it can be seen that the role management of the comprehensive evaluation system of college students' network literacy is mainly to restrict the login and use rights of different roles by the administrator, and only the administrator has restricted rights, which achieves the security and consistency of the system to a certain extent. When the administrator manages the role information, the role name is determined first to ensure the certainty of the role authority, and after the role name is input, the system immediately detects the singularity of the role name, and if the user name is repeated, it is reset to avoid the duplication and uniqueness of the role name.

### 2.2 BASIC STUDENT INFORMATION MANAGEMENT

The basic student information management mainly focuses on examining and testing the

basic quality of students, including the functions of adding, modifying and deleting information. The basic information management authority for students includes administrators and teachers. When the teacher enters the user name and password, the system automatically verifies the correctness of the user name and password, and then the system can be accessed after success. Students can change and view their basic personal information, add evaluation information for everyone, and have the final authority to disclose or not disclose personal information. Personal information mainly includes, personal school semester grades, contact phone number, home address, education experience, etc., to a certain extent to maintain the reliability of data.

### **2.3 COMPREHENSIVE NETWORK LITERACY MANAGEMENT**

The comprehensive web literacy management as an evaluation indicator analyzes the breakdown of the student's project, and this module is operated by different users, implementing different functions and with different operational rights [10]. Each function of the comprehensive network literacy management is maintained by the administrator as well as statistics. The summaries and details of network literacy are entered and uploaded by the administrators to ensure the authenticity and security of the data. The data information is maintained in two ways: Excel and front-end input. The former is done by uploading data to the system backend, which is verified by the system and saved in the data list by forming business data according to the preset regulations. In the latter, the data information is entered by the manager in the background and then saved in the system, thus realizing the comprehensive management of college students' network literacy.

## **3. CONSTRUCTING A COMPREHENSIVE EVALUATION SYSTEM FOR ONLINE LITERACY OF SCHOOL STUDENTS**

### **3.1 ESTABLISHMENT OF EVALUATION INDEX SYSTEM**

The total score of university students' online integrity file includes the sum of the scores of the five dimensions evaluated, such as academic integrity, online integrity, economic integrity, life integrity and work integrity. Among them, an evaluation cycle can be set for one academic year, and the score of each dimension is the sum of the basic score, plus score and minus score, and its basic score can be set at 60 points. On the premise that students get the basic score, they are given additional points for the corresponding dimension of trustworthiness, that is, they are given certain positive points, and vice versa, that is, they are given certain negative points as minus points. The educational authorities should improve the national college students' online integrity database, record the online integrity file scores of all college students in time, and form a complete system that can be queried, so that it can be connected with the school registration network for the convenience of colleges and universities, and even the whole society, and use it as a basis to measure the online integrity of college students.

### **3.2 IMPORTANT BASIS FOR EVALUATING MERIT TO JOIN THE PARTY**

College students' online integrity file scores can also be used as an important basis for students to apply for student loans and grants. In the graduation season, the school can also recommend talents to employers. In addition, colleges and universities should include in their school rules and regulations the punishment regulations for network integrity violations, introduce specific punishment policies, increase inspection and assessment, and punish college students for network moral failures or violations, so as to play the role of "supervision, education and rectification".

### **3.3 CARRY OUT NETWORK ETHICS REVIEW**

At the level of colleges and universities, the relevant departments supervise and audit the

work of online ethics education for college students. The competent educational departments should regularly carry out online ethics review activities, give commendations and rewards to colleges and universities that abide by professional ethics, criticize and punish behaviors that violate the law and social morality online, and take the high level of online ethics education work of each college and university as an important evaluation criterion for the assessment and evaluation of its ideological and political education work level.

#### 4. ANALYSIS OF THE APPLICATION OF COMPREHENSIVE EVALUATION SYSTEM OF NETWORK LITERACY

In this paper, a comprehensive evaluation system model of network literacy is constructed, an evaluation index system is established, and an experimental analysis of the network literacy of school students is conducted. First of all, experimental group A and experimental group B are set up, and in the evaluation subject, if there are more than 8 in the evaluation of the three levels of indicators for a student, the evaluation result is excellent. 6-7 or more is the evaluation result of needing efforts, and 5 is qualified. A total of 3 experiments were conducted, and the evaluation results are shown in Table 1.

**Table 1.** Evaluation index of comprehensive literacy of college students

Experimental group	First experiment	Second experiment	The third experiment
A	5	7	9
B	5	8	10

Analyzing the evaluation results in Table 1, the scores of both experimental group A and group B were 5 in the first experiment, group B had been evaluated as excellent in the second experiment, and both groups were excellent in the third result. The psychological characteristics and behavioral patterns that college students have themselves make their living habits, learning methods, and online behavior different. Therefore, for this special group, we should make full use of the network platform and establish educational websites adapted and matched to each individual to achieve the goal of strengthening college students' network literacy education, helping them to establish correct outlook on life and values, and continuously improving their network literacy and ability.

#### 5. CONCLUSION

In this paper, we conducted an in-depth study on establishing college students' online integrity files, constructing a mechanism for rewarding and punishing college students' online morality, and forming a mechanism for supervising and evaluating online literacy education, and constructed a system for evaluating college students' online literacy. The experiments were conducted through the comprehensive evaluation system, and both experimental groups scored more than 8 excellent points after three experiments. In summary, the system plays an important role in the statistics and the integration of the data information of college students' comprehensive Internet literacy, which improves the efficiency of data processing while reducing the labor cost and simplifying the processing process. The system is stable.

# RESEARCH ON TEACHING SUPERVISION MODEL AND EVALUATION INDEX SYSTEM OF HIGHER EDUCATION INSTITUTIONS UNDER THE BACKGROUND OF INFORMATIONIZATION

---

Li Zhang\*

Luzhou Vocational and Technical College, Luzhou, Sichuan, 646000, China

[33470054772@qq.com](mailto:33470054772@qq.com)

---

## ABSTRACT

In the context of information technology, in order to improve the quality of teaching in institutions such as et al., this paper constructs an index system by constructing a supervision model and using Delphi method research as a basis for decision making. Using big data technology and cloud computing technology and other processing, the teaching supervision model is diagnosed, and the final evaluation index system is given weights. The results showed that the weighted index B3 "teaching content" (0.364) and B7 "teaching effect" (0.891) had significantly higher teaching content and effect. Thus, it can be seen that the model of teaching supervision in higher education institutions can promote the continuous improvement of teaching effectiveness and provide reference for the development of teaching innovation in higher education institutions.

## KEYWORDS

Teaching supervision model; Delphi method; Evaluation index system; Big data technology; Cloud computing

## 1. INTRODUCTION

With the continuous development of modern science and technology level, the comprehensive strength of the country has been increasing, in which teaching knowledge and thinking play a very big role and gradually become the key indicators reflecting the scientific and cultural literacy of the nation [1-2]. Teaching courses in higher education institutions not only play the role of auxiliary courses, but also are the cornerstones of many professional courses, which are directly related to the effectiveness of students' professional knowledge learning and their future career planning [3-4]. It is the noblest and most difficult mission of higher education to link the advanced information technology with the teaching in higher education institutions, to promote the innovation of teaching system reform in higher education institutions, and to cultivate more excellent talents for the country [5-6].

At the same time, many new teaching modes relying on the Internet are generated, which bring new opportunities for teaching reform in higher education institutions and promote the smooth implementation of teaching reform. The literature [7] analyzed the feasibility of task-driven teaching method applied to the teaching of AI course according to the teaching objectives of AI course and the characteristics and steps of task-driven teaching method. For the instructional design of the intelligence stage, the inevitability of the paradigm shift of instructional design in the context of AI is firstly described in terms of the opportunities brought by AI to education and teaching, the problems of the original information-based instructional

design and the many challenges faced. The literature [8] shows that mobile learning is a new learning method that uses wireless communication networks to access educational information, educational resources and educational services. Mobile learning can integrate mobile technology into the learning process, and teachers can push learning content to mobile platforms through the Internet, and the learning format will be more free. Thus, the integration of modern information technology and curriculum is not only the innovation of teaching mode, but also the direction of future development of teaching. To sum up, modern teaching methods as well as ways to achieve poor teaching effect, not essentially change the traditional teaching methods, not to mention the good solution to the problems existing in traditional teaching.

Based on this, this paper designs a model of teaching supervision model in higher education institutions in the context of information technology. Firstly, the supervision model model is constructed, and big data technology and cloud computing technology are used to introduce facts and empirical evidence into management decision making, and secondly, accessible evidence, practices and data are collected to diagnose the teaching supervision model and determine the evaluation index system. Finally, the experimental analysis proves that the model can effectively optimize the teaching supervision evaluation system and improve the development of higher education institutions.

## **2. TEACHING SUPERVISION MODEL OF HIGHER EDUCATION INSTITUTIONS**

### **2.1 BUILDING A MODEL OF TEACHING SUPERVISION**

Professional teaching model construction is the basis and prerequisite for implementing diagnosis and improvement work, so higher education institutions should invest more in information technology and equipment, and use information platforms to collect and organize relevant information in the teaching process to get more reliable diagnosis results [9-10]. A large amount of data information has been generated in the long-term supervised teaching process, which should be processed by using big data technology and cloud computing technology to improve the efficiency of information acquisition and integration, and at the same time to develop the depth of the content, which is conducive to finding the deeper influencing factors of teaching quality and more targeted when formulating strategies to improve supervised teaching. Following the basic principle of "self-diagnosis as the main focus and external diagnosis as a supplement", we strengthen teachers' awareness of self-diagnosis and make improvements according to their own teaching conditions. We will speed up the construction of smart courses and cloud classrooms, optimize the process of information collection and sharing, and implement the diagnostic work with the concept of refinement.

### **2.2 STRENGTHEN THE TEACHING TEAM**

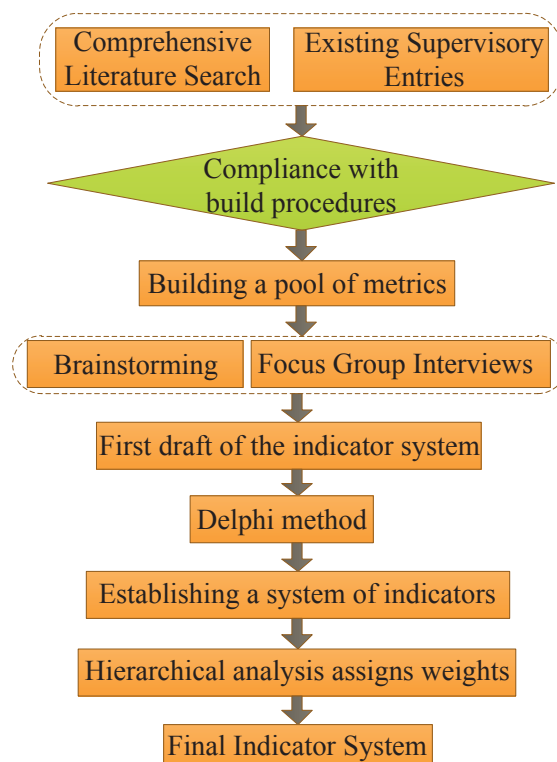

The construction of teaching team is conducive to improving the overall efficiency of practice and creating talent guarantee for the improvement of teaching quality. The traditional teaching methods are reformed and optimized, so that information-based teaching in practice presents the characteristics of normalization, and timely diagnosis is made for the data in teaching in order to obtain more reasonable diagnosis results and clarify the goals and directions of improvement [11]. Taking blended teaching as an opportunity to analyze online teaching on the basis of obtaining offline teaching information, the teaching supervision mode is diagnosed from different perspectives. Higher education institutions should improve communication with experts in related fields, hire experts to provide guidance within the school, improve the overall level of teaching team construction, and present a stronger vitality in their work. Highlight the subjectivity of students in teaching, consider their experiences and

feelings in learning, and create a humanized teaching model.

### 2.3 CLEAR TEACHING EVALUATION INDEX SYSTEM

Through systematic and multiple research methods, we analyze and study the teaching supervision model by combining current modern university development concepts and advanced experiences at home and abroad, and explore the teaching supervision model in higher education institutions by considering the inherent needs and characteristics of higher education institutions, so as to provide a model and reference for the setting, management and operation of teaching supervision in higher education institutions in the future. Introduce facts and empirical evidence into management decision making by collecting available evidence, practices and data, analyzing them on this basis, and then combining them with the experience of managers and the characteristics of their fields, industries and units as a basis for decision making. Combining the existing indicators collected from the practical application of teaching supervision for the evaluation of various aspects of teaching, a comprehensive analysis is conducted on this basis, and a Delphi method study is used as a basis for decision making to construct an indicator system to provide an objective and quantitative evaluation basis for the future development of teaching supervision in higher education institutions. The evaluation index system of teaching supervision in higher education institutions is shown in Figure 1.

**Figure 1.** Supervisory evaluation index system

As can be seen from Figure 1, the teaching supervision evaluation index system is constructed to provide a model and standard for self-evaluation, self-restraint and self-improvement of education and teaching subjects. Through comprehensive literature search and existing supervisory entries, the index pool becomes the index pool by conforming to the construction procedure, brainstorming and focus group interviews become the first draft of the index system, using the Delphi method to establish the index system, and the final index system after giving weights. Through the hierarchical structure the expert evaluation is transformed into a number of factors, and the degree of importance is compared two by two, thus transforming the difficult to quantify qualitative evaluation into quantitative evaluation,

and then calculating the weight coefficient of each indicator according to the results of the comparison. This teaching supervision evaluation index system provides a unique perspective to evaluate and diagnose the state of school operation, provides accurate and effective evidence reference for the management decision-making level of higher education institutions, and provides a reliable basis for making education and teaching management decisions, which can then be targeted to improve work and enhance management effectiveness.

### 3. EXPERIMENTAL ANALYSIS OF EVALUATION INDEX SYSTEM

This paper uses the Delphi method to evaluate the indicator system to analyze the supervisory model of higher education institutions. The Delphi method of collecting experts' feedback includes investigating experts' evaluation of the importance of indicators and experts' opinions and suggestions on the indicator system as a whole. Several rounds of letters were sent to the experts to solicit their opinions by anonymous means, while the decision-making team summarized and organized the opinions of experts in each round, and then sent them to each expert again as reference materials, analyzing and judging them while putting forward new opinions and suggestions, and so on until the experts' opinions converged and the final conclusion was reached. The experts who participated in the Delphi survey in this study were all from a university in Beijing, and a total of 20 letters were sent to explain the survey. The analysis of teaching index weights is shown in Table 1.

**Table 1.** Analysis of Index Weight

First-level Indicators	Secondary Indicators	Relative Weight	Sort
A1. Teaching Preparation	B1 Teaching Design Scheme	0.600	1
	B2 Information Teaching Resources	0.400	2
A2. Teaching Implementation	B3 Teaching Content	0.362	1
	B4 Teaching Organization	0.384	2
	B5 Teaching Evaluation	0.284	3
A3. Teaching Effect	B7 Target Achievement	0.891	1
	B6 Classroom Atmosphere	0.238	2

As can be seen from Table 1, the relative weights of the secondary indicators under the primary indicator "teaching preparation" are B1 teaching design plan (0.536) and B2 informatization teaching resources (0.464) in descending order; under the primary indicator "teaching implementation", the relative weights of the secondary indicators are B3 teaching content (0.364), B4 teaching organization (0.345) and B5 teaching evaluation (0.364) in descending order. In the dimension of primary index "teaching implementation", the relative weights of each secondary index are B3 teaching content (0.364), B4 teaching organization (0.345) and B5 teaching evaluation (0.291) in descending order. Under the primary indicator "teaching effectiveness", the relative weights of the secondary indicators are B7 goal achievement (0.891) and B6 classroom atmosphere (0.238) in descending order. It indicates that the teaching in colleges and universities should improve the professional evaluation mechanism, take professional evaluation as the grasp, and guide teachers to focus on technical skills training and application technology services.

### 4. CONCLUSION

In this paper, a model of teaching supervision model in higher education institutions is constructed in the context of information technology. In the process, the index system is constructed using Delphi method research as the basis for decision making, and the practical application effect of the model is proved through experimental analysis. The results showed

that the weight index B3 "teaching content" (0.364) and B7 "teaching effect" (0.891) were very effective in terms of teaching content and effect. It shows that the model of teaching supervision in higher education institutions can help the professional development of teachers and the improvement of teaching quality in higher education institutions.

[wenwen000love@163.com](mailto:wenwen000love@163.com)

---

## ABSTRACT

Based on big data technology, this paper constructs an innovation platform of Manchu folk dance props single drum. Data collection and screening techniques are used to manage and classify resource data, find potential data information through data mining, and organize multi-faceted information to build a database on this basis. The simulation results show that the prediction accuracy of the innovation platform constructed in this paper reaches 92%, the search frequency of single drum keywords is 0.81, and the click rate is 96%. It can be seen that the innovation platform constructed in this paper expands the coverage and influence of the single drum culture of Manchu folk dance props, and lays the foundation for its innovation and development.

## KEYWORDS

Big data technology; Data collection; Data mining; single drum innovation platform; Prediction accuracy

## 1. INTRODUCTION

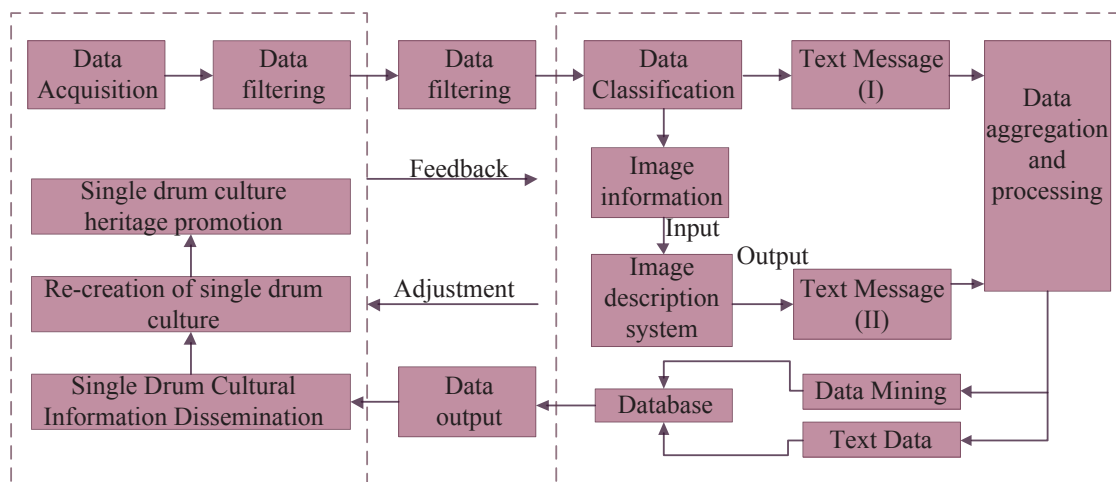

The survival of traditional culture has changed with the revolution of the times brought about by media technology, and with the continuous development of economy and society, people's production and life style have become more diversified. The single drum dance has formed the present-day Manchu single drum dance through the long-term collision and integration of Manchu and Chinese cultures [1-2]. In the era of big data, the change of concept and the progress of social productivity, the self-entertainment of mono-drum dance has been increasing and turned into a popular and highly performative folk art for the masses [3-5].

Manchu folk dance prop single drum has a rich and colorful culture and has a long history of development. If the single drum culture wants to innovate again, it has to find a breakthrough from the form and content. In the literature [6], by innovating the culture of folk dance props through multimedia information technology, anyone can accurately grasp the connotation of the culture of Manchu folk dance props monodrum, and thus be more resourceful in choosing unique dance movements in different dance rehearsals and performance scenarios. The literature [7] uses language and writing to record and document the Manchu folk dance props single drum, fusing and sorting the relevant information for reference and learning with those who come later. The method in the above literature is more conservative difficult to break through, and does not better promote the innovation and development of Manchu folk dance props single drum.

Based on this. In this paper, an innovation platform of Manchu folk dance prop single drum is constructed based on the background of big data. In the process of construction, data collection and mining are realized through big data technology, and the obtained information is classified and organized. And the practical effect of the platform is proved by the simulation practice results. It is shown that it makes the culture of Manchu folk dance prop single drum more visualized and accelerates the dissemination and innovation of single drum culture.

## 2. CONSTRUCTION OF MANCHU FOLK DANCE PROPS SINGLE DRUM INNOVATION PLATFORM

In China, the dance culture of ethnic minorities is colorful and has a long historical development. In this process, the culture, skills and the inheritance and development of their traditional culture are indirectly shown [8-10]. Among them, single drum music is rooted in the soil of the Manchu ethnic folk, it is the most direct, natural and realistic reflection of the spiritual activities and aesthetic interests of the Manchu people at that time. Nowadays, in the context of big data, it can meet the user to obtain, store, retrieve, share, analyze and visualize quickly and accurately, creating a new quantitative research system and method for single drum culture. In this paper, through the understanding and development of Manchu folk dance props single drum, the innovation platform of Manchu folk dance props single drum as shown in Figure 1 is constructed by using big data technology.

**Figure 1.** Structure of single drum innovation platform

As can be seen from Figure 1, data acquisition is the first and the most critical step of information processing. The collected data types include image data and video data, which is the process of obtaining data through network search and other means for Manchu folk dance prop single drum culture. Then the collected information is screened and sorted by data screening, and the collected image information and video information are classified and processed so that data with the same attributes or characteristics are grouped together. After data screening, the data processing will be more specific and operational, and the results thus obtained will be more targeted and systematic.

Data mining can find important information that is implicit, previously unknown, and potentially valuable from a large amount of data. It is mainly through machine learning or mathematical algorithms to reveal the connections and trends between data, to obtain deep knowledge, and to organize multi-faceted information to build a database on this basis. Data mining can provide accurate and perfect information resources of Manchu folk dance prop monodrum culture, truly present the cultural information that can be easily ignored and missed, effectively protect and inherit monodrum culture, and provide the possibility to control the

development trend of Manchu folk dance prop monodrum and make prediction and decision efficiently.

Big Data is a network technology, not a communication medium. It does not change the medium that carries information, but the capacity that carries information, thus accelerating the speed of processing information. The value of big data technology is that through rapid processing and analysis and extraction technology, data is continuously mined and reorganized to form new valuable information. By introducing big data technology into the research of the innovation and development of Manchu folk dance props single drum, the resources of folk dance props single drum culture are mined through big data technology, and the traditional single drum performance is continuously innovated based on the new aesthetic concept. It can be seen that in the era of big data, better use of data systems will folk art will Manchu folk dance props single drum culture protection and storage, will make outstanding contributions to the inheritance of folk art.

### 3. ANALYSIS OF THE SIMULATION RESULTS OF THE INNOVATION PLATFORM

In this paper, based on big data technology, an innovation platform of single drum, a Manchu folk dance prop, is constructed. In order to verify the effectiveness of the platform, we test its application effect in practical application. And compare and analyze with the traditional platform, the specific information is shown in Table 1.

**Table 1.** Comparison information

	Technical Support	Click-through rate	Keyword frequency	Prediction accuracy
Traditional web platforms	Traditional systems	36%	0.24	29%
Innovation platform	Big Data Technology	96%	0.81	92%

As can be seen from Table 1, the traditional platform click rate is only 36%, and in the keyword search, the frequency of single drum keywords appear only 0.24, and the prediction accuracy rate only reached 29%. Saying that the traditional network platform lacks professional technical operation, the problem of Manchu folk dance props single drum innovation development still has not been fundamentally and comprehensively solved. And the innovation platform built based on big data technology has a prediction accuracy rate of 92%, which can accurately predict users' preferences and provide them with data on the single drum dance they are interested in. And the keyword search frequency is 0.81, and the click rate is 96%. This effectively proves that the platform can precisely target users and place them, bringing the single drum culture precisely to the eyes of users who are interested in it. It further enhances the charm of single drum, a Manchu folk dance prop, and provides a more convenient adaptation path for the future inheritance and innovative development of this type of culture.

### 4. CONCLUSION

This paper constructs a single drum innovation platform based on big data technology for Manchu folk dance props with the innovation development of single drum as the research goal, and verifies the effectiveness of the platform in practical application. Compared with the traditional platform, the prediction accuracy and click rate of the single drum innovation platform based on big data technology reached 92% and 96% respectively, and the keyword search frequency was 0.81. This shows that the single drum innovation platform built in this paper can provide more possibilities for the innovation development of single drum culture and promote the inheritance and propagation of single drum culture.

## ABSTRACT

To expand the level of ideological and political education (IPE) in colleges and universities and develop a novel path of IPE work. This paper collects and analyzes data through big data technology (BDT), digs and researches to determine the thought dynamics and social behavior of college students, quantifies and analyzes the characteristics of college students' groups, and designs a model of innovative education model for ideological and political work (IPW) in colleges and universities. The consequences demonstrate that in the cross analysis of the degree of integration of IPW in colleges and universities, 74.95% of the total number of undergraduates are "very good", and the proportion of "better" in all colleges and universities is as high as about 70%. Thus, it can be seen that the innovative education model of IPW in colleges and universities based on BDT can improve the accuracy and effectiveness of talent cultivation work and generate a novel situation of IPE work in colleges and universities.

## KEYWORDS

College ideology and politics; Innovative education model; BDT; Quantitative analysis; Cross analysis

## 1. INTRODUCTION

As an emerging technology, big data is entering human vision at an unprecedented speed and scale, increasingly subverting and reshaping people's thought patterns, cognitive styles, behavioral paradigms and social patterns [1-2]. Colleges and universities are the key positions for value shaping, belief generation, professional learning and ability cultivation of college students, and the traditional rough working mode and the diversified expansion needs of college students have become the main contradiction facing the current IPW [3-4]. In the era of big data, the massive information resources, real-time collection of data, accurate portrait of individuals and intelligent pushing of information provide an opportunity for the IPW of colleges and universities to improve from simple and rough to lean [5-6].

Human society has arrived the stage of "big intelligence and cloud", and big data, as the core element, provides a powerful driving force for college ideologists to analyze students' personalized characteristics, provide targeted educational contents, implement scientific decision making and enhance antecedent management. The literature [7] is based on digital information technology, which overturns the traditional forms of media. In the IPW of

universities, how to play the role of novel media and meet the challenges brought by the expansion of novel media has become the focus of ideological and political educators. Literature [8] shows that the traditional teaching method can no longer see the learning requests of students at this stage, and the amalgamation of IPE work and Internet platform is conducive to the online education platform to break through the traditional teaching method, so as to stretch occupied show to the role of IPE of college students. To sum up, IPE in colleges and universities cannot use BDT to open up a novel path of IPE work when dealing with the challenges of the times.

Therefore, this paper uses BDT to build a model of innovative education model for IPW in colleges and universities. Firstly, it collects and analyzes the data resources of each individual college student, and mines, researches and judges and foresees the college students, social behaviors as well as learning behaviors through prediction function. Secondly, it coordinates and cooperates with the internal and external education bodies. Lastly, it is demonstrated through experiments that the model can break the bottleneck of traditional IPE and improve the effect of IPE in colleges and universities.

## **2. INNOVATIVE USE OF IPW FOR NURTURING PEOPLE IN COLLEGES AND UNIVERSITIES**

### **2.1 BDT INTEGRATES IDEOLOGICAL AND POLITICAL RESOURCES**

Many universities have initially established relatively perfect education information business systems and accumulated a large amount of IPE resource data with certain value. Due to the constraints of the departmental connection mechanism, resource integration and other objective factors, these data resources cannot be used reasonably. With the advent of the era of big data, it is possible to collect and analyze the "comprehensive data" of each individual college student through BDT. Using all the data resources, we can realize the measurable study of college students by first-hand information from family upbringing, study and education, living and consumption status and interpersonal social activities, so as to explore and sort out the characteristics of college students' group and promote the smooth expansion of IPE work in colleges and universities [9-10].

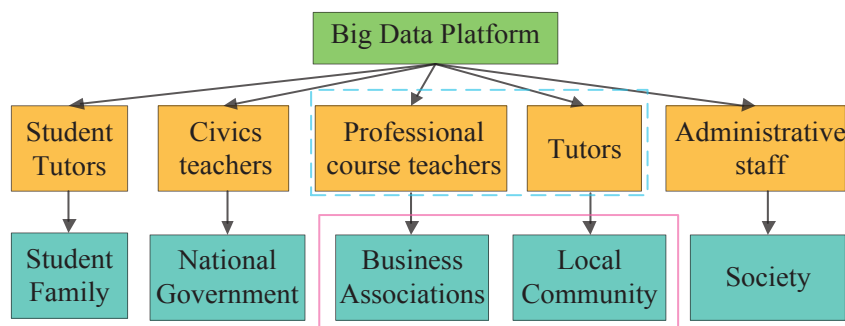

### **2.2 BDT ENHANCES IPW PREDICTION**

The core value of big data is "prediction", and the IPE workers in colleges and universities can make use of the prediction function of big data to excavate, study and judge the ideological dynamics, social behavior and learning behavior of college students, so that the ideological problems of college students can be "early found, early followed up and early diagnosed", and then the early warning mechanism of IPE of college students can be established in time, so as to truly achieve "ideological prevention" instead of "treatment" [11]. In this way, the early warning mechanism of IPE of college students can be established in time, so as to truly achieve "ideological prevention" instead of "treatment" [11]. For example, the IPE workers in colleges and universities can understand the latest ideological and emotional dynamics of college students according to their WeChat, friends circle dynamics and QQ comments, and if they find various irrational behaviors of college students, they should intervene early to channel and guide them, so as to contain various dangerous events in the bud.

### **2.3 ESTABLISHING THE MODEL OF IDEOLOGICAL AND POLITICAL INNOVATION EDUCATION MODEL IN UNIVERSITIES**

In the background of big data era, modern information technology has given birth to a large number of information exchange models and data integration models, which have

comprehensively broken the situation of single-armed and separate efforts of university education subjects [12]. It also collects data and information related to teaching and education and management services of each nurturing body in a coordinated manner, gradually realizes the synergistic linkage between the nurturing body within the university and the nurturing body outside the university, and gradually forms a precise synergistic pattern with multiple participation and interaction of family, school, enterprise, government, community and society. The innovative nurturing model of IPW in colleges and universities is exposed in Figure 1.

**Figure 1.** Innovative parenting model

From Fig. 1, it can be seen that the multiple nurturing subjects in the IPW of colleges and universities, as a social relationship network, are interdependent and inseparable, and together constitute an organic and unified collaborative system. The model breaks the gaps and barriers between the multiple subjects, promotes the precise synergy of all the work and brings into play the combined effect of each nurturing subject. The IPW system of colleges and universities is a "total nurturing" work system formed by different departments and various nurturing subjects, which has the typical characteristics of close connection, mutual influence and collaboration. "It is a strategic support for IPW-ers to promote their respective duties and responsibilities as well as to work with one heart and one mind, and it is also an significant means to encourage the all-round and personalized expansion of college students.

### 3. INNOVATIVE EDUCATION EXPERIMENT ANALYSIS

As a scientific thinking activity, the sense of precision is a reflection of objective things realistically under the guidance of basic Marxist methods, and it is also a product of combining the emerging technology represented by big data with the IPW of colleges and universities. The independent variable of the study is clearly the modern frontier information technology with big data as the core, and the dependent variable is the degree of precision of IPW in colleges and universities. This paper analyzes the working result of the innovative education model of IPW in colleges and universities through the sense of precision. The mathematical statistics and analysis of the questionnaire data of colleges and universities are carried out, and the analysis results of the incorporation degree of BDT and IPW of colleges and universities are exposed in Table 1.

**Table 1.** Analysis results of ideological and political integration

	Very nice	Quite good	Same as	Just so	Very bad	Total
Junior college education	85	98	40	35	28	286
Undergraduate course	536	735	284	84	42	1681
Postgraduate	230	492	286	46	15	1069
Other	11	8	3	3	2	27
Total	862	1333	613	168	87	3063

As can be seen from Table 1, the cross-analysis between the education level of survey

respondents and the degree of integration of BDT in the IPW of colleges and universities shows that a total of 154 of the specialist students said very good and relatively good, accounting for 64.44% of the total number of students. A total of 1128 undergraduates said very good and relatively good, accounting for 74.95% of the entire number. An entire of 721 graduate students, or 69.59% of the total, said very good and relatively good. It can be seen that there are some differences in the degree of integration between BDT and IPW of colleges and universities in different levels of schools, and the precision awareness of undergraduate schools is obviously better than that of specialized higher vocational institutions. However, in general, the proportion of "very good" and "better" is as high as 70%, and more and more colleges and universities have tasted the "sweetness" of big data in the change of IPW precision. "The incorporation of the two has become an irreversible trend of the times, reflecting the awareness that the innovative model of IPE in colleges and universities can improve the precision of IPW.

#### **4. CONCLUSION**

Based on BDT, this paper actively explores the innovative education model of IPW in colleges and universities.

In the process of exploration, a model of innovative education model of IPW in colleges and universities is designed, and the feasibility of the model is verified through the analysis of experimental results. The results show that 74.95% of the total number of undergraduates are "very good" in the degree of integration of IPW in colleges and universities, and the proportion of "better" in all colleges and universities is already as high as about 70%.

It shows that the model of innovative education model of IPW in colleges and universities based on BDT gives full play to the positive effect of BDT and can promote the IPE work to a novel level.

# THE DEVELOPMENT, DILEMMA AND COUNTERMEASURES OF UNIVERSITY ENGLISH TEACHING UNDER THE INFLUENCE OF "INTERNET+"

---

Lihua Wang\*

Jiangsu University Jingjiang College, Zhenjiang, Jiangsu, 212100, China

[wlh517679@163.com](mailto:wlh517679@163.com)

---

## ABSTRACT

Under the influence of "Internet+", this paper breaks through the limitation of time and space and builds a model of university English teaching. By increasing the access of teaching subjects to resources and creating a multi-dimensional interactive English teaching environment, and by providing specific language observation, input and learning training, students can develop and enhance their independent learning ability. The paper also aims to develop and enhance students' independent learning ability through specific language observation, input and learning training. The results show that the weighted average contact degree of the English teaching response analysis is 0.679, and the overall evaluation score of teaching quality of the "excellent" teachers is  $>0.79$ . Thus, it is clear that "Internet+" can enhance the effectiveness of college English teaching and improve classroom teaching. The effectiveness of classroom teaching can be enhanced and the quality of classroom teaching can be improved.

## KEYWORDS

College English teaching; Internet+; Interactive teaching; Weighted average connectedness; Comprehensive evaluation score

## 1. INTRODUCTION

With the development and innovation of information technology, human society is gradually developing in the direction of informatization and technology. Internet technology plays an important role in promoting and supporting the evolution of the education model, providing direction and motivation for the reform and innovation of the education model, especially having a significant impact on college English teaching [1-3]. The traditional foreign language teaching mode can no longer serve students better, so reforming the traditional foreign language teaching mode, applying information technology to college English classroom, and increasing the fun and vividness of English classroom are the inevitable trends of teaching reform in major universities [4-5].

The "Internet +" is the new industry of innovative Internet development, the evolution of the Internet form driven by the innovation of knowledge society and the new form of economic and social development it has spawned. "Internet +" is a further practical result of Internet thinking, which drives the evolution of economic forms continuously, thus driving the vitality of social and economic entities and providing a broad network platform for reform, innovation and development. The literature [6] explores the reform of university English teaching mode, teaching ideas and methods. The theory of multiple intelligences provides strong theoretical

support for the reform of college English teaching. The new model can improve students' comprehensive language application ability through teaching methods using various modern technological tools. The literature [7] found lecturers' views on formative assessment of English through online classroom tests and identified the baptism of formative assessment of students through online classroom tests in English teaching. The perceptions of English instructors were appropriate to the positive feedback obtained in formative assessment by providing feedback to students through online classroom. In summary, there are still problems in English language teaching, gaps in the level of English language teaching, lack of proficiency in "Internet+" technology, and fixed mode teaching.

Based on this, this paper designs a college English teaching model under the influence of "Internet+". Firstly, the English knowledge and teaching channels are updated, and the students' main position is emphasized. Secondly, we conduct specific language observation, input and learning training, and follow the principles of motivation and structure. Finally, the model is experimentally demonstrated to optimize the strategies of college English teaching and improve the teaching efficiency of modern college English classroom.

## **2. COLLEGE ENGLISH TEACHING MODE UNDER THE INFLUENCE OF "INTERNET+"**

### **2.1 TEACHING AND LEARNING DEVELOPMENT OF COLLEGE ENGLISH**

The "Internet+" has brought great changes to human production and life, and it has gradually penetrated into college English teaching, influencing the methods and thinking concepts of college English teaching, acting on teachers' classroom teaching methods, knowledge updating and teaching channels, and prompting the development trend of diversification and flattening of college English classrooms [8]. With the support of information technology, university English teaching has also broken through the limitation of time and space, and the era of educational knowledge sharing has come, and the knowledge base of high-quality educational resources has increased the way for teaching subjects to obtain resources and further improved the effectiveness of talent cultivation. The reform of university English teaching in the context of "Internet+" is bound to enhance the leading role of teachers, emphasize the main position of students, promote the effective interaction between the two, and promote the ecological benign operation of the whole university English teaching.

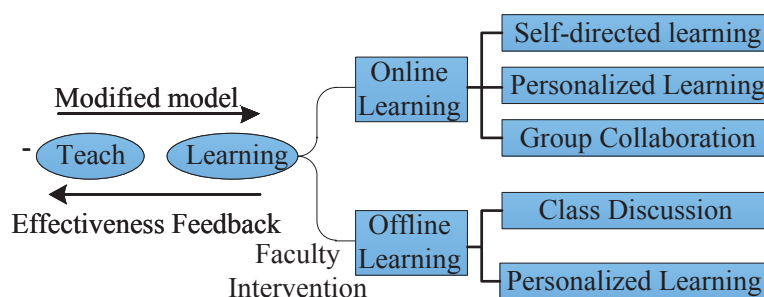

### **2.2 TEACHING DEVELOPMENT COORDINATION FUNCTION IMBALANCE DILEMMA**

In the university English ecological teaching classroom based on Internet information technology, originally teachers and students should be the main subjects of ecological teaching at the same time, but at the present stage, many university English teaching has the following problems, which lead to the imbalance of the coordination function between ecological subjects [9-10]. Firstly, the quantity and quality of students trained by university English teachers can hardly meet the needs of the market based on the continuous expansion of universities and colleges. Second, the implementation of the graded teaching mode of university English in the context of "Internet+" has achieved certain teaching results, but it has also affected the original ecological pattern of classroom teaching. The influx of a large number of information devices in the Internet information era has led to a decrease in communication and interaction between teachers and students and an increase in students' interaction with computers and information devices. All these series of problems have led to an imbalance between ecological subjects, i.e., teachers and students. On the one hand, teachers keep applying modern information technology to innovate teaching methods and continuously develop and enhance students' independent learning ability. On the other hand, students believe that their purpose is to learn English rather than to focus on information

technology, thus leading to a poor curriculum atmosphere and an imbalance between ecological subjects.

### 2.3 COLLEGE ENGLISH TEACHING MODEL CONSTRUCTION

The application of Internet technology can help students meet these needs more comprehensively by providing specific language observation, input and learning training. Specifically, building a college English teaching model in which the college English teaching classroom is the process of interaction and influence between the teacher, the teaching environment, and the students, creating a multidimensional interactive English teaching environment can provide support for both teachers and students. Specifically, the construction of a multidimensional and interactive classroom includes: before the class, the English classroom should be equipped with complete multimedia teaching equipment and corresponding teaching materials, and the natural physical environment should be prepared in advance. In the course, it is necessary to build a harmonious external classroom environment and form an equal and harmonious teacher-student relationship, while the multidimensional interactive ecological classroom is essentially centered on interaction. Thus, teachers can use a variety of Internet information technology tools to add more interactive links between teachers and students in the preliminary design of the college English lesson plan. The university English teaching model is shown in Figure 1.

**Figure 1.** College English teaching model

As can be seen from Figure 1, this paper constructs a three-dimensional teaching model for college English teaching supported by cognitive learning theory and constructivist theory, and explores its application in daily teaching through examples. The teaching model is used to create a display space for each student under limited conditions and to receive timely feedback. The teaching should follow the principles of motivation i.e. inquisitive drive, competent drive, and reciprocal drive, the principle of structure i.e. knowledge is composed of actions, images, and symbols, the principle of procedure i.e. the process of knowledge acquisition, and the principle of reinforcement i.e. the timeliness of evaluation feedback.

### 3. ANALYSIS OF THE RESULTS OF ENGLISH TEACHING COUNTERMEASURES

In order to verify the effectiveness of the college English teaching model constructed in this paper, the research text of this paper was a total of 347 college students enrolled in a university in Shanghai, and 12 English teachers in the university were evaluated by means of a questionnaire. The results of the response analysis are shown in Table 1.

**Table 1. Results of Countermeasure Analysis**

Connectivity	A	B+	B-	C+	C-
Excellent	0.429	0.003	0.384	0.005	0.357
Good	0.684	0.254	0.341	0.003	0.002
Differ from	0.285	0.454	0.004	0.516	0.003
Score	0.876	0.489	0.804	0.782	0.835

As shown in Table 1, the evaluation results of the response analysis show that the characteristic values of the four levels of variables are consistently close to the average value of the grade Good, and among the weighted average association of the four evaluation levels Excellent, Good, Medium and Poor, the association of the Good level is the largest at 0.679. The overall evaluation score of the teacher who was rated as "excellent" was >0.79, and the evaluation result was "medium"; the overall evaluation scores of the other nine teachers were all between 0.89 and 0.8, and the evaluation result was The other nine teachers' overall evaluation scores were between 0.89 and 0.8, and their teaching evaluation results were "good". This indicates that the quality of English teachers' teaching tends to be good, and the teachers' teaching ability and overall quality have improved.

#### 4. CONCLUSION

In this paper, we study the development, dilemmas and countermeasures of college English teaching under the influence of "Internet+". In this study, a university English teaching model was designed, and the experimental analysis of countermeasures proved the effectiveness of the model. The results show that the weighted average contact degree of English teaching countermeasures analysis is 0.679, and the overall evaluation score of teaching quality of teachers who are rated as "excellent" is >0.79. This indicates that under the influence of "Internet+", university English teaching has the effect of jointly promoting the reconstruction of university English teaching. This shows that under the influence of "Internet+", university English teaching has the role of jointly promoting the optimization and reconstruction of university English teaching, which highlights the value of university English teaching activities.

## ABSTRACT

To optimize the practical perception of social organizations' participation in educational governance. This paper proposes the logic, practice approach and optimization strategy of social organizations' educational governance in the period of social development transition. By reconstructing the focus of social organizations' participation in educational governance, it makes substantial changes in the connotation and extension of educational governance. By optimizing the educational governance practices and strategies of social organizations, the cognition of social organizations' participation in educational governance is reshaped and the effectiveness of educational governance is increased. The simulation results show that the efficiency of education out of poverty in region A is increased by 33.74%. This shows that the educational governance practices and optimization strategies of social organizations are conducive to the construction of a new educational governance pattern.

## KEYWORDS

Social organizations; Optimization strategies; Educational governance; Educational poverty alleviation; Governance effectiveness

## 1. INTRODUCTION

Social organizations are various forms of organizations or networks spontaneously established by citizens of all social strata in the process of social transformation, which have certain social public attributes [1-3]. With their unique nature and functions, social organizations have played an active role in participating in national decision making, local innovation, and educational governance reform [4-5].

For example, the literature [6] studied the characteristics of social organizations and their ability to manage public safety emergencies in schools from a public safety perspective, making social organizations systematic in their participation in the governance of public safety in schools. The literature [7] conceptualized the organizational projects and financing strategies of social organizations through quantitative and qualitative studies in order to increase the dependence of decision beneficiaries and reduce the complexity of management. The aforementioned literature only explores the content and paths of social organizations' participation in educational governance and does not address the renewal of their educational governance mechanisms in the transition period.

Based on this, this paper proposes the logic, practice approach, and optimization strategies of educational governance for social organizations in the transition period of social development. By reconstructing the focus of educational governance and optimizing the practical approaches and strategies of governance, it enables social organizations to respond spontaneously to the objects of educational governance.

## 2. PARTICIPATORY MECHANISMS OF EDUCATIONAL GOVERNANCE

Social organizations, as a special social force, are an important force in the contemporary Chinese educational governance system [8]. In the context of the Internet era, social organizations have been given a new educational meaning, which not only constitutes an important element in the construction of a high-quality education system, but also an important cut-off point for dealing with several issues such as the new relationship between church and state and improving governance capacity.

### 2.1 EDUCATION GOVERNANCE LOGIC

Educational governance gives rationality and legitimacy to social organizations in terms of ethics and procedures, allowing social forces to participate in the process of educational governance in order to complement and optimize governmental educational functions [9]. In the period of social development transition, the construct of social organizations' participation in educational governance has experienced a shift in focus. On the governance-focused construct, the form of governance in education shifted from general governance to educational governance. In the construction of education as the center of gravity, there is a shift from governance about education to governance based on education. From this point on, the participation of social organizations in educational governance began to rise to the level of national discourse, and its connotation and extension began to undergo substantial changes.

### 2.2 EDUCATIONAL GOVERNANCE PRACTICE APPROACH

The participation of social organizations in educational governance is manifested in multiple dimensions or levels, and in terms of participation content, it includes participation in macro educational decision-making, participation in local educational innovation, and participation in school governance. The specific governance contents are shown in Table 1.

**Table 1.**Content of education governance of social organizations

Levels	Nature	Content	Mode
Macro	Professional Organizations	Expert consultation and construction	Indirect Participation
		Involvement in educational strategy decisions	
Central View	Public benefit organizations	Advisory Board	Direct, indirect participation
	For-profit organizations	Advisory Board	
Microscopic	Professional organizations	Participation in the school	Direct participation
		Educational Relief	
		Participation in school governance	

As can be seen from Table 1, social organizations provide more social resources for schools when they participate in school operation during the transition period of social development by funding the construction of schools or donating funds for school operation. When participating in the process of school governance, they provide diversified resources for school development through management and supervision and making school development plans. When participating in social relief and educational compensation, they

provide personalized services for educational governance through financial support and other actions. In addition, social organizations have played a good complementary role in helping to fight poverty in education.

## **2.3 OPTIMIZATION STRATEGIES FOR EDUCATIONAL GOVERNANCE**

### **2.3.1 PROMOTE THE CONSTRUCTION OF SOCIAL ORGANIZATIONS**

In the context of the Internet era, social organizations' participation in education governance firstly requires the establishment of an efficient and smooth internal governance structure and the efficient division of powers and responsibilities between various departments. Secondly, it is necessary to establish a true and transparent information disclosure system, enhance the professionalism of social organizations, and participate in education governance reform with a professional perspective and professional methods.

### **2.3.2 INNOVATIVE SOCIAL ORGANIZATION SYSTEM**

Establishing a modern management system for social organizations requires comprehensively promoting a unified registration system for social organizations, changing the previous dual management system under the separate responsibility of different government departments, making a more scientific and reasonable classification of social organizations, and carrying out effective supervision according to the classification. Encourage and support social public media to supervise social organizations and establish a sound third-party evaluation mechanism for social organizations.

## **3. ANALYSIS OF THE PRACTICE RESULTS OF EDUCATIONAL GOVERNANCE**

In this paper, the practical approach of social organization participation in educational governance was applied to the actual governance process. The social organization R was selected for the experiment and made to carry out educational governance in area G for a period of 12 months. The level of education after governance is shown in Table 2. As shown in Table 2, after social organization R conducted education governance for 3 months, the amount of education relief and compensation in area G increased from 32,500 yuan to 209,500 yuan, and the efficiency of education out of poverty increased from 53.67% to 87.41%, which improved the efficiency of poverty relief by 33.74%. And the number of out-of-school education and training in G area has also increased from 2 times per quarter to 16 times per quarter, promoting the overall development level of students. 35 sessions of youth red education, law promotion, mental health and self-care education were carried out in 2022, covering more than 1,800 youths in the district. 2022 service activities for accompanying children, serving a total of more than 1,000 accompanying children. The joint Guandu District Office of the Undisciplined has written 36 social investigation reports after being entrusted by the case-handling authorities, carried out conditional non-prosecution for 46 minors in conflict with the law, and issued 28 psychological assessment and psychological counseling reports. This shows that the social organization R has made good progress in the education of poverty relief in G area after participating in education governance.

**Table 2** Effectiveness of educational governance in R organizations

	Before treatment	After treatment
Educational Relief and Compensation	32500	209500
Expert consultation and advice	23	204
Number of off-campus training	2	16
Education out of poverty efficiency	53.67%	87.41%
Number of educational and practical activities	11	35
Covering the range of youth in the district	26.7%	70%
Number of people served by service activities for children moving with them	268	1000
Number of social investigation reports related to minors written after commissioning by case authorities	7	36

#### 4. CONCLUSION

Standing in the context of the Internet era, this paper analyzes the logic of social organizations' participation in social governance in the transition period, and innovates the practice and strategy of educational governance. And its role in educational governance is verified in practice. After the participation of social organizations in education governance, the efficiency of education out of poverty in area A increased from 53.67% to 87.41%, and the number of out-of-school education training increased from 2 to 16 per quarter. It shows that social organizations have an innovative role in the practice of education governance and can promote the reform and development of education governance system.

# RESEARCH ON THE CONSTRUCTION AND APPLICATION OF COMPUTER NETWORK SECURITY EVALUATION MODEL BASED ON IMPROVED CIRCULAR ALGORITHM

---

Zhenghui Wang\*

Guangdong Teachers College of Foreign Language and Arts, Guangzhou, Guangdong,  
510640, China

[wanghui\\_6666@163.com](mailto:wanghui_6666@163.com)

---

## ABSTRACT

With the continuous promotion of information technology construction, computer network security evaluation has become the focus of attention in the industry. This paper introduces the establishment strategy of computer network security evaluation system, analyzes the advantages of the application of the improved cyclic algorithm in computer network security evaluation, and describes the specific strategy of the algorithm applied to the computer security network evaluation model system. The results show that the security level of the computer network security evaluation model is B, and the average error between the expected output and the actual output is less than 3.7%. Therefore, by constructing the computer network security evaluation model, it can effectively guarantee the operational security of computer networks and reduce information security problems.

## KEYWORDS

Network security evaluation; Improved round robin algorithm; Security level; Actual output; Average error

## 1. INTRODUCTION

With the widespread use of computer networks, network security has become an important frontier research topic that is urgent and needs to be addressed in the development of network technology [1-2]. Due to the development of the Internet and the progress of related science and technology, there are more and more hazards for computer network security, such as the continuous emergence of various viruses, or the emergence of other network attacks [3-4]. These are great threats to network security. At the same time, because these attacks have a very complex connection, the traditional security assessment methods have been unable to effectively assess, and the accuracy of their final evaluation results is very low [5-6]. Therefore, in today's very complex and changing network environment, an excellent network security evaluation system must be built immediately, while on top of it, the analysis and prediction of future network security problems must be completed [7].

Network security evaluation is actually a nonlinear approximation and pattern recognition problem. The literature [8] briefly analyzed the security risk of ship communication network brought by cloud computing. Based on the analysis of the relationship between the traditional ship communication information security risk assessment method and the nine elements, the security risk assessment model of ship communication network based on cloud computing is proposed. The model has some similarity with the traditional ship communication information security risk assessment method, and can well predict the information security of ship

communication network in cloud computing service. The literature [9] points out that 5G networks have been enabling the creation of various new services and applications, which require a new cyber security architecture. By examining the similarities between immune systems and cybersecurity systems, some guidelines for the design of cybersecurity architectures are extracted. The literature [10] physical layer attacks threaten the services transmitted through optical networks. To detect the attacks, an investigation of spectral signature analysis and identification is proposed. The cornerstones of network security presented in the above literature are more fragile and the grid structure is not secure enough to exploit the security flaws for network attacks.

Therefore, this paper calculates the advantages of computer network security evaluation by constructing a computer network security model and using an improved circular algorithm. Based on this algorithm can effectively guarantee the operational security of computer networks and reduce information security problems. At the same time, the construction and application of computer network security evaluation model is analyzed in conjunction with the connotation of computer network information security, aiming to promote the safe and stable operation of computer networks. The security level of computer network security evaluation and the actual output are verified through experiments, which provides a feasible higher security evaluation path for network security.

## 2. COMPUTER NETWORK SECURITY MODEL BASED ON CIRCULAR IMPROVEMENT ALGORITHM

### 2.1 IMPROVED LOOP ALGORITHM

This paper proposes the construction of a computer network security evaluation model based on a circular improvement algorithm, and the improvement method is divided into the following steps:

- (1) Feature word priming.
- (2) Feature word screening.
- (3) Spatial vector: composition of feature word spatial vector.

The specific content of network security evaluation is mainly for the five aspects of network topology topic, network structure elements, overall network synthesis, network reinforcement scheme and network posture.

### 2.2 COMPUTER NETWORK SECURITY EVALUATION MODEL

The computer network security evaluation model itself has dynamic and multi-level characteristics, and after repeated modifications, the corresponding functional model contains four parts: protection, detection, response, and recovery, mainly using the corresponding backup recovery mechanism, the system can recover from the failure as quickly as possible and reduce the loss. The constructed network security evaluation model is shown in Figure 1.

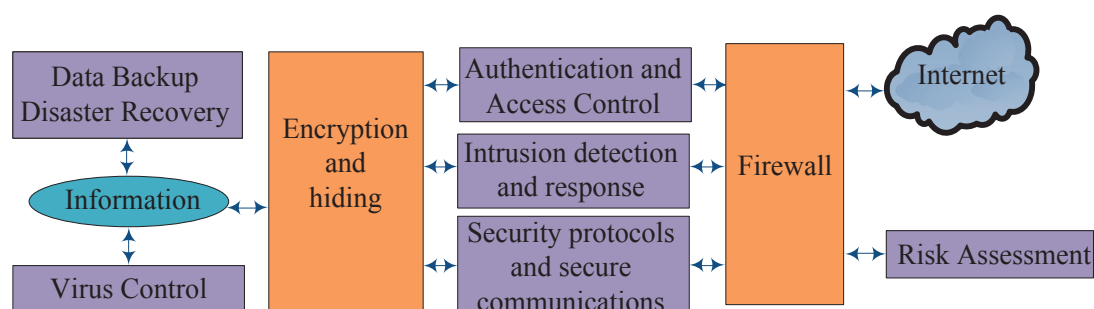

Figure 1. Computer network security model

As can be seen from Figure 1, in the process of information transmission in computer networks, the firewall will first filter the communication rules, and then within the system, a variety of security protection technologies, such as authentication and access control, intrusion detection and response, security protocols and secure communication, are used to control the behavior of network users. In the underlying information protection, emphasis should be placed on the encryption of information, transforming the original plaintext information into ciphertext information that cannot be directly identified, and also backing up some important information to ensure that it can be recovered after the information is damaged. At all levels of information application, corresponding antivirus software should be set up to do a good job of virus prevention and control.

### **3. COMPUTER NETWORK SECURITY EVALUATION MODEL DESIGN ANALYSIS**

#### **3.1 SAFETY EVALUATION INDEX SELECTION AND SYSTEM**

Reasonable security evaluation index is the key to build computer network security evaluation model, and the complexity of computing network should be fully considered when selecting the model, so that the evaluation index can have as much coverage as possible, and the level of influencing factors should be analyzed according to the characteristics of different security factors, and then each risk factor should be evaluated to finally come up with a scientific and reliable evaluation system.

The independence of the evaluation system is mainly reflected in the selection process, which should not only avoid repeated selection to reduce the representativeness of the sample, but also reduce the degree of correlation between various different indicators as much as possible, so as to accurately reflect the network security situation and improve the overall adaptability of the target.

#### **3.2 CRITERIA FOR THE ESTABLISHMENT OF COMPUTER NETWORK SECURITY EVALUATION SYSTEM**

From the perspective of the establishment and standardization of computer network security evaluation system, including quantitative evaluation and qualitative evaluation of two different indicators, according to the different rules and range of values also need to be standardized to better adapt to different evaluation standard system. For quantitative indicators, in the evaluation process, we should pay attention to the actual environment of the network system based on which the values are taken, not only not to carry out one-size-fits-all treatment according to certain standard rules, but also not to be overly independent and specific, and to standardize the treatment through different measurement units, so as to achieve the goal of controlling the range of values, which is the way to improve the efficiency of evaluation. For qualitative indicators, we invite professional technical consultants to score and strengthen the evaluation and supervision of the network system, so as to achieve internal comparison of quantitative indicators, which also contributes to the better standardization of qualitative indicators.

#### **3.3 COLLECTION OF RUBRICS FOR COMPUTER NETWORK SECURITY EVALUATION SYSTEM**

The characteristics of network security evaluation determine the selection and generalization principles of evaluation indexes. In the process of establishing the evaluation result rubric, it can be divided into four different sets of safe, relatively safe, as well as insecure and extremely insecure, according to certain evaluation criteria and descriptions to make the evaluation result clear at a glance, so as to further enhance the construction effect of the network security evaluation model.

#### 4. MODEL PERFORMANCE ANALYSIS

Combined with the characteristics of network security evaluation, this paper divides the computer network security level into four levels: A, B, C and D, which correspond to very high security, high security, average security and low security respectively. Combined with 12 groups of typical single indicators of network security (input value), 17 network security indicators of specific scores, we can find the comprehensive evaluation of security scores (output item). Routing control technology, network security education, and digital signature technology. The individual evaluation indexes are shown in Table 1.

**Table 1.** Individual evaluation indicators

	<b>C1</b>	<b>C2</b>	<b>C3</b>	<b>C4</b>	<b>C5</b>	<b>C6</b>	<b>C7</b>	<b>C8</b>
1	1	0.9	0.93	0.94	0.84	0.91	0.91	0.94
3	0.74	0.71	0.77	0.68	0.7	0.7	0.71	0.82
5	0.95	0.91	0.85	0.81	0.71	0.88	0.85	0.87
7	0.7	0.71	0.69	0.61	0.61	0.81	0.79	0.69
9	0.85	0.93	0.87	0.85	0.61	0.88	0.82	0.57
11	0.63	0.59	0.63	0.5	0.6	0.72	0.53	0.62
12	0.62	0.51	0.42	0.5	0.61	0.59	0.61	0.41

As can be seen from Table 1, an improved round-robin algorithm is used for the comprehensive evaluation of computer network security. The hidden nodes of the whole computer network security evaluation model are 5, based on the hidden nodes for evaluation, the parameters of, are set to 0.1, after 1000 times of training, the expected output and the actual output of the computer network security model are 0.844, 0.866, the average error is 2.84, the average evaluation value is 8.67, the security level is B. Because the expected output and the average error between the expected output and the actual output is less than 3.7%, so it can be determined that the computer network security evaluation model is valid and reliable, and can better meet the needs of comprehensive evaluation of computer network security.

#### 5. CONCLUSION

This paper focuses on the important applications in the field of computer security evaluation. Based on the improved recurrent algorithm, the nonlinear relationship between computer network security evaluation indexes is sorted out, and the computer network is further optimized to accelerate its convergence speed, so that the number of input neuron nodes becomes larger, thus increasing the accuracy of the computer network security evaluation model. The experimental results show that the security level of the computer network security evaluation model is B, and the average error between the desired output and the actual output is less than 3.7%. In summary, the improved recurrent algorithm applied to computer network security evaluation results are more realistic and create the corresponding conditions for the smooth development of computer security management.

## ABSTRACT

To enhance the online education teaching management of college students in universities. Based on the perspective of big data analysis, this paper firstly scans the online education database in the process of platform construction to derive multiple problem-prone parts of online education teaching management, which is regarded as a frequent itemset. Secondly, we iterate on the frequent itemset to derive the main factors that eventually affect online education teaching management. Finally, the online education teaching management platform is constructed based on the obtained factors. To verify the effect of the constructed platform, a set of simulation results designed shows that before and after the use of the online education teaching management platform, students' rating of the richness of online education teaching resources increases from 70 to 95, which is an increase of 25 points. It can be seen that relying on big data analysis technology can improve the online education teaching management level of college students.

## KEYWORDS

Association rule analysis; Educational database; Frequent item set; Online education; Instructional management

## 1. INTRODUCTION

Under the impact of the new wave of informationization, the innovation of college student education and management has been imminent. In the traditional college management mode, teachers' guidance plays a decisive role in college students' education management, but with the development of big data technology, online education has replaced part of offline education [1]. Traditional college teaching and management has even been resisted by students, who

have higher expectations for college teaching and management methods. Therefore, in today's big data era, the advantages of big data technology should be fully applied to the education and management of college students [2].

The literature [3] designed a teacher teaching management system based on the analysis of the basic functional and non-functional requirements of the system, using object-oriented development methods, Asenet, MVC, SQL Server 2015 and other big data development technologies. The literature [4] developed a teaching management system using big data technology based on the idea of hierarchical design. The system contains two underlying modules of network communication and message pushing, and five functional modules of experiment arrangement, work management, interactive question answering, user management and settings. Using this system, teachers, students and administrators can access and manage teaching resources at any time, and educate and interact online through the interactive question-answer module. Although the method proposed in the above literature can effectively improve teaching management, its flexibility as well as convenience and other properties can no longer meet the requirements of the current booming online education.

Based on this, this paper constructs an online education teaching management platform for college students based on the perspective of big data analysis. Firstly, the online education data of college students are extracted and integrated into a database. Secondly, the database is scanned using association rule analysis to get a frequent item set of online education management problems. Secondly, the frequent itemset is continuously scanned and iterated to get the main factors affecting online education management and build the online education management platform. Finally, the effect of the platform built in this paper on the online education teaching management of college students is analyzed through simulation experiments.

## **2. ONLINE EDUCATION MANAGEMENT OF COLLEGE STUDENTS UNDER BIG DATA ANALYSIS**

### **2.1 THE RELATIONSHIP BETWEEN BIG DATA ANALYSIS AND ONLINE EDUCATION MANAGEMENT**

The management of students' online education mainly relies on each node in Internet teaching, through which the integration and transmission of teaching resources and data are completed. If you want to manage the online education of college students, you should make full use of the advantages of information sharing platform, deeply optimize the information content related to big data, and conduct efficient data collection, classification, analysis, storage and application by the unified platform for the information from schools, families, students and various nodes in online teaching, so that effective information can be delivered to all parts of teaching and improve the management while optimizing The efficiency of supervision within the enterprise.

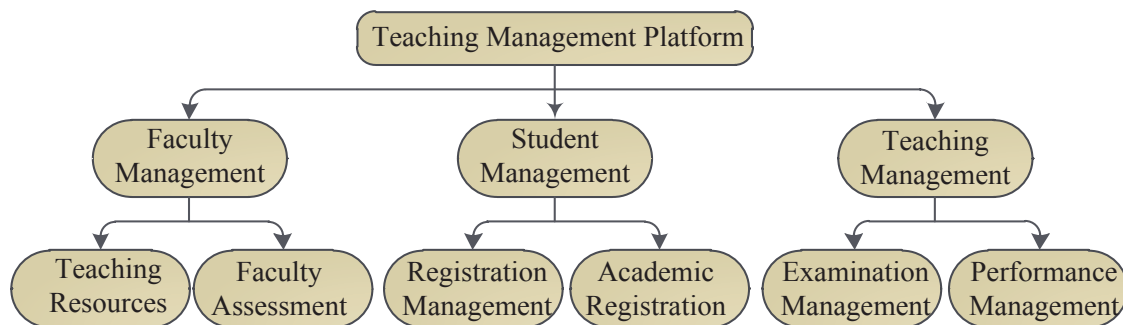

### **2.2 ANALYSIS OF ASSOCIATION RULES**

Unlike traditional teaching, online education generates a large amount of data. To achieve better teaching effect, we need to analyze these data, which requires the use of big data analysis technology. Big data analysis refers to the analysis of large amounts of data, which can be divided into four categories: association rule analysis, classification analysis, regression analysis, and cluster analysis according to the form of input and output [5-7]. These analytical models and their combinations are widely used in teaching scenarios as well as in analytical tasks in other industries, such as teaching resource optimization, teaching effectiveness prediction, and enterprise customer analysis [8-9].

Accordingly, this paper uses association rule analysis to mine the association relationships that exist between different teachers and students in the online education database, so as to obtain general rules for teachers and students to conduct online education, and use these rules to guide teachers to conduct reasonable teaching management. The data of online education is extracted into a new database, and the dataset is firstly scanned once to get multiple frequently occurring problems in online education teaching management, which is regarded as a frequent item set. Then the candidate set is obtained from the frequent itemset layer by layer by iteration, and the frequent itemset is filtered from the candidate set by using the nature of frequent itemset until no new frequent itemset is generated.

### 2.3 ONLINE EDUCATION MANAGEMENT PLATFORM BASED ON BIG DATA ANALYSIS

After analyzing the online education data using big data analysis technology, the main factors that ultimately affect the teaching management of online education can be derived. Accordingly, this paper develops the design of online education teaching management platform for college students from three aspects, which are teacher management, student management and teaching management. The online education teaching management platform based on big data analysis is shown in Figure 1.

**Figure 1.** Management platform based on big data analysis

As can be seen in Figure 1, teaching resources and teacher assessment are the main components of instructional management. To elaborate, teacher resources include information resources and physical resources. Information resources are mainly teachers who organize teaching tasks according to the number of students as well as teaching contents, update necessary online teaching resources according to specific situations, including information such as PPT lectures, videos, quizzes and syllabi, and store information on remote servers using videos and other means. The preparation of physical resources is to arrange the teaching environment for the implementation of the course according to the number of seats in classrooms and computer rooms, multimedia situation and machine environment. The teaching management stage is mainly for teachers to "teach" and students to "learn". Students can view teaching resources, upload assignments, and communicate with teachers and classmates online, while teachers can provide personalized guidance to students and realize remote and distributed collaborative learning for joint improvement. In addition, the platform realizes the evaluation of students, including examination management and grade management. Teachers maintain exam information through the system, including test papers, exam time, exam location, and invigilators, etc. The test database is stored on a remote server for management, avoiding problems such as the traditional test paper management which is not easily accessible and easily lost. The system adopts the random function Random in Java to realize the automatic generation of examination seats, which solves the complexity and tediousness of traditional examination arrangement work and reduces the burden of teaching staff. The system realizes online grade entry for teachers and provides flexible grade query

and statistics, so that teaching staff can make grade query and statistical analysis according to course information and student information, and realize timely feedback of grade information.

### 3. ONLINE EDUCATION TEACHING MANAGEMENT PLATFORM EFFECT PREDICTION ANALYSIS

To verify the effectiveness of the online education management platform, 50 students and 50 teachers are randomly selected to rate the online education teaching management-related indicators of a school out of 100 points in this paper. Considering the lengthy teaching process, this paper predicts the scores of the same online education teaching management-related indicators through the online education classroom performance of teachers and students. The scoring results are shown in Table 1.

**Table 1.** Changes in ratings before and after platform use

Evaluation Indicators	Faculty and student ratings before platform use		Faculty and student rating predictions after platform use	
	Student Grading	Teacher Ratings	Student Grading	Teacher Ratings
Richness of teaching resources	70	73	95	97
Reasonable arrangement of machine room	69	65	90	93
Quickness of remote guidance	60	60	93	90
Timeliness of assignment feedback	67	65	94	91
Ease of access to results	73	79	98	98

As can be seen from Table 1, before the use of online education teaching management platform, students' rating of richness of online education teaching resources was 70. And after the use of online education teaching management platform, the predicted students' rating of richness of online education teaching resources is 95 points based on students' performance, which is 25 points higher than before. After the application of online education teaching management platform, this paper predicts that the ratings of students and teachers on the reasonableness of computer room arrangement are 90 and 93 respectively, which are 21 and 28 points higher than before. From the ratings, teachers were able to provide timely feedback on students' assignments before and after the use of the online education teaching management platform. Before the use of the online education teaching management platform, the students' rating of the timeliness of feedback on assignments was only 67. After the use of the platform, students rated the timeliness of homework feedback as 94, which was 27 points higher than before. After the use of the online education and teaching management platform, this paper predicts that both students' and teachers' scores on the convenience of querying grades will be 98, which is 25 and 21 points higher than before the use of the online education and teaching management platform, respectively. Thus, it can be seen that the online education teaching management platform constructed based on big data analysis for college students has improved the teaching management from multiple dimensions.

### 4. CONCLUSION

In this paper, an online education teaching management platform for college students was constructed under the perspective of big data analysis, and the effects of the constructed platform were verified and analyzed in practical applications. The relevant results show that before and after the use of the online education teaching management platform based on big data analysis, the students' rating of the timeliness of teachers' feedback on assignments increased from 67 to 94, an increase of 27 points. The changes in the ratings of students and teachers show that the online education teaching management platform based on big data analysis for college students can improve the online education teaching management.

## ABSTRACT

In order to improve the competitive advantage of Chinese garment industry in the international arena. This paper actively explores the intersection of Chinese traditional costume elements and modern clothing design, and designs a big data-based clothing intersection design method. A differentiated fusion algorithm is used to inform the characteristic data of clothing elements. The fuzzy attribute set of fabric management data is utilized to meet the needs of the wearer. The simulation results show that the overall design experience of designers is improved by more than 1.14 points, and the average experience rating of users in product performance is 9.19 points. This shows that big data technology can meet the experiential needs of modern clothing interfacing design and enhance the artistic image of clothing.

## KEYWORDS

Big data; Differentiated fusion; Feature data; Apparel design; Fuzzy attribute set

## 1. INTRODUCTION

Costume culture is one of the important components of traditional Chinese civilization, with a wide variety and unique styles, and plays a crucial role in modern fashion design [1-2]. Nowadays, more and more scholars propose for fashion designers to look to traditional arts to draw inspiration from them for fashion design. For example, literature [3] used data mining and Internet of Things technology to build an intelligent ethnic clothing design system and constructed an intelligent clothing design system based on the idea of human-computer interaction to meet customer needs. The literature [4] demonstrates the way in which discourse symbols are integrated with the material design of clothes, enriching the concept of materiality understanding in clothing culture design. Although the aforementioned materials integrate traditional art into the process of modern clothing design, they ignore the role of dress elements in informing modern clothing design. Therefore, this paper designs a big data-based clothing intermingling design method to explore the application of traditional costume elements in modern clothing design. Using big data technology, the way of intermingling traditional Chinese costume elements with modern costume design is analyzed in three aspects: reasonable matching of costume elements, flexible selection of patterns and colors, and rigorous selection of costume fabrics.

## **2. BIG DATA-BASED CLOTHING INTERGRATION DESIGN**

In the context of big data, the intermingling of traditional costume elements with modern fashion trends can play a significant role in effectively promoting the development of China's apparel industry [5-6].

### **2.1 BASIC CHARACTERISTICS OF TRADITIONAL COSTUME ELEMENTS**

In terms of the styling characteristics of traditional Chinese clothing, it tends to be cut in a straight line, making the structure of the clothing flat and fitting to the features of the human body [7]. Such clothing design products are smooth and simple in shape, comfortable and easy to wear. In traditional Chinese costume culture, the design of patterns is very elaborate, and the rich patterns are not only embellishments and decorations for the costumes, but more importantly, they contain some kind of moral meaning. For example, the design of magpie on plum and so on implies people's aspiration and pursuit of a better life. In today's society, although modern design concepts are constantly updated and developed, the patterns of these traditional costumes still contain profound connotations.

### **2.2 APPLICATION OF TRADITIONAL ELEMENTS IN MODERN CLOTHING DESIGN**

#### **2.2.1 RATIONAL MATCHING OF CLOTHING ELEMENTS**

Traditional Chinese dress culture is very particular about the selection and matching of points, lines, surfaces, bodies and their various factors, and the matching and combination of different factors produce different effects. Therefore, in the process of modern clothing design, differentiated fusion algorithms can be used, combined with the optimal deployment of IoT nodes, to inform the characteristic data of different clothing elements [8-9]. In order to achieve the topological design of the functional and stylistic characteristics of the apparel, harmony and unity from the whole to the local can be achieved.

#### **2.2.2 FLEXIBLE SELECTION OF PATTERNS AND COLORS**

Based on big data, the intermingled design of clothing should fully consider the real needs of the wearer, and while using patterns such as flower clusters and dragon patterns in traditional clothing culture, modern clothing design techniques are cleverly used to make appropriate data processing of traditional patterns. In terms of color matching, modern clothing designers can use the method of logo bit discrimination to calculate the sample fusion coefficient of the wearer's color matching needs, taking into account the popular design needs [10].

#### **2.2.3 RIGOROUS SELECTION OF CLOTHING FABRICS**

In big data-based apparel intermingling design, modern apparel designers can get the statistical distribution attribute values of fabric scheduling through the fuzzy attribute set and similarity feature distribution set of apparel fabric management data. In this way, the fabric can be selected reasonably according to the needs of the wearer and create a tasteful garment with comfortable fabric.

## **3. SIMULATION RESULT ANALYSIS OF CLOTHING INTERGRATION DESIGN**

In this paper, a big data-based clothing intergration design method is designed by combining the differentiated fusion algorithm and the logo bit discrimination method to integrate the traditional Chinese clothing elements with modern clothing design in the context of big data. In order to verify the feasibility of the design method, this section analyzes the practical application effect of the big data-based clothing intergration design method from the perspective of two experiences of designers and wearers.

### 3.1 DESIGN EXPERIENCE COMPARISON RESULTS

In order to get a comprehensive understanding of the designers' design experience in using the big data-based apparel intersection design method, this paper uses five designers A-E as the experimental samples and five designers F-J as the control samples, making them incorporate geometric pattern elements into their modern apparel design products. The comparison results of the design experience of the ten designers are shown in Table 1.

**Table 1.** Comparison of designers' apparel design experience

	A-E	F-J
User Needs Analysis	3.14	4.89
Apparel fabric design	2.98	4.12
Understanding the level of convenience of patterns	3.07	4.67
Color Matching	3.56	4.98

As can be seen from Table 1, after using big data-based apparel intergration design method, the designer's design experience in user requirement analysis improved by 1.75 points, in apparel fabric design experience improved by 1.14 points, and in pattern and color matching design experience improved by 1.6 points and 1.42 points, respectively. It can be seen that the use of big data to intermingle traditional clothing elements and modern clothing can improve the overall design experience and design efficiency of designers.

### 3.2 ANALYSIS OF USER EXPERIENCE RESULTS

The apparel design products of the five designers in the previous section F-J were put on sale, and after all of them were sold, a return analysis was conducted on the purchasing users, and the results of the collated user experience ratings are shown in Table 2.

**Table 2.** Apparel product user experience results

	Product Performance	Appearance
F-designed apparel products	8.92	9.34
G-designed apparel products	9.15	9.71
H-designed apparel products	9.36	9.65
I-designed apparel products	9.75	9.12
J-designed apparel products	8.79	8.87

As can be seen from Table 2, all five users gave high ratings to the design products that fused traditional costume elements with modern clothing. The average user experience rating in terms of product performance is 9.19, and the average user experience rating in terms of clothing appearance is 9.34. This indicates that the use of big data-based clothing fusion design products has ensured the quality of clothing design to a greater extent, and provided a practical path reference for clothing products that fuse traditional clothing elements with modern clothing design.

## 4. CONCLUSION

Standing in the context of big data, this paper actively explores the fusion design of Chinese traditional costume elements and modern clothing, designs a big data-based clothing intermingling design method, and verifies the practicality of the design method through the analysis of simulation results. After using this paper's design method, the designer's design experience in user requirement analysis improved by 1.75 points, and the user's experience rating in product performance was 9.19 points on average. It indicates that the clothing intermingling design method based on big data can achieve better design results

in practical application, which is conducive to promoting the joint development of traditional Chinese clothing elements and modern clothing design.

## ABSTRACT

In this paper, based on the dynamics theory of vibration characteristics, the vibration of the automotive battery pack suspension is analyzed by constructing and using the dynamics simulation software ADAMS model. The transfer matrix method is applied to analyze the vibration isolation effect, optimize the force transfer rate of vibration isolation system, and parametrically design the damping coefficient to apply the vibration excitation to the vehicle body and power assembly. The results show that the energy decoupling rate is less than 86%, the average inherent frequency of power assembly is 12.36, and the optimal value of damping is in the range of 0.3~0.5Ns/mm. Thus, it can be seen that the battery pack suspension model based on vibration characteristics analysis accelerates the analysis efficiency, thus improving the working performance of electric vehicles.

## KEYWORDS

Vibration characterization; Dynamics software; ADAMS model; Damping coefficient; Energy decoupling rate

## 1. INTRODUCTION

In recent years, electric vehicles have become an important development direction for the automotive industry and have received widespread attention from the global automotive industry. Electric vehicles not only show great superiority in energy saving and environmental protection, but also have advantages in power performance such as fast torque response and acceleration, which can better meet the requirements of handling stability and response agility [1-3]. However, the power battery, as the most important energy storage element of electric vehicles, has the characteristics of large size and mass. Newly developed new energy power is gradually outlawing coal power, and the problem of environmental pollution from power plants has been greatly alleviated, which makes the indirect pollution problem of electric vehicles effectively improved [4-5].

The concept of vehicle response agility has been constantly mentioned due to the increase in consumer demand for responsiveness while driving. Electric vehicles have a long history of NVH problems, with electromagnetic vibrations and transmission gear mesh excitation causing high frequency vibration noise in the powertrain, which seriously affects the driving and riding comfort of the vehicle. The literature [6] suggests that the transport mode has the potential to replace internal combustion engine vehicles in the near future. Electric vehicles can have a significant impact on the environment, the electrical system and other related sectors. The current power system may face great instability and with proper management and coordination, electric vehicles can turn out to be a major contributor to the successful implementation of the smart grid concept. The literature [7] presents a simple and easily optimized mathematical representation of the energy management strategy of an electric vehicle hybrid energy storage system. The analysis is based on the drive cycle speed and the internal resistance of the battery module. The objective is to minimize the energy consumption. It achieves the best results in low-speed cycles. In summary, conventional energy sources still dominate and cannot improve all aspects of electric vehicle performance to lead the automotive industry.

Based on this, this paper designs a simulation software ADAMS model to analyze the working performance of the automotive battery pack mounts based on vibration characteristic analysis dynamics. Firstly, each dispersed mass isolation system is designed separately, and the force transfer rate of the isolation system is used as the optimization target. Secondly, the output torque fluctuates under the non-sinusoidal distributed air gap magnetic field. Finally, it is experimentally demonstrated that the model can reduce the vibration and noise of electric vehicles, thus improving the NVH performance of electric vehicles.

## **2. VEHICLE VIBRATION CHARACTERISTICS ANALYSIS**

### **2.1 AUTOMOTIVE AGILE DYNAMICS**

Automotive suspension systems are dominated by single-layer vibration isolation systems, but it is difficult to meet the vibration isolation requirements of electric vehicle suspension systems in the high frequency band due to the influence of the elastic vibration of the foundation and the standing wave effect of the vibration isolator [8-9]. In the 1960s, a vibration isolation method of installing dispersed mass blocks in the middle of the vibration isolator was proposed, which not only has excellent vibration isolation capability in the high frequency band, but also can individually design the structure size and shape of each dispersed mass, etc., and is suitable for small and discontinuous installation space. The small intermediate mass vibration isolation system has excellent high frequency vibration isolation performance and practical application value. The transfer matrix method is applied to analyze the vibration isolation effect of small intermediate mass vibration isolation system, and the influence of the size of the intermediate mass on the vibration isolation system is studied. The optimal design of the small intermediate mass isolation system is carried out with the force transfer rate of the isolation system as the optimization target, and it is proposed that the arrangement of the small intermediate mass blocks can be adjusted to improve the vibration isolation capacity of the isolation system in the low frequency band.

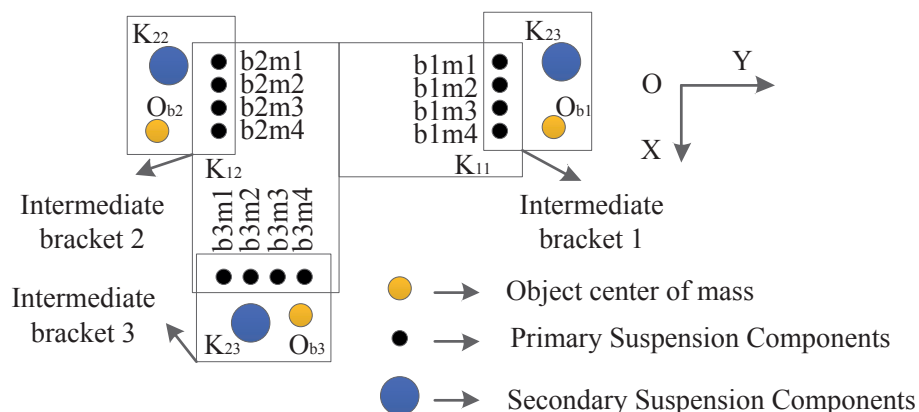

### **2.2 BATTERY PACK SUSPENSION SYSTEM VIBRATION CHARACTERISTICS**

Electric vehicles are subjected to different external excitation of the battery pack suspension system than fuel vehicles due to the electric motor drive rather than the internal combustion engine, where the torque generated by periodic inertial forces causes periodic inertial force excitation of the piston and connecting rod [10]. The inertial forces generated by vehicle acceleration, braking or sharp turns, after the damping coefficient is parameterized,

cause the motor to vibrate due to unbalanced rotor rotation. The centralized motor powertrain suspension system includes a permanent magnet synchronous motor, a gearbox, and a suspension element. The motor output torque fluctuates due to the non-sinusoidal distribution of the air gap magnetic field, fluctuations in the stator gear torque, and deviations in the motor manufacturing and installation processes. The road surface unevenness causes vibration excitation of the powertrain and the vehicle body. After the excitation is attenuated by the tires and suspension system, only the vibration excitation within 0-3.5 Hz can be applied to the vehicle body and the powertrain.

### 2.3 BUILD SIMULATION SOFTWARE BASED ADAMS MODEL

The vehicle powertrain consists of a longitudinally mounted engine, clutch, transmission, etc., with a 3-point suspension support and rear engine rear wheel drive. The two front mounts are located at the lower front side of the engine and the rear mounts are located above the transmission, both with pure rubber mounts [11]. Meanwhile, two sets of drive belts are restrained in front of the EV engine, one set connecting the crankshaft pulley and the air conditioning compressor drive pulley, and the other set connecting the crankshaft pulley and the radiator fan pulley. The base is fastened to the frame, which can be considered as a rigid foundation. A coil spring suspension is attached to the frame to form another vibration subsystem. Connected through the drive belt to become an elastic coupling, the simulation software ADAMS model is constructed to analyze the vibration system of the car battery pack suspension as shown in Figure 1.

**Figure 1.** Vibration Analysis System

As can be seen from Figure 1, the O-XYZ in the simulation software ADAMS model is defined as the global coordinate system of the electric vehicle, with the X direction pointing along the body toward the rear of the vehicle, the Z direction pointing upward vertically to the ground, and the Y direction determined according to the right-hand rule, with the Y direction pointing to the right along the wheel axis. The local coordinate system at the center of mass is oriented in the same way as the global coordinate system of the vehicle. According to the coupling interface, the suspension system can be divided into the vibration source and power assembly subsystem A, the primary elastic element subsystem B, the intermediate support subsystem C, the secondary elastic element subsystem D and the frame support base subsystem E. The force and response velocity vector and transfer matrix model between the input and output ends of each subsystem.

### 3. EXPERIMENTAL ANALYSIS OF BATTERY PACK SUSPENSION WORK PERFORMANCE

In order to can understand the electric vehicle system modal distribution, targeted to avoid resonance between the electric vehicle system or with external excitation, effectively reduce

vibration. The modal analysis of the suspension system model can be done directly in the simulation software ADAMS model, and the modal inherent frequencies and vibration patterns of each order are shown in Table 1.

**Table 1.** Initial Position of the Suspension System

Modal Order	1	2	3	4	5
Inherent Frequency/Hz	5.64	11.09	12.02	14.94	15.66
Vibration Type Dominant Direction	Longitudinal Panning	Lateral Panning	Vertically Flat	Flat Rotation	Transverse Rotation
Decoupling Rate/%	94.75	84.38	56.81	42.84	74.28
Damping Factor Ns/mm	0.32	0.42	0.38	0.46	0.31

As can be seen from Table 1, the first 24 orders of modal frequency decoupling rate is poor, including the first 6 orders of energy decoupling rate, the powertrain transverse (2nd order), vertical (3rd order) translational and translational rocking (4th order), and transverse rocking (5th order) energy decoupling rate in the direction of rotation is less than 86%, the average inherent frequency of the powertrain under rigid base is 12.36, and the optimal value of damping is in the range of 0.3~0.5Ns/ It is shown that the accuracy of the model can be verified by the vibration simulation analysis of the model and the electric vehicle response has agility.

#### 4. CONCLUSION

In this paper, the working performance of electric vehicle battery pack suspension is simulated and analyzed based on vibration characteristic analysis. In the analysis process, the simulation software ADAMS model is designed, and the feasibility of the model is verified by the analysis of experimental results. The results show that the energy decoupling rate is less than 86% in the rotation direction of the electric vehicle, the average inherent frequency of the powertrain under the rigid base is 12.36, and the optimal value of damping is in the range of 0.3~0.5Ns/mm. It shows that the battery pack suspension model based on the vibration characteristic analysis can help improve the robustness and comfort of the electric vehicle and enhance the market competitiveness.

## ABSTRACT

In order to promote the development process of informationization and intelligence for the education management of college students. This paper constructs an adaptive feature matching framework based on the improved VSLAM algorithm, and builds a working path of education management mechanism with the participation of multiple subjects. The results show that the management work scores are all over 0.5 in the analysis of the innovation ability of college students' education management. It can be seen that the improved VSLAM algorithm can propose the optimization path of education management work in a targeted way and promote the innovation of education management work of college students.

## KEYWORDS

VSLAM algorithm; Adaptive features; Innovation capabilities; Educational management; Multiple subjects

## 1. INTRODUCTION

The education and management of college students is an important part of college

management, and with the progress of society and economy, the education and management of college students in colleges and universities has been promoted [1-2]. In recent years, with the change of the main generation of college students, the challenges and opportunities of college students' education and management coexist [3-5]. The psychological characteristics of college students and their needs are changing constantly. In the new period, the college students put forward higher requirements for college management, so colleges and universities must understand the current situation of college students and adjust the work direction according to the actual needs of college students' education and management [6-7]. Constantly innovate and develop new models in order to meet the demand for college students' education and management in the new era.

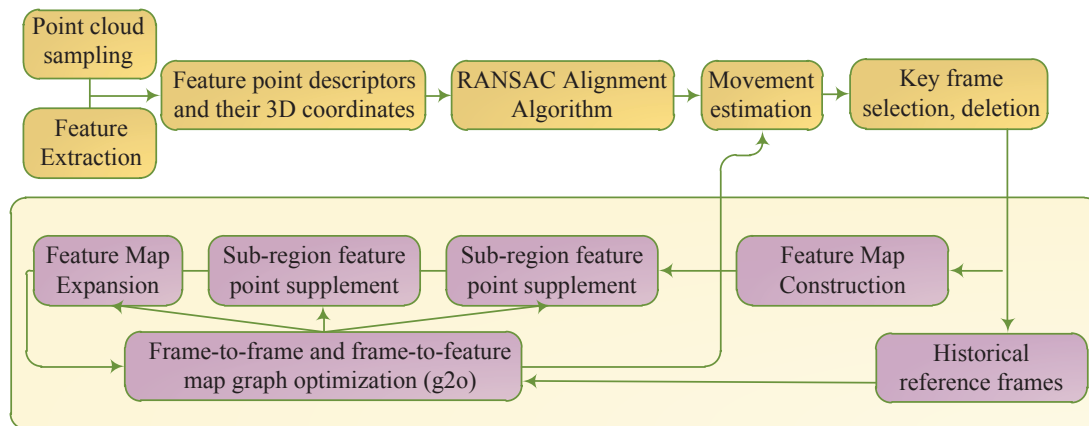

The management of university education is an important task for universities. The main purpose of the study in the literature [8] is to help the scholarly community to distinguish those educational methods that try to maintain "unsustainable" and to identify the problems of lecturer-student interaction in the process of large-scale transition to distance education and to find solutions to these problems. In the literature [9], an expert system based on belief rules was developed in order to analyze in depth the educational management costs of R&D talent development, and the first educational management cost prediction was achieved through incremental data and parametric learning. The literature [10] suggests that the growth of competitiveness of domestic organizations and enterprises depends to a large extent on the education sector. For the development of the domestic education system, educational management research is of particular importance and it should ensure the development of domestic educational management theory, which has long been under the influence of Western management theory. The educational management work presented in the above literature lacks the sense of independent innovation, and the management model is too traditional and too poor in innovation.

Therefore, this paper constructs a VSLAM algorithm framework to analyze the innovation path optimization of college students' education and management work. Under the new situation, the education and management work of college students should be based on their psychological characteristics and establish a student-oriented education and management concept. The education management mode should recognize the situation, establish the education management of multiple subjects, actively explore and study the education management mode in the new period, and vigorously promote the development and innovation of education management in colleges and universities. Finally, the experiment proves that combining innovative education concept with college education management can not only help to promote the reform of higher education, but also clarify the direction and goal of talent cultivation and deliver excellent talents to the society.

## **2. IMPROVING VSLAM ALGORITHM APPLIED TO COLLEGE STUDENTS' EDUCATION MANAGEMENT**

### **2.1 IMPROVED VSLAM ALGORITHM FRAMEWORK**

VSLAM algorithm is an algorithm proposed through the inspiration of human eye visual system, and this paper carries out the innovation path optimization of college students' education management work through VSLAM algorithm. The framework of the constructed VSLAM algorithm is shown in Figure 1.

**Figure 1.** VSLAM algorithm framework

As can be seen from Figure 1, adaptive features are added to the framework of VSLAM to align each frame with the adaptive scale features, which improves the estimation accuracy while reducing the computational effort. In this paper, VSLAM information technology is used to realize the innovation and optimization of the educational management of college students and the improvement of the educational work of colleges and universities by using Internet thinking.

## 2.2 PRINCIPLES AND BASIC IDEAS

As a group with the most active thoughts, college students' personality, independent consciousness and independent character can develop faster and more fully in an open society than other social groups due to their own characteristics. In the face of the new situation, the following principles should be grasped in order to guide the development of college students' personality, independent consciousness and independent character to the benign side for the progress of college students and the whole society: student-oriented principle, openness and innovation principle, guidance and restraint principle.

Student education and management workers in colleges and universities should constantly explore and research to find the best solutions to problems. These include: establishing the concept of student-oriented education and management, and actively playing the main role of students. Optimize the student education and management system and establish a scientific and effective working mechanism. Strengthen students' self-management and enhance students' ability of self-education and management.

## 3. OPTIMIZATION OF THE INNOVATION PATH OF EDUCATION AND MANAGEMENT OF UNIVERSITY STUDENTS IN THE PERIOD

### 3.1 IMPLEMENT THE CONCEPT OF HUMANE EDUCATION AND MANAGEMENT

According to the new situation and new requirements, we innovate the concept of education and management of college students, adopt humanized management, and give more care and love to college students. The concept of humanization requires that in the process of management, it is not only necessary to abide by the rules and regulations and promote the standardization and institutionalization of education and management, but also pay attention to the humanistic care for students. In order to help students properly solve the difficulties encountered in study and life, relieve psychological pressure, so that college students can better integrate into learning activities. In the specific work, we should not only care about students' study, but also care about their psychological health and help them properly solve the difficulties they encounter in their life. Make students feel humanistic care, enhance their sense of belonging and identity, make them consciously abide by the rules and

regulations, and promote the efficiency of college students' education and management.

### **3.2 ESTABLISH THE EDUCATION MANAGEMENT MECHANISM WITH THE PARTICIPATION OF MULTIPLE SUBJECTS**

At present, one counselor is usually responsible for the education and management of one grade or several classes. However, the results achieved by some counselors are not very satisfactory, which restricts the efficiency of work and the overall development of students. To make up for this deficiency, the counselor team can be subdivided into study, life, thought and career counselors, each of whom is responsible for the corresponding work.

### **3.3 BUILD AN INFORMATION-BASED EDUCATION MANAGEMENT SERVICE PLATFORM**

Establishing a perfect database to grasp the basic information of students in detail and understand their basic situation is conducive to improving the relevance and effectiveness of work. Focus on the convenient features of microblogs, weibo and the Internet to facilitate communication and interaction with college students, to understand the dynamics of students' thoughts and the difficulties they encounter in life and study, and to help them answer their doubts in a timely manner. Reasonable use of computers and the Internet to publish educational management materials, including video clips, slides, text materials, etc., so that college students can access and study these materials, and then inspire and guide students, and promote the effectiveness of college students' educational management work.

## **4. EDUCATION MANAGEMENT INNOVATION PATH ANALYSIS**

This paper builds a framework based on the VSLAM algorithm and applies it to the innovation of college students' education management. The experimental analysis of university students is divided into "excellent, good and poor" and projected into the interval of [0,1] with the values of "1, 0.75, 0.5, 0.25, 0". At the same time, different assessment targets were averaged to find the values. The experimental results are shown in Table 1.

**Table 1.** Results of innovation in educational management

	<b>Management Innovation</b>	<b>Management Capability</b>	<b>Management Method</b>	<b>Management Effectiveness</b>	<b>Number of samples included</b>
Excellent	0.77	0.78	0.75	0.80	16
Good	0.6	0.58	0.55	0.55	32
Rather poor	0.3	0.3	0.29	0.29	5

As can be seen from Table 1, all of the above experimental analyses have scored more than 0.5 for innovation in college students' educational management, which is a moderate to high level. Among the four different attribute values, management innovation has the largest value, which indicates that management innovation has a strong role in the educational management of college students. The management method score is the lowest among all the scores, which indicates that the management method, to a certain extent, needs to be further adjusted with the counselors needed. In a word, college student education and management is a kind of art education integrating ideology, policy, knowledge and practice, as well as a comprehensive education and management promoting students' all-round development in moral, intellectual and physical aspects. Under the new situation, the education and management of students in colleges and universities should be changed from passive to active, establish the concept of student-oriented education and management, regard students as both management objects and management subjects, give full play to democracy in management, mobilize the enthusiasm of college students and strengthen self-management.

## **5. CONCLUSION**

To promote the smooth educational management work of college students. Based on the improvement of VSLAM algorithm and the basic principles and ideas of education management, this paper proposes the innovation paths of implementing the concept of humanized education management work, establishing the education management mechanism with the participation of multiple themes and constructing the information-based education management service platform to promote the smooth education management work of college students and improve the effect of college students' education management and the quality of talent cultivation. The experimental results show that the scores of innovation ability of college students' education management are all over 0.5, which are in the middle to upper level. Therefore, the proposed algorithm can effectively improve the education management work of college students.

# NEW IDEAS OF MENTAL HEALTH EDUCATION FOR COLLEGE STUDENTS IN THE CONTEXT OF BIG DATA

---

Zhuo Chen\*

China West Normal University, Nanchong, Sichuan, 637009, China

[czz6336@163.com](mailto:cz6336@163.com)

---

## ABSTRACT

The purpose of exploring new ideas of mental health education work for college students in the background of big data is to cultivate excellent college students who are more in line with the development of society. This paper starts from positive psychology, takes the principle of its application in the mental health education work of college students as the starting point, and then analyzes the application strategy of positive psychology in the mental health education work of college students. Through the analysis, it can be concluded that the use of positive psychology can effectively help college students' mental health education and can become a new research direction for college mental health education work.

## KEYWORDS

big data; college; college students; mental health education; positive psychology; application strategy

## 1. INTRODUCTION

It is very important to promote each student to have a healthy body and mind and a positive personality [1-2]. Currently, most universities in China adopt the traditional psychology education model based on problem awareness [3-4]. Positive psychology, on the other hand, changes the perspective based on the original teaching and plays a heuristic role in the promotion of mental health of college students [5-6].

College students hope to get good evaluation from the society, realize themselves and achieve themselves, and they also look forward to a bright future and desire happiness as well as joy [7]. Therefore, how to guide the positive psychological development of college students has become a focus of attention.

This paper analyzes the application principles of positive psychology in college

mental health education from the connotation and kernel of positive psychology, and then gives its application strategies. It is hoped that the strategy will provide new research ideas for the mental health education work of college students, and then tap the positive potential of most ordinary students and play the role of psychological education in terms of fundamental prevention.

## 2. POSITIVE PSYCHOLOGY

### 2.1 THE MEANING OF POSITIVE PSYCHOLOGY

Positive psychology believes that although psychological problems in themselves do not add strength and excellence to human beings, the presence of problems also provides an opportunity for human beings to show their excellent qualities and potential abilities. Anyone has a need for self-actualization, and this need stimulates their latent positive strengths. Positive psychology helps people find their inner resources and use them to the fullest, so that they can realize their potential, have higher quality of life, better quality of life and a happy life. Experiments have shown that more than 95% of human neurons are unused, and that there is unlimited potential in this untapped area. When viewed from the perspective of positive psychology, every individual has excellent qualities. Positive psychology supplemented with excellent qualities of college students is shown in Figure 1.

Figure 1 Excellent quality

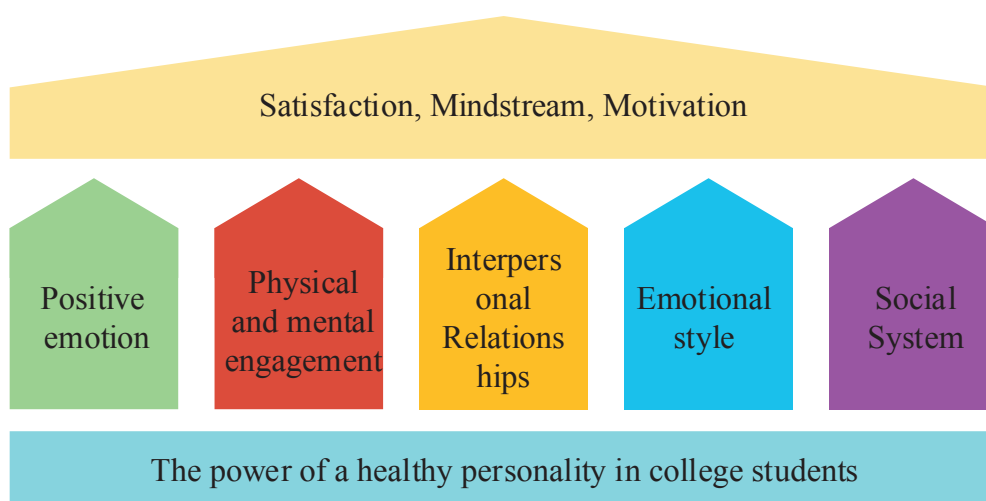

### 2.2 THE KERNEL OF POSITIVE PSYCHOLOGY

Positive psychology explores the positive strengths of human beings from three

perspectives. The individual perspective focuses on the positive qualities that contain personality traits such as intellectual dignity. The subjective perspective looks at three perspectives: past present and future. For the past, we should study the sense of accomplishment and satisfaction, etc.; for the present, we should study happiness and joy, etc.; for the future, we should study a series of positive and good experiences such as confidence and hope. The collective perspective, in general, explores the positive social system including macro level, meso level and micro level.

Positive psychology has the main purpose of counseling college students to achieve positive personality, positive emotions and harmonious integration into positive social systems, through the development of individual personality, the sharing of subjective well-being and generalized social systems in order to achieve mental health education for college students.

The counseling path of positive psychology for college students to achieve mental health is shown in Figure 2.

**Figure 2** Coaching Pathways

### **3. PRINCIPLES OF POSITIVE PSYCHOLOGY APPLIED TO MENTAL HEALTH EDUCATION**

#### **3.1 PRINCIPLE OF SUBJECTIVITY**

The principle of subjectivity refers to the fact that the mental health education of college students under the perspective of positive psychology takes students as the main body, takes students as the center and starting point, and the selection of teaching contents and the use of teaching methods should fully respect the law of physical and mental development and the growth needs of college students, so that the initiative of college students can be given full play. If there is no subjective experience of college students, the educational activities will become a kind of forced behavior and lose the meaning of education. College students' self-awareness and

independence are increasing, and the implementation of the principle of subjectivity is an inherent need for the development of positive psychological qualities of college students.

### **3.2 MOTIVATIONAL PRINCIPLE**

Needs are the prerequisite and basis for an individual to make a behavior, and a certain need of a college student stimulates a certain motivation, which determines the corresponding behavior. Marx pointed out, "Everything that people strive for is related to their interests." If the mental health education of college students can meet the reasonable needs of the education target, it can gain the recognition of college students and avoid losing the foothold of education due to empty reasoning. Educators should adhere to the principle of motivation, mobilize the internal psychological mechanism of college students by satisfying their reasonable needs, and stimulate their motivation, emotion and potential to play.

### **3.3 EXPERIENTIAL PRINCIPLE**

The principle of experiential means that educators should insist on promoting the development of college students through practical activities. Practical activities are an important way to develop and improve one's abilities. College students can express themselves, know themselves and realize their potential and value in the activities. Educators should insist on combining theoretical education and practical training, and put the principle of experience into all aspects of education and teaching. Through practical exercise and situation creation, college students can gain insight through experience, accelerate the comprehension of theoretical knowledge and consciously educate themselves.

### **3.4 PRINCIPLE OF INFECTIVITY**

The principle of infectiousness refers to the purpose of education by influencing, sensitizing and inculcating the emotions of college students through certain environment or objects without their consciousness. Infection includes various forms such as emotional infection and image infection. Emotional infection is to create a certain atmosphere to influence the emotions of the educated, so that they can choose and accept the educational content. For example, creating a warm family atmosphere, carrying out recreational activities, visiting the school history museum, etc. influence on the educated. The image infection is the use of concrete, objective objects to influence the educated.

## **4. THE APPLICATION STRATEGY OF POSITIVE PSYCHOLOGY IN THE MENTAL HEALTH EDUCATION OF COLLEGE STUDENTS**

### **4.1 STRENGTHEN FACULTY CONSTRUCTION AND ENHANCE TEAM LEVEL**

The construction of faculty has an important influence on the quality of psychological counseling and education work in colleges and universities, but mental health education started late in Chinese colleges and universities, and the construction of faculty cannot meet the actual demand in terms of quantity and quality. Strengthening the construction of teachers and improving the overall quality of the teaching team are the keys to solve the real problems.

The competent departments of colleges and universities should study and formulate teacher training programs for colleges and universities, establish teacher training bases, and give policy and financial support. Clarify the training contents and assessment methods, standardize the induction qualification, unify requirements and management, and carry out training on mental health education topics at least once a year for in-service counselors, class teachers and instructors to improve the level of teachers in all aspects.

### **4.2 STRENGTHEN PRACTICAL TEACHING TO ENHANCE POSITIVE EMOTIONAL EXPERIENCE OF STUDENT COLLEGE STUDENTS**

What really determines human intelligence is emotions and feelings, and practice is an effective way to gain emotional experiences and develop abilities. Practical activities can make college students consolidate and deepen their theoretical learning and expand their knowledge field, which is the bridge and link connecting college and society, theory and practice, classroom and extracurricular.

Colleges and universities should firmly establish the idea of cultivating people through practice, encourage and organize college students to carry out social practice which is closely integrated with professional learning, provide college students with practice bases through school-enterprise cooperation, etc., and combine theoretical teaching with contextualized practical exercise. The university should give full play to the personalities and strengths of college students, accelerate their comprehension of knowledge and systematic thinking, and cultivate their independent ability, exploration consciousness, creative talent and practical spirit.

### **4.3 STRENGTHENING CAMPUS CONSTRUCTION AND CREATING A HARMONIOUS NURTURING ENVIRONMENT**

According to positive psychology, "people do not develop themselves exactly according to their genetic factors, but their personality develops mainly through the interaction between the individual and the social environment, where the internal and

external factors interact with each other."

The cultivation of psychological quality is difficult to achieve the ideal effect only by the transmission of knowledge and education, it needs a cultural atmosphere of inculcation, infection. With its beautiful and clean physical environment and pleasant humanistic environment, the campus culture moistens the soul and cultivates the spirit, relieves the fatigue generated by study and work, transforms the inner world of college students, and promotes the establishment of ideal beliefs of college students.

The construction of campus physical environment should always be designed and developed around the formation of college students' personality. Improve the infrastructure construction, actively carry out school greening work, and build elegant humanistic landscape to provide good support for teaching practice and after-school leisure.

## **5. CONCLUSION**

As the future pillars of the country, whether college students have a positive psychology or not is directly related to the development of the country. Therefore, we should give enough attention to the mental health education of college students. In this paper, in order to explore new ideas of college students' mental health education work under the background of big data, the principles and strategies are analyzed with positive psychology as the main means. By applying the strategies, we hope to provide a new research direction for the development of college students' mental health education work, so that colleges and universities can cultivate excellent college students who are more in line with the development of society.

## ABSTRACT

In this paper, the intelligent evaluation system of physical education is constructed through the modular programming of intelligent technology development. In the evaluation process, relevant parameters as well as evaluation indexes are set. Secondly, the data module is used for unified and centralized management, and finally, the analysis results are displayed in the form of data through the result analysis module. The simulation results show that the intelligent evaluation system has 99.56% and 99.25% confidence in the evaluation indexes, and the error rate is only 1.03% and 2.4%, respectively. Thus, the intelligent evaluation system of physical education built in this paper becomes an important platform for improving teaching quality and strengthening teaching management.

## KEYWORDS

Physical education; Intelligent technology; Evaluation system; Data module; Confidence level

## 1. INTRODUCTION

Nowadays, the concept that teaching quality is the lifeline of schools has become the general knowledge of schools of all levels and types, and the quality of classroom teaching, as the main channel to implement the teaching intention, directly determines the quality of teaching [1-2]. Evaluation of physical education teaching is an important part of physical education teaching, which is the evaluation of the quality of physical education teaching and the feedback of the effect of physical education teaching, and it has positive significance and important role in improving the quality of physical education teaching [3-5].

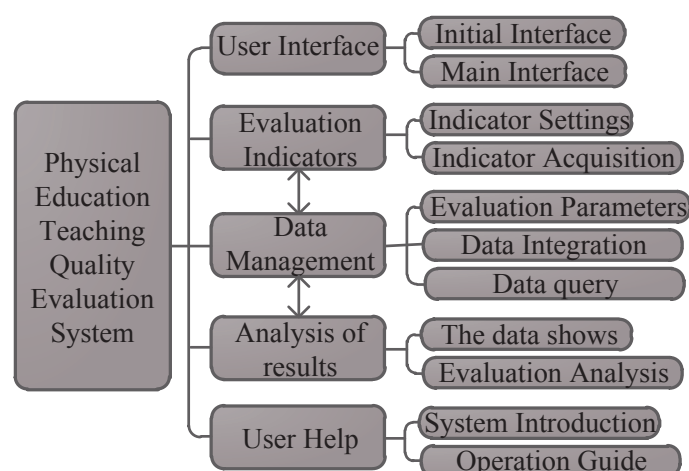

The evaluation of physical education has long been limited to a qualitative description, and the evaluation results are often influenced by the subjective consciousness of the evaluator, thus affecting its authenticity and objectivity. How to evaluate physical education quantitatively is an important factor to improve the quality of teaching. The literature [6] introduced a fuzzy evaluation algorithm in the system. In the data processing, all collected teaching evaluation data were classified by unsupervised learning in advance. The literature [7] used hierarchical analysis to determine the weights of evaluation indexes. The evaluation system in the above literature lacks authenticity and objectivity, and there are redundancy, fusion and superposition of evaluation data.

Based on this, this paper designs an intelligent evaluation system for physical education based on intelligent technology. In the design process, modular programming idea is adopted, and the main body of the evaluation system includes 5 functional modules. In the evaluation process, relevant parameters and indexes are established and selected, based on which, the evaluation results are organized in data unification and then displayed through digital

methods. And the practicality of the intelligent evaluation system is confirmed by simulation practice.

## 2. BUILD AN INTELLIGENT EVALUATION SYSTEM FOR PHYSICAL EDUCATION

The modern education technology characterized by informationization and intelligence to promote the reform of physical education in colleges and universities is both an inevitable trend of deepening the application of modern education technology and a necessary way to meet the development of the times and realize the leapfrog development of physical education [8-10]. Therefore, it is an important task of physical education to establish a scientific physical education teaching quality evaluation system. In this paper, intelligent technology is used to build an intelligent evaluation system for physical education, and the system structure is shown in Figure 1.

**Figure 1.** Structure of intelligent evaluation system

As shown in Figure 1, this teaching quality evaluation system adopts modular programming ideas in the development process and uses intelligent technology to make the whole system highly readable, intelligent and flexible. The evaluation system mainly includes 5 functional modules user interface module, evaluation index module, data management module, result analysis module and user help module.

The system login interface is a human-computer dialogue interface, which is operated by the user with the mouse or keyboard to achieve the function of human-computer dialogue.

It enables the selection of relevant parameters and the capture of evaluation indicators in the evaluation process. The system also ensures that different teachers and different courses can be evaluated under the same evaluation index and evaluation mode, so as to achieve the principle of fair and just evaluation.

It is a unified and centralized management of the data from the teaching evaluation results entered on different computers distributed in the campus network. It mainly includes the services of collecting evaluation parameters, data inheritance and querying related evaluation data or evaluation objects, which is the main function module of classroom teaching quality evaluation system.

According to the evaluation parameters set by users, the evaluation results are displayed as data using curves or figures. It can also do horizontal or vertical comparison of teaching quality of different courses or different teachers, and realize analysis of evaluation results.

In order to facilitate the user's operation, the system also sets up a help item file and provides an online help module.

### 3. ANALYSIS OF THE PRACTICAL RESULTS OF THE EVALUATION SYSTEM

In order to verify the effectiveness of the intelligent evaluation system of physical education constructed in this paper, a school was randomly selected as the experimental object in this paper, and the physical education data of the school was obtained through multiple channels, and a comprehensive evaluation of the quality of physical education in the school was conducted. The same operation is then performed using the traditional evaluation system, and the comparison information is shown in Table 1.

**Table 1.** Comparison information

Evaluation indicators	Intelligent Evaluation System		Traditional evaluation systems	
	Confidence%	Error rate%	Confidence%	Error rate%
Teaching content	99.56	1.03	50.13	22.68
Teaching methods	99.25	2.4	62.17	29.31
Orientation	99.62	2.45	51.93	31.69
Teaching Objectives	99.73	2.71	66.18	27.86

As can be seen from Table 1, in the two evaluation indexes of teaching content and teaching method, the confidence level of the traditional evaluation system is only 50.13% and 62.17 respectively, and the error rate reaches 22.68% and 29.31. The low confidence level indicates that the evaluation of the traditional evaluation system is too homogeneous and narrow, which makes it difficult to evaluate the physical education teaching satisfactorily. In contrast, the intelligent evaluation system constructed in this paper has 99.56% and 99.25% confidence in these two evaluation indexes, and the error rate is only 1.03% and 2.4%, respectively. This proves that the intelligent evaluation system further improves the quality of teaching evaluation and has good guidance and reference significance.

### 4. CONCLUSION

In this paper, an intelligent evaluation system of physical education based on intelligent technology is constructed from the perspective of physical education evaluation, and the application effect of the system is verified in practical activities. Compared with the traditional evaluation system, the intelligent evaluation system has only 1.03% and 2.4% error rate in the evaluation index, and the confidence level is as high as 99.56% and 99.25%, respectively. It shows that the intelligent evaluation system designed in this paper is beneficial to the reform and development of physical education teaching, and provides effective data and support for teaching quality evaluation.

## ABSTRACT

The study of multi-response parameter optimization problems is of great significance for complex industrial systems. In this paper, a two-dimensional matrix optimization model is developed through the work decomposition structure and cost decomposition structure. The mathematical modeling differential equations for multi-response parameter optimization are derived using perturbation suppression and ambiguity resolution, and are evaluated in terms of both optimization time and the fit of optimization results. The method in this paper saves 2.13 s of time cost compared to the MEA-based SVM parameter optimization and 4.02 s compared to the fish swarm algorithm. The stability of the multi-response parametric mathematical model designed in this paper is high and can effectively meet the needs of nonlinear control models.

## KEYWORDS

multi-response parameters; two-dimensional matrix model; mathematical modeling; parameter optimization

## 1. INTRODUCTION

Process parameter optimization design, as the first barrier to control the quality of products, has a decisive impact on the quality of product production [1-2]. As industrial manufacturing becomes increasingly intelligent, more and more noise factors appear in the production process, which seriously affect the product quality. In the face of

numerous noise disturbances, the initiative of designing a large number of noise factor tests to obtain robust parameters may greatly increase production costs, which is contrary to the principle of manufacturing economy [3-4]. In addition, when the number of noise factors increases exponentially, the orthogonal test table has to be increased, which will eventually lead to overflow of test data into the orthogonal table and make it difficult to perform parameter design [5].

To address these challenges, the literature [6] simplifies the system mainly by means of dimensionality reduction. For systems that are not easily subjected to dimensionality reduction, the literature [7] uses the integrated satisfaction method to deal with the integrated quality index to represent the overall optimization degree of multiple responses. The Box-Behnken response surface method and the gray relational analysis optimization method were proposed in the literature [8] to optimize the EDM process parameters. However, all of the above methods eventually require weight setting in order to simplify the complex system. In this paper, a two-dimensional matrix model is used to optimize the state eigenvolume of the multi-parameter response mathematical modeling for perturbation suppression.

## **2. OPTIMIZATION METHOD BASED ON TWO-DIMENSIONAL MATRIX MODEL**

### **2.1 TWO-DIMENSIONAL MATRIX MODEL**

#### **2.1.1 WORK BREAKDOWN STRUCTURE**

The Work Breakdown Structure, or WBS for short, is a powerful analytical tool whose concept was first widely used in large scale project management in the 1970s. Through WBS, a project is organized hierarchically and systematically broken down into smaller and manageable units, with each decreasing level representing an increasingly detailed definition of all project components, with the phases interconnected, starting at the beginning of the project and decomposing one by one, with the subsystems interacting to form a unified and integrated management, which is oriented to the project deliverables by breaking down the overall project work into smaller sub-unit modules for easy project management and control of individual work unit modules, and thus defines the entire scope of work of the project.

#### **2.1.2 COST BREAKDOWN STRUCTURE**

Cost Breakdown Structure, or CBS for short, establishes a sharp tool for integrating this mapping model with relevant cost categories and functional breakdowns throughout the project life cycle. The decomposition of the appropriate cost structure system plays a crucial role in project LCC, which can visualize the analysis, occurrence and interrelationship of project costs, so that project tracking management can be

implemented in a targeted manner, and the CBS can collect, analyze and output cost reports for any project that generates costs.

### 2.1.3 TWO-DIMENSIONAL MATRIX

Two-dimensional matrix model is a means of whole life cycle cost analysis, which combines work breakdown structure and cost breakdown structure in a mathematical mapping model. It analyzes the LCC occurrence of a project from functional, elemental dimensions and multi-dimensional threads in the form of a matrix, and then derives the total cost of a phase, a sub-project or the whole LCC of a project vertically or horizontally through simple mathematical modeling operations. It can monitor, analyze and dynamically manage the whole life cycle cost of the project, and grasp the cost situation of the whole process of the project in time, so that the whole process cost data information of the project can be summarized in different hierarchical structures, and the project cost can be predicted, analyzed and controlled in different organizational levels, which can effectively solve the problem of separating each phase of the whole life cycle.

## 2.2 MULTI-RESPONSE PARAMETRIC MATHEMATICAL MODELING

### 2.2.1 MULTI-RESPONSE PARAMETRIC MATHEMATICAL MODELING DIFFERENTIAL EQUATIONS

In this paper, we use the method of perturbation suppression and fuzzy degree resolution to obtain the differential equations of multi-response parameter mathematical modeling, satisfying its function  $x = [x_1, \dots, x_p] \in R^p$ . The distribution interval of the bounded characteristic solution of the multi-response parameter mathematical model is obtained under the multimodal constrained fluctuation perturbation satisfying the fuzzy degree function  $y: R^p \rightarrow R$ . The stability generalized equation of the multi-response parameter mathematical modeling differential equation is given by:

$$y(x) = \exp \left\{ - \sum_{k=1}^p \omega_k (x_k - x'_k)^2 \right\} \quad (1)$$

Where  $\omega$  is a column vector of unknown spatial correlation coefficients to represent as the input  $x$  is separated from  $x'$ . In the linear programming region of the differential equation for multi-response parameter mathematical modeling, let  $x^*$  be a vector of spatial marginal values in the set of eigen-solutions of the differential equation for multi-response parameter mathematical modeling. In the stochastic eigensolution distribution region, the singular decomposition operator of the multi-

response parameter fitting eigenequation is obtained as  $g_k$ . Under the singular perturbation constraint, the stable eigensolution of the multi-response parameter fitting is obtained as  $(g_0, g_1)$ . Under the smooth periodic solution constraint, the steady-state model of the multi-response parameter fitting state eigenequation is obtained as:

$$\phi(x) = \frac{1}{(2\pi\tau^2)^{n/2}} |g_k|^{1/2} \exp\left\{-\frac{1}{2\tau^2}(d-x\beta)^T\right\} \quad (2)$$

Where  $\beta$  denotes the state term of the pairwise Cauchy-Hadamard type,  $d$  denotes the uncertain state parameter of the multi-response parameter fitting state, and  $\tau$  denotes the edge vector of the smooth periodic solution of the nonlinear system. Using the least-squares fitting control method, the supercritical fluctuation integral term is obtained as:

$$f(x) = \int_{-\infty}^{\min(\gamma)} (\min(Y) - y(x)) \phi\left(\frac{y(x) - \lambda}{d_1(x) - d_2(x)}\right) dx \quad (3)$$

Where  $\lambda$  is the boundary stability convergence characteristic solution,  $d_1(x)$  and  $d_2(x)$  are the fuzziness generalization parameters of the multi-response parameter fitted state equation, respectively, and define the boundary equation term  $d(x)$ . Under the critical condition, the finite function of the multi-response parameter fitted state equation is obtained as follows:

$$Y = \Pi\left(\min\{d(x_k)\} | x_k \in y(x)\right)^\omega n \quad (4)$$

In the sparse bounded distribution set of the differential equations for the mathematical modeling of the multi-response parameters, the smooth periodic stable solution of the system is obtained denoted by  $\Delta d(x)$ . In the singular space  $IR^3$ , the differential equation for the multi-response parameters fitting the state parameters is obtained as:

$$u(x) = \frac{\partial\phi(x)\partial y(x)}{\partial x^2} - \frac{\lambda}{2} \ln(2\pi) \quad (5)$$

Based on the above analysis, the multi-response parameter mathematical modeling differential equations are constructed, and the multi-response parameter mathematical modeling and parameter seeking control are realized under the critical conditions.

## 2.2.2 MULTI-RESPONSE PARAMETRIC MATHEMATICAL MODELING

In a complex industrial production process,  $k$  observations of influencing factors are used as control variables, denoted as  $X_1, X_2, \dots, X_k$ , and  $m$  observations of quality fluctuations are used as response variables, denoted as  $Y_1, Y_2, \dots, Y_m$ . A total of  $n$  sets of experiments are designed in the experimental process, denoted as  $1, 2, \dots, n$ . The model of the multi-response parameter optimization problem is shown in Table 1.

**Table 1** Multi-response parametric optimization problem model

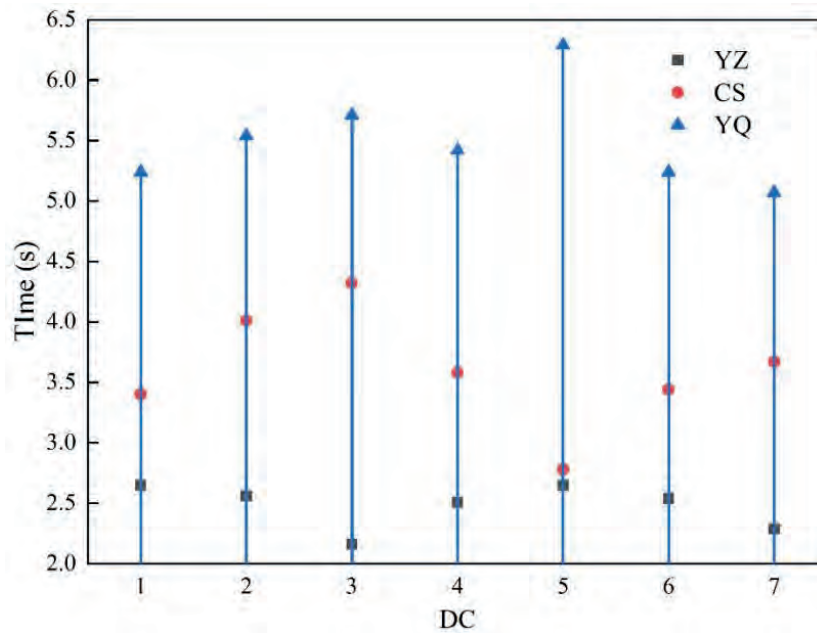

Control Variables			Response Variables		
$X_1$	.....	$X_k$	$Y_1$	.....	$Y_m$
$x_{11}$	.....	$x_{1k}$	$y_{11}$	.....	$y_{1m}$
.....	.....	.....	.....	.....	.....
$x_{n1}$	.....	$x_{nk}$	$y_{n1}$	.....	$y_{nm}$

## 3. OPTIMIZATION ANALYSIS BASED ON TWO-DIMENSIONAL MATRIX MODEL

### 3.1 PARAMETER OPTIMIZATION TIME ANALYSIS

In order to verify the overall effectiveness of the multi-response parameter optimization method, the multi-response parameter optimization method needs to be tested. The multi-response parameter optimization method based on matrix model, the SVM parameter optimization method based on MEA, and the classification parameter optimization method based on fish swarm algorithm were tested to compare the classification time of the three different methods. The average classification time for the six iterations was 2.68 s. The average classification time for the six iterations for the MEA-based SVM parameter optimization method was 4.12 s. The average classification time for the six iterations for the fish swarm algorithm-based classification parameter optimization method was 5.63 s. The average classification time for the six iterations for the heterogeneous network big data classification method, the MEA-based SVM parameter optimization method and the fish swarm algorithm-based classification parameter optimization method were compared. The average classification time of the multi-response parameter optimization method, the MEA-based SVM parameter

optimization method, and the fish swarm algorithm-based classification parameter optimization method is less than the above two methods.

**Figure 1** The time used for the classification of the three different methods

### 3.2 OPTIMIZATION RESULTS

The stability analysis of the multi-response parameter mathematical model is carried out by numerical analysis and MATLAB simulation, and the number of iterations of the steady-state control of the multi-response parameter mathematical model is given as 130, and the planning set size of the test sample function is 2200. the above test parameters are set to realize the optimal design of the multi-response parameter mathematical model, and the optimized parameter analysis results of the multi-response parameter mathematical model are obtained. The analysis of the test results shows that the stability of the parametric analysis results of the multi-response parametric mathematical model is good and the test parameters are well fitted.

### 4. CONCLUSION

In this paper, the multi-response parameter mathematical modeling is optimized based on a two-dimensional matrix model, and the results show that it still has a good fit with a short optimization time. Different treatment methods can be adopted for different stages of multi-response parameter optimization design, so that the overall product quality can be improved. The introduction of matrix model can solve the problem that the response weights are difficult to determine directly and expand the application scope of the method. With the adoption of bidirectional projection decision, the resolution of the system simplification results can be improved and the reliability of the parameter design can be further enhanced.

## ABSTRACT

Each era has its own development characteristics and teaching forms. In the background of big data era, along with the emergence and application of new technologies, it has changed people's thought patterns and working methods. In the process of ideological and political education in colleges and universities, scientific response to students' complex and jumpy thinking is the basis for teachers to effectively accomplish their teaching goals. However, some teachers are still not provided with more reasonable teaching methods to grasp students' "fickle" thoughts in time, which brings problems and difficulties to their teaching work. Teachers should update their educational philosophy and effectively integrate big data thinking; and continuously enrich their teaching tools and scientifically use big data technology to get out of the dilemma based on the new teaching model.

## KEYWORDS

Big data; Universities; Ideology and politics; Educational environment; Application path

## 1. INTRODUCTION

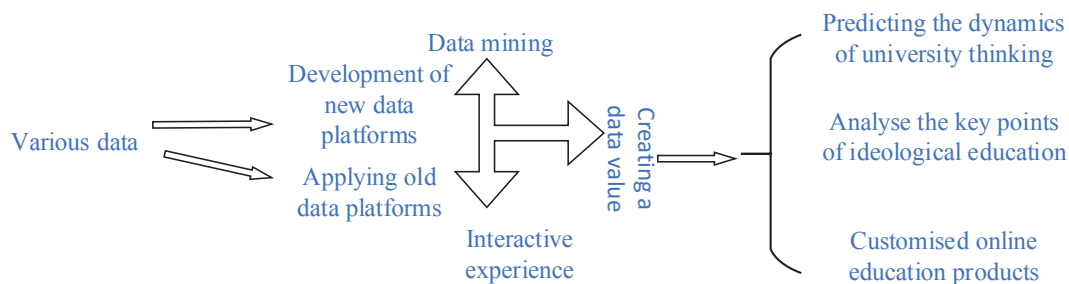

The application of big data technology has set off an information storm that has swept through the entire educational field. It not only brings a certain promotion to the form of teaching, but also, brings a certain influence to the thinking of college students [1-2]. Based on the popularity and use of Internet technology and mobile smart devices, contemporary college students can get richer information through different ways, and their thinking has changed dramatically [3-4]. Teachers use the traditional teaching format to maintain the classroom teaching process, which can no longer meet the learning needs of students [5-6]. In particular, ideology and politics in colleges and universities mainly focus on students' ideological and political dynamics, political awareness and value system, etc. If teachers cannot form a correct understanding of students' physical and mental development and changes, they cannot teach in a more targeted way and thus cannot effectively accomplish their teaching goals [7-8]. In this paper, we intend to discuss the rationality, mechanism and path of combining big data with ideological and political education in colleges and universities in order to promote the effectiveness of ideological and political education in Chinese colleges and universities.

## 2. THE APPLICATION OF BIG DATA IN IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES

Figure 1 shows the mechanism of big data applied to ideological and political education in colleges and universities. Big data has four basic characteristics: large data volume, diverse data, low value density and fast speed. According to the insight of Victor Mayer-Schönberg,

one of the authoritative proposers of big data, the reason why big data is valuable is that big data reveals the correlations between things with rational full-volume data information, and these correlations can observe the development trend of things. People can make effective behavioral choices based on these trends. In fact, it is the users themselves who create the correlations reflected by big data. Previously, it was difficult to obtain these valuable relationships through research among all users because of the difficulty of observation. Behind big data are the habits of thought and behavior of users. These, like personalities, do not change easily, so Big Data makes it easier for people to understand themselves and the people around them.

**Figure 1.** The Mechanics of Big Data Applied to Ideological and Political Education in Universities

## 2.1. DATA ACQUISITION

On data platforms, various different types of data are generated every day. Some of the more famous and large data platforms in China are Baidu, Taobao, Renren and so on. If you want to know the interests of a group or a person, you can easily get all the data through these data platforms. These are ready-made data platforms. There are also new data platforms that individuals and organizations can build to capture data. For example, the WeChat public platform that more organizations are continuously opening recently. To understand the socialist core values identity of college students, for example, first, universities should determine the on-campus data platforms to be collected. For example, students online, BBS, WeChat, socialist core values special website, secondly, integrate into commercial websites such as Baidu posting bar, Tencent microblog, Sina microblog, Renren, Tianya community, Tencent QQ group, etc. Finally, establish data filtering and screening system to obtain structured and unstructured data related to socialist core values in real time.

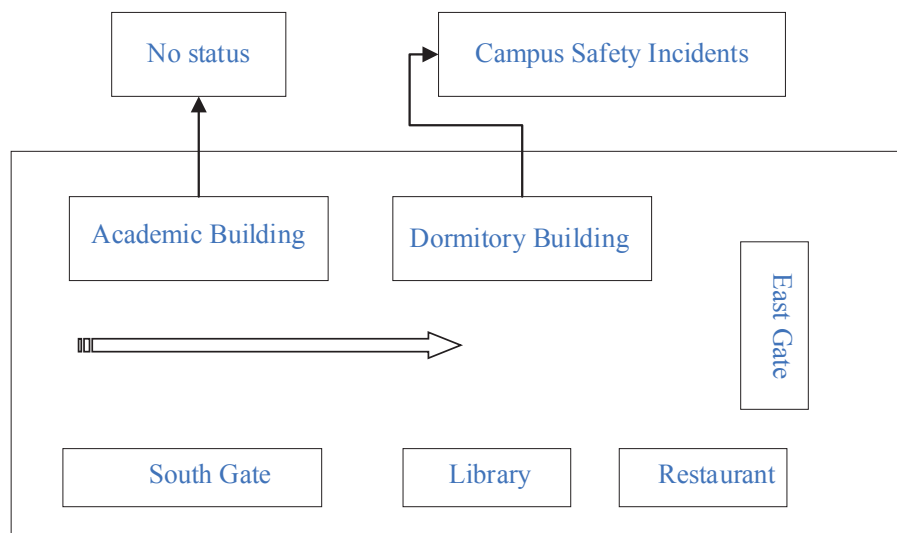

## 2.2. DATA MINING

Data mining involves specific techniques for data analysis. Commonly used techniques are semantic analysis techniques, building data models. The parameters of how to determine correlations and the attributes that define those correlations are the core domain. This requires an interdisciplinary group of data scientists with specialized knowledge and skills or a professional organization. One of the better known current data application platforms is hadoop, through which any individual and organization can mine data according to their needs. Take understanding the daily thought dynamics of students as an example, the relevant departments of universities will collect all kinds of structured and unstructured data through hadhoop platform processing, which can define some attributes, such as search hot words, political life events of concern, active forms, and value deviation. The relevance is determined by the number of clicks, the number of statements, the frequency of occurrence of phrases, and the concentration of data types.

## 2.3. HUMAN-COMPUTER INTERACTIVE EXPERIENCE

Figure 2 shows the dynamics of student thought based on location. Data is lifeless, while

the human experience is real and valuable. Therefore, the value of data is reflected in the interactive experience between people and data. Data will only produce great value when combined with human analysis and judgment, and with various human needs. Currently, wearable devices are entering the market, and wearable devices are a model of human-computer interactive experience. The devices not only produce a lot of data every moment, but the data generated can become the basis for the devices themselves to continue to innovate, and bring perceptual experience to the users. Still taking the example of college students' thought dynamics, avoiding the simple presentation of statistical tables, if we can combine location data for visual presentation of scenes, it will enhance the experience of college management.

**Figure 2.** Location-based student thought dynamics

### **3. INNOVATION OF IDEOLOGICAL AND POLITICAL EDUCATION PATHS IN UNIVERSITIES IN THE ERA OF BIG DATA**

#### **3.1. APPLY BIG DATA TO DEVELOP NEW PRODUCTS OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES**

According to the application mechanism of big data, only by combining data mining analysis with the experience of college students can the developed products be attractive. Based on the application of big data for opinion monitoring and analysis, the new products developed should have the characteristics of good experience, interesting, real-time feedback and close to life. The new products developed should respect students' personality characteristics and current needs. The new products should have a rich variety of forms, which can be either online courses, themed games, or offline activity arrangements.

#### **3.2. PAY ATTENTION TO THE NETWORK PRACTICE OF IDEOLOGICAL AND POLITICAL EDUCATION IN COLLEGES AND UNIVERSITIES**

College students' values are unstable and subject to the effects of socialization validity and education. College students' behaviors and perceptions are often in a state of inconsistency. The current application of big data focuses on the cognitive aspect of college students' values. As cognition can reflect problems, big data is used to classify students' cognition, compare unreasonable cognition and biased cognition with rational cognition, find out the gaps, and then formulate specific practice programs, and then correct cognitive bias through practical actions, so that cognition and behavior can be matched, and socialist core values can be established and consolidated in practice.

### 3.3. SCIENTIFIC USE OF BIG DATA TECHNOLOGY

In the process of teaching, teachers should continuously enrich their teaching methods based on new teaching ideas so as to carry out ideological and political education activities in a more scientific way. In the background of the big data era, based on the use of the Internet and other technologies, teachers can filter effective information from the huge amount of information and integrate it into their teaching. When teachers provide ideological and political education to students, they mostly use relevant teaching materials to carry out classroom teaching activities, but the content of teaching materials is not updated in real time due to the influence and limitation of various factors. In the current era, teachers can collect more practical knowledge into the teaching content according to the information focus of students, so as to enrich teaching resources and provide favorable conditions for effective classroom teaching. When students are interested in, and even resonate with, the content provided by teachers, they can more actively participate in the learning atmosphere. Only when students have a deep understanding and absorption of the relevant teaching content can they essentially have a positive influence on their thinking and achieve the purpose of ideological and political education.

### 4. CONCLUSION

When carrying out ideological and political teaching work, colleges and universities should be good at using big data, the Internet and other cutting-edge technologies. They should be able to enhance their data sensitivity and observe and feel the changes in students' thoughts with a dynamic mode of thinking, so as to provide more targeted ideological education to students. According to the "people-oriented" teaching concept, we should pay more attention to students, and then solve the actual problems of students' minds.

**ABSTRACT**

This paper investigates the current situation of health career in Shaanxi Province in the context of data collection, analyzes the basic data of health and medical service level, and gives the development strategy of health career construction in Shaanxi Province. The development of health undertakings in an integrated manner should be promoted in terms of ideas, mechanisms as well as effectiveness, so as to realize the demonstration construction of 8 types of health cells in Shaanxi Province, weave the warp and weft network of healthy Shaanxi, and improve the level of health literacy of the public.

data collection; Shaanxi Province; health career; medical services; health literacy level; mechanism

**1. INTRODUCTION**

As the wheel of time continues to move forward, the world's shared concept of sustainable development has brought China and the entire world to a climax. However,

if the skin does not exist, how can the hair be attached? The quality of life of contemporary people and their health are the cornerstones of sustainable human development [1-2]. Health is the cornerstone of overall human development and happiness in life, as well as an important symbol of national prosperity and social civilization progress [3]. Medical and health care has long been one of the important indicators of China's coordinated economic and social development and the overall building of a moderately prosperous society [4].

Medical and health care is a matter of vital interest to the people and has received close attention from the whole society. With the upgrading of economic development and consumption structure, the people's demand for medical and health services and multi-level health services has further increased [5]. In recent years, Shaanxi Province has attached great importance to public health work, and from its own reality, it has boldly explored innovations to achieve new breakthroughs in key areas and critical links. It is committed to strengthening the prevention and control of major diseases in rural areas of the province, health reform and other key work, and strives to solve the outstanding problems that affect the health of the people, such as the difficulty of access to medical care and expensive medical care [6-7]. The scale of medical and health services, service conditions and service levels have been effectively improved and enhanced, and the province's medical and health care has continued, stable and healthy forward development.

This paper analyzes the level of health and medical services in the context of data collection, starting from the data survey of the current situation of health undertakings in Shaanxi Province. Based on the data analysis, it is proposed that the development of health undertakings in Shaanxi Province should start from the demonstration construction of 8 types of health cells, and mainly work on unifying ideas, improving mechanisms as well as enhancing effectiveness, so as to promote the construction of healthy Shaanxi.

## **2. Survey on the current situation of health business in Shaanxi Province**

Medical and health care is related to the quality of health of the people, and the people's vital interests are closely related. To meet the growing medical and health needs of the people, vigorously develop medical and health care, ensure public health security, improve the health quality of the whole nation and the relevant departments, especially the health system in front of the majority of medical and health workers a major historical task. This chapter is based on the "Shaanxi Province Health and Health Care Development Statistics Bulletin 2021", using data collection techniques to investigate the current situation of health care in Shaanxi Province data, through data analysis to provide the basis for the development of health care construction strategies

in Shaanxi Province later.

## 2.1 HEALTH AND WELLNESS LEVEL

### (1) Total number of medical and health institutions

At the end of 2021, the total number of medical and health institutions in the province 34,971, down 4 from the previous year. Among them, 1270 hospitals, 33,185 primary health care institutions, 415 professional public health institutions. Compared with the previous year, the hospital increased by 51, primary health care institutions decreased by 14.

### (2) Number of beds

At the end of 2021, there were 284,500 beds in medical and health institutions in the province, including 233,600 beds in hospitals (82.08%), 40,900 beds in primary medical and health institutions (14.38%), and 0.97 million beds in specialized public health institutions (3.39%). The number of beds in medical and health institutions in the province and the growth rate are shown in Figure 1.

**Figure 1** Number of beds and growth rate

### (3) The total number of health personnel

At the end of 2021, the total number of health personnel in the province will be 445,900, an increase of 555 (0.12%) over the previous year. 2021 end health personnel institutional distribution is 286,800 (64.33%) in hospitals, 125,000 (28.04%) in primary health care institutions, and 30,800 (6.91%) in specialized public health institutions. 2021 3.05 practicing (assistant) physicians per 1,000 population, 4.03 registered nurses per 1,000 population. 3.35 general practitioners per 10,000 population, and 7.79 personnel per 10,000 population in professional public health institutions.

## 2.2 MEDICAL SERVICES

### (1) Outpatient and inpatient volume

In 2021, the total number of visits to medical and health institutions in the province will be 187,049,500, an increase of 10,219,100 visits (5.78%) over the previous year. (41.15%), and 671.09 million visits to other medical and health institutions (3.59%). Compared with the previous year, the number of hospital visits increased by 17,097,200 and the number of primary care visits decreased by 5,986,900. 85,343,800 visits were made to public hospitals in 2021 (82.56% of the total hospital visits) and 18,023,300 visits were made to private hospitals (17.44% of the total hospital visits). The specific workload is shown in Table 1.

**Table 1** Province-wide medical service workload

Institution Type	Number of consultations		Number of hospital admissions	
	2020	2021	2020	2021
Total medical and health institutions	17683.04	18704.95	675.68	728.42
Hospital	8627	10336.71	589.55	649.52
Public Hospitals	7140.37	8534.38	466.43	510.95
Private Hospitals	1486.62	1802.33	123.11	138.57
Hospitals in:				
Tertiary hospitals	3804.26	4708.3	233.49	276.34
Level II Hospital	3985.13	4656.44	295.75	305.65
-level hospitals	364.85	450.65	26.73	31.3
Primary Health Care Institutions	8295.84	7697.15	54.33	53.58
Other institutions	760.21	671.09	31.81	25.31
In total: Non-public medical and health institutions	3675.37	4052.24	23.74	139.02

### (2) Workload of hospital physicians

In 2021, the average daily workload of hospital physicians will be 5.8 consultations and 2.3 inpatient bed days, of which: 6.2 consultations and 2.3 inpatient bed days will be the average daily workload of public hospital physicians.

### (3) Hospital bed use

In 2021, the province's hospital bed utilization rate will be 72.41%, including 78.61% in public hospitals. Compared with the previous year, the hospital bed utilization rate increased by 3.74 percentage points (including public hospitals increased by 3.44 percentage points). 2021, the average hospital discharges hospital days was 9.0 days (including public hospitals 8.9 days), compared with the previous year, the average hospital discharges hospital days decreased by 0.1 days (including public hospitals decreased by 0.2 days).

#### (4) Improve medical services

By the end of 2021, 34.14% of public hospitals at the second level and above had carried out consultation appointments, 91.54% had carried out clinical pathway management, 56.49% had carried out telemedicine services, 87.92% had participated in mutual recognition of examination results at the same level, and 93.05% had carried out quality nursing services.

#### (5) Blood security

In 2021, the annual number of blood donations will reach 562,300 and the volume of blood collected will reach 973,100 units, an increase of 9.1% and 10% respectively compared to 2020, with a blood donation rate of 14.2 per 1,000 population.

In addition to health care and medical services, health care in Shaanxi Province also includes primary health services, Chinese medicine services, patients' medical costs, disease control and public health, maternal and child health and healthy aging, food safety and health supervision, and population and family development, etc. Based on the limited space of the article, only health care and medical services are used for the later development of health care construction in Shaanxi Province Provide data.

### **3. HEALTH CONSTRUCTION DEVELOPMENT STRATEGY IN SHAANXI PROVINCE**

Shaanxi Provincial Party Committee and Provincial Government earnestly implement the important discourse of General Secretary Xi Jinping on the construction of health China, implement the new era of health and health work guidelines, raise the construction of health Shaanxi to the province's strategy, adhere to the government-led, departmental coordination, social participation, common construction and sharing, from the extensive, social and overall nature of health impact factors, comprehensively promote the construction of healthy organs, healthy military barracks, healthy communities, healthy villages, healthy schools, healthy hospitals, healthy enterprises, healthy families and other eight types of health cell demonstration, weaving the warp and woof of health Shaanxi, and improve the level of health literacy of the masses.

#### **3.1 PROMOTE SOLIDLY AND WORK ON UNIFYING IDEAS**

From the extensive, social and diverse health influencing factors, scientific planning, graded implementation, the provincial level by the Health Shaanxi Construction Work Committee Office is responsible for the formulation of implementation plans, determine the objectives and tasks, coordinate the relevant units to organize and implement, so that there are annual goals, tasks are led, responsibilities are borne, work is done, quarterly monitoring, year-end inspection.

The city (district) and county refer to the provincial practice to set up a special team, develop a work plan and collaborate to promote. The provincial, municipal and county levels work together in the same direction, mobilizing from the government, departments, communities, families and individuals at five levels, mobilizing the enthusiasm and initiative of all parties, maximizing the overall resources, coordinating and promoting in a coordinated manner.

### **3.2 INTEGRATING DEVELOPMENT AND WORKING ON SOUND MECHANISMS**

Strengthen the industry and departmental collaboration, and consolidate the foundation of health Shaanxi action. Against the 17 contents and 130 indicators of Health Shaanxi Action, further improve the content of tasks related to the demonstration construction of 8 types of health cells. Focus on the health knowledge and healthy habits that the people are most concerned about and most closely connected with, do a good job in the management of chronic disease services, implement comprehensive prevention and control of infectious diseases, cultivate a civilized and healthy, green and environmentally friendly lifestyle, and improve the overall health level.

### **3.3 FOCUS ON IMPROVING THE EFFECTIVENESS**

Take health education and health promotion work platform as the carrier, take health knowledge popularization as the entry point, actively explore new ways to mobilize the masses to participate in health cell demonstration construction under the new situation, guide the masses to actively participate in health cell demonstration construction, transform the people's extensive concern for health into active participation in health behavior activities, and make health cell demonstration construction a conscious action of the whole province.

## **4. CONCLUSION**

This paper investigates the current situation of health undertakings in Shaanxi Province in the context of data collection, and proposes strategies for the development of health construction in Shaanxi Province by analyzing two basic data on health and medical service levels. In the process of promoting the construction of healthy Shaanxi, it is important to focus on unifying ideas, improving mechanisms as well as enhancing effectiveness, so as to promote the development of the health cause in Shaanxi Province, weave the warp and weft of healthy Shaanxi, and improve the level of health literacy of the public.

# CONSTRUCTION OF CIVIC INFORMATION EDUCATION MODEL FOR UNDERGRADUATES OF LANDSCAPE ARCHITECTURE VOCATIONAL EDUCATION BASED ON SEQUENTIAL QUADRATIC PROGRAMMING ALGORITHM

---

Chunzhi Jiang\*

Chengdu Agricultural College, Chengdu, Sichuan, 611130, China

[kuangchunji@126.com](mailto:kuangchunji@126.com)

---

## ABSTRACT

This paper starts from the specific connotation of Civic Information and Landscape Architecture VET undergraduate, and points out the problems of integrating ideological education in Landscape Architecture VET undergraduate. Under the OBE concept, the path of landscape gardening innovative education mode is given, that is, the improvement and comprehensive development of landscape gardening students' ideological quality is realized through double classroom teaching and double tutor teaching methods.

## KEYWORDS

Civic Information Technology; Landscape Architecture; OBE Concept; Education Model; Dual Tutor; Dual Classroom

## 1. INTRODUCTION

Establishing moral education is the fundamental task of education, and all types of classroom teaching in colleges and universities have different functions of educating people. General Secretary Xi Jinping pointed out in the National Conference on Ideological and Political Work in Colleges and Universities that "classroom teaching should be used as the main channel, and ideological and political theory courses should adhere to strengthening in improvement, enhancing the affinity and relevance of ideological and political education, and meeting the needs and expectations of students' growth and development." In many colleges and universities today, ideological education and professional knowledge have not been well penetrated, and ideological education courses are often taught as independent courses, and classroom teaching is one of the main breakthroughs of ideological education [1-2]. Nowadays, colleges and

universities should highlight the value of "curriculum ideology" from daily classroom education, and explore new ways to break through the problems of combining ideology and politics with professional courses, which is of great significance to the comprehensive training of college students [3-4].

As one of the backbone disciplines of the Habitat and Environment discipline cluster, landscape architecture is inextricably linked to important national construction areas such as rural revitalization, territorial spatial planning, national parks, and urban renewal [5-6]. With global resources, environment, and ecology becoming primary issues, practitioners of landscape architecture play an important role in the protection and development of habitat environment. Therefore, institutions of higher education should further improve the professionalism, skills, and moral cultivation of landscape architecture students and cultivate landscape architecture talents and practitioners with the spirit of craftsmanship [7-8].

In order to explore the construction of the ideological informatization education mode for undergraduates in landscape gardening vocational education, this paper firstly explains the connotation of ideological informatization and landscape gardening vocational education undergraduate. Then it points out the problems of integrating ideological education for undergraduate students in landscape gardening vocational education, that is, the teaching methods, ideological understanding and the relatively backward teacher team. Finally, under the guidance of OBE theory, an effective path for the innovative education model of landscape architecture is proposed, namely, promoting the synergization of the teaching team, strengthening the practicalization of teaching contents and promoting the diversification of teaching methods. Through dual classroom teaching and dual tutor teaching methods to promote the overall improvement of the ideological quality of undergraduate students in landscape architecture vocational education, it also provides a new research direction for landscape architecture talent training.

## **2. THINKING INFORMATION TECHNOLOGY AND LANDSCAPE ARCHITECTURE VOCATIONAL EDUCATION UNDERGRADUATE**

### **2.1 CIVIC INFORMATION BASED ON SEQUENTIAL QUADRATIC PROGRAMMING ALGORITHM**

A nonlinear planning problem is a planning problem in which the objective function or constraints contain nonlinear functions. Generally speaking, solving nonlinear planning is much more difficult than solving linear planning problems. Moreover, unlike linear programming, which has a general method called the simplex method, there is no general algorithm for nonlinear programming that is suitable for all kinds of problems, and each method has its own specific scope of application. When the objective function

and constraints have good analytical properties, people like to use the indirect method to analyze and solve the constrained optimization problem. Thinking information technology through the sequence of quadratic programming algorithm for data statistics, statistical analysis results to landscape gardening vocational undergraduate students to improve the quality of thought, and then to achieve the full range of landscape gardening practitioners' quality development.

## **2.2 BACHELOR OF LANDSCAPE ARCHITECTURE VOCATIONAL EDUCATION**

Landscape Architecture is an engineering major with a high degree of integration of humanities, arts and natural sciences, and a strong application type. It is an important carrier of human civilization, with the fundamental mission of harmonizing the relationship between human beings and nature, and the fundamental task of creating an ideal living environment for human beings in harmony with heaven. There are still two skins in the ideological education and professional education of landscape architecture, and professional teachers have vague or wrong perceptions of the curriculum, and the professional curriculum emphasizes the mastery and application of engineering knowledge and technology, pursuing "fine in work" but neglecting "craftsmanship in the heart and quality in action. ". Teachers are not cohesive enough and lack the awareness of using the mainstream socialist ideology to guide students to form correct values. In the landscape architecture program, teachers can tap the ideological elements from the professional teaching to cultivate students' knowledge and skills, values and sense of mission, and guide students to establish correct outlook on life and values, so as to cultivate qualified successors for socialist construction.

## **3. THE PROBLEM OF INTEGRATING IDEOLOGICAL EDUCATION IN UNDERGRADUATE LANDSCAPE ARCHITECTURE EDUCATION**

### **3.1 LACK OF INNOVATION IN TEACHING METHODS**

The traditional teaching method is the teacher's theoretical knowledge transfer method and course design guidance method in the classroom, students are more "listening" to the teacher, their own sense of participation is not strong. The abstract professional knowledge is obscure and difficult to understand, and it is not easy to arouse students' desire to know, and it is difficult to mobilize their learning enthusiasm.

And in the context of today's rapidly developing Internet, information is disseminated more rapidly and people have wider sources of access to data and information, so online teaching is gradually gaining public attention and popularity. How to attract students to learn knowledge efficiently within their own classrooms and at the same time be able to enhance students' cultural self-confidence is a question that teachers in contemporary colleges and universities should think deeply about. Faced with the impact of diversified cultural trends, teachers should understand that traditional

teaching methods can no longer meet the needs of curriculum ideas and teaching practices in the context of the new era, while landscape architecture majors are committed to cultivating innovative and applied professionals, and need more diversified and innovative teaching methods.

### **3.2 STUDENTS HAVE A SHALLOW UNDERSTANDING OF IDEOLOGICAL EDUCATION**

The traditional ideological education is carried out in the ideological and political science class, the content of the lectures are mostly political theory, rarely have the ideological content of Chinese garden culture, so the ideological education lecture effect is also unsatisfactory, and outside the classroom there are few garden culture ideological education-related content, the students' attention to this is minimal. Based on this, it is not easy to enhance the autonomy of students' ideological learning inside and outside the classroom, and students' limited access to garden ideological education and insufficient internal motivation for their own learning lead to a lack of in-depth understanding of the excellent Chinese traditional culture. The understanding of the excellent Chinese classical garden culture is even more superficial, so that the understanding of garden culture-related ideological education is shallow.

### **3.3 BACKWARD FACULTY DEVELOPMENT**

In the practice of educating culturally confident ideas in landscape garden planning and design courses, the teachers' own cultural literacy inevitably affects their teaching level and teaching effectiveness. The process of incorporating ideas in today's curriculum still has many problems in this regard, which also leads to the failure to effectively improve the quality of the curriculum.

On the one hand, teachers' salary levels are not reasonably raised, thus failing to motivate teachers. On the other hand, the quality of the curriculum thought teachers group is mixed, there is a big ability gap between different teachers, and there are fewer teachers with strong integrative skills. The performance of teachers' own cultural literacy infects students at all times, while the neglect of students' moral quality and cultural literacy cultivation leads to the failure to achieve the teaching goal of all-round cultural education.

## **4. THE EFFECTIVE PATH OF LANDSCAPE GARDENING INNOVATIVE EDUCATION MODEL**

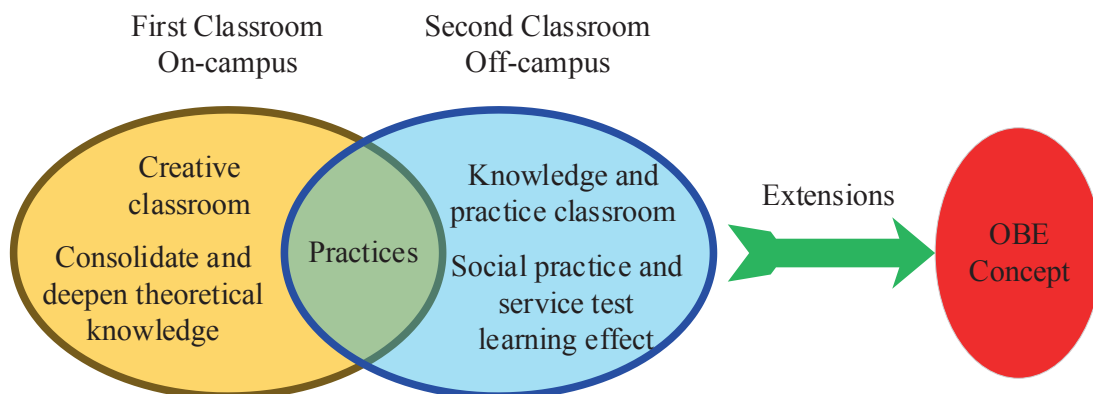

### **4.1 FACULTY SYNERGIZATION**

Build a team of teachers with collaborative education and industry. The teaching team of this course is composed of on-campus instructors with many years of teaching experience and engineering background, off-campus enterprise instructors and alumni,

thus ensuring that the instructors have both solid professional theoretical knowledge and practical experience that closely follows the development needs of the industry. In the course of teaching, the instructors are able to educate students from industry needs, combine their own experiences and social hot issues, and help students understand the current situation and trends of the development of China's modern landscape architecture industry

#### 4.2 REALISTIC TEACHING CONTENT

Through the introduction of actual enterprise projects, we carry out practical content teaching, and emphasize "industry-oriented" and "product+service oriented" in content design to meet the "design and construction integration" requirements. The content design emphasizes "industry-oriented" and "product+service oriented" to meet the requirements of industry development and service satisfaction of project products. From the OBE education concept, the teaching content is designed in the reverse direction, and the traditional mode of "teaching-learning" is shifted to the independent learning mode of "learning-teaching" as shown in Figure 1, so as to cultivate students' innovation and entrepreneurial ability and social service ability. The course is designed to develop students' innovative and entrepreneurial skills and social service abilities. The ideological elements of the course are explored and the spirit of craftsmanship is internalized in the course projects.

**Figure 1** Instructional design for dual classroom linkage

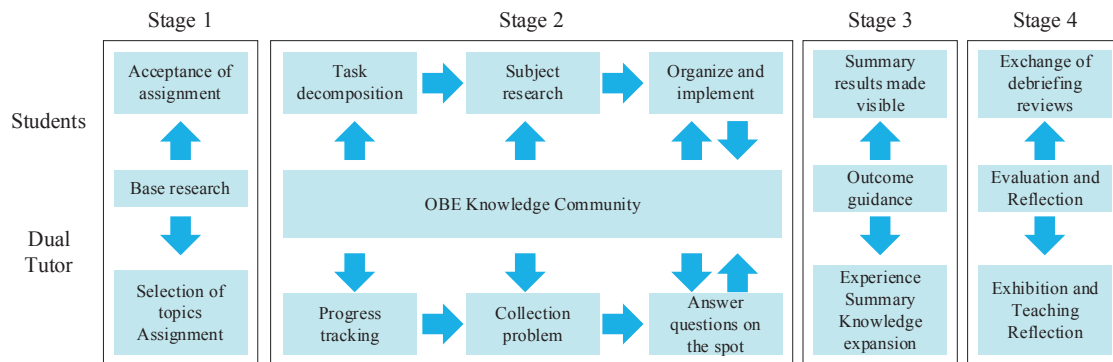

The course is organized into two classes, "Creative Classroom" and "Knowing and Doing Classroom", which are combined with summer social practice and full participation of instructors to enhance students' awareness and ability to serve the society through "collaborative, base and on-site" teaching methods.

#### 4.3 Diversification of teaching methods

As shown in Figure 2, the course is student-oriented, teacher-led, and teacher-student participation, forming a new teaching method of "OBE teacher-student knowledge community" to help the implementation of "craftsmanship". Project-driven

teaching is used to guide students to learn independently online and offline, to mobilize students' enthusiasm and cultivate their ability of independent learning, division of labor and social service by conducting base site research, designing project plan, implementing project construction process and summarizing practice independently.

**Figure 2** Dual Tutor Teaching Programme

Through group research, group discussion, group construction, group practice at the base to train students' communication and teamwork skills, through the whole process of participation, systematic training, the formation of a community of knowledge between teachers and students. Students will establish the concept of "knowledge in action", promote the professionalism of craftsmanship and cultivate lifelong learning habits.

## 5. CONCLUSION

On the whole, it is necessary to accelerate the integration of ideological education into all teaching aspects of landscape architecture courses, as landscape architecture students are mostly engaged in environment-related work after they enter society, and their physical and mental cultivation is of vital significance to the future development of ecological and environmental construction in China. Therefore, it is important to grasp the ratio between professional courses and ideological education in the teaching content, and to teach both of them in concert to provide correct ideological and political guidance to landscape architecture students. In this paper, under the guidance of OBE theory, the integration of professional and ideological education in landscape architecture is developed through dual classroom teaching and dual tutor teaching programs as a way to provide a new direction for university undergraduate students in landscape architecture vocational education and thus cultivate well-rounded talents.

### ABSTRACT

Exploring the construction of human resource management system based on deep learning model is to provide research direction for intelligent human resource management. Starting from HRM, this paper analyzes the logic of the impact of artificial intelligence technology under deep learning model on HRM practice. The development direction of HRM evolves through HRM intelligence as a way to provide new directions for building an efficient, scientific and rational HRM system. The strategic performance management system, HRM mechanism and networked HRM technology are used to provide theoretical support for the future intelligent HRM system.

### KEYWORDS

deep learning models; human resource management; artificial intelligence techniques; HRM intelligent evolution; strategic performance management; networking

### 1. INTRODUCTION

With the deep development of various industries, it is crucial for enterprises to enhance their core competitiveness in the market, which is directly related to human resource management, and the traditional single, lagging management concept and management mode are difficult to meet the objective requirements of modern enterprise development [1-2]. Modern enterprises should pay close attention to changes in market demand, analyze the actual situation of their own human resource management, improve all aspects of human resource management on the basis of exploration, deeply link their own development and job staff development in the process of transformation and upgrading, enhance internal staff cohesion, centripetal force and comprehensive quality, and simultaneously improve human resource management as well as comprehensive operational efficiency [3-4].

The evolution of HRM is also closely related to the technological revolution, and the current artificial intelligence under deep learning models representing the latest technological power has entered the workplace, and the question of how these technologies will affect HRM practices and whether they will bring about changes in HRM models has received increasing attention from academia [5-6]. The development

of deep learning models also provides a new opportunity for change in HRM, in the face of the fact that job matching has become a pain point in HR recruitment management and the traditional manual management methods are subjective, unscientific in judging, and heavy in workload [7-8]. The use of deep learning models can realize scientific analysis of massive data and objective judgment of candidates, thus providing a more effective way to deal with human resource management.

Starting from the definition and functions of HRM, this paper analyzes the logic of the impact of AI technologies on HRM practices under the deep learning model, which includes symbolism, connectionism, and behaviorism technologies. Then the HRM intelligent evolution of HRM model by AI technology is analyzed, and the evolution direction in four different contexts is given. Finally, the direction of HRM system construction in the era of AI is given, and the strategic performance management system, HRM mechanism and networked HRM technology should be used as the focus point to achieve the innovative development of HRM system of enterprises.

## **2. HUMAN RESOURCE MANAGEMENT**

Human resources are the most valuable and important resources in all enterprises, and the primary driving force for economic development. Proper human resource management can maximize the potential of workers, achieve knowledge innovation, continuously optimize the knowledge structure of enterprise employees, enhance working ability, create a good working environment and promote the development of value-added enterprise resources.

### **2.1 HUMAN RESOURCE MANAGEMENT DEFINITION**

Human resources is the general term for the education, ability, skills, experience, and physical strength possessed by people in an organization that can be used by the company and contribute to the value of its role in a certain period of time. The essence of human resources is the sum of mental and physical strength that people have, which can be collectively referred to as labor power. Human resource management is the use of scientific methods and systematic management, combined with capital, equipment, markets and other elements, the full use of human physical and mental power, to create economic benefits for the organization. At the same time, the process of improving the subjective ability of people, stimulating their potential and creating greater wealth.

### **2.2 FUNCTIONS OF HUMAN RESOURCE MANAGEMENT**

The functions of human resource management are usually divided into six modules, but summarized in four words "selection, training, employment, retention", combined with the internal and external operating environment of the enterprise, to form a series of systems and implementation methods, and implementation, so as to build a systematic human resource management system.

## **3. THE LOGIC OF DEEP LEARNING MODELS TO INFLUENCE HRM PRACTICES**

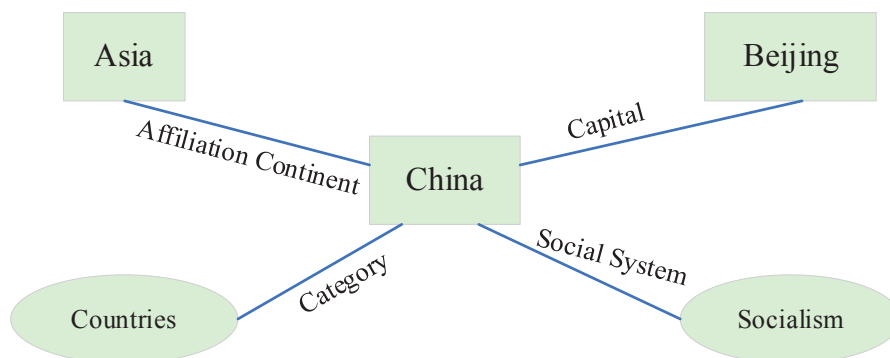

Whether artificial intelligence is an intelligent enhancement or an intelligent replacement for human HR depends on the specific application of different genres of technology in HRM. And what will be the impact of intelligent enhancement and

intelligent replacement on HRM respectively, again, has to be analyzed in the specific HRM practice.

### 3.1 THE LOGIC OF INFLUENCE OF SYMBOLIST TECHNOLOGY

During the heyday of symbolism, relevant technologies did not penetrate the field of human resource management. It was not until the 1990s that industrial engineers and scholars in management science gradually began to experiment with the development of HRM tools such as recruitment and training based on expert system technologies. But nowadays, the symbolism technology that is more frequently used in HRM is knowledge mapping, which is a new approach to knowledge acquisition in the information explosion Internet era.

Deep learning techniques are sometimes used in the process of building knowledge graphs, but in general, knowledge graphs emphasize logical relationships between things and are a symbolic logic system. A typical simple knowledge graph is shown in Figure 1, which consists of nodes and edges, where squares and ellipses are nodes, which represent things and abstract concepts, respectively, and solid lines represent relationships between things and dashed lines represent properties of things.

**Figure 1** A simple example of knowledge mapping

### 3.2 THE IMPACT LOGIC OF CONNECTIONIST TECHNOLOGY

The question and answer system, when combined with connectionist technology, can result in a more intelligent chatbot, thus taking the role of the AI "HR assistant" one step further and becoming the "HR senior assistant". This is made possible by two types of technologies: natural language processing, speech recognition, speech synthesis and image recognition based on deep learning, which allow bots to communicate with applicants as comfortably as real people. The second is machine learning algorithms such as deep learning, which allow recruitment bots to make initial predictions and judgments about applicants for HR's reference.

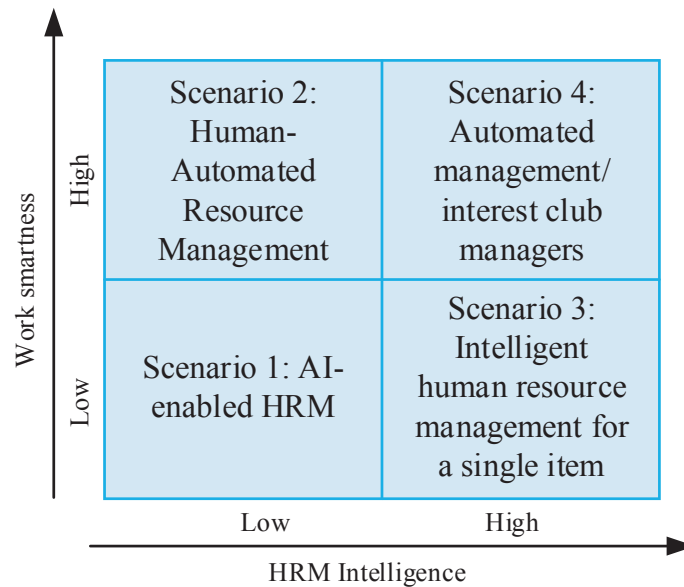

### 3.3 THE IMPACT LOGIC OF BEHAVIORIST TECHNOLOGY

Behaviorism focuses on the imitation of human "behavioral intelligence", and the technical results are mainly expressed in robots. There are three generations of robots. The first generation of robots is controlled by a set program and does not have intelligence. The second generation of robots can obtain information about the operating environment and the operating object, and adjust their behavior accordingly,

and have some intelligence. The third generation robot is still in the experimental stage of research and development, and it has a high degree of self-adaptability and can make complex reasoning, judgments and decisions, and has a high degree of intelligence.

### 3.4 EVOLUTION OF HUMAN RESOURCE MANAGEMENT MODEL IN THE ERA OF ARTIFICIAL INTELLIGENCE

It is clear from the previous analysis that whether the human resource management model will change or not is closely related to the degree of intelligence of work. The work here refers not only to the work of the management subject, but also the work of the management object. Accordingly, based on the two dimensions of HRM intelligence and work intelligence, combined with the emphasis on organizational contextual factors from the constructivist perspective in the study of technology and organization, we initially constructed an analytical framework for the evolution of HRM in the AI era, the specific structure of which is shown in Figure 2.

**Figure 2** An analytical framework for the evolution of HRM

The degree of intelligence in the framework refers to the extent to which the work is done by AI. When the degree of intelligence is low, AI is more like "intelligence augmentation", which only assists humans in their work. The different levels of HRM intelligence and work intelligence form four organizational contexts, and accordingly, HRM will evolve different models in each of these four contexts.

## 4. CONSTRUCTION OF HUMAN RESOURCE MANAGEMENT SYSTEM IN THE ERA OF ARTIFICIAL INTELLIGENCE

### 4.1 OPTIMIZE STRATEGIC PERFORMANCE MANAGEMENT SYSTEM

Modern enterprises should build a new strategic performance management framework system based on their own strategic planning objectives, strategic requirements, etc., combined with the current stage of operation and development of

each branch, and based on innovation and sustainable development, etc. Take job positions as the entry point and set up feasible performance evaluation index system. Modern enterprises should adhere to the principles of scientificity, feasibility, comparability, systematization and precise quantification in the process of contacting strategic performance management system, and scientifically set up the quality evaluation index system based on human resource management around job staff recruitment, welfare treatment, basic salary, performance salary, training, incentive and restraint.

#### **4.2 BUILDING A NEW HUMAN RESOURCE MANAGEMENT MECHANISM**

Improve the mechanism of attracting, recruiting and retaining talents. Modern enterprises should be guided by the new human resource management system built in the process of contacting the actual, improve the mechanism of attracting, recruiting and retaining talents formulated. Adopt the method of mainly cultivating, introducing and cultivating at the same time, and optimize the introduction of talents based on the change of job requirements. While broadening the introduction channels, we also use various feasible strategies to attract all kinds of high-end talents from the perspectives of operation development, job salary, welfare, development space, etc.

Modern enterprises should also reasonably set up the mechanism of talent incentive constraints and talent training, seamlessly connect individual interests, collective interests and strategic goals of each stage, and make short-term, medium-term and long-term incentives coordinated, including material incentives, spiritual incentives and emotional incentives.

#### **4.3 IMPROVING NETWORKED HUMAN RESOURCE MANAGEMENT TECHNIQUES**

Focus on the application of information network technology in human resource management, realize the office automation of human resource management work, create a good working atmosphere for employees, and ensure that employees have a good sense of belonging in the enterprise. Focus on the application of digital human resource management mode, play an important role of networked human resource management.

### **5. CONCLUSION**

Exploring the construction of HRM system based on deep learning model, this paper starts from HRM and analyzes the logic of the impact of artificial intelligence technology under deep learning model on HRM practice. The effective evolution of AI HRM model is used to provide the direction for the construction of HRM system, to take strategic performance management system, HRM mechanism and networked HRM technology as the main driving force, and then build an efficient, rational and, scientific HRM system.

## ABSTRACT

With the popularity of Internet technology, the importance of network security education is increasing. This paper first analyzes the characteristics of virtual machine technology, and explores the problems in the current network security education in colleges and universities from two aspects of network security awareness and network security education methods. In response to these problems, virtual machine technology is applied to network security education. The current network security education in colleges and universities is still carried out mainly by special lectures, accounting for 66.6%. At the same time, college students' network security awareness is very high only accounts for 16.5%. This paper lays the foundation for a more effective application of virtual technology in teaching computer network security courses.

## KEYWORDS

security education; virtual machine technology; network security awareness; security education methods

## 1. INTRODUCTION

In the era of information technology, people's activities such as clothing, food, housing, transportation, and entertainment and learning are closely related to network information services. And there are various objective risk factors in the network, such as computer viruses, cyber crimes, etc., which may bring potential threats and harm to the people [1-2]. Therefore, it is especially important to carry out network safety education. In their daily learning life, adolescents widely use computers and cell phones; however, due to their poor self-control and risk awareness, they easily lose themselves on the Internet and become victims of cybersecurity [3-5]. Strengthening the application of computer technology in network safety education has positive significance for maintaining social security and stability and protecting the healthy growth of adolescents.

The current cybersecurity education has formed a complete social synergy. The study of literature [6] summarized the connotation and significance of cybersecurity

education, identified the problems of cybersecurity education in colleges and universities, and put forward relevant suggestions. The literature [7] focused on the application of MOOC hybrid teaching mode in the practice of cybersecurity education for college students. The literature [8] objectively analyzed the problems in cybersecurity education in colleges and universities by means of a questionnaire survey. The literature [9] constructs a four-in-one innovation mechanism of university cybersecurity education in the era of mobile Internet from four dimensions: systematic education system, diversified education mechanism, professional education capability, and comprehensive education platform. According to the above research, this paper proposes to explore the application of computer technology in network security education in the context of data mining, and proposes the application method of virtual machine technology in it based on the analysis of the current problems of network security education in colleges and universities.

## **2. VIRTUAL MACHINE TECHNOLOGY**

### **2.1 VIRTUAL MACHINES IN THE CONTEXT OF DATA MINING**

Virtual machine technology actually refers to a virtual computer, a virtual product. Virtual computers have similarities to physical computers in terms of operation and practice. However, these virtual machines are able to operate independently of each other without interference between computers and also have the ability to constantly change computer configuration elements. In the context of data mining, there is no need to worry about the negative impact of improper operation on the physical computer, so it is necessary to promote virtual machines in the teaching of network security technology in universities.

### **2.2 FEATURES OF VIRTUAL MACHINE TECHNOLOGY**

#### **2.2.1 COMPATIBILITY FEATURES**

The structure of virtual machines is unique. Generally speaking, a virtual machine has a self-contained client operating system, and this system also has a more complete set of applications. The virtual machine also has various internal structures of a normal computer, such as the network card and the graphics card, which are very similar to a computer. On the one hand, this shows that virtual machines are different from ordinary computers to a certain extent, but they still have similar roles to ordinary computers. On the other hand, the difference between a virtual machine and an ordinary computer is that each system of a virtual machine is independent and cannot be viewed as a whole in the same way as a computer system. Therefore, it can be said that virtual machines are more compatible than ordinary computers.

#### **2.2.2 ISOLATION CHARACTERISTICS**

Virtual machines have many characteristics, and one of the most prominent is isolation. Virtual machines are used to share computer screens and systems. At the same time, virtual machines allow people to easily create a sandbox-like structure that helps staff to have a clear and comprehensive view of the physical computer and prevent viruses from invading the computer during the sharing process and affecting

the normal use of the computer. The independence of virtual machines is another outstanding feature. When people use virtual machines, it is easy to see that the virtual machine system is able to display the combination of its own hardware and operating system in a clear and independent way.

**2.2.3 SELF-INDEPENDENCE**

Another feature of virtual machines that needs attention is their independence. In studying virtual machines, one needs to pay attention to their independence and not treat them as a whole. If we look at the user level, each user of a virtual machine is able to independently configure the hardware and components of the virtual machine to achieve different needs and results.

**3. Analysis of the current situation of cyber security education**

**3.1 Analysis of the current situation of network security awareness**

The current situation of college students' network security awareness is shown in Figure 1. 16.5% of college students' network security awareness is very high. 28.4% of college students' network security awareness is okay and needs to be continued to be strengthened. 47.6% of college students' network security awareness is not high. 7.5% of college students have almost no network security awareness. Colleges and universities do not know enough about the importance of network security education, and always make relevant remedial work only after a series of network security problems happened to college students. Even if there are some related lectures and propaganda, they are only formal and do not really think about the actual problems for students. The reason is that they do not realize the great harm of network to college students, to campus harmony, to social stability and to national security, and do not deeply appreciate the pain that these hazards bring to colleges and universities.

**Figure 1** The current situation of college students' awareness of cyber security

### 3.2 ANALYSIS OF INTERNET SECURITY EDUCATION METHODS

The distribution of network security education methods in colleges and universities is shown in Figure 2. At present, colleges and universities still carry out network security education mainly by special lectures, accounting for 66.6%. It is followed by publicity through exhibition boards or windows, accounting for 9.2%. The way of classroom teaching is 15.4%, generally mostly for computer school students in professional classes involving some knowledge of network security, the teacher will teach with the class. Student unions, college student groups and other organizations of publicity activities club activities accounted for 8.8%. Although the current situation of network security education has improved, but there is still in the emphasis on "security management" light "security education" as the dominant ideology.

Figure 2 Network security education approach

## 4. APPLICATION OF VIRTUAL MACHINE TECHNOLOGY IN NETWORK SECURITY EDUCATION

### 4.1 CONDUCTING HANDS-ON TEACHING

In the current higher-level computer network security teaching, most teachers mainly explain theoretical knowledge, and students lack the proper practical ability. The use of virtual machine technology can build a training platform, allowing students to have a deeper understanding of knowledge in the teaching process. Teachers can classify the course teaching content in the teaching process, and start teaching from two aspects of attack methods and attack objects to strengthen students' understanding of network security knowledge.

### 4.2 CARRY OUT VARIOUS FORMS OF TEACHING

The method of teacher demonstration and student learning is no longer suitable for modern college computer teaching. Teachers can explore a new teaching mode. In the whole teaching process of computer network security, relevant competitions can be held to improve students' knowledge; exercise students' operation ability, effectively improve students' understanding of computer knowledge through the comparison of attack and defense between students, and also can stimulate students' interest in learning to a certain extent, so as to learn computer network security knowledge more efficiently.

## 5. CONCLUSION

Through the analysis of the current situation of network security education in colleges and universities, this paper proposes the application of virtual machine technology to network security education for the problems existing in it. As the core curriculum of higher education institutions, computer network security course realizes comprehensive, practical and application as one. In today's progress of education, it is necessary for us to continuously innovate teaching forms, adjust education methods and education concepts, and promote the progress and development of society. Under the command of virtual machine technology, we can alleviate the problem of insufficient space and experimental equipment, and improve the rationality and safety of experimental equipment in all aspects. Use the process to reduce the difficulty of laboratory management, bring students more interesting and rich practical training content, and improve the fun of practical training while controlling expenses.

**ABSTRACT**

In order to explore the implementation of political and business talent development, this paper designs a data survey and analysis model of political and business talent development policy in the context of data collection. The data collection is fully utilized to monitor and evaluate the effects of the policy. Multi-dimensional evaluation indicators are used to investigate the relationship between the dependent and independent variables, and the degree of influence of each factor on political and business talent is investigated through regression analysis. The results showed that the implementation of political and business talent development policies including research participation, thesis performance and gender optimization were all positively related to the performance of talent cultivation. It is clear that the survey has a positive impact on the development of data collection and innovation in the area of talent development policy, and is an important guide for governments, universities and enterprises.

## KEYWORDS

political and business talent development policy; performance of talent cultivation; data collection; survey; multidimensional evaluation; regression analysis

## 1. INTRODUCTION

With the rapid development of Internet technology and the advent of the era of big data, data collection has become an important topic in the information age <sup>[1-2]</sup>. The cultivation of political and business talents, as the key to the current social and economic development, is attracting more and more attention. Both governments and enterprises are actively exploring how to cultivate more political and business talents to promote sustainable economic development <sup>[3-5]</sup>.

Big data, also known as huge data collections, is a term used in the computer industry to refer to large collections of data that cannot be processed with conventional tools and must be processed in a way that requires a new information-based processing model to unlock the value of the massive growth in data. The literature <sup>[6]</sup> selected 35 OECD economies for the study to address the issue of equality with their World Talent Survey data. Data from three different directories were transformed with the Gini index to achieve a pattern of distribution across economies. Cluster analysis was performed to determine the interpretation of the best clusters, the Gini index could be used to appropriately transform data with classical indicators of equality, and a tree diagram showing the two clusters between the economies provided meaningful information for further interpretation of the dataset. The aim of the literature <sup>[7]</sup> is to provide a useful exercise in the use of virtual reality technology in student education and the main points of teaching at this stage, thus opening up ideas for further research. The current state of research and some important concepts of virtual reality technology are introduced to clarify the importance and some drawbacks of education in the traditional education model. Through the collected literature and survey data, the feasibility of combining virtual reality technology with education is analyzed and a theoretical basis is provided.

Based on this, this paper designs a data survey and analysis model for political and business talent training policies in the context of data collection. Firstly, the technical means of data collection and analysis are fully utilized to support and analyze the data. Secondly, the policy effects are monitored and evaluated, using multi-dimensional evaluation indicators, with the number or growth rate of political and business talents as the dependent variable. Finally, the experiment proves that research can provide data and methodological support for theoretical as well as practical research on the policy of cultivating political and business talents.

## **2. DATA COLLECTION BACKGROUND APPLICATIONS**

### **2.1 INTEGRATING AND OPTIMISING DATA**

The cultivation of political and business talents refers to the cultivation of talents with both political and business acumen, aiming to promote the coordinated development of politics and economy. In the current era of big data, the cultivation of political and business talents also needs to make full use of the technical means of data collection and analysis to better meet the needs of society and the economy <sup>[8-9]</sup>. Policy formulation and implementation of political and business talent cultivation needs to be based on adequate data support and analysis, including monitoring and evaluation of policy effects. Government departments can use questionnaires, interviews and case studies to gain an in-depth understanding of the needs of political and business talent and the implementation of policies, as a basis for formulating more scientific and practical policy solutions.

### **2.2 POLITICAL AND BUSINESS TALENT DEVELOPMENT**

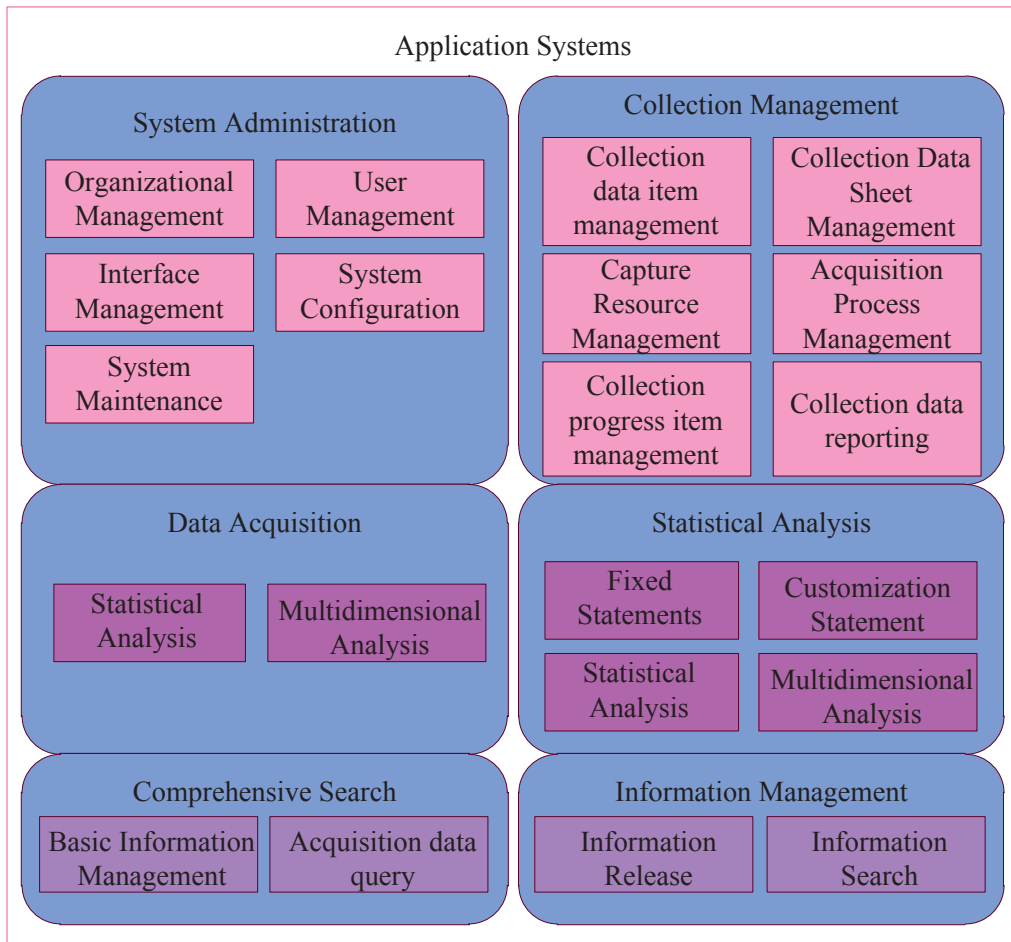

The evaluation and selection of political and business talents also needs to fully consider the methods of data collection and analysis, and adopt multi-dimensional evaluation indicators and models, including comprehensive quality evaluation, behavioral interviews and psychological tests, in order to improve the accuracy and fairness of the evaluation <sup>[10]</sup>. It is also necessary to establish and improve talent pools and talent information platforms to facilitate resource sharing and information exchange among political and business talents. The training and development of political and business talents also needs to make full use of technological means of data collection and analysis, including big data analysis, artificial intelligence and virtual reality, in order to improve the accuracy and personalization of training effects and personal development. There is also a need to establish and improve the incubation mechanism and ecological environment for innovation and entrepreneurship in order to stimulate the innovative spirit and entrepreneurial passion of political and business talents.

### **2.3 BUILDING A MODEL FOR TRAINING POLITICAL AND BUSINESS TALENT**

Regression modelling is a statistical method used to analyze the relationship between variables and is usually used to examine the relationship between the dependent and independent variables. In constructing models, regression models can be used to explore the effects of policy factors and other influences on political and business talent, as well as to predict the effects and trends of policy implementation. In the survey data on political and business talent cultivation policies, policy factors, talent factors and other influencing factors can be used as independent variables, and the number or growth rate of political and business talent can be used as the dependent

variable to explore the degree of influence of each factor on political and business talent through regression analysis. The analysis model of the survey data on the cultivation policy of political and business talents is shown in Figure 1.

**Figure 1** Political and business talent training model

As can be seen from Figure 1, the data collection in the political and business talent training model includes two parts: data collection and data audit. The management of data collection of political and business includes the management of collected data items, the management of collected data tables, the management of collected resources, the management of collection process, the management of collection progress and the management of collected data reporting. Statistical analysis of the collected data can be carried out, mainly including four parts: fixed reports, custom reports, statistical analysis and multi-dimensional analysis of advanced statistics. The collection processing engine is the business processing layer of various functions, and is the core and brain of the collection platform, including the collection engine, process management engine, report engine, interface engine and system security engine. The database is the storage layer of system data, storing system data, collected state data and statistical analysis data respectively.

### 3. TALENT DEVELOPMENT POLICY REGRESSION DATA ANALYSIS STUDY

In this paper, a regression analysis model of political and business talent cultivation policy was designed in the context of data collection, and 220 undergraduate and master students in a university were randomly selected as the research subjects for regression data analysis. The independent variable is political and business talent cultivation policy, which includes three dimensions, X1 is "research participation", X2 is "thesis performance", X3 is "gender optimization", and the dependent variable Y is the performance of talent cultivation, where Model 1, Model 2 and Model 3 are the early, middle and late effects (one semester apart for each stage) of the policy implementation respectively. The academic research of the paper is evaluated by the production quantity of the paper, and the thesis performance are quantified by the evaluation results of the school. The comprehensive quality evaluation score of talents is used as the target. By inviting experts to score (1 ~ 100), the results of the training effect are quantified. Descriptive statistical analysis of the independent and dependent variables is shown in Table 1.

**Table 1** Descriptive statistical analysis of talent training

Variables	Y		
	Model 1	Model 2	Model 3
C	-18.622** (-2.449)	-7.828*** (-3.695)	-4.989*** (-4.800)
X1	0.146** (2.446)	0.093*** (4.886)	0.028** (2.458)
X2	0.202 (1.260)	0.040 (0.869)	0.065*** (3.983)
X3	0.482*** (3.980)	0.067 (1.157)	0.009 (0.414)
N	220	220	220

The R<sup>2</sup> values and F-test values in Table 1 show that the model passed the test. Comparing the corresponding terms among the tested sample models, the regression coefficient of "research participation" was 2.458, while the coefficient of "thesis performance" was 3.983 and the coefficient of "gender optimization" was 0.414. The empirical results show that the improvement of thesis performance, the optimization of a more balanced gender ratio of political and business talents, and the improvement of research participation of students with academic research careers can effectively increase the development performance of political and business talent cultivation; from the perspective of personal initiative, such graduate students are demanding themselves strictly, and their degree course grades and thesis scores are both high. The model can understand the situation and effect of policy implementation, provide

the basis for government, universities and enterprises, etc. to optimize the policy and further improve the effectiveness of the policy.

#### **4. CONCLUSION**

In this paper, a data analysis model was designed in the context of data collection for the cultivation of political and business talents, and the experimental results were analyzed to verify the model. The results show that research participation, thesis performance and gender optimization policy are all contributes to the improvement of talent cultivation performance. The results indicate that by studying the role of government and business talent training policies in promoting data collection and innovation development, we can provide more ideas and solutions for governments, universities and enterprises to further promote data collection and innovation development.

## ABSTRACT

This paper designs a model for researching the history of health culture in Shaanxi during the Tang Dynasty in the context of data collection information. The information is analysed and mined through web crawler data collection. The Tang dynasty Shaanxi query terms were selected as topics, the initial resource system was located, and topic relevance predictions were made so as to improve the accuracy and timeliness of the information. The results show that the selection confidence level  $\alpha=0.05$  in Tang Dynasty Shaanxi health culture, the effective rule of mutual influence degree is greater than 0.5, and the possibility of analytical output is 99.5%. It can be seen that the data and information collection helps to explore the history of health culture in Shaanxi during the Tang Dynasty in depth, and is of some significance in promoting the inheritance and development of China's traditional health culture.

## KEYWORDS

data collection; web crawlers; relevance prediction; selection confidence level; valid rules

## 1. INTRODUCTION

In recent years, with the development of information technology and data collection techniques, data analysis methods in historical and cultural research have been widely used [1-2]. The Tang Dynasty was an important period in China's history, and Shaanxi was one of the political, economic and cultural centres of the Tang Dynasty. In the

<https://doi.org/>

Shaanxi region during the Tang Dynasty, people had unique characteristics in terms of lifestyle, dietary habits, medical knowledge and health concepts [3-4].

The development of the Internet has led directly to the rapid growth of information on the Internet, which is becoming a huge digital information resource. The Internet covers a wide variety of Tang Dynasty health culture histories and is a crucial first step for the collection and measurement of Tang Dynasty health information data, both from the perspective of information retrieval and scientometric analysis. The literature [5] establishes a foundation that allows for the understanding and acceptance of other cultures. Travel, which appears in traditional Chinese culture, also evolved with Chinese history, and was more developed in the Tang dynasty than in the past, as the openness that characterised the Tang dynasty transformed it into a systematic form. In addition, the nomadic character that emerged in Tang scholarly travel is an area that requires continued attention and research, as it has a different value from the nomadic peoples discussed in contemporary society. The literature[6] created a new cultural norm that did not exist in any other dynasties before or after it. Qujiang culture grew as a unique culture in the Tang dynasty, and it was able to see its own golden age. The Qujiang culture allowed literature and feasting to be combined and did not neglect any part of the culture. This culture with this characteristic developed and reached its golden age. In summary, the artistic culture of the Tang dynasty could not be raised to a level unmatched by any other dynasty.

Based on this, this paper uses data collection information technology to design a research model for the history of health culture in Shaanxi during the Tang Dynasty. Firstly, data collection was carried out by means of web crawler technology, which was generated using search engine development. Secondly, the query words of the history of health culture in Shaanxi of the Tang dynasty were taken as the theme, and the initial resource system was positioned for theme relevance prediction. Finally, it was demonstrated through experiments that the model can not only provide a reference for our understanding of the history and culture of Shaanxi region in the Tang Dynasty, but also provide useful insights for promoting the inheritance and development of traditional health culture in China.

## **2. DATA INFORMATION COLLECTION BACKGROUND**

### **2.1 TANG DYNASTY HEALTH CULTURE COLLECTION IN SHAANXI**

Data collection can be done through various technical means, such as web crawlers and sensors, to collect data and use various data processing techniques to analyse and mine the data to obtain valuable information and knowledge [7-8]. Data collection not only improves the accuracy and timeliness of information, but also provides support and basis for research in various fields. In historical research, data collection also plays an

<https://doi.org/>

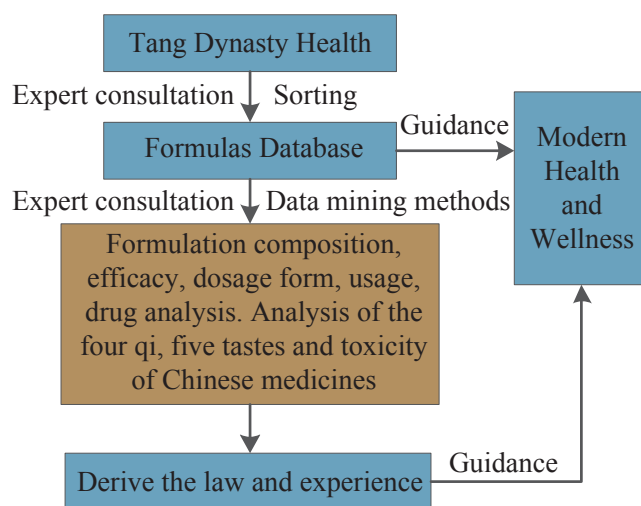

important role. Traditional historical research mainly relies on documents, historical materials and other information for analysis and inference, but such information is usually not comprehensive and accurate enough. With the development of modern technology, however, historians can obtain more comprehensive and accurate historical data through various technological means, such as digital processing and geographical information systems, so as to study historical events and phenomena in greater depth.

## **2.2 WEB CRAWLER DATA COLLECTION**

Web crawlers enable the automatic collection of information data from the Internet, thus making up for the shortcomings of manual collection. Web crawlers are a generic information gathering technology that emerged with the development of search engines and are a core part of search engines [9]. The thematic web crawler is an extension of the general-purpose web crawler, which conducts queries for relevant information based on specific themes within the field of health culture, searches the Internet to crawl downloadable web pages, and collects information data and hyperlinks related to the history of health culture in Shaanxi during the Tang Dynasty from the web pages. Using the Tang dynasty Shaanxi health culture history query term as the theme, all hyperlinks in the web page are accessed from the selected initial resource location system, subject relevance is predicted for these resource location systems according to some search strategy, data resources that meet the requirements are added to the queue to be accessed, and are extracted from the queue in order of priority as the next object to be accessed, and this pattern is executed until The queue is empty, or some stopping condition is met.

## **2.3 A MODEL FOR THE STUDY OF THE HISTORY OF HEALTH CULTURE IN SHAANXI DURING THE TANG DYNASTY**

The Tang Dynasty (618-907) was a very important period in Chinese history, and one of the most prosperous periods in Chinese history in terms of culture and art [10-11]. During this period, the health culture of the Shaanxi region also developed and progressed greatly. The Shaanxi region in the Tang Dynasty was very distinctive in terms of medicine. The medical theories of the Tang Dynasty were mainly based on the Yellow Emperor's Classic of Internal Medicine and the Book of Difficulties. Based on the medical theories of the Shaanxi region in the Tang dynasty, including the theoretical systems based on the Huangdi Neijing and the Nangjing, Figure 1 shows the model for the study of the history of health culture in Shaanxi during the Tang dynasty constructed in this paper.

**Figure 1** Model of Shaanxi Health Culture History in Tang Dynasty

As can be seen from Figure 1, the model of health culture history research in Shaanxi during the Tang Dynasty combines the theoretical approaches of basic Chinese medicine theory, prescription science and traditional Chinese medicine, and uses traditional Chinese medicine documentation methods to systematically sort, analyse and summarise them, on the basis of which a database of health culture history in Shaanxi during the Tang Dynasty is established. Using modern statistical methods and techniques, the history of health culture is classified and organised to further the systematic study of health culture in Shaanxi during the Tang Dynasty. Through the establishment of this model, the experience of the history of health culture in the Tang Dynasty is summarised, the historical significance of health culture in Shaanxi during the Tang Dynasty is evaluated, and reference and methodological enlightenment is provided for modern health culture.

### 3. ANALYSIS OF THE EFFECTS OF HEALTH CULTURE AND WELLNESS

In this paper, based on the background of data collection information, we designed a research model for the history of health culture in Shaanxi during the Tang Dynasty, and conducted correlation analysis on the selected four health and wellness drugs, and the experimental results are shown in Table 1.

**Table 1** The effect of health preservation in the Tang Dynasty

Prescription	Support	Confidence	Chi-square Value	Impact Rate
Angelica Sinensis	0.0758	0.6887	86.6482	0.83
Cinnamomum Sassia	0.0596	0.5222	98.7268	0.6426
Rhizoma Zingiberis	0.0684	0.4893	84.7944	0.5484
Dendrobe	0.0588	0.385	65.866	0.5961

As can be seen from Table 1, among the four Tang dynasty health and wellness drugs, namely Angelica, Cinnamon, Dendrobium and Atractylodes, the selection

<https://doi.org/>

confidence level of Atractylodes was found to be  $\alpha=0.05$  according to the cardinality table, and the cardinality value was transformed into the correlation odds ratio with a mutual influence degree greater than 0.5 valid rules, and the analytical output likelihood was 99.5%. It indicates that the model can be used to dig out drug combinations with clear meaning and guidance for clinical application from a large number of Tang Dynasty compound prescriptions, to better understand and use the health and wellness culture of Shaanxi in the Tang Dynasty, and to provide a convenient and systematic reference basis for modern health culture.

#### **4. CONCLUSION**

This paper actively explores the history of health culture in Shaanxi during the Tang Dynasty based on the background of data collection information. In the process of exploration, a research model for the history of health culture in Shaanxi of the Tang Dynasty is designed and the practical feasibility of the model is demonstrated through the analysis of experimental results. The results show that the selection confidence level  $\alpha=0.05$  in the health culture of Shaanxi in the Tang Dynasty, the effective rule of mutual influence degree is greater than 0.5, and the analytical output possibility is 99.5%. It indicates that the research on the history of health culture in Shaanxi during the Tang Dynasty based on the background of data collection information contributes to the transmission of traditional Chinese health culture and has extremely important research value for future generations.

---

## ABSTRACT

In this paper, a positive psychology model of entrepreneurial employment is designed in the context of the Internet+ perspective. Using a systematic research approach, it provides a thorough analysis of the entrepreneurial mindset of university students. From a holistic and systematic perspective, the cultivation of entrepreneurial thinking among university students in "Internet+" is explored to improve the systematicity and scientificity of the discourse. The results show that 34.32% of college students are interested in entrepreneurship and 54.4% of college students have the courage to overcome the difficulties of entrepreneurship. The percentage of university students who have a positive mindset to face setbacks is 82.46%. 25.39% of students were brave enough to bear the consequences of their actions. It can be seen that positive psychology in the Internet+ perspective can help university students develop positive psychological qualities for entrepreneurship and improve their willingness and ability to start a business.

## KEYWORDS

internet+; entrepreneurship and employment;; systematic research method; systematicity; scientificity

## 1. INTRODUCTION

With the onslaught of the "Internet Plus", many traditional industries have found their own "Internet Plus" solutions, ushering in the opportunity to leapfrog the dragon. This shows that only those who are good at discovering and innovating, and who seize the opportunities, may be able to return with a full harvest in the process of development of the times [1-3]. Innovation is the fundamental driver of the "Internet Plus" era, and the

gradual increase in demand for innovation and opportunities for innovation will inevitably link the advent of the entrepreneurial era, providing a broader platform for those who truly have entrepreneurial dreams [4-5].

With their own unique mindset, enthusiasm for knowledge and strong ability to integrate network resources, university students are gradually participating in the huge team of online entrepreneurship through the new space and new momentum given to them by the "Internet +" in terms of entrepreneurial environment, entrepreneurial thinking and entrepreneurial paths, and are rapidly becoming the "Internet +" era entrepreneurial situation of the backbone of the force. The literature [6] shows that support vector machine algorithms are applied to the management of university students' employment and entrepreneurship in order to improve their work efficiency. Literature [7] points out that some university students are confused about their future career development and have lost confidence. In the face of this development situation, Premier Li Keqiang advocated the new concept of "mass entrepreneurship and innovation", which undoubtedly pointed out a new development direction for universities. Combining with the current development situation, the current situation of entrepreneurial ability cultivation of college students is analyzed and corresponding cultivation strategies are proposed, which is of great significance to cultivate entrepreneurial ability of college students for their future development. In summary, the cognitive bias of entrepreneurship among university students, the lack of grasp of market orientation and the deficiency of psychological quality.

In this paper, a positive psychology model of entrepreneurship and employment is designed in the context of the Internet Plus. Firstly, it analyses the unique characteristics of university students' entrepreneurial groups and analyses the entrepreneurial employment space given to them by the Internet Plus. Secondly, we collect information on the entrepreneurial environment for comparison and thoroughly analyse the literature on entrepreneurial thinking among university students to form our personal view. Finally, the positive psychology model of entrepreneurship and employment is shown to offer the possibility of expanding the entrepreneurial horizons and platforms of university students.

## **2. POSITIVE PSYCHOLOGY IN THE CONTEXT OF INTERNET+**

### **2.1 POSITIVE PSYCHOLOGY APPROACH TO ENTREPRENEURSHIP**

In the era of Internet +, all industries are in full swing and have started to connect with the Internet. As a group with an active mind and a strong desire for knowledge, university students have undoubtedly become the driving force of "mass entrepreneurship and innovation" [8-9]. Firstly, according to the situation of entrepreneurship and employment in the era of "Internet+", we analyze the new space

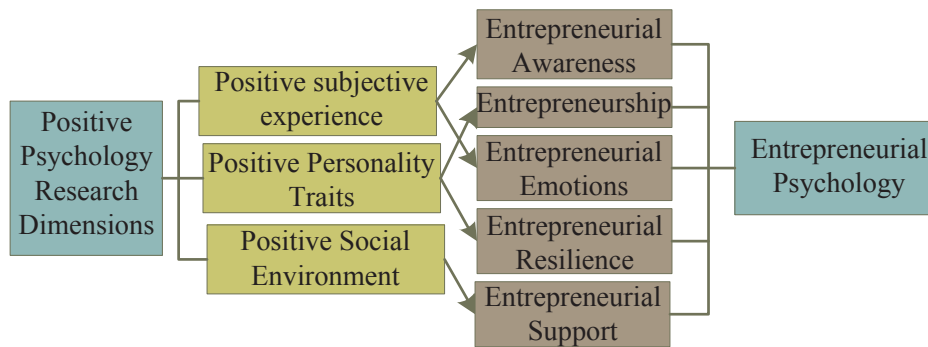

of entrepreneurship and employment given by "Internet+" in conjunction with the analysis of the uniqueness of college students' entrepreneurial group. Secondly, it is not enough for students to grasp the opportunities of the "Internet +" era, to have innovative ideas and to become the trendsetter of entrepreneurship and employment, but a good entrepreneurial mindset is the inner motivation of students' entrepreneurial activities. By carefully comparing the data collected on the entrepreneurial environment of the Internet Plus and thoroughly analysing the reasonable components of the literature on university students' entrepreneurial thinking, we form our own viewpoint. Using a systematic research approach, we explore the cultivation of entrepreneurial thinking among university students in the Internet Plus era, thereby improving the systematic and scientific nature of the thesis.

## **2.2 GUIDANCE FOR UNIVERSITY STUDENTS ON THE CONCEPT OF ENTREPRENEURSHIP AND EMPLOYMENT**

To successfully transform college students from potential entrepreneurs into practical entrepreneurs, the main thing is to help them develop good entrepreneurial psychological qualities and college students firmly establish their entrepreneurial dreams [10]. Therefore, a systematic, scientific and comprehensive entrepreneurial psychological quality education should be carried out for college students, so that they can have a positive entrepreneurial consciousness, a tenacious entrepreneurial will and a unique entrepreneurial personality, etc. This will enable more college students with entrepreneurial ideas to actively engage in entrepreneurial practice, so as to realize entrepreneurship-driven employment and relieve employment pressure. Successful entrepreneurship can also effectively convert knowledge into productivity, promote the development of social economy, create more employment opportunities and achieve the purpose of entrepreneurship-led employment.

## **2.3 BUILDING A POSITIVE PSYCHOLOGY MODEL OF ENTREPRENEURIAL EMPLOYMENT**

Positive psychology is a new trend in the field of psychological research, dating back as far as the 1930s to the study of marriage, happiness and the meaning of life [11-12]. Positive psychology organically integrates theoretical foundations with practical teaching and the systematic study of positive organisation at the group level, which is the inspiration point for constructing positive entrepreneurship psychology education. In the entrepreneurship education of college students, the research of positive psychology is applied to positive entrepreneurship psychological education and its role in improving the psychological quality of college students' entrepreneurship is explored. Based on this, a positive psychology entrepreneurship employment model is constructed as shown in Figure 1.

**Figure 1** Positive psychology entrepreneurial employment model

From Figure 1, it can be seen that in the positive psychology entrepreneurship and employment model, the positive subjective experience of entrepreneurship education has an enhancing effect on entrepreneurial consciousness and entrepreneurial emotion. Entrepreneurial consciousness directly influences whether college students have a positive attitude towards entrepreneurship, whether they are adequately prepared for entrepreneurship and whether they are committed to entrepreneurial practice. Positive entrepreneurial motivation, needs and interests match with the psychological needs and subjective experiences of university students in order to stimulate endless entrepreneurial employment potential and motivate the continuous development of entrepreneurial practice activities. The role of education on positive entrepreneurial personality traits in enhancing entrepreneurial ability and entrepreneurial resilience. The focus is on cultivating students' positive self-confidence in entrepreneurship and employment and their courage to deal with entrepreneurial setbacks, and on the continuous development of students' entrepreneurial and employment potential, which plays a decisive role in guiding students' entrepreneurship and employment.

### **3. ANALYSIS OF THE CURRENT SITUATION OF UNIVERSITY STUDENTS' ENTREPRENEURSHIP AND EMPLOYMENT**

In this paper, a positive psychology entrepreneurship and employment model is designed in the Internet+ perspective to conduct entrepreneurship and employment experiments on university students, and the results of the experimental analysis are shown in Figure 2.

**Figure 2** Survey of entrepreneurial psychology of college students

From Figure 2, it can be seen that 34.32% of the students who chose "strongly agree" when asked "I am interested in starting a business" and 54.4% of the students who chose "strongly agree" when asked "do you have the courage to overcome When asked "Do you have the courage to overcome the difficulties in starting your own business", 21.04% of students chose "strongly agree" and 54.4% of students chose "agree". When asked if they had a positive mindset to face the setbacks they encountered in starting their own business, 82.46% of students chose "strongly agree" and "agree". When asked if they were brave enough to bear the consequences of their actions, 25.39% of students said "strongly agree". This indicates that students have a correct perception of entrepreneurship and have developed positive entrepreneurial qualities in the context of positive psychology.

#### 4. CONCLUSION

This paper conducts an effective study on the positive psychology entrepreneurial employment view of university students in the Internet+ perspective. In the research process, a model of positive psychology entrepreneurship and employment based on the Internet+ perspective was designed, and the application effect of the model was verified through the analysis of experimental results. The results show that; 34.32% of college students are interested in entrepreneurship, and 54.4% have the courage to overcome college students in the face of entrepreneurial difficulties. The positive mindset to face setbacks was 82.46% of the university students. The courage to bear the consequences of their actions was 25.39% of college students. This shows that giving full play to the role of positive psychology in motivating and stimulating potential in the Internet+ perspective can cultivate entrepreneurial talents with good psychological quality.

# DESIGN STUDY OF AN INTELLIGENT AQUACULTURE ENVIRONMENT MONITORING SYSTEM BASED ON STM32 MICROCONTROLLER

---

Liuna Zhou\*

Guangxi Vocational University of Agriculture, Nanning, Guangxi, 530007, China

[liuna\\_zhou@163.com](mailto:liuna_zhou@163.com)

---

## ABSTRACT

This paper designs an intelligent aquaculture environment monitoring system based on STM32 microcontroller, including three parts: water environment terminal node, field display node and upper computer software, combined with NB-IoT communication in order to achieve real-time monitoring of various key indicators of aquaculture water quality environment. The results show that the time interval for temperature is 15 min, pH is 2 min and dissolved oxygen is 5 min. Therefore, the system has high stability, reliability and accuracy, which not only improves economic efficiency, but also reduces material and human resources and improves the survival rate of aquatic organisms.

## KEYWORDS

STM32 microcontroller; intelligent aquaculture; environmental monitoring system; key indicators; dissolved oxygen

## 1 . INTRODUCTION

In recent years, the aquaculture industry has developed rapidly, producing aquatic products that are not only self-sufficient but also exported in large quantities abroad [1-3]. However, the traditional aquaculture industry has many problems in terms of environmental water quality monitoring [4-5]. The traditional method of manual monitoring not only wastes a lot of human and financial resources, but also leads to errors in the collected data due to manual monitoring, and users are unable to make correct judgments on changes in water quality, making the development of the industry subject to greater constraints. With the rapid development of wireless sensor network technology, it has begun to be widely used in various industries, and also provides new solutions for aquaculture environmental monitoring [6-7]. Therefore, research on how

to better use wireless sensor networks to monitor aquaculture has received widespread attention and has become a hot issue.

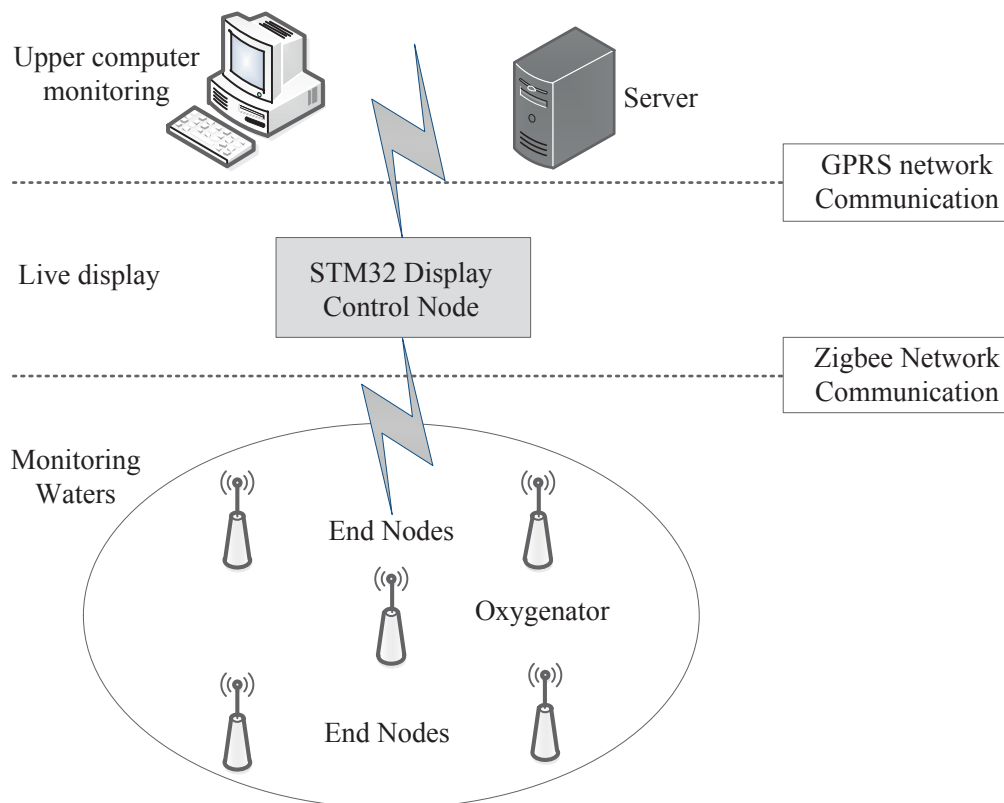

The establishment of 'aquaculture environmental monitoring systems' is an important tool to improve the quality and efficiency of aquaculture. In the literature [8], progress in marine research to understand environmental change and its effects on marine ecosystems has relied on the use of heavy and invasive biological instruments and sensory telemetry networks to collect data on the physiology of species, their habitats and their movement patterns. In the past, a lightweight compliant environmental monitoring system. Literature [9] Plastic pollution has become one of the most pressing environmental challenges and has received a correspondingly wide range of attention. Although it is a top priority for policy makers and scientists, the knowledge needed to guide decision-making, implement mitigation actions and evaluate their results is still inadequate. An integrated global plastic pollution monitoring system is needed to provide comprehensive, harmonised data for environmental, social and economic assessments. The initial focus on marine ecosystems has been expanded to include atmospheric transport and terrestrial and freshwater ecosystems. The literature [10] proposes an environmental monitoring system based on spatial and temporal correlation in order to provide accurate environmental maps while avoiding unnecessary transmissions from IoT devices. In the ST-EMS (environmental monitoring system), IoT devices decide whether to transmit sensed data to the IoT gateway by considering the temporal correlation and energy level of the sensed data. The optimal policy is obtained through the formulation of a Markovian decision process and it is shown that the optimal policy has a threshold structure that is easy to implement through the use of the submodular concept. The environmental monitoring system proposed in the above literature has low sampling frequency, poor real-time performance and security concerns.

Therefore, this paper studies an intelligent aquaculture environmental monitoring system that can meet the requirements of intelligent management. The system is based on the STM32 microcontroller chip and accomplishes a large number of tasks with repetitive nature, making the monitoring content more comprehensive and improving the timeliness and accuracy of environmental monitoring. The results show that the system has timely warning and efficient reporting functions, and the key indicators extracted, Ph and dissolved oxygen, meet the requirements of accurate monitoring.

## 2 . OVERALL SYSTEM DESIGN

### 2.1 SYSTEM FRAMEWORK

This design is mainly based on microcontrollers and technology to design an intelligent aquaculture environment monitoring system. It includes three parts: the water environment terminal node, the field display node and the upper computer software, and the overall structure is shown in Figure 1.

**Figure 1** System overall framework diagram

As can be seen from Figure 1, the terminal node on the water surface is responsible for the collection and forwarding of water temperature, values and water dissolved oxygen concentration through the module and can control the oxygen concentrators. The on-shore field display node is responsible for receiving, storing and analysing the data via the coordinator. It also performs the functions of displaying parameters and communicating with the host computer via the module, and automatically controls the oxygen concentrators according to the weather conditions issued by the host computer. The software of the upper computer can complete the functions of serial debugging, network debugging, protocol analysis and sending control commands. This system can better monitor and control the water environment required for aquaculture. Not only can it automatically adjust the dissolved oxygen content to prevent fish from being deprived of oxygen and improve the safety factor. It is also possible to view parameters on site

and store them so that control commands can be issued remotely and data collected for long-term research.

## **2.2 MONITORING PARAMETER SELECTION**

To ensure proper growth of fish and shrimp, etc. The culture environment usually requires consideration of the following parameters:

(1) Dissolved oxygen is the molecular state of oxygen dissolved in water. Aquatic plants and animals must survive in conditions where dissolved oxygen is suitable. When dissolved oxygen falls below, fish head floating will occur. When there is a severe lack of oxygen, fish will suffocate and die. Generally the dissolved oxygen in a body of water should be maintained at, or at least above, the level of dissolved oxygen. However, it is important to note that oversaturated oxygen can cause fish to get bubonic disease.

(2) Depending on the type of culture, most are between. For mariculture, the value is on the shouty side. In between, the daily difference must not be greater than.

(3) Water temperature is an extremely important element in the production conditions of aquatic products. Temperature directly affects the reproductive and metabolic activities of aquatic products, which in turn affects the production quality of aquatic products. At the same time, the water temperature also affects the amount of dissolved oxygen.

## **2.3 OXYGENATION SOLUTIONS**

The state of the oxygenator is divided into several conditions. The first is the off state; the second is when the dissolved oxygen concentration is lower than the set value. This is the state with the highest priority for passive oxygenation, in which the oxygenator continues to work until the detected dissolved oxygen concentration reaches the set saturation limit. In addition to receiving the dissolved oxygen concentration and water temperature data from the terminal node, the field display node also measures the current temperature and receives information from the server about tomorrow's weather, which automatically controls the start-up of the aerator through the weather conditions.

## **3. SOFTWARE DRIVER DESIGN**

### **3.1 NB-IOT COMMUNICATION PROGRAMMING**

In accordance with the objectives of this design, the aquaculture environmental monitoring system software program is to be set up to drive the motor to inject baking soda, if too alkaline to inject carbon dioxide. The design mainly has the following points, respectively: STM32 initialization, PH value detection, oxygen concentration 4 system implementation degree detection, temperature measurement, manipulation of DC

motors to NB-IoT communication, etc. Selected according to the subject design, the system can achieve the monitoring and regulation of water quality, water quality PH value detection program and NB-IoT communication program for detailed description.

### **3.2 PH VALUE TESTING PROGRAM DESIGN**

The PH detection module selected for this system, the analog output pins of the module are connected to the PA0 port of the STM32, the PH module is initialized and the PH value is corrected, the PH module reads the potential difference between the two electrodes, after which the output voltage signal is converted into the PH value of the solution to be measured according to the standard curve, if the detected PH value is too acidic when compared with the threshold value, the motor is driven to inject baking soda, if it is too alkaline, carbon dioxide is injected.

### **4. ANALYSIS OF SYSTEM DATA MEASUREMENT RESULTS**

The designed intelligent aquaculture device will be tested, the test items mainly include network data loss rate, water quality data collection and equipment operation, the network data loss rate is used to verify the accuracy of network transmission, water quality data collection is to test the reliability of sensor data collection and transmission data, equipment operation is used to test the stability of equipment operation. In the aquaculture company will be placed in 6 sensor nodes in 6 fish ponds, placed 6 router nodes and 1 convergence node, where the sensor nodes are mainly responsible for the collection of water quality environment, router nodes are responsible for forwarding data, convergence nodes as a monitoring centre. Sensor node every 30s to collect data, the whole system packet loss rate of 0.62%.

When detecting the system water quality information and motor status, the water quality was partially interfered with, allowing the water quality data to be between equipment start-up and shutdown. In general, the values of temperature, pH and dissolved oxygen in the fish pond were set at  $\geq 20^{\circ}\text{C}$ ,  $\leq 6.5$  and  $\geq 6\text{mg/L}$ . The system measurement data and error results are listed in Table 1.

**Table 1** System testing data and error results

Control parameters	Testing time	System detection value	Accuracy instrument detection value	Equipment Status	Alarm or not	Actual relative error/%
Temperature/°C	21;05;00	16.2	17.4	ON	Yes	-6.3
	21;20;00	18.8	19.3	ON	Yes	2.7
	21;35;00	20.7	21.2	OFF	No	-1.5
pH	21;40;00	5.3	5.3	ON	Yes	-3.6
	21;42;00	6.2	6.3	ON	Yes	-1.5
	21;44;00	7.4	7.3	OFF	No	1.5
Dissolved oxygen	22;00;00	4.6	4.2	ON	Yes	4.8
	22;05;00	5.4	5.4	ON	Yes	-3.7
	22;10;00	7.7	7.8	OFF	No	-1.4

As can be seen from Table 1, pH and dissolved oxygen respectively from the database to extract three times the data results, the time interval of temperature is 15min, pH is 2min, dissolved oxygen is 5min, the above three control parameters for the actual relative error calculation, from the calculation results can be seen that the relative error of water quality measurement is not very large. The control parameters obtained three times critical data can clearly see that the electric heating rod, lime powder thrower, oxygenator and alarm device are running normally. Through the table can be seen to detect the accuracy of the sensor measurement, the real-time wireless transmission and the reliability of the equipment control, basically in line with the design requirements.

## 5. CONCLUSION

This paper designs an intelligent aquaculture testing system based on the STM32 microcontroller Intelligent monitoring centre can be set up in various places, in the remote console users can browse equipment operation and water quality data information through computers, mobile phones, tablets and other electronic devices. Through the STM32 microcontroller to the system of water quality monitoring, SMS alarm, automatic adjustment of water quality, so that the whole system more intelligent, technology. The whole system is based on automation and automatically starts oxygenators, thermoelectric rods and other equipment, which greatly avoids economic losses caused by unqualified water quality, improves the production and quality of aquaculture, reduces the consumption of human and material resources in the aquaculture process and has good economic benefits.

# STUDY ON THE OPTIMIZATION OF THE CULTIVATION PATH OF "THREE AGRICULTURAL SENTIMENTS" AMONG UNIVERSITY STUDENTS BASED ON DATA COMPRESSION ALGORITHM IN THE CONTEXT OF RURAL REVITALIZATION

---

Chunzhi Jiang\*

Chengdu Agricultural College, Chengdu, Sichuan, 611130, China

[jstyjcz@163.com](mailto:jstyjcz@163.com)

---

## ABSTRACT

Based on the data compression algorithm, this paper integrates the design of the education and teaching cultivation system of "three agricultural sentiments", and constructs an optimal analysis of the cultivation path of sentiments that takes university students as the main body, takes serving the three rural areas as the goal, encourages students to participate in relevant experimental activities, and combines theory and practice. The results of the analysis show that: the second experiment was scored separately, and the number of people who scored 5 in the second experiment rose by 8 compared with the first, with a total number of 25. Therefore, in the context of rural revitalisation, it is of great importance to actively cultivate students' sentiment for the "three rural areas".

## KEYWORDS

rural revitalization; data compression algorithm; three rural sentiments; cultivation system; path optimization

## 1. INTRODUCTION

Facing the cause of the "three rural areas", cultivating high-quality technical and skilled talents, and cultivating a workforce that understands agriculture, loves the countryside and loves farmers, is the mission and responsibility given to contemporary university students in the new era[1-4]. Agriculture is the foundation of the country. The issue of agriculture, rural areas and farmers is a fundamental issue related to the people's livelihood of the country, and it is necessary to accelerate the modernization of agriculture and rural areas, implement the strategy of revitalizing the countryside, and cultivate a workforce that understands agriculture, loves rural areas and farmers

[5-6]. At present, the quality of the student population is declining, some students are not deeply attached to the "three rural areas", their political awareness is weakened and their professional thinking is unstable, especially some graduates are not willing to work in agriculture, and their employment is in an awkward situation of "not being able to get high but not being able to get low"[7]. How to promote students' determination to strengthen agriculture and promote farming, and implement the fundamental task of educating people with moral character has become a new proposition for universities at this stage.

The successful implementation of the modernisation of agriculture and rural areas and the revitalisation of the countryside requires the support of a large number of highly qualified technical and skilled personnel with a "three-farm sentiment". The literature[8] shows that intervention in the revitalisation and development of artistic villages is one of the ways to brand rural areas, to meet contemporary aesthetics and to satisfy the diversified needs of modern life. At the same time, it is not limited to artistry per se, but is a comprehensive artistic activity with modernity, industrial relevance and sustainability. The experimental results of the dataset show that rural planning and design with artistic intervention is a way to respect local memory, to pass on folk craftsmanship, to reshape historical culture and to identify with the countryside itself. It also proposes new development ideas and guidance methods for sustainable rural development. The literature [9] reveals the difficulties faced in implementing rural revitalisation strategies. Design/methodology/approach. The difficulties in implementing rural revitalisation strategies were systematically analysed from three aspects: people, land and money. The findings concluded that it is necessary to revitalise rural human resources by introducing skilled labour; and to deal with the relationship between farmers and land by deepening land reform and providing facilities for farmers. The literature [10] proposes rural revitalisation as an attempt to reform China's rural programme. Among other things, the pastoral complex emphasises the integration of agriculture and tourism, extending the agricultural industry chain and integrating medical care, technology, tourism, creativity and leisure. The complex factors affecting the pastoral complex are analysed. Fuzzy calculation theory is introduced into the pastoral complex to discuss the operational characteristics of the pastoral complex system and further explore how to construct an adaptive system evaluation system at different system levels. Therefore, more attention should be paid to the operational mechanism factors in the composite pastoral process to make the composite pastoral system more scientific. The lack of rural talents, the lack of distinctive industries and the relatively weak competitiveness of rural revitalisation as suggested by the above literature.

Therefore, this paper constructs a system for cultivating the sentiment of the three farmers based on the data compression algorithm, and analyzes the optimization of the cultivation path of the "sentiment of the three farmers" among university students. In the new development stage of comprehensively building a socialist modern country, university students are the head of the tide of heavy responsibilities and the new impetus for the whole nation to move forward. Cultivating their "three rural sentiments" is the key point to properly solve and deal with the three rural issues, which is related to the fundamental issue of rural revitalization and has extremely important implications of the times.

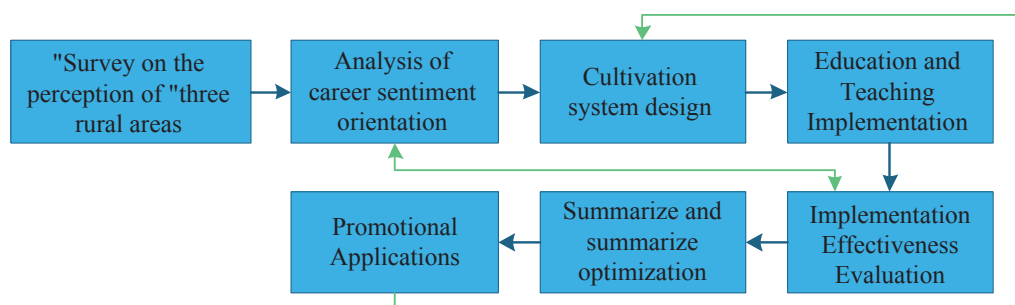

## 2. A DATA COMPRESSION ALGORITHM BASED SYSTEM FOR CULTIVATING THE SENTIMENT OF THE THREE FARMERS

### 2.1 DATA COMPRESSION ALGORITHMS

The application of data compression algorithms must meet the requirements for high data compression rates and large amounts of data storage. At the same time, data compression and decompression should be efficient and rapid in order to meet the requirements of real-time data recording and querying. Therefore, the data compression algorithm in the real-time database should be studied in detail to master its characteristics and principles, so as to better serve the production activities. And on this basis, a three-farm sentiment cultivation system should be constructed.

### 2.2 A SYSTEM FOR NURTURING LOVE FOR THE THREE FARMERS

The University insists on cultivating people with moral values, takes the guiding ideology of "three comprehensive education", aims to serve the "three rural areas", takes students as the main body, focuses on the actual situation of the "three rural areas" in the student's place of origin, and cultivates This paper is based on the guiding ideology of serving the "three rural areas", with students as the main body, and cultivating students' "three rural issues" around the actual situation of the "three rural areas" in their places of origin. The system of cultivating the sentiment of the three rural areas constructed in this paper is shown in Figure 1.

**Figure 1** Three agricultural sentiment cultivation system

As can be seen from Figure 1, according to the college's aim of "serving the three rural areas", on the basis of investigation and analysis of students' "three rural areas" cognition and career orientation, the "three rural areas sentiment" education and teaching cultivation system is designed in an integrated manner, exploring the cultivation path of "three rural areas sentiment" for agricultural students and continuously summarizing the implementation effect to achieve the integration of students' vocational skills and "three rural areas sentiment". Based on the survey and analysis of students' awareness of the "three rural areas" and their career orientation, the College will design an integrated education and teaching cultivation system for the "three rural areas", explore and practice the cultivation path of the "three rural areas" for students majoring in agriculture, and continuously summarise the effects of the implementation to realise the integration of students' vocational skills and "three rural areas". The programme will actively guide students and teachers to pay attention to the development of modern agriculture, care about the construction of socialist villages and farmers' lives, and effectively promote students' service to the "three rural areas", serve their hometowns and contribute to the revitalisation of the country's rural areas.

### **3. THE CULTIVATION PATH OF STUDENTS' SENTIMENT FOR THE THREE RURAL AREAS IN THE CONTEXT OF RURAL REVITALIZATION**

#### **3.1 CULTIVATING THE IDEA OF "THREE AGRICULTURAL SENTIMENTS" AMONG UNIVERSITY STUDENTS**

"The education process should focus on the three rural issues in their hometowns, with service to the three rural areas as the goal, so that students can form a strong love for their hometowns. The process of cultivating students' sentiment for the three rural areas in higher education is to achieve the integration of students' vocational skills and their "sentiment for the three rural areas". It should be a general education subject that all students should study, regardless of their major. Universities should encourage their teachers and students to pay more attention to information about agricultural development, to devote more attention to the construction of the new socialist countryside in China, and to deeply appreciate the hardships of farmers, so as to effectively promote the process of university teachers and students serving the three rural areas and their hometowns, and to devote more powerful strength to the development of the new countryside.

#### **3.2 THE GOAL OF DEVELOPING A SENSE OF FARMING IN UNIVERSITY STUDENTS**

Through the education of the "Three Rural Issues", students will be able to gain a comprehensive understanding of the three rural issues, so that they can grasp some of the issues in modern agriculture and gain a deeper understanding of their own

hometown. The cultivation of students' "three rural sentiments" requires them to have a good grasp of agricultural and rural issues, a process that can be achieved through student research. Universities should encourage students to take part in more research activities to improve their practical investigative skills. Students can also contribute their own suggestions for the development of their hometowns through the results of their research. In the process of research, students can form more tacit understanding with the team and feel the important power of the team in advance, so that they can provide certain conditions for future entrepreneurship.

### 3.3 EDUCATIONAL DESIGN FOR UNIVERSITY STUDENTS' "THREE AGRICULTURAL SENTIMENTS"

The first is the theoretical part, which can be implemented in two ways: the creation of a curriculum and the development of lectures. Teachers should make full use of multimedia tools in the teaching process, so that students can turn passivity into initiative, gain a deep understanding of the background of the "three rural sentiments" and master the knowledge of rural areas and agriculture. In addition, schools should actively organise practical activities for students to develop a more systematic understanding of the subject and to learn more useful things in the process of practice, to improve their skills and to develop their professionalism.

### 4. ANALYSIS OF THE OPTIMIZATION OF THE CULTIVATION PATH OF THE THREE AGRICULTURAL SENTIMENTS OF UNIVERSITY STUDENTS

This paper is based on a data compression algorithm to build a system for cultivating the sentiment of the three farmers, and to optimize the cultivation path of the students' "three farmers" sentiment by the relevant departments and instructors of the school. The experiment was divided into two sessions, with scores of 1-5 and a total of 50 students, and the results are shown in Table 1.

**Table 1** Optimization assessment of students' activities in "agriculture"

	1 Point	2 Points	3 Points	4 Points	5 Points
First experiment	5	7	9	12	17
Second experiment	1	3	8	13	25

As can be seen from Table 2, the number of people who rated 5 in the first experiment was 17, and the number of people who rated 5 after the second experiment was 8 higher than that of the first experiment, with a total of 25 people and only 1 person who rated 1. To sum up, the cultivation of university students' sentiment for the "three rural areas" should not only be based on the foundation of moral education, but also be

fully integrated with the specific development of the country and the actual needs of university students' employment and entrepreneurship, so as to ensure that the "three rural areas" sentiment can be put into practice in the integration of the macro development of the times and individual micro choices. The three rural areas" sentiment should take root in the ground, so as to provide a solid contribution to the development of the "three rural areas" of the country.

## **5. CONCLUSION**

The strategy of revitalizing the countryside is an important way to solve the problems of the three rural areas, and is of practical significance to the overall development of the countryside and the modernization of agriculture. The precise cultivation of university students' sentiment for the "three rural areas" is a realistic requirement for the innovation of talent cultivation in higher education institutions in the new era of comprehensive implementation of the rural revitalization strategy. This not only points out the direction for higher education institutions to innovate talent cultivation mode and improve the quality of talent cultivation, but also cultivates a large number of high-quality talents with "one knowledge and two loves" for the development of "three rural areas". Of course, this cultivation process is gradual and is a task that needs to be adhered to in the long term, based on the historical background of agricultural development and in line with the continuous innovation of the talent revitalization strategy. Only by adhering to the coexistence of modernity and creativity and pooling the concerted efforts of all parties can university students "know agriculture" in theory, "love agriculture" in emotion and "help agriculture" in action, so as to consciously contribute to the construction and revitalisation of the countryside.

# INNER MECHANISMS AND PRACTICAL STRATEGIES OF BIG DATA TO FACILITATE RURAL REVITALIZATION

---

Xue Li\*

Yiwu Industrial and Commercial College, Yiwu, Zhejiang, 322000, China

[xuexue321219@163.com](mailto:xuexue321219@163.com)

---

## ABSTRACT

Big data is one of the powerful tools for promoting rural revitalization, which can promote the modernization and informatization process of the countryside and inject new vitality into the development of the countryside. How to better play the role of big data in promoting the transformation and upgrading of rural economy in the era of big data has become an important issue facing agricultural and rural work in the new era. This paper explores the inner mechanism and practical strategies of big data in promoting rural revitalization, aiming to deeply explore its potential driving role, taking province H as an example, discusses the problems in big data to boost rural revitalization, by analyzing the intrinsic mechanism of big data to promote rural revitalization and taking into account the geographical characteristics and agricultural development of Province H, we propose a practical strategy for rural revitalization in Hunan to promote the economic and social development of the region. The results show that: through the big data + rural revitalisation model, 8.1% of the value added of industry in province H is composed of the agricultural digital economy, an increase of 4.15 percentage points compared with last year. It indicates that the Big Data + Rural Revitalisation model has led to a year-on-year increase in the digitalisation of agriculture and improved the potential for rural development.

## KEYWORDS

big data; rural revitalization; modernization; intrinsic mechanism; informatization; practical strategies

## 1. INTRODUCTION

Against the background of global economic slowdown and sluggish growth, the digital economy, with its excellent ability to enhance total factor productivity and improve the quality and efficiency of traditional industries, has shown a strong vitality against the

trend and is widely regarded as a new driving force for global economic growth and a new lever for economic development [1-3]. With the arrival of the "Internet+" era, digital technologies and applications have had a profound impact on various fields of economy and society, giving rise to a number of new industries and new business models. Globally, the development of digital economy has become a general consensus, and developed countries generally show a trend that the growth rate of digital economy is higher than the growth rate of GDP in the same period, for example, the growth rate of digital economy in the United States, the growth rate of digital economy in the United States, and the growth rate of digital economy in the United States, Japan and the United Kingdom in 2016 were 7.3%, 5.2% and 4.7% respectively [4]. This compares with GDP growth rates of 1.7 per cent, 0.8 per cent and 2 per cent respectively over the same period[5]. The US digital economy reigned as the world's largest in 2019, reaching US\$13.87 trillion and accounting for 58.3 per cent of GDP[6]. This is sufficient to see that the continuous upgrading of digitalization in various industries, high-tech renewal under the relevant industries and fields of business form changes and industrial restructuring, for all sectors of society and the deep integration of economic and social fields to accelerate [7-9].

In this paper, we consider big data as the foundation and key production factor for developing digital economy, which promotes efficiency improvement and economic structure optimization. In this thesis, we argue that big data is an important foundation for the development of digital economy and an important production factor for the development of digital economy, which is conducive to improving efficiency and optimizing economic structure. Combining big data with rural revitalization, we make full use of the advantages of big data to promote intelligent agricultural production, efficient agricultural management and convenient agricultural information. In this way, we can provide comprehensive and powerful support for the implementation of the rural revitalization strategy and truly realize the rural revitalization strategy.

## **2. ANALYSIS OF THE MECHANISM OF THE ROLE OF BIG DATA ON RURAL REVITALIZATION**

The organic integration of big data and rural revitalization will provide new ideas and effective ways for the implementation of rural revitalization strategy. With the deepening of the national big data strategy, it can also provide more means and tools for agricultural upgrading, rural progress and farmers' development, which will help the realisation of smart countryside, intelligent agriculture and beautiful countryside, thus realising the comprehensive revitalisation of the countryside.

## **2.1 . AGRICULTURAL MODERNISATION MODEL**

A thriving industry is the basis and focus of rural revitalization, and industrial revitalization must be taken as the primary task of rural revitalization.

At present, the smallholder economy still dominates the development of agriculture in China, and there is still a low degree of intensification, low production efficiency and waste of factor resources in agricultural production, In this case, the traditional agricultural production methods are no longer well adapted to the needs of modern agricultural development. The focus of developing modern agriculture lies in the rationalisation of industrial structure and maximisation of economic benefits through the efficient allocation of production factors such as land, capital and labour.

Based on big data technology, cloud computing and the Internet of Things can effectively enhance the efficiency of agricultural resources, and promote the intensive and large-scale transformation of agriculture. By establishing an agricultural product quality traceability mechanism, the issue of agricultural product quality and safety can be addressed. In order to meet the needs of accelerating the transformation of traditional agriculture to modern agriculture, to regulate the current chaos of agricultural production and layout through precise guidance of agricultural production, to solve the current contradictions of supply and demand of agricultural products, and to establish a scientific and convenient comprehensive data information platform for agricultural products, thereby promoting the structural reform of the agricultural supply side

## **2.2 ECOLOGICAL AND ENVIRONMENTAL PROTECTION EFFECTIVENESS MODEL**

While the rural economy is developing well, the problem of rural ecological environment is becoming increasingly prominent, and ecological environment is a major social issue related to people's livelihood. Rural areas are the construction of rural areas with green ecological and environmental rational development is the focus of China in ecological protection.. Through big data technology, We can maximize the use of ecological resources, provide new methods for ecological prevention and control, and also effectively improve the rural ecological environment and provide technical support for pollution prevention and control.

Firstly, using big data technology, we can manage the mountain, water, forest, field, lake and grass systematically, and plan and promote it as a whole, and from the perspective of data ecosystem, design the whole element, whole system and whole process of beautiful countryside construction, implement resource development activities according to local conditions and improve the science of resource allocation.

Secondly, the application of big data technology can assess and analyse the level of agricultural green development and rural environmental remediation. Through the monitoring and early warning of rural waste collection and sewage treatment, the construction of a soil environment monitoring system and an agricultural surface source pollution monitoring system, relevant pollution sources can be quickly identified and the causes of pollution can be effectively analysed.

Finally, Promote agricultural ecological compensation. The prerequisite for the application of big data technology is accurate data. In agricultural ecological compensation, big data can provide more accurate carbon sink measurement and compensation data for different regions and crops, so as to provide a more scientific basis for the formulation and accounting of compensation standards for agricultural ecological compensation. At the same time, big data can provide technical support for agricultural and rural green development and promote the implementation of rural revitalization strategy.

### **2.3 INNOVATIVE MODES OF INTERACTIVE CULTURAL COMMUNICATION**

The construction of rural culture and civilization is both an important driving force and a reflection of the soft power of rural revitalization. The good wishes of rural residents in their future life are mainly supported by the current intellectual support and spiritual motivation enriched by rural culture and civilization.

The full integration of high-tech in rural civilization can improve the cultural literacy of farmers, and has a very good effect in enriching the connotation of rural civilization, and the unique local charm and humanistic charm of Pei can develop and change with it, and has been actively inherited on the basis of excellent traditional culture and modern culture docking.

Based on big data as a tool, the sharing and dissemination of scientific knowledge, agricultural production techniques and other resources can be realized on the big data teaching platform, thus breaking through the limitations of time and space, allowing more agricultural and urban education to combine, realizing the interconnection of urban and rural education resources, shortening the gap between urban and rural education, and thus improving the overall quality of farmers.

By building cultural databases, memorials and libraries with rural culture as the main body, traditional culture and humanistic cultural materials of the countryside are stored in the databases and disseminated on the network, thus achieving the purpose of inheriting and developing rural cultural memory and enriching the spiritual and cultural life of farmers. Through the means of big data, the scientific and cultural cultivation of farmers will be improved, the civilisation of rural society will be enhanced and new vitality of rural culture will be stimulated.

### 3 ANALYSIS OF THE PROBLEMS OF DIGITAL VILLAGE CONSTRUCTION IN THE CONTEXT OF RURAL REVITALIZATION

People living in the countryside, as the main group in the construction of digital countryside, still have no understanding or incomplete understanding of the construction of digital countryside in the construction of the countryside. The results of the survey on rural residents' understanding of the construction of digital villages in the context of rural revitalization are shown in Figure 1. Among them, 7.24% of the villagers said they understood it very well, 31.31% said they understood it relatively well, 52.06% said they did not understand it very well, and 9.39% said they did not understand it at all.

**Figure 1** Rural residents' willingness to participate in digital village construction

At the same time, Analysis of rural residents' awareness of digital village construction in Figure 2, in which 36.1% of the respondents said they were very willing, 49.6% said they were more willing, 8.3% said they were not very willing and 6% said they had nothing to do with me. This indicates that a large proportion of rural residents have an indifferent attitude towards participating in digital village construction practices. In practice, rural residents are not highly motivated to participate in the construction of digital villages, lack initiative and feel that it has little to do with them, which reduces the effectiveness of the application of new generation information technology in the countryside and makes the application of new technologies in agriculture and rural areas restricted, affecting the overall construction of digital life, digital agriculture and digital governance in the countryside Progress.

**Figure 2** Rural residents' knowledge of digital village construction

Talent is the focus of rural revitalization. In the construction of rural informatization, a large number of talents are inevitably needed to support and promote the development and implementation of projects, but at present, the majority of big data talents are gathered in first-tier cities, therefore, the number of rural big data talents can be increased in rural revitalization in two ways: training and introducing. In addition to the above construction of agricultural platforms and big data infrastructure, as well as the introduction of talents, in the process of Based on the current development of the use of big data for the construction of rural revitalization and other aspects of use. In terms of e-commerce of agricultural products and agricultural by-products, rural tourism, etc., the whole industrial chain of agriculture and the development of tourism in Hunan Province will be further promoted, thus facilitating the revitalisation of the countryside and increasing farmers' income.

#### **4. CONCLUSION**

Under the rural revitalisation strategy, rural planning and development in H Province can be integrated with big data technology to optimise rural development planning and promote rural revitalisation through modern technology. This paper optimises rural development planning and promotes rural revitalisation through modern technology. Big data technology can accelerate the process of agricultural modernisation, enhance rural ecological and environmental protection, and innovate cultural interaction and dissemination. At the same time, big data technology can make rural governance more modern and broaden farmers' income generation channels, further promoting rural revitalisation. The development of agriculture and the presence of big data in promoting

rural revitalization, the results show that: through the model of big data + rural revitalization, the share of agricultural digital economy in the value added of industry in H province is 8.1% and an increase of 4.15 percentage points compared with last year. This shows that an agricultural sharing platform has been established by using big data technology to promote rural revitalization, improved relevant supporting facilities, and increased rural development potential and economic income.

---

## ABSTRACT

In this research, the variables impacting the teaching of English in colleges and universities are thoroughly examined from a holistic, systematic, and developmental viewpoint using a decision tree method, using 500 students from 10 colleges and universities in X city as the research subjects. The results of the study show that the factor of "number of students' participation" is 0.456, this comes in second place to "preference" and "teacher's skill level" in the decision-making process. The most significant element in the decision branch is "students' participation," which has an effect value of 0.456. "Preference" and "teachers' skill level" are next with 0.384 and 0.305, respectively. This paper adopts the Internet terminal platform and decision tree algorithm means to promote the progress of university students' media literacy to a higher level.

## KEYWORDS

decision tree algorithm; college English; practical teaching; impact factor; decision branching; terminal platform

## 1. INTRODUCTION

Internet terminal platform is a new product formed under the progress and development of social science along with a new type of communication media [1-2]. Breaking the constraints of time and space, presenting information in a number of forms, combining images, text, video, and audio, and acquiring and receiving information in a variety of methods. [3-4]. The use of new media technologies in college and university English instruction can successfully throw off the constraints of the conventional teaching approach and has significant practical value[5]. According to

literature [6], the introduction of the Internet era has also created new development chances and difficulties for the English teaching profession in colleges and universities. According to literature [7], in order to improve the standard of English instruction in the Internet era, it is essential to combine the Internet with innovative English teaching methods and incorporate Internet terminal platform technology into the English classroom in order to develop high-caliber talents that are suitable for the needs of the new era. Therefore, English education in colleges and universities should actively use new media, improve the education and teaching system, effectively strengthen the effectiveness of English education and pave the way for contemporary college students to grow up and become successful[8].

In this essay, the elements impacting the instructional process of English practice in higher education institutions are discussed from several angles in relation to a research on the subject. The given set of indicators is ranked in order to determine the most significant influences on the practice of teaching English in colleges and universities, which serves as a guide for the practice of teaching public physical education in colleges and universities. This is done by building a decision tree from the value of the attributes of each indicator.

## **2. DECISION TREE ALGORITHM APPLICATION IMPLEMENTATION**

### **2.1 DATA PREPARATION**

A database of 500 students from 10 universities in X city was randomly selected for the study, and a database of English course students was created based on basic information collected from various sources and questionnaires. Four factors are included in the pupils' fundamental data: age, gender, IQ, and English proficiency. The student questionnaire contains 28 items of survey information, including English course grades, English course hours, enjoyment of English, number of English speaking competitions, technical level of English teachers in their schools, English teaching content, teaching methods used by English teachers, and assessment of physical education instructors' performance as teachers.

### **2.2 DATA PREPROCESSING**

Data pre-processing was mainly done by cleaning, integrating, selecting, transforming and conceptual layering of attributes to form a tuple of data training sets. The major goal of data cleaning is to eliminate a total of 26 information pieces that could not be queried for student physical fitness data and 30 information items that were left blank on the questionnaire. Data integration is the process of combining survey responses and fundamental student data into a dataset for study.

Six statistically significant variables were sieved from the 30 analyzed variables at the level of , using English course grades as the response variable, and made use of to build a decision tree model of the variables influencing the practical teaching of English in universities and colleges. The data chosen as the training set tuples are displayed in Table 1 based on the conceptual stratification of the six analytical variables.

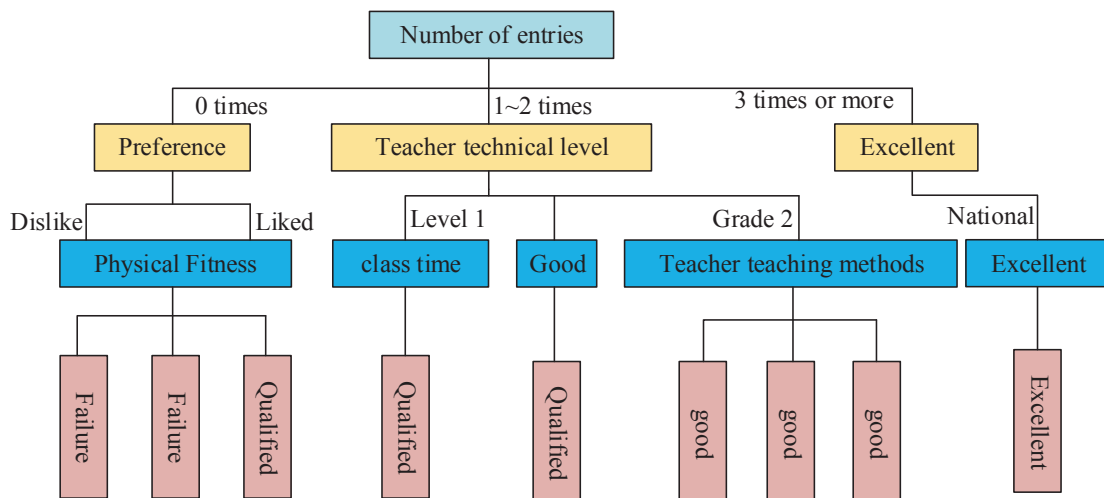

**Table 1** Tuple of training set of analysis variables selected in the database

Sample	Intelligence level	Lesson time	Student participation	Teaching Skills	Course Achievement	Physical fitness
1	Excellent	Unqualified	Liked	3 kinds	1 visit	64
2	Excellent	Qualified	Liked	1 kind	2 visit	72
3	Qualified	Qualified	Liked	1 kind	1 visit	64
4	Good	Good	Dislike	2 kinds	3 visit	48
5	Qualified	Qualified	Dislike	2 kinds	3visit	48
6	Good	Qualified	Liked	3 kinds	2 visit	72
...	...	...	...	...	...	...

### 2.3 CONSTRUCTING DECISION TREES

By randomly choosing 20% and 80% of the valid data, respectively, training samples (285 instances) and testing samples (50 cases) were created. The former were utilized to create a decision tree model of the variables influencing the practice of teaching English at colleges and universities, while the latter were utilized for the model's evaluation and assessment [9].

The decision tree's structure is depicted in Figure 1, where it is clear that the number of student entries serves as the model's root node and is therefore the most important factor influencing students' performance in English courses. Figure 1 also demonstrates that as student entries rise, so does the percentage of students who excel in English.

**Figure 1** Decision tree model structure

### 3. ANALYSIS OF DECISION TREE RESULTS

In the SpssClementine 12.0 data mining program, the model fitting procedure was carried out via the C5 decision tree node. According to Table 2, the branch nodes' attributes were chosen to have the highest rate of information acquisition and to not be less than the average rate of information gain for all attributes.

**Table 2** Information gain and information gain rate of each attribute

Attributes	Information Gain	Information gain rate
Number of student entries	0.2236	0.6787
Teacher's skill level	0.2018	0.6531
Student preference	0.1395	0.5352
Teacher's Teaching Tools	0.1516	0.3914
Lesson time	0.0769	0.3379
Intelligence level	0.0635	0.2941
Physical ability	0.0553	0.1314

The reasons for this may include the following:

(1) In English teaching, some teachers still adopt the old teaching point of view that the main task of learning is to take examinations, which leads to students' learning English also attaching too much importance to their examination results. Therefore, when learning English, they only learn by rote and do not adopt a flexible learning style, which eventually makes students bored with the English subject and even fearful of English.

(2) Higher education is different from secondary school in that it is not only about developing students' ability to listen, speak, read, write and translate, but also about improving their overall English language ability and proficiency. Some students may be afraid of English, thinking that it is a difficult subject and that they will not be able to learn it, and gradually lose interest in learning English.

### 4. CONCLUSION

English education at colleges and universities nowadays must keep up with the changes and use new media to innovate in order to increase teaching efficacy. Information technology is advancing quickly. In order to undertake a thorough and in-depth analysis of the variables impacting the teaching of English in higher education from a holistic, systematic, and developmental viewpoint, a decision tree algorithm is utilized in this research. It is shown that the influence factor of "number of students' participation" is 0.456, which, after "preference" and "teacher's skill level," has the most effect over the choice branch. The influence factor of "preference" and "teacher's skill level" are 0.384 and 0.305 respectively, which are also important aspects of teaching English in higher education.

The discussion above is merely an attempt to use decision tree data mining technology to elevate the application of data from low-level description and inference to knowledge mining from data, building predictive models, and providing decision support. The growth of English at colleges and universities will be given new life by the integration of Internet technologies.

## **ABSTRACT**

In this paper, 96 patients with chronic insomnia who attended the clinic from March 2022 to January 2023 were randomly divided into three groups for the study, one group received Zhuang ethnic group the Momie Spice bag aromatherapy treatment. One group received cognitive behavioural therapy and one group received pharmacological treatment. The relief of insomnia symptoms in the three study groups was compared after 5 and 10 weeks of treatment respectively. Normal measures were analysed by ANOVA and count data by chi-square test. The results showed that the anxiety and depression self-rated scores of the Zhuang ethnic group the Momie Spice bag aromatherapy group were  $39.18 \pm 2.24$  and  $49.52 \pm 3.11$  respectively after treatment, which were also the lowest compared to the other two treatments. This indicates that the Zhuang ethnic group the Momie Spice bag aromatherapy was superior to cognitive behavioural therapy in terms of overall sleep evaluation and the alleviation of negative psychological states in insomnia patients, and that the long-term effect of Morita therapy was significantly higher than that of pharmacological treatment.

## 1. INTRODUCTION

Sleep plays an extremely important role in the ability to think and function physically, and people need sufficient length and quality of sleep to ensure a normal working life [1-2]. Insomnia is a sleep disorder that usually manifests itself as the patient being physically tired but unable to fall asleep. Insomnia mostly occurs at night and can be primary or secondary [3]. Long-term insomnia can lead to depression, emotional disorders and a serious reduction in quality of life [4-5]. In recent years, as the pace of life continues to increase, the number of insomnia sufferers is increasing year by year, so research into effective treatments for chronic insomnia is necessary [6]. Current mainstream treatments for long-term insomnia include cognitive behavioural therapy and pharmacotherapy, of which cognitive behavioural therapy is a psychologically based treatment system that is currently designated as the treatment of choice for long-term insomnia by several treatment guidelines [7]. Medication refers to the use of sleeping pills to relieve insomnia, which can quickly improve the quality of sleep in the short term but do not address the root cause of the problem, Some patients have relapsed after stopping the drug while others have even shown drug resistance or addiction [8].

In this study, the Zhuang ethnic group Momie Spice bag aromatherapy was used to confirm the efficacy of the Zhuang ethnic group Momie Spice bag aromatherapy for patients with chronic insomnia, and to compare the efficacy of the Zhuang ethnic group Momie Spice bag aromatherapy with cognitive behavioural therapy and pharmacotherapy. The Zhuang ethnic group Momie Spice bag aromatherapy was compared with cognitive behavioural therapy and pharmacological treatment. The relief of insomnia symptoms in the three groups was compared after 5 and 10 weeks of treatment respectively. The data were analyzed by ANOVA and the data were analyzed by chi-square test.

## 2. INSOMNIA PATIENT PROFILE AND RESEARCH METHODOLOGY

### 2.1 GENERAL INFORMATION

A total of 96 patients with chronic insomnia were admitted to the study and all subjects were informed of the relevant instructions. The subjects signed the informed consent form for the experiment. Inclusion criteria:

(1) The patient's condition meets the conditions associated with chronic insomnia in the International Classification of Sleep Disorders, 3rd edition.

(2) The duration of the illness is more than six months and no other type of sleep treatment has been received within one month.

Exclusion criteria:

- (1) Patients with insomnia due to medication or somatic illness.
- (2) Those with a history of substance abuse.
- (3) Female patients during pregnancy and lactation.
- (4) Patients with a significant life event in the month of January.

## **2.2 RESEARCH METHODOLOGY**

The Zhuang ethnic group Momie Spice bag aromatherapy (ZM) group, cognitive behavioural therapy (CBT) group and pharmacotherapy (DT) group were divided into three equal groups (32 cases each) for the study. The Zhuang ethnic group Momie Spice bag aromatherapy, cognitive behavioural therapy (CBT) and drug treatment were applied to the three groups for a period of 10 weeks.

For the ZM group, the treatment was carried out according to the Zhuang ethnic group Momie Spice bag aromatherapy standardised practice guidelines, taking into account the linguistic and cultural characteristics of the patients in the area. The psychological mechanisms of insomnia are explained to the patients at the beginning of the treatment and the principles of spiritual interactions to help them rationalise their anxiety about insomnia itself and other real life factors. In addition, each patient is helped to set goals, change the status quo and break the bondage according to their specific situation. The intervention is conducted once a week for the first 5 weeks of treatment and once every 1 week for the second 5 weeks, with patients invited to give feedback on their feelings and experiences at the end of each intervention.

For the CBT group, a combination programme based on sleep hygiene education, sleep restriction therapy and stimulus control therapy is used. The core of this is for patients to improve their sleep both cognitively and behaviourally at the same time. In the treatment layer, patients are introduced to the science of sleep and given the correct knowledge about sleep. CBT is administered once a week for the first 5 weeks and once a week for the next 5 weeks.

For the DT group, the sleeping medication was eszopiclone tablets (1 mg/tablet), with the study subjects taking 4 mg each night at bedtime for the first 5 weeks and reducing the dose to 2 mg for the second 5 weeks.

## **2.3 OBSERVED INDICATORS**

- (1) Pittsburgh Sleep Quality Index Inventory (PSQI)

It includes 18 self-assessment entries and consists of 7 dimensions: sleep quality, time to fall asleep, sleep duration, sleep efficiency, sleep disorders, hypnotic drug application and effects of daytime functioning. For each dimension, scores are given on a scale of 0 to 3, with higher scores associated with poorer sleep quality.

## (2) Self-Rating Scale for Neuroticism by Tethering (SSTN)

The SSTN consists of 20 items and is composed of 6 dimensions: mental interaction, attention fixation, thought ambivalence, body social functioning, symptom tolerance, and desire for perfection. Each dimension is scored on a scale of 1 to 4, with the higher the score the more severe the degree of restraint.

### 3. INTERVENTION TRIAL TREATMENT RESULTS AND ANALYSIS

#### 3.1 COMPARISON OF CHANGES IN PSQI BEFORE AND AFTER PATIENTS RECEIVED THE INTERVENTION

The changes in PSQI scores of the three study groups before and after receiving the intervention are shown in Table 1. The PSQI performance of the study subjects improved significantly under all three therapies. When the experiment reached week eight, the ZM group had the lowest PSQI scores.

**Table 1 Comparison of changes in patients' PSQI scores**

Group	Before treatment	After treatment		F	P
		5 weeks	10 weeks		
ZM group	18.39±1.53	11.96±1.74	9.81±1.31	4.733	0.0005
CBT group	18.95±1.32	14.93±2.05	13.14±1.83	3.841	0.028
DT group	18.55±1.09	15.15±1.61	14.51±1.78	3.522	0.039

#### 3.2 COMPARISON OF CHANGES IN SSTN BEFORE AND AFTER PATIENTS RECEIVED THE INTERVENTION

The changes in SSTN before and after the three groups of patients received the intervention are shown in Table 2. The indicator in the MT group decreased from a mean of 54.43 to 41.79 among the three groups of patients, while the other two groups did not change by more than 2.

**Table 2 Changes in patients' SSTN scores**

Item	ZM group (n = 32)		CBT group (n = 32)	
	Before treatment	After treatment	Before treatment	After treatment
Mental interaction	13.41±2.41	10.32±1.63	13.88±3.19	12.15±3.08
Attention fixation	8.41±3.15	6.75±1.22	8.93±1.37	8.09±1.39
Thought ambivalence	10.24±3.13	8.19±7.05	10.71±2.36	10.08±2.43
Body social functioning	6.48±0.96	5.86±1.47	7.39±0.99	6.63±1.42
Symptom tolerance	7.18±1.44	6.54±1.35	9.38±1.39	8.38±0.93
Total perfection desire score	4.96±0.63	4.96±0.74	4.55±0.81	4.25±0.55
Total Score	54.43±9.15	41.79±7.27	53.96±8.48	52.74±8.14

### 3.3 A COMPREHENSIVE COMPARISON OF THE EFFECTIVENESS OF TREATMENT FOR CHRONIC INSOMNIA SYMPTOMS

A comparison of the combined efficacy of the three therapies on chronic insomnia symptoms is shown in Figure 1. 75.41% and 71.33% were achieved in the CBT and DT groups respectively, while the ZM group achieved 91.58%.

**Figure 1** Comparison of the combined efficacy of the three therapies on insomnia symptoms

#### 4. CONCLUSION

In this paper, the Zhuang ethnic group Momie Spice bag aromatherapy was used to treat insomnia and to compare the relief of insomnia symptoms in the three groups after 5 and 10 weeks of treatment respectively. The normal measures were analysed by ANOVA and the count data by chi-square test. According to the PSQI test results of this trial, the PSQI scores of the ZM group decreased rapidly as the treatment proceeded, with a mean score of 8.83 at the eighth week of treatment. the CBT group showed the same downward trend, but the decrease was significantly less than that of the ZM group. the trend of the DT group showed a rapid decrease followed by a rebound, with the lowest PSQI score in the DT group at 5 weeks after the treatment examination, which represented The patients in this group had the best sleep. However, the DT group showed an increase in scores at week 8. The Zhuang ethnic group achieved a combined efficacy of 91.58% for the Momie Spice bag aromatherapy in this trial, while the other two treatments ranged from 70% to 80%. Overall, the Zhuang ethnic group Momie Spice bag aromatherapy showed the best long-term efficacy in the treatment of chronic insomnia. It was also effective in relieving anxiety and depression as well as the symptoms of being tied up in chronic insomnia, with better efficacy than traditional cognitive behavioural therapy and medication.

## ABSTRACT

This paper analyses the development ideas of Guangxi's red tourism cultural creative products and taps into red tourism cultural resources with regional characteristics to promote the development of the local red tourism industry. With the help of a mixed qualitative and quantitative research method, it explores the relationship between the composition of the semiotic system of the tourist place and the influence it has on the construction of youth red memories. The results show that the standardised path coefficient value is  $0.231 > 0$  when the choice of semiotic design has an impact on plot memory, and this path shows a significance at the 0.01 level ( $z = 2.631, p = 0.005 < 0.01$ ). Therefore it indicates that semiotic design will have a significant positive influence relationship on red plot memory, which can effectively combine the value information, the symbolic characteristics of the tourist place, and the needs and experiences of the youth to promote the transmission of red culture.

## KEYWORDS

red tourism in Guangxi; creative products; regional characteristics; semiotics; plot memory; path coefficient; red culture

## 1. INTRODUCTION

Revolutionary museums, memorials, party history museums and other red tourism destinations are responsible for the important mission of red culture inheritance[1-3]. The Party and government have always attached importance to the status and role of red culture in ideology, and memory is an important part of culture. Whether the people can form correct and profound red memories is related to the inheritance of red culture and spirit, social identity and the enhancement of national cohesion [4-5]. Red tourism

is different from school education in that a large number of historical relics can shape a relatively independent and complete space of reality [6-7]. The literature [8] discusses the relationship between archives and memory construction, and the memory construction function of archives. It enables visitors to immerse themselves in historical sites, participate in red activities and commemorative ceremonies, and use symbolic carriers to awaken memories, pass on and promote the red spirit [9]. Based on the transformation of the memorial space into a networked space, this paper focuses on its impact on red memory and attempts to explore how red memory can be better written and passed on in the new context. With the help of a mixed method of qualitative and quantitative research, the relationship between the composition of the semiotic system of tourist places and the construction of red memories of youth is explored.

## **2 RED TOURISM CULTURAL AND CREATIVE PRODUCTS**

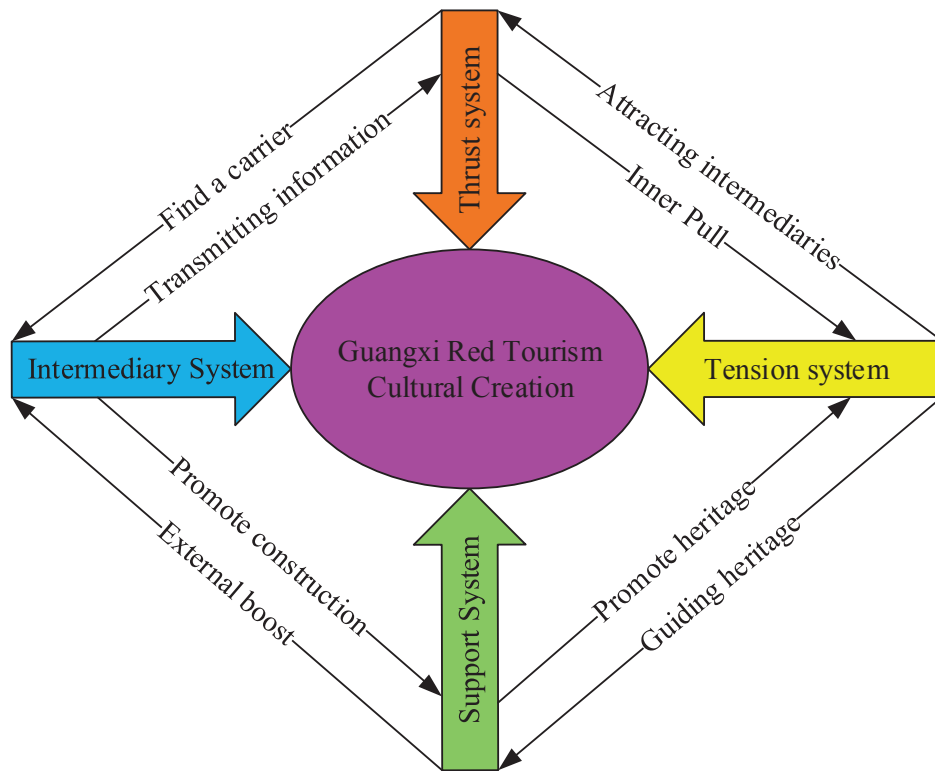

The so-called red tourism cultural creative products, as the name suggests, refer to products with creative and cultural design developed according to red tourism, which are an important part of the red tourism industry. On the one hand, they are monumental for the purchaser, and on the other hand, they can promote the local red history and culture.

### **2.1 DESIGN AND DEVELOPMENT OF RED TOURISM CULTURAL AND CREATIVE PRODUCTS**

The development and design of red tourism cultural creative products not only spreads local red culture to customers and conveys red sentiments through materialised cultural and creative products, but is also an important driving force for the development of the tourism industry for the better, and good cultural and creative products can greatly promote consumers' desire to buy. As can be seen from the above, the development and design of red tourism cultural and creative products have special significance in terms of cultural dissemination and economic development. The developers and designers should give full play to local red cultural resources and use creative expressions to design cultural and creative products with local characteristics.

### **2.2 THE RED TOURISM CULTURAL AND CREATIVE PROCESS**

In the process of developing red tourism in Guangxi region, extra attention needs to be paid to the development and design of cultural and creative products, which not only need to inject cultural connotations into the products, but also should have certain brand awareness, develop and design a series of red tourism cultural and creative products by combining the red cultural resources in Guangxi region, and build them into influential brands of cultural and creative products, the process of designing red cultural tourism cultural and creative products is shown in Figure 1.

**Figure 1** Red culture tourism creative product design process

The significance of this specifically includes:

(1) Make full use of revolutionary historical and cultural resources to form an effective protective role for various types of local revolutionary cultural heritage.

(2) Play the role of a bridge for cultural and creative products to awaken the red gene in people, revitalise red culture and convey the excellent red culture and immortal revolutionary spirit through cultural and creative products.

(3) Stimulating the growth of the local economy and promoting orderly and coordinated economic and social development, the market for cultural and creative products has unlimited vitality and possibilities, especially for red cultural and creative products, which carry special historical and cultural significance and will occupy a place in the market for cultural and creative products as long as care is taken in their development and design.

(4) Promote the development of local tourism. The cultural and creative industry with red tourism cultural derivatives as its core will become an important industry for tourism in the future, and the development and design of cultural and creative products will also have a leading and promoting role for the development of tourism.

### **3. SEMIOTIC DESIGN FOR THE CONSTRUCTION OF CULTURAL MEMORY IN RED TOURISM**

As a social memory, red memory does not only mean that the past is preserved, but also that it is reorganised, filtered, integrated and reconstructed on the basis of the 'present'. Therefore, young people's perception of the symbolic dynamics of a tourist destination is likely to influence their perception and construction of red memories. In addition, as young people generally perceive the spatial environment first when they arrive at a tourist destination, and then acquire more specific information, the place memory that may be formed has a positive effect on the episodic memory. In order to verify the influential relationship between these variables, the following hypothetical relationship is proposed in this study.

Hypothesis H1 is that the symbolic choice of tourist destination has a significant positive effect on youth's perception of episodic memory.

Hypothesis H2 is that the symbolic choice of place of travel has a significant positive effect on youths' perception of place memory.

Hypothesis H3 is that the symbolic interpretation of tourist places has a significant positive effect on youths' perception of episode memory.

Hypothesis H4 is that the symbolic interpretation of tourist places has a significant positive effect on youth's perception of place memory.

It is hypothesised that the symbolic reproduction of H5 as a tourist place has a significant positive effect on youths' perception of episode memory.

It is hypothesised that H6 is a significant positive effect of symbolic reproduction of tourist places on youths' perception of place memory.

Hypothesis H7 was that youths' place memory perceptions had a significant positive effect on their episode memory perceptions.

### **4. EMPIRICAL ANALYSIS**

The path analysis lies in the study of model impact relationships and is used to test the model hypotheses. The results of the path analysis and model testing are shown in Table 1.

**Table 1** Path analysis and model test results

Assumptions	X	Y	z-value	p-value	Path factor	Results
H1	Symbol Selection	Episodic memory	2.631	0.005	0.235	YES
H2	Symbol Selection	Place memory	2.259	0.000	0.219	YES
H3	Symbol Explanation	Episodic memory	0.137	0.836	0.009	NO
H4	Symbol interpretation	Place memory	2.582	0.035	0.153	YES
H5	Symbol Reproduction	Episode Memory	4.638	0.000	0.293	YES
H6	Symbol Reproduction	Place memory	4.833	0.000	0.337	YES
H7	Place memory	Episodic Memory	6.937	0.000	0.437	YES

The path analysis (adjusted for  $MI > 10$ ) yields whether the effect relationship between the variables is significant and whether the discriminant hypothesis relationship holds, as described in the specific data results below:

(1) The standardised path coefficient value was  $0.235 > 0$  when symbol selection had an effect on plot memory and this path showed a significance at the 0.01 level ( $z = 2.631$ ,  $p = 0.005 < 0.01$ ). Thus indicating that symbol choice produces a significant positive influence relationship on plot memory.

(2) The standardized path coefficient value was  $0.219 > 0$  for the effect of symbol selection on place memory, and this path showed a significance at the 0.01 level ( $z = 2.259$ ,  $p = 0.000 < 0.01$ ), thus indicating a significant positive relationship between symbol selection and place memory.

## 5. CONCLUSION

Relying on a semiotic perspective to examine the construction of memory in the mechanism of the red tourism process, this paper finds that the specific ways in which symbols are dynamically encoded and the effects of their presentation are important influencing factors in the construction of youth red memories. The display of tangible symbols such as artefacts, archives, pictures and sculptures, the restoration of regional places, additional explanations and descriptions, activities and rituals are the sources of information perceived by youth and the process of experience. At the same time, the perception of memory spaces stimulates the perception and memory of the historical episodes they carry. The diversity of backgrounds, perceptions of experiences and behaviours of young people all contribute, to varying degrees, to differences in the construction of memories. Therefore, red tourism sites need to take a holistic and

systematic approach, combining the value messages that the party and government must convey, the symbolic characteristics of the tourism site, and the needs and experiences of youth, in order to better realise memory construction and cultural transmission.

## ABSTRACT

With the rapid development of online shopping, a variety of shopping websites have grown and competition has become increasingly fierce. This paper examines consumers' willingness to buy online under personalized recommendations in four aspects: information arrangement, recommendation strength, recommendation validity and visual cues. The findings show that recommendation strength has a significant positive effect on consumers' perceptions of emotions, while recommendation strength has no significant effect on consumers' perceived economic benefits, perceived privacy risks and perceived performance risks. Recommendation validity has a significant effect on perceived economic benefits, perceived emotional benefits and perceived performance risks. This study provides a comprehensive and objective analysis of consumers' purchase intentions, which is of guiding value to the study of online economic consumption.

## KEYWORDS

personalised recommendation; online shopping; purchase intention; influencing factors; consumers

## 1 INTRODUCTION

With the continuous growth of residents' income, residents' consumption needs are also increasing, from the original focus on consumption quantity gradually changed to focus on consumption quality [1-3]. For many shopping platforms, it is important to fully consider consumers' consumption wishes, bring them consumption convenience and make them have a good shopping experience so that they can win consumers' trust and achieve continuous improvement in performance [4-7]. At present, many shopping websites use accurate personalised recommendation systems to recommend products to consumers, but how to ensure that personalised recommendations can achieve good

marketing effects within reasonable limits, but also to satisfy consumers and maximise the value of personalised recommendations [8].

In this study, four dimensions of information arrangement, recommendation strength, recommendation effectiveness and visual cues are used to build the research model. The impact of these four dimensions on consumers' perceived benefits and perceived risks is firstly tested, and the perceived benefits are divided into perceived emotional benefits and perceived economic benefits, and the perceived risks are divided into perceived privacy risks and perceived performance risks. This is followed by an in-depth analysis of the effects of independent and mediating variables on purchase intentions. The research model in this paper covers independent, mediating and dependent variables, where the independent variable is the influence of personalised recommendations, the mediating variable is the perceived value of the consumer and the consumer's purchase intention is the dependent variable.

## **2 PERSONALISED RECOMMENDATION MODEL CONSTRUCTION AND RESEARCH HYPOTHESIS**

### **2.1 ANALYSIS OF THE FACTORS AFFECTING PERSONALISED RECOMMENDATIONS**

The online shopping market is very competitive, and how to accurately recommend products to consumers based on their preferences is an important part of the success or failure of the competition. In this regard, shopping websites should have an accurate understanding of the factors that influence personalised recommendations. Although many e-commerce companies market their products to consumers based on personalised recommendation systems, few scholars have analysed them in depth, let alone identified a personalised recommendation effectiveness model with certain applicability. For factors affecting personalised recommendation, this paper was obtained through literature reading method and interview method. The collation found that information arrangement, recommendation strength, recommendation validity and visual cues are the main factors affecting personalised recommendations.

### **2.2 RESEARCH HYPOTHESIS**

With the advent of powerful online shopping software, information is no longer presented in one form or another, and the ability to sell a product through text alone is a thing of the past. Images, audio and video are now essential content, and with the rise of live streaming, many personalised recommendation platforms are following this trend. As you can see, personalised recommendations are becoming more and more diverse and lively, and are ultimately designed to quickly capture the interest of consumers among the tens of thousands of products available, leading to purchase decisions.

Based on the above analysis, this paper proposes the following set of hypotheses: H1: Personalised recommendations have a significant impact on consumers' perceived value. H1.1: Information scheduling has a significant positive impact on consumers' perceived economic benefits. H1.4: Information arrangement has a significant negative effect on consumers' perceived performance risk. h1.5: Recommendation strength has a significant positive effect on consumers' perceived economic benefits. h1.6: Recommendation strength has a significant positive effect on consumers' perceived emotional benefits. h1.7: Recommendation strength has a significant negative effect on consumers' perceived privacy risk. h1.8: Recommendation strength has a significant positive effect on consumers' perceived performance risk. h1.9: Recommendation strength has a significant positive effect on consumers' perceived emotional benefits. H1.9: Recommendation validity has a significant positive effect on consumers' perceived economic benefits. h1.10: Recommendation validity has a significant positive effect on consumers' perceived emotional benefits. h1.11: Recommendation validity has a significant negative effect on consumers' perceived privacy risks. h1.12: Recommendation validity has a significant negative effect on consumers' H1.13: Visual cues have a significant positive effect on consumers' perceived economic benefits. h1.14: Visual cues have a significant positive effect on consumers' perceived emotional benefits. h1.15: Visual cues have a significant negative effect on consumers' perceived privacy risks. h1.16: Visual cues have a significant negative effect on consumers' perceived performance risks. h1.17: Visual cues have a significant negative effect on consumers' perceptions. h1.18: Visual cues have a significant negative effect on consumers' perceptions. H2: Personalised recommendations have a significant effect on consumers' purchase intentions H2.1: Information arrangement has a significant positive effect on consumers' purchase intentions H2.2: Recommendation strength has a significant positive effect on consumers' purchase intentions H2.3: Recommendation validity has a significant positive effect on consumers' purchase intentions H2.4: Visual cues have a significant positive effect on consumers' purchase intentions H2.4: Visual cues have a significant positive effect on consumers' purchase intention.

### **3 AN EMPIRICAL ANALYSIS OF THE IMPACT OF PERSONALISED RECOMMENDATIONS ON CONSUMERS' WILLINGNESS TO BUY ONLINE**

#### **3.1 RELEVANCE ANALYSIS**

Correlation analysis of personalised recommendations and perceived value. The correlations between the various dimensions of personalised recommendations and consumer perceived value using SPSS 20.0 software are shown in Table 1.

It can be seen that information arrangement, recommendation validity, recommendation strength and visual cues have a significant positive correlation on

consumer perceived economic benefits and consumer perceived emotional benefits, and information arrangement, recommendation strength, recommendation method and visual cues have a significant negative correlation on consumer perceived privacy risk and consumer perceived performance risk.

**Table 1** Correlation analysis of personalised recommendations and perceived value

Name		Economic	Emotional	Privacy	Performance
Rank	Pearson correlation	0.527**	0.427**	-0.427**	-0.413**
	Significance (two-sided)	0.00	0.00	0.00	0.00
Validity	Pearson correlation	0.556**	0.467**	-0.336**	-0.433**
	Significance (two-sided)	0.00	0.00	0.00	0.00
Strength	Pearson correlation	0.418**	0.444**	-0.296**	-0.324**
	Significance (bilateral)	0.00	0.00	0.00	0.00
Visual	Pearson correlation	-0.426**	0.562**	-0.493**	-0.476**
	Significance (bilateral)	0.00	0.00	0.00	0.00

The correlation analysis between perceived value and purchase intention, the correlation analysis between the dimensions of consumer perceived value and consumer purchase intention is shown in Table 2.

The results in the table show that both consumer perceived emotional benefits and perceived economic benefits have a significant positive relationship with consumer purchase intentions at the 0.02 level, while consumer perceived performance risks and consumer perceived privacy risks have a significant negative relationship with consumer purchase intentions at the 0.02 level.

**Table 2** Correlation analysis of perceived value and purchase intention

Name		Rank	Method	Strength	Visual
Purchase	Pearson correlation	0.598**	0.583**	0.511**	0.624**
	Significance (two-sided)	0.00	0.00	0.00	0.00

### 3.2 REGRESSION ANALYSIS

In this paper, information layout, recommendation validity and perceived economic benefits are selected as independent variables and purchase intention as the dependent variable, and the regression results obtained are shown in Table 3.

According to Table 3, the coefficient on the validity of the information layout recommendation is significant at the 0.99% level when the model introduces perceived economic benefits, which indicates that there is a partial mediating effect of perceived economic benefits on the validity of the information layout recommendation and purchase intentions. Similarly, the analysis of the mediating effect of perceived affective benefits shows that there is a partial mediating effect between the four variables and purchase intention for perceived affective benefits. For perceived privacy risk, there is also a partial mediating effect between the four variables and purchase intention.

**Table 3** Regression analysis results

Dependent variable	Independent variable	Non-standardised coefficients		Standard factor	T	Sig	VIF
		B	Standard error	Beta			
Willingness to buy	(constants)	0.325	0.178		1.804	0.071	
	Information layout	0.352	0.047	0.328	7.151	0.00	1.423
	Recommendation validity	0.291	0.045	0.291	6.211	0.00	1.485
	Perceptual economy	0.292	0.049	0.287	5.692	0.00	1.724

#### 4 CONCLUSION

As the advertising market continues to evolve, advertising that includes graphic and video content provides a detailed presentation of the product, allowing consumers to gain a more intuitive sense of the product, increasing consumer convenience and thus perceived emotional benefits. In addition, both perceived privacy risk and perceived performance risk are detrimental to the growth of consumers' purchase intentions, with perceived privacy risk having a greater detrimental effect than perceived performance risk. This suggests that there is some concern about consumers' personal privacy being compromised when purchasing products on websites through personalised recommendations, and that consumers' willingness to purchase will decrease or even disappear if they have serious risk concerns about the recommended products.

## ABSTRACT

With the continuous development of information technology, this has also triggered a higher demand for computer-related software technology and service quality in the current society. In this paper, we first study computer software technology from three aspects: virtualization technology, cloud storage technology and data mining technology, and then analyse the application of data mining technology through simulation experiments to specifically analyse the strengths and weaknesses of cognitive function in different groups of elderly people, who maintain various ability indicators between [-2.5-1.3]. In the face of the increasing number of elderly groups, it is This will help patients and families to plan ahead and minimise financial loss and family burden. This study has practical implications for the dissemination of knowledge about cognitive function and the screening and prevention of cognitive impairment.

## KEYWORDS

virtualization technology; cloud storage technology; data mining technology; elderly population; cognitive function

## 1 INTRODUCTION

The use of computer-assisted training has been greatly promoted due to the popularity of computers and the increasing level of software development technology, which makes it convenient and flexible, greatly reduces the time of health care workers, and allows the difficulty of the training to be adjusted according to the patient's needs and cognitive ability [1-3]. The development of computer software technology has led to the increasing use of computer-assisted cognitive training in the diagnosis of dementia, disease tracking, carer support and more [4]. A cognitive scale based assessment and data management system has been developed to help cognitive

training professionals to screen and assess cognition in older adults, manage data more easily and improve the efficiency of healthcare workers [5-6].

The literature [7] describes the use of computer graphics and imaging software in marine graphic design. The authors describe how these software can be used to produce marine related visual elements and designs and illustrate the application of these tools in the marine sciences. The literature [8] describes the benefits of using computer-aided software engineering tools to develop and document product configuration systems, assesses the advantages of such tools in developing and maintaining product configuration systems, and discusses how it can be used to improve productivity and product quality.

The first part of this paper: computer software technology. Virtualisation technology, cloud storage technology and data mining technology are studied respectively, and the characteristics and application prospects of computer software technology are discussed.

The second part of this paper: analysis of the application of data mining techniques. Firstly, a simulation experimental environment is constructed, and then the cognitive ability of the elderly population is analysed by clustering with five attributes related to cognitive function, and corresponding cognitive training strategies are developed to provide personalised cognitive training services to different groups of elderly people.

## **2 COMPUTER SOFTWARE TECHNOLOGY**

### **2.1 VIRTUALISATION TECHNOLOGY**

Virtualisation technology is favoured by many Internet companies as well as research institutes to improve the content of the company's work and the progress of the research projects of the research institutes. Virtualisation technology can be used not only in computers, but also in the everyday life of the public. The incorporation of virtualisation technology in Big Data can increase the height of research in virtual technology. With the support of big data, virtualisation technology can further improve the functions of virtualisation software. In the process of virtualisation software development, some previously envisaged functions are solved by the inclusion of big data, allowing for further improvements in the innovation and future development of virtualisation technology.

### **2.2 CLOUD STORAGE TECHNOLOGY**

The most important feature of cloud storage technology is that it breaks the boundaries of time and space. When users need to access and download the stored content, they only need to connect the network terminal to the network through a computer to download and access the stored data from the cloud storage space, which

provides a lot of convenience for many enterprises and individuals. With cloud storage technology, information that is difficult to store can be stored effectively and for a longer period of time through cloud storage. These are features that are not possible with traditional storage methods. Cloud storage is a whole consisting of several storage units, and the use of virtualisation technology in computers can effectively improve the processing of information within the company, making it possible to bring the various departments of the company closer together and promote cooperation between them. As the cloud storage function is a multi-functional integration, it makes the process of storing information more convenient and provides more convenience for users.

### **2.3 DATA MINING TECHNIQUES**

Figure 1 shows the eight major application areas of data mining. Data mining is the process of collecting, collating and analysing the vast amount of information that has exploded in the current era of big data, revealing the potential value of the information hidden in this vast amount of data. Through data mining, many unrelated and illogical data can be effectively collated through data mining technology, so that the potential value hidden in it can be unearthed, enabling companies to plan their future development routes more effectively through data mining technology. Data mining can also be used in various fields such as healthcare and the military. Data mining is the process of analysing the knowledge in a database to discover its potential value. The main steps are:

(1) Preliminary data collection is needed for preparation. Through the web crawler technology or some usual accumulated data, do the preliminary data preparation work.

(2) Data pre-processing work, through which a number of different data types can be transformed, a large number of duplicate values, null values, missing values of data or the current data to find the variance, summation and other operations.

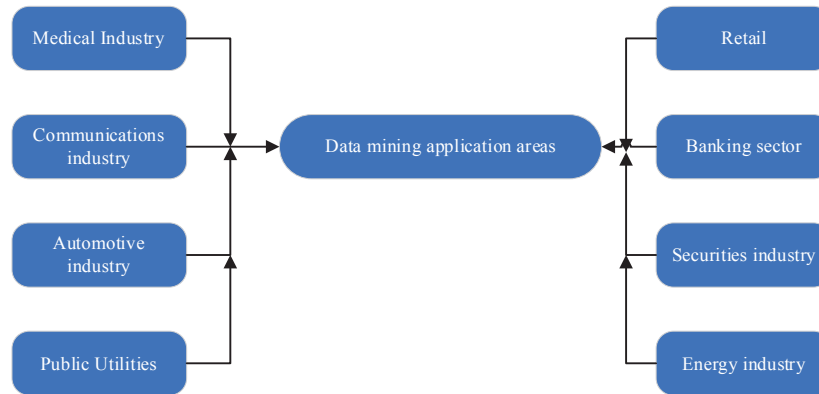

(3) Data mining. By organising the pre-processed data through algorithms, the current data can be analysed effectively and valuable information hidden behind the data can be unearthed.

(4) Interpretation and validation of mining results. By dividing the data into training data and test data, these different data are interpreted and restricted.

Data mining technology is a complex and tedious technique. Preparation and planning in the early stages are the basis on which the subsequent work can be carried out in an orderly manner. The pre-processing of the data in the medium term is what takes up the longest time in the data mining process. The invalid data has to be eliminated and the valid data retained for the operations to be carried out and in the context of the actual situation. This step also requires a lot of time and effort on the part

of the engineer, including the purification of data, the integration of variables and the linking of data tables.

**Figure 1** Eight application areas for data mining

### **3 ANALYSIS OF THE APPLICATION OF DATA MINING TECHNIQUES**

#### **3.1 SIMULATION OF EXPERIMENTAL ENVIRONMENTS**

The experimental environment requires an Intel core series i5 or above processor, 4.0GB or above capacity memory and 100GB or above capacity hard disk. In terms of software, a Windows operating system is used and the system needs to have Java software and Matlab software installed as well as other commonly used software.

#### **3.2 CLUSTER ANALYSIS OF OLDER PEOPLE WITH DIFFERENT COGNITIVE ABILITIES**

The results of the cluster analysis of the cognitive ability of the elderly population using five attributes related to cognitive function are shown in Table 1 below. It can be seen that the older adult group 1 is the largest on the D (delayed recall ability) attribute and the smallest on the O (orienting power) attribute. Older adult cohort 2 was the largest on the O (orienting power) attribute and the smallest on the A (attention and computational power) attribute. Older adult group 3 has the greatest I (immediate memory) attribute and the least O (orienting power) attribute. Older adult group 4 was greatest on the A (attention and computational power) attribute and least on the D (delayed recall ability) attribute.

**Table 1** Clustering results of the elderly with different cognitive abilities

Cluster Category	Number of clusters	Cluster center				
		O	A	L	I	D
Elderly population 1	5	-2.446	-1.168	-1.355	-0.953	-0.945
Elderly population 2	17	0.212	-0.943	0.161	0.084	0.203
Elderly population 3	11	0.634	0.827	0.702	1.310	1.208
Elderly population 4	21	0.041	0.642	-0.227	-0.623	-0.672

#### 4 CONCLUSION

With the continuous development of society, science and technology have made great contributions to the residents of China, and the rapid development in computers has made the people now in the era of big data. This paper uses data mining techniques to classify the elderly population, explore and analyse the impact of personal factors on cognitive ability, and analyse the strengths and weaknesses of different categories of the elderly population in various cognitive functions. Early screening for cognitive function is therefore crucial, and early prevention can help patients and families plan for it.

## ABSTRACT

With the continuous development of computer technology and big data, residents' lives cannot be separated from various types of computer software. This paper studies the production principle of strong acidic oxidized ionized water, sterilization mechanism, use characteristics, precautions, application prospects and problems. The technology is an environmentally friendly disinfection and sterilization technology with a wide sterilization spectrum, strong sterilization effectiveness, low price and easy production. The results of the disinfection treatment of 15 species of seeds for ecological restoration of mine waste sites, such as alfalfa and purple acacia, with chlorothalonil, potassium permanganate, formaldehyde and boiling water scalding showed that the mould rate was the highest when treated with potassium permanganate solution and the lowest when treated with chlorothalonil, and the difference between the two was significant at the level of 4.99% and not significant at the level of 0.99%. This study has some ecological and economic significance in the disinfection of seeds with bacteria.

## KEYWORDS

strong acidity; plasma; disinfection and sterilization; carrier seeds; mould rate

## 1 INTRODUCTION

With the development of the global livestock industry, natural grasslands have been overloaded and overgrazed for a long time, degradation is serious, and good forage grasses are decreasing day by day. To carry out grassland improvement, excellent grass seeds are needed first [1-2]. However, due to the unregulated seed market and the imperfect quarantine system for the transfer of domestic germplasm resources, the purchased seeds often carry a large number of fungi, bacteria and other harmful microorganisms, and the use of such seeds not only affects seed germination, but also causes the spread of diseases and pollution of the soil and ecological environment [3-

4]. The disinfection of seeds with bacteria before sowing has certain ecological and economic significance [5]. Licorice, also known as sweet grass, is a perennial herb in the legume family. Its rhizome and roots contain a variety of substances such as dried oxalic acid, reducing sugar, starch and gum, which can clear heat and detoxify the body, tonify the spleen and benefit the qi, treat sore throat, cure hyperalgesia, have significant effects on peptic ulcers and jaundice, and enhance human immunity [6-7]. As a result, it has high medicinal value and is classified as a key proprietary medicinal material by the state. Due to the exponential increase in global usage, wild licorice resources are increasingly depleted. Therefore, the state and relevant departments strongly advocate the artificial cultivation of licorice on a large scale to solve the demand of licorice pharmacogen [8-9].

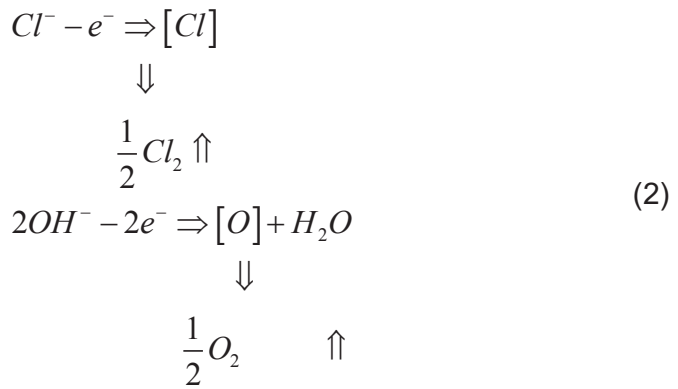

This paper firstly investigates the generation principle of strong acidic oxidised ionised water technology, as well as the bactericidal properties and mechanism of strong acidic oxidised ionised water. Then experimental materials and methods are selected to analyse the effect of strong acidic oxidised ionised water technology on forage seeds with bacteria and germination, and the effect of different disinfection treatments on the rate of mould, and the importance of the research results to promote the growth and medical development of liquorice seeds.

## **2 STRONGLY ACIDIC OXIDISED IONISED WATER TECHNOLOGY**

### **2.1 PRINCIPLE OF THE GENERATION OF STRONGLY ACIDIC OXIDISED IONISED WATER**

Strongly acidic oxidised ionised water is generated by adding less than 0.1% NaCl to normal tap water and then electrolysing it in an electrolytic cross with an ion exchange diaphragm between the cathode and anode, as shown in Figure 1. The following electrochemical reactions will occur in the vicinity of the anode and cathode respectively:

Cathodes:

Thus a colourless, transparent, non-irritating and odourless liquid with strong acidity and redox capacity and low residual dissolved chlorine is obtained at the anode. Its redox potential (ORP value) is >110mv and acidity (pH value) <2.6 residual solution is 2049ppm.

**Figure 1** Principle of strongly acidic oxidised ionised water generation

## 2.2 STERILISATION PROPERTIES AND MECHANISM OF STRONGLY ACIDIC OXIDISED IONISED WATER

Table 1 shows the sterilization effect of strongly acidic oxidized ionized water on *Bacillus subtilis* black variant budding hold. A number of studies at home and abroad have proved that strongly acidic oxidised ionised water has a broad bactericidal

spectrum and is rapidly sterilised, killing not only bacterial propagules, viruses, but also a wide range of pathogenic microorganisms such as budding spores. The time required to kill pathogenic microorganisms generally does not exceed 5 seconds, and the longest is 2.5 minutes. Killing of fungi generally takes between 5 and 30 seconds, with the longest being no more than 5 minutes for *Bacillus cereus*. Antifungal does not exceed 2.5 minutes.

Laboratory sterilisation tests show that strong acidic oxidised ionised water without organic matter can completely kill bacterial colonies such as *E. coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus* including MRSA and gonococcus in 15 to 30 seconds. 30 seconds of action can completely destroy the surface antigen of hepatitis B and kill the AIDS virus. It can kill *Candida albicans* in 10 minutes and *Bacillus subtilis* black variant in 10-20 minutes.

Strong acidic oxidation ionized water sterilization mechanism has physical theory, chemical theory, electron movement theory and electric conduction theory, etc., but the current academic community recognized as the physical theory and chemical theory.

Physical theory: mainly including redox potential theory, electron movement theory and electric conduction theory, etc. Before 1994, people generally accept the physical chemistry theory proposed by Becking in 1960, that the acidic oxidation potential of water with low pH2.7 and high ORP+1100mV is beyond the survival range of microorganisms, and make the membrane potential of microbial cells change, which leads to cell membrane Increased permeability and destruction of cellular metabolic enzymes for the purpose of killing microorganisms.

The low pH and high ORP is not the main factor in its bactericidal properties. The main components of bactericidal activity include hypochlorous acid, hydrogen peroxide and OH groups. Interestingly, these components are identical to the composition of reactive oxygen species, which are responsible for the bactericidal effect of neutrophils. 1998 saw the confirmation of the effective oxygen theory, which established that effective chlorine in acidic oxidation potential water is the most important flash factor in the killing of pathogenic microorganisms.

**Table 1** Sterilization of *Bacillus subtilis* black variant bud-hold by strongly acidic oxidized ionized water

Redox potential ORP value (mV)	pH value	Organic concentration ( % )	Killing rates at different times of action ( % )				Number of control bacteria ( $\times 10^6$ cfu/ml)
			2min	5min	10min	20min	
1131	2.7	0	39.51	99.96	100.0	100.0	1.14
1022	3.2	0	89.75	90.25	89.43	89.33	9.51

### 3 EFFECT OF STRONGLY ACIDIC OXIDIZED IONIZED WATER TECHNOLOGY ON FORAGE SEED CARRYING AND GERMINATION

#### 3.1 TEST MATERIALS AND METHODS

##### 3.1.1 TEST MATERIAL

The seeds for ecological restoration were ryegrass, chokeberry, wattle, malan, white-flowered grey-leaved bean, grass mignonette, hoodia, multi-flowered mullein, sativa, acacia, purple-fringed acacia, horse spurge, bermudagrass, beautiful hoodia and forage seeds of 15 species. The seeds were purchased from Henan Huafeng Seed Company, and the reagents and containers required were chlorothalonil, potassium permanganate, formaldehyde, filter paper and petri dishes.

##### 3.1.2 EXPERIMENTAL METHODS

Table 2 shows the experimental design. The experiment was set up with 5 treatments, seeds were soaked in chlorothalonil wettable powder 500 times, 0.49% potassium permanganate solution, 0.079% formaldehyde solution for 12 h. The seeds were scalded in boiling water for 5 min, followed by soaking in sterile water for 12 h. The control was soaked in sterile water for 12 h. Twenty sterile Petri dishes of the same size were taken. Incubate at room temperature, observe and record regularly every day, and after 7d, count the percentage of mouldy seeds and germination rate of each treatment. Repeat 3 times and take the average.

**Table 2** Experimental design

Processing number	Pharmaceuticals	Processing time
1	Chlorothalonil 500 times solution	12h
2	0.49% potassium permanganate solution	12h
3	0.079% formaldehyde solution	12h
4	After scalding the seeds in boiling water for 5min, soak the seeds in sterile water for 12h	5min
5 ( CK )	Soaking seeds in sterile water	12h

#### 3.2 EFFECT OF DIFFERENT DISINFECTION TREATMENTS ON THE RATE OF MOULD DEVELOPMENT

Table 3 shows the mould rate of the seeds with different treatments, and Table 4 shows the difference test of the effect of several chemical treatments on the mould of the seeds. From Table 3, it can be seen that different disinfection treatments have different effects on the disinfection of different seeds, and the best treatment with Chlorothalonil 500 times solution, 15 seeds have no mould. The next best treatment was with 0.079% formaldehyde solution, only a small amount of mildew was found in the small crown flower and purple acacia, the others were free of mildew. Treatment with 0.49% potassium permanganate solution and treatment with boiling water scalding

seeds, the effect is not significantly different from warm water immersion seeds, as can be seen from Table 4, the treatment with potassium permanganate solution is the highest rate of mould, while the lowest treatment with chlorothalonil, the two at the level of 4.99% difference is significant, at the level of 0.99% difference is not significant. The differences between the other treatments were not significant. The highest percentage of mould was found in the control treatment of purple locust seeds up to 68.29%, which may be related to the quality of the seeds.

**Table 3** Mold rate of seeds with different treatments

Processing number	Rye grass	Small crown flower	thorns	Malan	white flower grey	Herb Mignonette	Eyelash beard seeds
1	0	0	0	0	0	0	0
2	0	3.29	4.99	3.29	13.29	0	0
3	0	1.69	0	0	0	0	0
4	0	0	0	0	0	0	1.69
5	0	3.29	0	0	6.69	0	0
Multiflora Magnolia	Sardarwan	Acacia	purple locust	horse thorn	Passiflora	beautiful beard seeds	molasses grass
0	0	0	0	0	0	0	0
0	0	11.69	53.29	1.69	0	3.29	0
0	0	0	9.99	0	0	0	0
0	0	3.29	9.99	0	0	0	0
0	0	3.29	68.29	9.99	0	1.69	0

**Table 4** Examination of differences in the effects of several chemical treatments on seed mold

Processing	Mold rate (%)
1	0
2	6.32
3	0.77
4	0.91
5	5.97

#### 4 CONCLUSION

In this paper, on the basis of big data, this paper uses chlorothalonil potassium permanganate A and boiling water scalding to sterilise 15 kinds of seeds for ecological restoration of mine waste land, such as purple flowering first purple spike acacia, the results show that the best sterilisation effect on seeds with chlorothalonil and the worst effect with potassium permanganate: boiling water scalding has a better sterilisation effect on larger leguminous seeds, while it has a greater harm to small leguminous seeds From the point of view of improving germination rate, the best effect This may be related to the germination characteristics of the seeds themselves. In combination with the practical application of ecological restoration in mines, the seeds can be disinfected with 500 times solution of Bacitracin and the germination rate can be used to calculate the amount of seeds used to ensure that the seeds can produce enough seedlings to play a role in ecological restoration.

---

## ABSTRACT

This study focuses on the effects of reflective journaling on English writing skills. In the context of big data, the attention received and students' engagement in all aspects of writing were explored by analyzing students' timely records of the entire process of completing time-limited compositions under the teaching experiment, including records of the first draft, revised draft, and final draft of each writing. Results showed that no student among the 40 students engaged in only one level of reflection, and every student engaged in at least two levels of reflection. The study used the reflection logs to gain an accurate understanding of the variability in students' focus of attention and levels of reflection in their writing, and thus the reflection logs have some advantages for improving students' critical writing skills.

## KEYWORDS

Reflective journal; English writing skills; Teaching writing discernment; Writing engagement; Levels of reflection

## 1. INTRODUCTION

Writing is a form of social dialogue, which has commonalities and individuality with oral dialogue, the commonality being that both focus on interactivity, and the individuality being that writing is a purely theoretical dialogue with words as the carrier. It is obvious that to write a quality article efficiently requires the writer to have deep writing skills, rich material, rigorous logical thinking and organizational structure [1].

Teaching necessarily involves both "teaching" and "learning" subjects. At present, there are more studies on the factors considered by teachers in reflective teaching, but not enough attention is paid to the factors of students. The learning reflective journal coincides with the goal of developing critical thinking skills, which consists of three dimensions: analysis, evaluation, and improvement [2-3].

A reflective journal is an activity in which students critically re-conceptualize the learning process and learning outcomes mainly in the form of writing in class [4-5]. The literature [6] analyzed that reflective journal has the significance of reviewing the learning process and analyzing the learning outcomes from the content perspective, and the literature [7] that writing a reflective journal enables students to clarify the learning plan, examine the learning process, measure the learning outcomes, regulate the learning deficit, and adjust the learning

process, and DM Jannah [8] conducted an experiment to analyze the effect of reflective journal on students' writing skills by monitoring their test scores of writing, it was concluded that reflective journaling is advantageous in improving students' writing skills.

This paper designed a teaching experiment, supplemented by an empirical study with questionnaires and interview assessments to understand the effectiveness of teaching the application and writing process of reflective journaling.

## **2. REFLECTIVE JOURNAL IN THE CONTEXT OF BIG DATA**

In the context of big data, more and more English teachers are adopting a combination of reflective journaling, English writing and big data to advance students' English writing thinking skills. Students record their perceptions, feelings and strategies about their subject learning in the form of journal entries, and reflect on and evaluate their subject learning in order to achieve a learning process that has the dual effect of causing reflection with learning and promoting learning with reflection.

### **2.1. THE USE OF REFLECTIVE JOURNALING IN ENGLISH WRITING SKILLS**

Reflective journaling has a positive impact on students' learning process:

(1) Using the reflective journal learning approach to English teaching activities makes students' English learning subject status established and recognized, so that students will conduct independent English writing learning based on their own English learning foundation, learning habits and learning levels, which not only stimulates students' passion for writing, but also pulls students' self-awareness and makes them voluntarily participate in English writing teaching activities, which helps improve This helps students to improve their English writing skills.

(2) Reflective journal learning process is essentially a process of thinking movement, students reflect on their English learning through the journal, have a precise idea of their English writing ability, accordingly this understanding can drive students to improve their English writing ability, then, once students form English thinking ability, they can make their English writing level break through the limits of the text level And it is rich in connotation.

### **2.2. THE DEVELOPMENT OF STUDENTS' CRITICAL THINKING SKILLS BY REFLECTIVE JOURNALING**

Thinking ability, also known as critical thinking ability or judgmental thinking ability, is an important part of secondary school students' comprehensive quality. Writing in English is a complex thinking activity, an important way of expressing students' thoughts and a comprehensive ability, but there are few studies, especially empirical studies, on secondary school students' discursive skills and writing level. Therefore, it is necessary to understand secondary school students' current discursive tendencies and the influence of discursive skills on secondary school English writing.

## **3. THE APPLICATION OF REFLECTIVE JOURNAL IN ENGLISH WRITING**

### **3.1. HIERARCHY OF REFLECTION IN THE STUDENT REFLECTION LOG**

To investigate the effect of reflection journals on English writing skills, 120 reflection journals submitted by 40 students were analyzed to classify the difficulty of students' reflections into:

Type A general reflection, objectively describing and recording events as they occur.

Class B process reflection, vertical reflection, puts one's writing process in the time dimension and re-examines and sorts it out.

Category C comprehensive reflection, a combination of vertical and horizontal reflection, opens up ideas and analyzes causes through peer learning.

Layers of reflection were created, and the results of the layers are shown in Table 1. Students did not deliberately avoid a particular type of reflection because it was more demanding on their thinking. All students engaged in reflection at the reason identification level, which requires a high level of critical thinking skills. 40 students, none of whom engaged in only one level of reflection, each engaged in at least two levels of reflection. Specifically, if the five levels are integrated into three levels, A, B, and C, then 14 students reflected in category C, 38 students in categories A and C, 57 students in categories B and C, and 56 students in categories A and B. It can be seen that the students analyzed the problem from multiple perspectives and had a wide range of ideas.

**Table 1.** Hierarchy of reflections in the reflective journal

Levels of Reflection	Description of the event	Process review	Identification of causes	Improvements	Event Evaluation
Number of people	31	25	32	14	7
Percentage of total	77.5%	62.5%	80%	35%	17.5%

### 3.2. SURVEY RESEARCH REFLECTIVE LOG FEEDBACK QUESTIONS

Students analyze and reflect on their performance and problems in the essay and write a reflection log to be given to the teacher of the class. After receiving the students' reflection logs, the classroom teachers wrote feedback or answered the students' confusion and returned them in a timely manner. In order to accurately understand the differences in students' focus and reflection levels in writing, this study randomly selected a total of 100 reflection logs of 20 students in the experimental class for five compositions to analyze, in order to grasp the reality of secondary school students' discursive ability in English writing, compare the reflection logs centrally, set up a questionnaire, and then derive the proportion of each concern. The results of the analysis are shown in Figure 1, which shows that the main areas of concern are grammar, opinion, fixed collocation, writing, composition content, and other formal aspects of composition. The most concerned area was opinion, and 17 students reflected on how to understand the opinion of the essay in English writing in their reflection logs. On the other hand, through the descriptions in the students' reflection journals, the teachers understood the problems and confusions of the students in writing and gave them appropriate help in the classroom. The teacher also gave help to the students by describing their problems and confusions in their writing, and emphasized the logical coherence of content, chapter structure, writing skills and sentence choice in class.

**Figure 1.** The attention received by all aspects of writing

#### 4. CONCLUSION

Undoubtedly, English teachers' adoption of reflective journaling strategies to promote students' English writing thinking skills is a pedagogical exploration by English teachers to deepen the innovation of the high school English curriculum, and is also an individual demand of students' desire to be respected and recognized for their self-learning differences. Only when English teachers enhance students' English writing thinking skills at the level of reflective English writing learning strategies can they solve the current situation of students' low English writing standards at the root, and also win students' support and participation psychologically, so that students can develop English thinking skills and eventually enhance their passion for English writing and achieve breakthroughs in English writing standards.

---

## ABSTRACT

To provide a course for college cognitive education that will better prepare students for their mental health. This paper analyzes college students' self-perception through big data to understand students' self-perception bias and the sources of negative emotions of contemporary college students. This is used to innovate the working mode, improve mental health education and guide college students to form positive psychological qualities. The results show that negative emotions among students mainly come from academic aspects, accounting for 25.7% of the total. The next is "emotional problems", accounting for 16.4%. This study offers a fresh direction for the university students' psychological health education.

## KEYWORDS

Mental health education; Ideological and political education; Psychological quality; Self-perception bias; Negative emotions

## 1. INTRODUCTION

Psychology is the human brain's subjective reflection of reality, and the psychological content as a criteria of division primarily refers to the total of the continuous and stable psychological traits of the individual that set them apart from other individuals in different situations and operate on their own external and behavioral patterns, and personality needs to be reflected and developed by virtue of psychological processes and cannot exist independently [1-2]. When it comes to substance, ideological and political education crosses over with the development of pupils' advantageous psychological traits. Particularly, it may be seen in the education of life perspective, which includes the education of ideas and beliefs, the education of life values, and the education of life values [3-4].

First and foremost, ideological and political education's primary aim in educating college students about ideas and beliefs is to allow them to lay a solid spiritual foundation [5]. Psychological reasons are frequently the underlying cause when college students believe that the ideal and reality are quite different from one another, since this causes them to lose confidence in life and become confused [6]. College students in the modern period must possess a number of good psychological traits, according to the physiological as well as unique characteristics of the law governing their psychological development [7]. The development of college students' positive psychological traits also lays the psychological groundwork for ideological and political education and aids in the achievement of the goal of ideological and political education, which is to establish moral education. At the same time,

the development of college students' ideology and morality cannot be accomplished without the support of psychological factors [8–9].

## **2. THE IMPORTANCE OF CIVIC EDUCATION IN MENTAL HEALTH EDUCATION IN THE CONTEXT OF BIG DATA**

### **2.1. ADVANTAGES OF CIVIC EDUCATION IN THE CONTEXT OF BIG DATA**

In colleges and universities, mental health education plays a significant role in the ideological and political curriculum as well as the talent development program. The information age has penetrated modern society, and by integrating resources for civic and political education with big data and improving curriculum delivery techniques, the goal of all-round education of all staffs and processes can be realized. The advantages of Big Data Civic Education as a new type of Civic Education are:

(1) It can help conventional civic education transcend its geographical and temporal boundaries and adopt the qualities of openness and timeliness.

(2) It may encourage the thorough integration of professional knowledge education and civic education, and it can create an all-encompassing educational environment both inside and outside of the classroom, online and off.

(3) Through open curriculum learning, it may take use of the network to compile high-quality curriculum resources across the country and solve the issue of uneven educational levels brought on by regional variances.

### **2.2. MENTAL HEALTH EDUCATION AND CIVIC EDUCATION SYSTEM IN COLLEGES AND UNIVERSITIES**

Three features are now prevalent in Chinese college students' mental health education:

(1) Marxism and other political ideologies serve as the guiding ideologies for mental health education, which means that it must adhere to ideological and political standards in order to serve intellectual and political education more effectively.

(2) The administration of mental health education is controlled by the school's several administrative divisions, which are based on an ideological and political management structure. They are in charge of doing research, creating work plans, relevant systems, and coordinating the activities of mental health education.

(3) Professional instructors deliver the mental health education classes, but thought and government employees provide the psychological therapy services.

## **3. ANALYSIS OF THE CURRENT PSYCHOLOGICAL QUALITY OF COLLEGE STUDENTS BASED ON BIG DATA**

### **3.1. SELF-PERCEPTION ANALYSIS**

College students' perceptions of themselves are depicted in Fig. 1 based on an investigation of big data technologies. 19% of college students have the cognitive bias of “appreciating their own merits, but sometimes being complacent about their merits”, and these students with conceited mentality tend to overestimate themselves, be proud and arrogant, and be blindly optimistic, which inevitably leads to This will inevitably lead to mistakes in life and study. 33% of college students have the cognitive bias of “appreciating their own merits, but sometimes they have low self-esteem”, and 12% of them even choose to “complain about their shortcomings and have extremely low self-esteem”. This is an emotional experience brought about by the low self-concept of college students. These college students who have low self-concept feel dissatisfied with their own ability, character or

behavioral performance, lack confidence in what they want to do, easily deny themselves, and do not pay attention to the value of self-existence.

**Figure 1.** Self-perception of university students

### 3.2. ANALYSIS OF NEGATIVE EMOTIONS

As Chinese schoolchildren's psychological development moves from sensitivity to stability, their negative emotions are becoming more pronounced and are more susceptible to outside influences. Figure 2 displays the origins of unpleasant feelings among current college students after big data technology study. "Family" accounts for 14.2%, "interpersonal relationship" accounts for 14.3%, "emotional problems" accounts for 16.4%, "employment The percentage of "family" is 14.2%, "interpersonal relationship" is 14.3%, "emotional problems" is 16.4%, "employment" is 15.3%, "academic" is 25.7%, and other negative emotions are 14.1%. It can be seen that college students have various negative emotions in different degrees in academics and interpersonal communication.

**Figure 2.** Negative emotions of contemporary university students

### 3.3. THE APPLICATION OF COLLEGE CIVIC EDUCATION IN MENTAL HEALTH

(1) Encourage the co-development of thought politics and mental health education

The development of Big Data The objectives of mental health education should be reformulated and made congruent with those of civic education so that they can work together to sustain mental health and advance civic education.

(2) Encourage localization and political thought on mental health education

It is necessary to follow the principles of socialist theories with Chinese characteristics, investigate the evolution of mental health education in accordance with Chinese circumstances, encourage the localization of the fundamental theories of mental health education, and develop Chinese conceptual frameworks and theoretical models for mental health education using big data technology, study the unique behavioral characteristics and influencing factors of Chinese people, and revise and design psychometric tools suitable for Chinese people.

(3) Improve the Civic Education management system using big data as a foundation.

A big data-based approach to civic education really combines technology tools with mental health education teaching strategies. Civic education will provide better practical results if proper teaching strategies are chosen and are supported by cutting-edge technological tools.

#### 4. CONCLUSION

Chinese colleges and universities have just recently begun to build their mental health curricula. These days, even though the State and the Party have steadily managed the growth of mental health education in colleges and universities through a number of laws and regulations, despite the fact that the "political" aspect of mental health education in colleges and universities has been established at the policy level, due to misunderstandings and flaws in public perception, and because of the long way it still has to go before becoming standardized, its construction and development still need to be researched and practiced.

Considering the political and ideological training received at colleges and universities against the backdrop of big data, in combination with the state of higher education today and its defining qualities, an examination of mental health education in colleges and universities is conducted, it is sorted out how mental health education has evolved in Chinese colleges and universities, Efforts are made to reflect the fundamental elements of mental health education in Chinese colleges and universities, and the manner of mental health education in colleges and universities is strategically placed, which has significant practical value in addition to enriching the theoretical framework and substance of ideological and political education, which may more effectively adapt to and fulfill the requirements of students who are receiving mental health education services, as well as support the growth and enhancement of mental health education work at colleges and universities.

## ABSTRACT

This paper applies big data technology to university music informational teaching and discusses the impact of information technology on music classroom teaching. The characteristics of the information technology music teaching platform are analyzed, and on this basis the information technology platform is designed to be more suitable for music classroom teaching. The results showed that the I rating, which considered the operation simple and quick, accounted for 63% of the teachers' opinion that the use of the platform was conducive to the adoption of a variety of music teaching, while the II rating, which considered the operation somewhat difficult but improved after skilled platform operation, accounted for 27%. The application of big data technology to music informatics teaching has some practical significance for teachers to be able to teach music easily and quickly.

## KEYWORDS

Music informatization; University music teaching; Informatization platform; Music teaching system; Informatization teaching

## 1. INTRODUCTION

With the deepening of quality education, general education awareness, and the promulgation and implementation of the Ministry of Education to strengthen literature arts education in public colleges and universities, music education in Chinese colleges and universities has been strengthened [1]. In this context, the development direction of college music education management has now entered a new stage, and college music education has advanced to the goal of scientific and standardized management [2-3]. Music teachers in the traditional sense of teaching mode, most of them go through the personal face-to-face form of teaching, the traditional teaching mode exists in a single way, the content of the lack of change [4].

Digital music education in China began in the 1980s and 1990s, during which various music informatization platforms emerged, which can be broadly classified into the following categories: composition informatization, score printing informatization, timbre editing informatization, automatic accompaniment software, and music education software [5]. Various types of informatization are applied to music teaching, although there are various forms of software, but due to the lack of relevant teaching software, when explaining basic pentatonic music theory knowledge, teachers often teach with the help of professional composition writing software, which often lacks convenience and relevance in teaching use because it is for the professional composition field with many pre-settings and complex operation procedures [6-7]. In accordance with the teaching requirements and training objectives, thus providing a deeper

understanding of music teaching at all levels in order to establish a more effective information platform for music teaching, improve the quality of teaching, and train personnel to ensure the development of all aspects of higher education.

It is evident that the informatization of music teaching at home and abroad has become a trend and has been developed considerably [8]. Within this trend, the informatization of music teaching is also becoming more and more mature. Moreover, as information technology continues to develop, it is necessary and meaningful to explore the informatization of platforms that are more convenient and applicable to music teaching.

## 2. FUNCTIONAL DESIGN OF MUSIC TEACHING INFORMATION PLATFORM

### 2.1. MUSIC TEACHING INFORMATION PLATFORM SYSTEM FUNCTIONAL MODULE DESIGN

In order to effectively manage and use multimedia network teaching resources and establish a scientific and reasonable music teaching mode, the system is divided into 5 functional modules based on the analysis of teachers' demand for music teaching information platform by big data technology, and the functional modules of music teaching information platform system are designed as shown in Table 1. Users with different roles have different permissions in each functional module. Student users only have the permission to view announcements in announcement management, while teacher users also have the permission to edit and publish announcements, and system administrators can view, publish and delete announcements. Each role has different permissions and functions for meeting the requirements of each role for the system.

**Table 1.** Music Teaching Information Platform System Module

	System modules	Function
<b>Music teaching information platform system</b>	System user management	User registration and login
	Bulletin Management	Posting and amending announcements
	Resource Management	Multimedia video teaching
		Question Bank Management
		Exercise exercises
		Online Examinations
	Teaching Management	Assignment Release
		Results Search
		Assignment Correction
	Course Management	Lesson Plans
		Classroom Management
		Student Management

### 2.2. INTRODUCTION OF FUNCTIONAL MODULES OF MUSIC TEACHING INFORMATION PLATFORM

This music teaching information platform is built based on big data technology. In order to achieve convenient interactive operation and easy and convenient functional features, the platform is divided into three major parts: UI module, data management module and dynamic display business logic module, which are independent of each other and interact with each other. Independence means that the three modules can be programmed independently in terms of implementation, and then each module communicates with each other through interfaces and functions. This can achieve a clear division of labor, interface design and display

changes do not require changes in the background data to adapt, to maintain the stability of the background data structure module and reduce the burden of developers. In this way, it can achieve the purpose of displaying different interfaces with the same set of data structure.

(1) Among them, i.e., the user interface module is responsible for user input interaction feedback, including mouse click, menu selection, input and other operations.

(2) The role of the data management module is to store and process relevant data, which defines the data model, describes the data to be stored and the method of processing data, and it is the core part of the whole platform implementation.

(3) Dynamic display business module is to realize the foreground display part of this music teaching platform, it is responsible for displaying the content added by users, responding to the actions operated, being the feedback for teachers to interact with the platform, and being the functional basis for teachers to show the teaching contents to students.

The above three modules not only represent the main system functions of this music teaching platform, but also reflect the core development idea of this platform, that is, each module is carried out independently, and the communication between modules is carried out through the interface method, so as to efficiently and correctly respond to the user's operation results and help teachers can carry out teaching work such as music composition more conveniently and quickly.

### 3. ANALYSIS OF MUSIC TEACHING INFORMATION PLATFORM

#### 3.1. ANALYSIS OF THE MOBILITY OF MUSIC TEACHING INFORMATION PLATFORM

To understand whether the music teaching platform helps music class teachers to teach easily and quickly in music teaching, the evaluation of teachers who use the music teaching platform was analyzed based on big data technology. The analysis of the mobility of music teaching information platform is shown in Figure 1. The specific content evaluation is divided into three levels: I, II and III. I evaluation, "easy and quick to operate" accounts for 63%, and teachers think that the use of the platform is conducive to music teaching using a variety of music teaching, II evaluation, "somewhat difficult to operate" accounts for 27%. 27%, but it improved after familiarizing with the operation of the system, and 10% of "very complicated to operate" in the evaluation of level III.

Figure 1. Analysis of the mobility of music teaching tools

#### 3.2. ANALYSIS OF THE TEACHING DIMENSION OF MUSIC TEACHING INFORMATION PLATFORM

In order to explore whether the music teaching informatization platform has music scenario in the music teaching dimension, whether the teaching contents are designed with the characteristics of the teaching objects in mind, and whether the teaching methods are diverse, which makes the course content rich and interesting and can enhance students' learning interests. Through big data analysis of teachers' and students' evaluation of the music teaching informatization platform, the teaching dimensions of the music teaching informatization platform were analyzed as shown in Table 2. The results show that the music teaching informatization platform was given a high level evaluation, accounting for 86.3%, a medium level evaluation, accounting for 7.8%, and a low level evaluation, accounting for 5.9%. The analysis results show that the music teaching information platform teaching can make students have a deeper feeling about the knowledge they learn, thus enhancing their musical sensibility and facilitating the consolidation of music knowledge points.

**Table 2.** Evaluation analysis of music teaching dimensions on the music teaching information platform

Teaching dimension	Indicators	Advanced	Intermediate	Low level
	Teaching the New Curriculum	Introductory musical situations Set richly	The musical context of the teaching content Single context	Musical contexts without music teaching content
	Teaching methods	Facilitate learning analysis using multiple A variety of teaching methods are used to develop music teaching that is innovative and ensures Students' attention to learning	The content of the teaching has changed, but for the most part of it is still the same, without Innovation	Instructional design that is not conducive to independent innovation
	After School Extensions	Facilitates the expansion of music teaching content A large number of pieces in the same genre, appropriate for students' learning and inspiring	Useful for expanding the content of music teaching with individual pieces of the same genre, inspiring	Not helpful for teaching music content to expand the same type of music
	Number of people evaluated	86.3%	7.8%	5.9%

#### 4. CONCLUSION

With the advancement of technology and the change of teaching mode, music teaching mode has also undergone great changes. The traditional single teaching mode has been changed, and big data technology has been expanded more and more popularly in information-based music teaching, playing a significant role in music classroom teaching. The platform has been balanced between convenience and professionalism and teaching freedom, and teachers can teach without the help of professional composition writing software with many pre-set and complicated operation procedures, breaking through professionalism and allowing the existence of unusual combinations of notes. It provides more possibilities for teaching demonstrations, and the more convenient and versatile management system is helpful to help music teachers in teaching management.

The development platform combined with future functions will be better improved, and after rigorous testing, we hope that it will eventually be applied to music classroom teaching and play its proper role to make a role and assistance for music classroom teaching.

## ABSTRACT

This paper constructs a basic framework for the cultivation of English intercultural communication competence among college students in terms of cognitive ability, emotional ability and behavioral ability of contemporary Chinese college students, and explores an effective path for the cultivation of English intercultural communication competence among college students. The study showed that students' willingness to communicate intercultural increased by 20%, their ability to acquire intercultural communication knowledge increased by 24.1%, students' cognitive ability of intercultural communication increased by 16.5%, students' affective ability increased by 20.1%, and students' behavioral ability increased by 26.1% after increasing intercultural communication experience for English teaching. It can be seen that increasing English teaching of intercultural communication is an effective way to improve English intercultural communication ability of college students.

## KEYWORDS

Intercultural communication competence; Competence development; English for college students; Intercultural communication; Communicative knowledge

## 1. INTRODUCTION

Intercultural communication competence is the ability to communicate between native and foreign language speakers, i.e., to understand the culture and ideas of both parties through communication [1-2]. Intercultural communication competence is an international communication competence, which is a major new requirement for university teaching nowadays [3]. English has become an international language, and the development of students' intercultural communication skills can be enhanced through English learning [4-5]. However, in China's teaching, due to the influence of exam-oriented education, the teaching of English is only focused on coping with exams, especially in universities.

In order to develop English intercultural communication skills among university students, it is required that teachers use university English as a tool for developing students' intercultural communication skills [6]. First of all, the corresponding cultural teaching should be carried out, i.e., the students should be trained in Western knowledge skills and Western consciousness, and the students' knowledge of Western values, customs, norms, etc. should be strengthened so that the corresponding teaching can be carried out, and then a comprehensive communication training should be carried out, i.e., the communication skills of the students

should be promoted so that the intercultural communication skills of the students can be cultivated [7-8]. Through this series of processes, students' intercultural communication skills can be strengthened through a step-by-step approach to achieve English teaching as a way to cultivate international talents who are more in line with the needs of society and accelerate the development of the country.

## **2. ENGLISH INTERCULTURAL COMMUNICATION SKILLS OF COLLEGE STUDENTS**

### **2.1. BASIC FRAMEWORK OF ENGLISH INTERCULTURAL COMMUNICATION SKILLS FOR COLLEGE STUDENTS**

#### **2.1.1. COGNITIVE ABILITY**

Cognitive skills specifically include the understanding of cultural knowledge as well as linguistic knowledge. In English intercultural communication, language is an important condition to ensure smooth communication. Learning language knowledge is a prerequisite for improving language ability, and only with solid language knowledge can communicators truly understand each other's meanings. English intercultural communication is not only to improve language ability, but also to be good at exploring the deep cultural connotation behind the language forms. Cultural knowledge can be divided into general cultural knowledge and special cultural knowledge. General cultural knowledge is good for students to understand the communication environment and culture, to improve their sensitivity to cross-cultural phenomena, and to understand the mental structure, values and behavior of the communicative objects in the language environment of cross-cultural communication.

#### **2.1.2. EMOTIONAL COMPETENCE**

Emotional competence consists of communicative purpose, communicative attitude, and cultural empathy. The communicative purpose refers to the intention of the communicator to actively participate in and conform to the cultural communication style of the object in a specific cultural communication environment. Communicative attitude refers to the communicator's true attitude toward the object's cultural environment and his or her own cultural identity, which is a key element of affective competence. Based on the basic theory of cultural empathy, teachers should focus on the development of students' own cultural empathy thinking and ability to avoid social barriers such as racial prejudice or cultural impositions in the process of communication. At the same time, based on the equality between different national cultures, teachers should follow the principle of moderation when cultivating students' cultural empathy and actively respond to the multicultural background to achieve the purpose of intercultural communication.

#### **2.1.3. BEHAVIORAL CAPACITY**

Behavioral competence mainly includes thinking, linguistic, adaptive, non-verbal, expressive and strategic communication skills in the process of intercultural communication. The adaptive ability, expressive ability and thinking ability of the communicator are the key parts of intercultural communication ability. The intercultural communication consciousness of the communicative subject determines its adaptability, and only with excellent intercultural expression ability can the intercultural adaptability be improved effectively.

## **2.2. CURRENT SITUATION OF UNIVERSITY ENGLISH EDUCATION**

### **2.2.1. TRADITIONAL TEACHING METHODS ARE NOT INNOVATIVE ENOUGH**

Even though China has entered the stage of teaching reform, many teachers still teach in the traditional and dull way, which makes English teaching boring and tedious. Moreover, the principle of "people-oriented" is not reflected in the teaching of English in college. In the

teaching process, the teacher often speaks on the stage and the students take notes off the stage, without giving the students the opportunity to think, so that the teaching only stays on the instillation of basic knowledge, and the whole teaching process cannot achieve the teaching goal.

### **2.2.2. TEACHING FOCUS DEVIATES FROM THE GOAL OF ENGLISH TEACHING**

In the process of teaching English in college, many teachers focus on teaching English grammar and vocabulary just to help students cope with the final exam. However, in order to cultivate more talents to meet the development of society, university teaching should gradually move away from the traditional teaching in junior and senior high schools to an open, thinking-based teaching mode. Only in this way can we develop students' imagination, promote students to learn to think independently, and cultivate students' ability of cross-cultural communication. Therefore, in the current university English teaching, many teachers have deviated from the focus of English teaching, so that students' intercultural communication skills are not cultivated.

### **2.2.3. THE QUALITY OF TEACHERS IS NOT HIGH**

In addition to the influence of the teachers' traditional teaching mode, there is another important factor - the limited quality of university English teachers. In many universities, the quality of English teachers is not high, their knowledge of English language is limited, and their understanding of English-related contents is not thorough. If the quality of the teachers is only that, how can they produce students with good intercultural communication skills? Therefore, in the teaching of English on weekdays, schools can hire some foreign teachers to teach students, which can increase students' simple communication with foreign friends and strengthen students' cultivation of intercultural communication skills.

## **3. RESEARCH ANALYSIS AND CULTIVATION PATH OF ENGLISH INTERCULTURAL COMMUNICATION ABILITY OF COLLEGE STUDENTS**

### **3.1. RESEARCH ON INTERCULTURAL COMMUNICATION AMONG COLLEGE STUDENTS IN HIGHER EDUCATION**

In order to investigate what is the average level of intercultural communication competence of college students, a study was set up to address this issue based on four dimensions of intercultural communication competence development: language and sociolinguistics, discourse and strategy, knowledge and skills, and attitude and awareness. The intercultural communication situation of college students participating in the study was graded, with Grade A being excellent intercultural communication ability, Grade B being good intercultural communication ability, Grade C being average intercultural communication ability, and Grade D being poor intercultural communication ability, and the results of the grading are shown in Figure 1. The data of this study show that: very few college students have strong intercultural communication ability A grade accounted for 7.79%, not many college students have good intercultural communication ability B grade accounted for 18.95%, the majority of college students have average intercultural communication ability C grade accounted for 27.68%, and poor intercultural communication ability D grade accounted for 45.58%.

Research shows that the overall level of Chinese college students' intercultural communication ability is low, mainly in terms of weak language ability, average or poor communication strategies and skills, limited intercultural knowledge, low desire for active communication, and weak intercultural communication awareness.

**Figure 1.** Statistics on intercultural communication

## **3.2. STRATEGIES FOR DEVELOPING INTERCULTURAL COMMUNICATION SKILLS OF COLLEGE STUDENTS**

### **3.2.1. INCREASING CROSS-CULTURAL KNOWLEDGE INPUT IN ENGLISH LANGUAGE TEACHING**

The use of language in communication is closely related to the culture of the communicator, i.e., language is a communicative symbol system based on culture, so cultural differences can lead to a series of communication barriers. This requires teachers to strengthen the teaching of culture in addition to the teaching of language itself in the process of teaching English. If language teaching and culture teaching are organically combined, appropriate penetration of foreign history and culture not only enhances students' learning initiative and enthusiasm, but also strengthens students' mastery of some foreign cultural knowledge, and enriches the level of language teaching, and also effectively improves the teaching effect and application practice effect of language teaching. In addition, an appropriate course on intercultural knowledge is conducive to further strengthening the broadening of students' intercultural knowledge and the cultivation of their thinking skills.

### **3.2.2. INCREASING CROSS-CULTURAL COMMUNICATIVE EXPERIENCES FOR ENGLISH LANGUAGE TEACHING**

To investigate whether adding intercultural communication experiences to English language teaching can improve college students' intercultural communication skills, the changes in intercultural communication of college students in English classes with added intercultural communication experiences, before and after class, are shown in Figure 2.

The data from the study showed that students' willingness to communicate intercultural increased by 20%, their ability to acquire intercultural communication knowledge increased by 24.1%, students' cognitive ability to communicate intercultural increased by 16.5%, students' affective ability increased by 20.1%, and students' behavioral ability increased by 26.1% after the course placement study. Compared to the pre-course study, the English classrooms that experienced increased intercultural communication experiences were enriched in terms of

students' intercultural communication experiences, and students were able to use intercultural communication concept vocabulary more frequently and appropriately to express themselves, as well as answer questions from a more professional and objective perspective, thus increasing intercultural communication experiences for English language teaching resulted in some enhancement of students' intercultural communication skills.

**Figure 2.** Changes in students participating in English intercultural communication

#### 4. CONCLUSION

With the further expansion of China's opening to the outside world, the value of English education has become clearer and clearer, and the cultivation of students' ability to use English in practice should be an important goal of English teaching at this stage. The ultimate goal of university English teaching is to cultivate students' ability to use foreign languages and thus to equip them with the ability of cross-cultural communication. English teaching is not only a process of teaching language, but also a way to cultivate the communicative ability of college students and improve the ability of our college students to compete internationally. In this way, we can achieve our teaching goals, fundamentally improve students' English intercultural communication skills, master this international language, understand other countries' culture, improve students' communicative ability, change the current situation of students' aversion to learning English, help students develop themselves, and improve their English literacy in an all-round way, so that we can really cultivate higher-level international talents for society.

## ABSTRACT

This paper is designed to explore the integration strategy of Chinese cultural management and frontier casting community consciousness in the Internet era. Using the thesis database as the search domain, a visual analysis of mainstream media's dissemination of community consciousness was conducted through the CiteSpace literature quantitative research method. The data show that the relevant research literature experienced two peak growth points until 2020, one is in 2018 with 78 articles, an increase of 30 articles year-on-year. The second is 2020, which saw an increase of more than 100 research papers to 182. This change is all related to the major events of the frontier casting community. Therefore, the news media in the Internet era has an important mission and responsibility to bear in the dissemination of community consciousness.

## KEYWORDS

Chinese cultural management; Mainstream media; Frontier casting; Community consciousness communication; Visual analysis

## 1. INTRODUCTION

In the Internet era, it is necessary to better play the role of mainstream media in communication, influence and guidance, and actively spread the awareness of frontier casting community. Casting a firm sense of community in frontier ethnic areas frontier casting is one of the core contents of ethnic work in frontier ethnic areas in the new era and the key to cracking the frontier ethnic problems [1-2]. Further expanding the in-depth research on casting a firm sense of community on the frontier in frontier ethnic areas provides a new perspective and space for exploration [3-4]. Casting a firm sense of community at the frontiers of ethnic areas in frontier regions requires both policy guidance and strong institutional support [5]. The system itself has the distinctive features of "global, fundamental, and long-term", and can play a powerful function of shaping, regulating, and regulating people's behavior, which has an irreplaceable role in promoting the social and economic development of frontier ethnic areas [6-7]. In the new era, frontier ethnic areas cast a firm sense of frontier casting community, and the issue of casting a firm sense of frontier casting community is incorporated into the institutional construction for interactive and holistic examination [8]. To explore the intrinsic fit between frontier casting community consciousness and institutional construction, to further enhance the sense of institutional access and happiness of people of all ethnic groups in frontier ethnic areas, and to gather majestic institutional strength for the realization of the Chinese dream of great rejuvenation of the Chinese nation.

## **2. STATUS OF RESEARCH ON FORGING A SENSE OF COMMUNITY AT THE FRONTIER**

### **2.1. COMMUNITY IDEOLOGY BUILDING CHALLENGES**

#### **2.1.1. THE SPECIFICITY OF MAINSTREAM IDEOLOGICAL IDENTITY SUBJECTS**

A comprehensive grasp of the subject of identity is a logical prerequisite and basic condition for promoting identity. “The subject is the practitioner, the knower or the actor of any objectivity activity itself.” The knower, practitioner and actor who identify with the mainstream ideology is the main body of mainstream ideological identity. The main body of mainstream ideological identity in the border ethnic areas is the people of all ethnic groups, the different basis of life practices of the people of all ethnic groups and the specificity that accompanies it is the prerequisite that must be taken into account to promote mainstream ideological identity, the specificity of multi-ethnic people’s own qualities, people’s values and religious belief activities, etc. Based on the specificity of the identity of the main body, to promote mainstream ideological identity in order to specific analysis of specific problems.

#### **2.1.2. MULTI-ETHNIC COMPLEXITY AND DIFFERENCES**

China is a unified multi-ethnic country, and multi-ethnicity and diversity are important features of the main body of Chinese society. In the border ethnic areas, this feature is more typical and significant. Multiple ethnic minority groups, cross-border ethnic groups, Han Chinese, and within a single ethnic group, there are different branches, different languages and customs; therefore, the subjects in border areas have ethnic differences and complexity. Therefore, how to respect the differences of each ethnic group while leading the construction of each ethnic group with the mainstream ideology as the ideology, promoting the activities of each ethnic group within an orderly scope, and constructing a border ethnic region with security and development is an issue to which the mainstream ideological identity pays attention.

#### **2.1.3. PLURALITY AND INSTABILITY OF VALUES**

Pluralism in the values of various ethnic subjects. With the increasing globalization and informatization and networking, the channels of communication between internal and external communities have been increasing. Coupled with the differences in the conditions of ethnic cultures, religious beliefs, social structures, economic status and other aspects of the people of various ethnic groups, the composition of the border heterogeneity of the situation is derived. In terms of values, the changes in economic and social life bring about changes in people’s values, and tradition and modernity intermingle to present a pluralistic and heterogeneous picture. Western forces always operate from the multi-ethnic areas of China’s frontiers, carrying Western cultural values with them in their economic and trade exchanges, distorting, discrediting and attacking socialist ideology, attempting to occupy people’s minds in the ideological sphere and realizing the “peaceful evolution”.

And in fact, shared concepts and culture play a fundamental role in advancing the stability and development of all ethnic groups in frontier ethnic areas. We seek positive and two-way identification with ethnic concepts and mainstream values, and then form a high level of common identity, and actively construct inclusive mainstream ideological contents, such as the great rejuvenation of the Chinese nation and the forging of a sense of community at the frontier.

## **2.2. BORDER GOVERNANCE IS THE REGIONAL GOVERNANCE OF THE SOVEREIGN STATE OF THE CHINESE NATION**

### **2.2.1. THE PRINCIPLE OF SOVEREIGNTY AND TERRITORIAL BOUNDARIES**

The designation of marginal parts of the state as “frontiers” as special areas for governance has a long history in the process of human state governance. The transformation of state form and the innovation of governance system have made the traditional frontier “alien people”, empowered by the identity system of “nation” and “nationals”, manifest the sovereign state’s People’s identity. Whether it is the “equality of all the people of the Republic of China” and “the sovereignty of the Republic of China belongs to all the people” established at the beginning of the Republic of China or the “people-centered” national value system and system established by the People’s Republic of China, the “people-centered” national system and the “people-centered” national system have been established. “The value system, system and action system of the country. In this process of national reconstruction and social reshaping of the Chinese nation, the national territorial characteristics and national sovereignty attributes given to the frontier also further highlight and strengthen the characteristics of the frontier community between the people of all ethnic groups in the frontier and the residents of the mainland.

### **2.2.2. THE COUNTRY AS A WHOLE AND THE FRONTIER EDGE**

The governance of the frontier in the process of nation-state construction and modernization embodies the integrity of national sovereignty and the regional nature of frontier governance. For a country with a long tradition of governance like China, the frontier is given a distinctive sovereign state core, not as a break with tradition, but as an absorption, adaptation and innovation of frontier governance in historical times. This national governance system, when projected onto the frontier regions, is reflected in the general governance issues based on the national identity of frontier residents and the unique connotation of promoting the rapid development of frontier ethnic regions through differential governance. In the concrete practice of frontier governance, although there are sometimes tensions between the two, the protection of the rights and interests of frontier residents and the adjustment of inter-ethnic relations are incorporated into the framework of the construction of a frontier community and regulated by the overall national identity.

## **3. INTERNET-BASED ERA OF FRONTIER CASTING COMMUNITY AWARENESS**

### **3.1. ANALYSIS OF THE INFLUENCE OF MAINSTREAM MEDIA ON THE SENSE OF COMMUNITY**

In *Imagined Communities: The Origins and Dispersal of Nationalism*, American scholar Benedict Anderson views the interplay of capitalism, print technology, and human linguistic predestination as the necessary conditions for the formation of imagined communities. This viewpoint provides insight into the critical role played by the news media in the dissemination of a sense of community. The mainstream media has an important mission and responsibility in constructing, shaping, and disseminating the sense of community forged on the frontier.

### **3.2. ANALYSIS OF MAINSTREAM MEDIA’S COMMUNICATION OF COMMUNITY CONSCIOUSNESS**

This paper uses the thesis database as the search domain and visualizes the analysis through the CiteSpace literature quantitative research method. It focuses on the current situation, hot areas, shortcomings and limitations of the dissemination of community consciousness by border casting and future research paths. The analysis of community consciousness dissemination by mainstream media is shown in Figure 1. Newspaper literature on the dissemination of community consciousness in frontier casting has been on an upward

trend.

The relevant research literature has experienced two peak growth points before 2020, one being 78 articles in 2018, an increase of 30 articles year-on-year. This is in line with the Party's 19th National Congress report, which clearly proposed "casting a firm sense of community at the border". Secondly, in 2020, more than 100 research papers were added, reaching 182. In 2019, General Secretary Xi Jinping emphasized the importance of casting a firm sense of community along the border at the National Conference on National Unity and Progress.

It can be said that the dissemination on casting a firm sense of community on the frontier casting has further deepened, and relevant research has grown in a spurt.

**Figure 1.** Distribution of research literature on sense of community, 2015-2020

### 3.3. KEYWORD ANALYSIS OF MAINSTREAM MEDIA COMMUNITY AWARENESS COMMUNICATION

Keywords are the focal words that objectively describe the main contents of the literature. Through the key words of the literature, we can effectively recognize the main research contents of the literature, and then get a glimpse of the current situation and trend of the research on the sense of community forged on the frontier in Chinese academia. The descriptive statistics of the key words of the newspaper literature on the sense of community forged on the frontier through CiteSpace software are shown in Table 1. In this paper, keywords are used as the analysis element, the time cut-off value is set to 1, and the threshold value is set to 40. 51 nodes are formed after the program is run, and a keyword co-occurrence network is finally formed. The keyword co-occurrence of each node can be used to analyze the hotspots of research literature on the sense of community forged in the frontier in the press over the past five years according to its frequency and network density.

**Table 1.** High-frequency keywords for the study of community awareness, 2017-2022

Serial number	Keywords	Frequency
1	Ethnic Work	146
2	Ethnic Interaction	79
3	Diversity in One	108
4	Ethnic Policy	76
5	Multi-ethnic State	127

#### 4. CONCLUSION

Enhancing mainstream ideological identity is an important element in the governance and effective development of border ethnic areas. Under the combined influence of geopolitical factors, ethnic factors, cultural factors, etc., the special locational characteristics in terms of cultural and social environment and living environment, the infiltration of Western ideology, the compulsion of separatist forces, etc., all profoundly affect the values and ways of thinking of the people of all ethnic groups, and bring certain influence to the mainstream socialist ideological identity of the ethnic groups in the border areas.

China's frontier ethnic regions are the fringes of the national frontier and an important window to the outside world to demonstrate the vitality and vigor of scientific socialism. The security and stability of the frontier has traditionally been the vane of national security. The cornerstone of security in frontier regions is mainstream ideological security, where people of all ethnic groups identify with the core socialist values and with the values in the system and governance practices. Converted into practice, it helps build a secure, stable and prosperous frontier in the interaction of policy dynamics, solidly promotes common progress and common prosperity, and works together to realize the dream of rejuvenation of the Chinese nation. Increasing the identification with the mainstream ideology of socialism with Chinese characteristics is an important cornerstone for adhering to and developing socialism with Chinese characteristics.

## ABSTRACT

In this paper, to study the main effective components of Zhuang Memie aromatherapy perfumed medicine bags, the volatiles of the leaves and branches of Zhuang Memie were examined, and a total of eight substances with  $\geq 90\%$  match were obtained. In terms of content, the vast majority of volatiles from the branches and leaves of *Cyperus rotundus* were olefins, with a relative content of 65%, as well as ketones 15%, alcohols 11%, and aldehydes 9%. The largest number of olefins was found in the volatiles. In a word, the wide range of aromatic plants available, the rational development of Chinese medicine aromatherapy and the comprehensive utilization of aromatic plant resources actively carried out will surely lead to a better development of society.

## KEY WORDS

Zhuang Memie incense bag; Chinese medicine aromatherapy; Aromatic plants; Aromatic substances; Human psychology

## 1. INTRODUCTION

Aromatic plants are a class of plants that can emit fragrance, and in nature there are many species and wide distribution, and the source of aromatic odor varies from plant to plant, and their aromatic odor comes from different kinds of aromatic substances [1-2]. Memie is an intangible cultural heritage of the autonomous region, and is an auspicious ornament unique to the Zhuang people in the upper reaches of the Baise Right River region. It is made of a variety of natural herbs such as mugwort, calamus, and atracylodes, with auspicious patterns of cotton cloth, and sewn into an incense bag shaped like a small person stretching out his limbs to hold a ball.

With the gradual advancement of modern scientific research, the psychological regulation of the human body by aromatic substances has been gradually discovered. Aromatic substances enter the human body and regulate physiological and psychological states in various ways [3]. The research and application of plant aromatic substances have become a hot research topic in recent years, including plant essential oils and aromatherapy, which have a wide range of prospects in relieving depression and anxiety and supporting medical treatment [4-5]. With the in-depth study of plant metabolites, a variety of plant volatile substances have been discovered and applied [6]. Studies have proved that the aromatic substances in some plants have positive effects on the regulation of human psychological state [7]. The fast-paced modern life increases people's competitive pressure, which easily leads to negative emotions such as anxiety and irritability, and even leads to psychological diseases, which can be regulated by natural plant aromatic substances [8]. Aromatic substances are secondary products produced by the transformation of aromatic plants themselves and are widely distributed among the roots, stems or flowers, fruits, and seeds of plants. Various classes of aromatic substances such as terpenoids, alcohols, phenols, ketones, and esters can be obtained using methods such as water distillation and leaching with volatile solvents. Terpenoids account for the largest proportion of aromatic substances, including monoterpenes and sesquiterpenes. Alcohols are the second largest component of aromatic substances. Phenols are more active and have bactericidal ability.

## **2. TRADITIONAL CHINESE MEDICINE AROMATHERAPY**

### **2.1. CONCEPT AND ORIGIN OF AROMATHERAPY IN CHINESE MEDICINE**

#### **2.1.1. THEORETICAL RESEARCH ON AROMATHERAPY IN CHINESE MEDICINE**

Aromatherapy, as the name implies, is a natural therapy that uses aromatic drugs or essential oils to enter the body through breathing, massage, and oral intake to regulate the body and mind, relieve stress, and prevent, alleviate, or treat certain diseases in the human body, often as a complementary therapy.

Traditional Chinese medicine aromatherapy is an important part of Chinese medicine, which is based on the holistic view of Chinese traditional medicine and theoretical basis of Chinese traditional medicine pharmacology. Through various ways of medicine, aromatic drugs with disease prevention and treatment efficacy are delivered to the body, so that the efficacy of the drugs can be effectively exerted in the body to achieve effective disease prevention and treatment. At present, Chinese medicine aromatherapy has formed a more systematic, perfect and mature theoretical system. The volatile oil components in aromatic drugs have excitatory or sedative effects on animals. The excitatory effects can improve alertness, enhance mood, reduce drowsiness, and improve or eliminate mental fatigue, while the sedative effects are mainly in hypnotic and tranquilizing.

#### **2.1.2. TCM THEORY OF AROMATHERAPY INHALATION**

Based on the theory of traditional Chinese medicine and the medicinal theory of the four qi, five tastes, elevation and sinking of Chinese herbs, and the attribution of meridians, the theory of Chinese medicine in aromatic inhalation therapy is discussed as follows. Since ancient times, Chinese medicine has taken the four qi and five tastes, lift and sink as the basis for identifying the medicinal properties. The qi of Chinese medicine is divided into four qi: cold, hot, warm and cool. The taste of Chinese medicine is divided into five tastes: acid, bitter, sweet, pungent and salty. Taste and qi are perceived by the senses of taste and smell respectively, so they explain the effects of drugs from different perspectives.

Nasal drug delivery has the following advantages:

(1) The nasal mucosa has a large surface area and is rich in blood vessels, so the drug takes effect quickly after administration.

(2) Compared with oral administration, nasal administration avoids degradation in gastrointestinal digestive juices and hepatic first pass effect.

(3) It can play local therapeutic effect as well as systemic therapeutic effect through nasal mucosa absorption into body circulation.

(4) The operation method is simple, with little side effects and high patient acceptance. Therefore, inhalation drug delivery can be used as an intervention method to replace oral and injectable drug delivery.

## **2.2. AROMATIC PLANTS AND AROMATHERAPY**

### **2.2.1. AROMATIC PLANTS**

Aromatic plants are a class of plants that contain high levels of aromatic substances that can be used therapeutically, as well as being widely utilized as aromatics. The aromatic properties of plants were discovered by Shennong more than 5,000 years ago, and in ancient Greek and Roman times, it was believed that spreading fragrance in bathrooms was beneficial to health. The ancients also made lilacs and other incense pouches from Zhuang Mu X and used chrysanthemum scented pillows to prevent disease. Aromatherapy has also encountered

distortions, misunderstandings and misrepresentations, but even in the cold winter, the vitality of spring is brewing in the dark, and the aromatic charm of aromatherapy itself cannot be hidden.

### **2.2.2. AROMATIC PLANT RESOURCES**

Aromatic plants are a group of plants that share common properties with medicinal plants. At present, there is no unified classification system for aromatic plants, which are usually classified by aromatic parts and so on.

(1) Floral fragrance plants. Petals can emit a refreshing, fragrant fragrance, can spread through their own plants, such as Yunnan smiles, moon, Yunnan knotted incense, etc..

(2) Fruity plants. Plants with oil glands on the fruit skin that can emit fruit fragrance. Most of the plants in this category are edible and have good taste, such as lemon, orange, pineapple, etc.

(3) Leaf fragrance plants. Most of the plant leaves have oil glands, which can emit refreshing fragrance after light rubbing, such as pepper grass, verbena, two-sided needle, sansho pepper, etc.

(4) Rhizome plants. This type of plants mainly from the plant's branches, rhizomes and other places to emit fragrance, can be used in seasonings, furniture, such as ginger, sweet pine, sandalwood, etc..

Among them, the main aromatic plants commonly used in Zhuang Moxu incense pouch is incense crown cypress.

## **3. IDENTIFICATION AND ANALYSIS OF AROMATIC PLANT VOLATILES**

### **3.1. DETECTION OF VOLATILE COMPONENTS OF CEDAR**

#### **3.1.1. EXPERIMENTAL APPARATUS AND METHODS**

Experimental instrument: Gas chromatograph-mass spectrometer, Agilent 7890A-5975C

Experimental method: Automatic thermal desorption-gas chromatography/mass spectrometry (ATD-GC/MS)

#### **3.1.2. INSTRUMENT OPERATING CONDITIONS**

Thermal desorption conditions are carrier gas (constant flow mode) flow rate: 1.0 mL/min.

Sample tube temperature (primary thermal desorption temperature): 250°C, heating for 10min, cold trap temperature during primary thermal desorption, -10°C.

Thermal desorption mode: import shunt, general dry blowing, time 3min.

Desorption flow rate: 10.00mL/min, inlet shunt flow rate: 0mL/min, outlet shunt flow rate: 10.00mL/min.

GC working conditions: Chromatographic column: DB-624MS (60m × 0.32mm × 1.8µm).

Programmed temperature rise: 40°C hold for 3min, rise to 250°C with 6°C /min, hold for 3min, then rise to 270°C, hold for 5min.

MS operating conditions: ionization mode, EI, electron energy 70 Ev. scan range: 29-350 amu. interface temperature: 250°C, ion source temperature: 230°C; quadrupole temperature: 150°C.

### **3.2. ANALYSIS OF VOLATILE CONSTITUENTS OF CEDAR**

The analysis of the volatile components of the branches and leaves of *Cyperus rotundus* is

shown in Table 1. The volatiles of the branches and leaves of *Cyperus rotundus* were examined, and a total of eight substances with  $\geq 90\%$  match were obtained. In terms of content, the vast majority of the volatiles from the branches and leaves of *Cyperus rotundus* were olefins, with a relative content of 65%, as well as ketones 15%, alcohols 11%, and aldehydes 9%. In terms of species, the most olefins were found in the volatiles.

**Table 1.** Volatile matter composition of the branches and leaves of *Cyperus rotundus*

Serial number	Retention time	Relative content	Match	Name
1	11.03	31.3%	97	$\beta$ -Laurene
2	12.31	7.4%	96	$\beta$ -Watercressene
3	28.21	11.2%	94	D-Limonene
4	28.94	15.1%	97	Terpinolene
5	25.67	6.8%	92	2-Nonanone
6	24.19	3.2%	93	Lateralinone
7	17.45	11%	94	Citronellol
8	27.28	9%	02	Sphagnum

#### 4. CONCLUSION

Smelling aromatic plants for a period of time has a certain effect on human physiology and psychology, according to the statistical analysis of human physical and mental health related indicators. Smelling cedar can make people calm and enter a state of relaxation, and the longer the time, the better the effect may be, and long time sniffing is more likely to make men relax. In addition, smelling cedar can reduce tension, anger, panic and depression, and improve self-esteem.

According to the experimental results, aromatic plants can interfere with the physical and mental health of human body through olfactory organs, and the effects of volatiles on human body can be different for different aromatic plant species, different sniffing time and different genders. Under the guidance of TCM theory, the clinical study was conducted by combining traditional Chinese medicine aromatherapy with conventional therapy and traditional Chinese medicine aromatherapy to clarify the feasibility and effectiveness of its clinical application and to provide a reference basis for improving the quality of clinical care and expanding the clinical application methods of combined Chinese and Western medicine nursing techniques.

#### 5. FUNDING

This research was supported by General Program of humanities and Social Sciences Research, Ministry of Education, 2020(Youth Foundation Program, ethnology and Cultural Studies): The Ethnobotanical Study on Zhuang Mascot Memie and Its Internal Filling Herbs in Youjiang River Basin, Project approval number: 20XJC850001

This research was supported by the 13th Five-Year Plan of Guangxi Education Science in 2017: Research on the Application of Emotional Freedom Techniques with Meridian Acupoints in Psychological Counseling of Minority Preparatory Students in Guangxi Universities (2017C406)

## ABSTRACT

This paper explores the sponge city landscape construction based on Internet of Things (IoT) technology, and establishes an online monitoring system for sponge cities through IoT technology. Where the sensing layer is based on RS485 serial port connection with sensors, remote reading of rainfall, water level, flow and other parameters, and with the help of GPRS wireless communication module to transmit the data to the remote server side. It realizes the functions of sensor signal acquisition, conversion and remote monitoring. Following the principle of sponge city construction, it protects, restores and improves the natural ecology, raises the flood retention and drainage capacity, makes up for the defects of hard municipal engineering, and achieves the construction goal of alleviating urban flooding.

## KEYWORDS

Sponge city; Urban landscape construction; Online monitoring system; Urban flooding; Ecological environment

## **1. INTRODUCTION**

In 2012, China proposed the “Sponge City Agenda” to address the challenges of urban flooding and water pollution caused by urbanization and population growth [1]. Sponge cities, as an ecosystem-based approach integrated with urban planning to address urban water and environmental problems caused by extreme weather events such as storms, are well suited for urban construction in China [2-3]. However, since there is uncertainty in sponge city design and construction because of rainfall, determining the capture rate of annual precipitation and appropriate rainfall thresholds is the key to building sponge cities and also requires analysis of sponge city funding, which is likely to lead to failure in sponge city construction if these key points cannot be grasped [4-5]. Using IoT applied to the study of sponge city construction, the main difficulties including vulnerability and danger are analyzed, the economic and natural benefits are fully estimated, and further studies identify various opportunities for building sponge urban landscapes [6-7]. With the advancement of IoT-based water informatics, hydrological data are becoming more and more abundant. As a result, more and more algorithms and methods relying on deep learning are being introduced for flood forecasting, monitoring and analyzing the water information of cities through IoT technology [8]. To better adapt to environmental changes and respond to natural disasters, to improve the quality of urban ecological environment and to build sustainable ecosystems.

## **2. ANALYSIS OF THE CURRENT SITUATION OF SPONGE CITY CONSTRUCTION IN CHINA**

### **2.1. SPONGE CITY LANDSCAPE PLANNING AND DESIGN**

Sponge city construction needs certain urban landscape planning and design theories to guide rainwater landscape design. In the background of sponge city construction, the research associated with it in the theoretical system of landscape planning and design still needs to be perfected, and there is also the phenomenon of aesthetic lack of landscape design in sponge city construction projects around the world, so it is necessary to combine the theory of urban landscape planning and design with the reality of sponge city construction in China for research, and explore the humanized design suitable for China's national conditions.

The theory of landscape planning and design has an important guiding significance for the development of landscape design work. Based on the relevant theories of sponge city and urban park landscape planning and design, and with the goal of improving the quality of urban landscape in the process of sponge city construction, it adds a certain complement to the usual methods of urban park landscape planning and design, and extends the intersection between different disciplines. The research of this topic will lay a certain foundation for the development of similar topics in the future and has certain theoretical significance.

### **2.2. SPONGE CITY CONSTRUCTION PRINCIPLES**

In the construction of sponge cities, we should coordinate planning and consider all aspects and factors to promote and facilitate the effective development of sponge cities, specifically through the following ways to achieve the construction and development of sponge cities:

- (1) Protect the original urban ecosystem

In the process of sponge city construction and development to take protective measures for various urban ecosystems, for example, for urban rivers, lakes, wetlands, ponds and other ecological resources to provide sufficient water connotation, while for woodlands, grasslands, wetlands and other ecological resources, in the process of urban development and construction is not damaged.

- (2) Ecological restoration

In the process of urban development, a large number of water bodies and natural resources are destroyed. And in the process of sponge city construction must be aimed at this part of the ecology, through science and technology to repair and restore it, and gradually realize the unity of the ecological environment.

(3) Low-impact development

In the process of urban development and construction, the carrying capacity of urban ecology must be considered, urban development intensity and urban development progress must be reasonably controlled, and sufficient ecological land must be retained in urban development according to urban land planning to further control and reduce the impervious area of the city and improve the protection of the original urban ecosystem.

(4) In the construction of sponge city, we should follow the principle of adapting to local conditions

According to the current situation and characteristics of urban water resources system, the legal objectives of planning should be reasonably determined, and various facilities such as sunken green areas, grass planting ditches and rainwater wetlands should be effectively used to improve the effect of sponge city construction.

**2.3. THE WAY TO BUILD A SPONGE CITY**

**2.3.1. PERMEABLE PAVING MATERIALS**

Building outdoor ground, roads, squares and parking lots are very easy to become water-collecting areas, we should use modern technology to promote permeable paving materials vigorously and change the traditional hardening method in order to infiltrate rainwater to recharge groundwater and recycle rainwater. The data from the analysis study on the function of outdoor permeable paving materials for buildings through IOT monitoring is shown in Table 1. Through the construction of bioretention ponds, infiltration wells, infiltration trenches, sand filters and the use of permeable pavements, rainfall runoff from impervious surfaces is filtered, transmitted and infiltrated to achieve the treatment of surface runoff pollutants and groundwater recharge, alleviating a series of urban and ecological problems caused by the increase in impervious surface area.

**Table 1.** Functional study of outdoor permeable paving materials

Name	Reduced flooding capacity	Flood protection capacity
Permeable tile paving	34%	64.2%
Permeable asphalt paving	43.9%	27.4%
Permeable concrete paving	27.6%	24.6%
Crushed material paving	76.9%	43.2%

**2.3.2. SOFT LANDSCAPE PATHWAYS**

According to the local climate and soil environment, plant more shrubs and trees suitable for water storage. Transforming the traditional irrigation mode, turning active irrigation into passive irrigation mode, collecting the rainwater accumulated in the season of sufficient precipitation to realize the local water extraction for plants; for plants to be able to absorb water automatically in the period of no rainfall, providing continuous and sufficient irrigation for plants, reducing human irrigation and enhancing the cycle of ecological sustainability construction. The main ways to strengthen urban greening include improving urban green permeable network by building more urban wetland parks, country parks, small green areas, small parks and other urban green areas according to local conditions, and strengthening rainwater ecological management mainly through the use of plants, gravel, sand and other natural

elements.

### 3. ONLINE MONITORING RESEARCH OF SPONGE CITY BASED ON INTERNET OF THINGS

#### 3.1. ONLINE MONITORING ELEMENT STUDY

##### 3.1.1. BASIC ELEMENT MONITORING

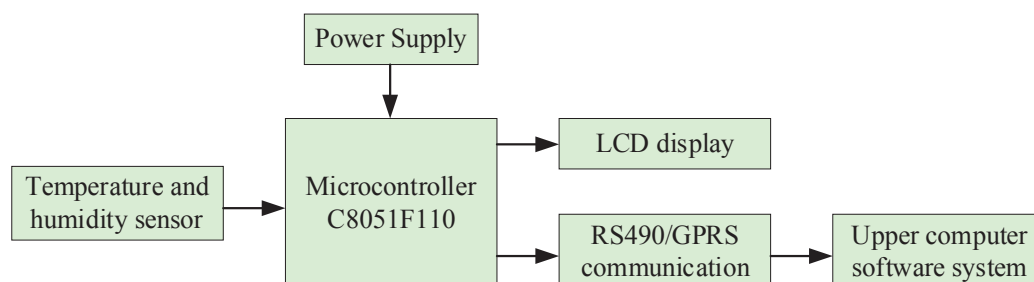

The rainfall data synchronized with the water level flow monitoring is the basis for supporting the analysis of the effectiveness of sponge city facilities and the assessment and evaluation basis for runoff control and surface source pollution control. Because of the random nature of rainfall, combined with the principle of distribution, every 2km<sup>2</sup> set a rainfall station, and take redundant settings, rainfall online monitoring in different areas, testing the rainfall runoff in different areas and different sub-bedding surface; at the same time monitoring the temperature in different areas, provide accurate temperature data, support the sponge city heat island effect mitigation effectiveness analysis and assessment, combined with the principle of distribution, temperature measurement points in accordance with every 3km<sup>2</sup> set a temperature monitoring station in the area outside the perimeter of the appropriate amount of 1. The temperature monitoring station is set up in every 3km<sup>2</sup>, and 1~3 stations are arranged in appropriate amount around the area.

##### 3.1.2. SOURCE, PROCESS AND END ELEMENT MONITORING

The study builds a “source-process-end” online monitoring system, through monitoring the flow and water quality of the project’s drainage outfalls, as the source calculation basis for the total annual runoff control rate, urban surface source pollution control rate and other indicators, while the ecological detention facilities, grass planting ditches, green roofs, rain gardens and other LID low-impact development to achieve source monitoring, according to the rainwater collection process and the flow of the nodes of the pipe network process element monitoring, combined with the collection process of rainfall runoff, water quantity and quality monitoring of rivers, flood-prone waterlogging points to achieve the final assessment.

#### 3.2. IOT SENSING TECHNOLOGY ENGINEERING APPLICATIONS

According to the sponge city project needs and the actual situation to choose the appropriate temperature and humidity sensor, rainfall sensor, ultrasonic level meter and flow sensor and other high-precision sponge city online monitoring system data ingestion necessary for intelligent monitoring equipment, based on the Internet of things sponge city online monitoring system architecture. The perception layer is based on RS485 serial port connection with sensors, remote reading of rainfall, water level, flow rate and other parameters, and with the help of GPRS wireless communication module to transmit data to the remote server side. The intelligent decision layer mainly includes the environmental monitoring server side and the remote control server side. This project integrates intelligent sensors, acquisition and control modules and communication modules into an intelligent sensing unit. The intelligent sensing unit has good portability, as shown in Figure 1, and can realize the functions of sensor signal acquisition, conversion and remote monitoring.

**Figure 1.** Acquisition communication module

#### **4. CONCLUSION**

In this paper, in order to explore the application of IOT technology in sponge city combined with landscape construction, the current situation of sponge city in China and the construction path of sponge city are studied, and the research of online monitoring application of sponge city based on IOT is established. All-round dynamic grasp of sponge city monitoring facilities and equipment operating conditions and project construction control, operation and maintenance process, while providing dynamic and continuous data support and decision-making basis for quantitative assessment of sponge city construction effects.

The construction of ecological landscape is to adhere to the principles of site-specific, gradual, ecological and sustainable development, combining natural ecology and artificial construction closely, and proposing a scientific and reasonable ecological recyclable model. Urban ecological landscape is not simply greening planting and surface decoration of urban image, but as an ecosystem that undertakes a number of important functions such as urban ecological environmental protection, recycling and reuse of natural resources and inheriting urban humanities and history. It is necessary to take the sponge city as the goal and adhere to the principle of reshaping the urban ecological landscape. In response to the ecological problems that have emerged in the city, it is necessary to actively face them and not to escape from them, giving priority to ecological protection, water reuse, people-oriented and improvement of human living environment as the starting point of ecological landscape construction.

## ABSTRACT

This paper studies the visualization digital technology in landscape design scheme expression system and analyzes the advantages of visualization digital technology in landscape information analysis link. The visualization digital technology is introduced into the landscape system to construct 3D landscape visualization model. Focusing on the study of landscape visualization design methods for design and construction integration, the landscape design process of the park is summarized as data collection, landscape information analysis, scheme design and construction building. Suitable visualization techniques are combined with site design using interactive 3D technology. Visualization tools can in turn bring different landscape feelings to explore the possibility of visual landscape features and strengthen the spatial design knowledge system of landscape architecture.

## KEYWORDS

Spatial design; Landscape design; 3D landscape; Information analysis; Visualization model

## 1. INTRODUCTION

Landscape design is a comprehensive art, and it is developing on an unprecedented scale and magnitude [1]. Since the 20th century, public landscape art has emerged as a social necessity, and the demand for landscape is becoming more widespread, and the demand for natural landscape design is increasing. Among them, the green dimension has gained the highest preference. The green dimension, including water features, trees, plants, and shrubs, influenced the preference for landscape design [2-3]. Landscape as a continuous process moves forward and is created based on historical accumulation [4]. Designers map landscape spaces by hand and through modern technology, enabling landscape architects to describe, understand, and interpret the spatial visual characteristics of the landscape. This helps to strengthen the body of knowledge of spatial design in landscape architecture through the measurement and visualization of concepts common to the field and by exploring the possibilities of spatial-visual landscape features that were not previously possible [5]. Landscape as a comprehensive art, in design performance mainly in the form of static media, such as one-dimensional textual symbols, two-dimensional graphic images, three-dimensional model sand table, etc., can not go to dynamic display of the changes inherent in the landscape itself, the professional expansion of landscape design is becoming more and more space, and the traditional qualitative design will certainly be transformed to quantitative design [6-8]. In the face of the development of digital information technology, landscape design should be solidly innovative, and designers should keep pace with the times, constantly update their personal knowledge of the industry and technical skills, and present

people with high-quality landscape spaces that are more adapted to the requirements of the times on the basis of comprehensive use of visualization technology.

## **2. THE CURRENT SITUATION OF LANDSCAPE DESIGN DEVELOPMENT AND THE PROBLEMS FACED**

### **2.1. THE DEVELOPMENT STATUS OF LANDSCAPE DESIGN**

#### **2.1.1. PENETRATION OF CULTURAL CONCEPTS**

Artists in the 19th century, wisely perceived the unity of time and space. Due to the development of science and technology, people's concept of time and space has changed a lot, which is reflected in the landscape, that is, people began to pursue the quick-growing landscape. With the gradual disappearance of people's concept of time and the expansion of the concept of space, people began to have more and more control over space. But the establishment of a large number of repetitive landscapes led to an era of static, efficient and uninnovative landscapes. With the increasing deterioration of the environment and the gradual depletion of resources, we began to pursue an ecological, sustainable and more scientific landscape.

#### **2.1.2. LANDSCAPE DESIGN PROCESS AND PERFORMANCE**

In the pre-design, designers seldom do holistic assessment, lack of grasp of the overall environmental conditions, the use of the current state of the design only focuses on the rationality of the internal structure and layout, rarely consider the impact on the design process and on the environment after completion, lack of science. Landscape design process itself is a multidisciplinary cooperation process, planning involves a wide range of fields, including ecology, botany, computer technology, etc. Visualization construction needs more cooperation of new technologies, visualization digital technology introduced into the landscape system has good application prospects. Visual digital technology itself is the product of multidisciplinary combination, and only multidisciplinary cooperation with each other can bring its advantages to the best.

## **2.2. TRANSFORMATION OF LANDSCAPE DESIGN EXPRESSION**

The development of technology continues to provide new media for design performance, design media through "one-dimensional language and text - two-dimensional drawings - three-dimensional models - multi-dimensional display", "static - dynamic" development process. Multi-dimensional display", "static - dynamic" development process. These expressions have their own advantages and limitations, so they should be used together to complement each other's strengths and weaknesses and optimize the expression.

In the actual design process, landscape architects often depict ideas on paper, constantly compare, modify and improve them, thus stimulating the development of thinking and finally completing the whole program. Drawing expressions include plans, elevations, sections and perspective views. The limitation of the graphical expression is that the expression of the scheme needs to choose a specific perspective for refinement and cannot fully express the essence.

## **2.3. THE INEVITABILITY OF DEVELOPING VISUALIZED LANDSCAPES**

With the development of computer technology, visualization digital technology provides new opportunities for the development of landscape discipline, injects new expansion space, and brings certain guidance and help for scientific landscape design. Landscape elements have the characteristics of spatial and temporal change and uncertainty, which leads to the unique complexity of dynamic management of landscape information, spatial analysis and

real-time decision-making. Landscape visualization has the characteristics of immersion, interactivity, intelligence and high information intensity, which lay a solid foundation for further improving the scientificity and feasibility of the scheme. Visualization digital technology has important practical applications in landscape planning and design, real-time management, and program expression. Using visual digital technology, the optimal expression of landscape design schemes can be realized.

### 3. VISUALIZATION TECHNOLOGY IN CAMPUS LANDSCAPE DESIGN

#### 3.1. LANDSCAPE DESIGN OF THE PARK

With the development of visual digital technology, the functions provided by visual digital technology are widely applied to the process of landscape design. Most traditional landscape design methods rely on the designer's personal experience and subjective judgment, but the development of digital technology allows one to analyze data can understand the more core property characteristics of things and discover the objective connections between things. The landscape design of the park should pay attention to both technical support and the guidance of theoretical methods. Digital technology can be both a technical means in design and can bring about a change in design thinking and methods. The full process of landscape visualization design should generally include five links: data collection, statistical analysis, scheme simulation, digital construction and performance measurement and control. The research in this paper focuses on the study of landscape visualization design methods for design and construction integration. The landscape design process of the park is summarized into four links: data collection, landscape information analysis, scheme design and construction building, and the process of landscape design is shown in Figure 1.

Figure 1. Flow chart of landscape park design

#### 3.2. ADVANTAGES OF VISUALIZATION TECHNOLOGY IN THE ANALYSIS OF LANDSCAPE INFORMATION

Data collection is an important prerequisite and basic step of post-industrial landscape design in the context of visualization, and is the initial stage of landscape visualization design. The main task of this stage is to obtain the data information needed to carry out post-industrial landscape design in an all-round way, and to prepare the data information for the subsequent work of design.

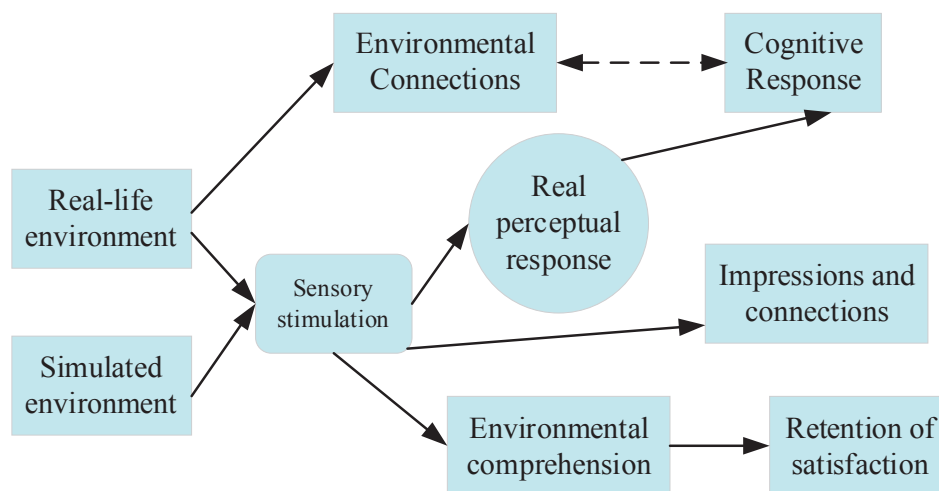

With the continuous development of hardware and software technology, the channels of data acquisition have been broadened and the types of data available have become more and more diverse. Under the current conditions of lack of big data storage and open environment in China, it is also a practical need to study the means of landscape design under the background of big visualization by seeking reasonable new technology tools and designing reasonable analysis methods to view and analyze the industrial space facing the transformation and development. The basic design data in the visualization era can be obtained through a combination of new visualization channels and traditional methods, which can save a lot of time and energy and better ensure the comprehensiveness and accuracy of the data.

### 3.3. RESEARCH ON THE INTEGRATION OF LANDSCAPE DESIGN AND VISUALIZATION TECHNOLOGY

#### 3.3.1. VISUALIZATION MODEL STUDY

The simulation of the virtual environment combined with the real environment will leave strong sensory stimulation for the human body to improve people's cognitive ability and deepen their comprehension of the environment. The impact of the environment on people's perception is shown in Figure 2. Although digital reforms have led to the continuous development of techniques and tools used to create landscape visualizations, these results are still only simple impressions of the landscape (quick imaging). These stylized landscapes are useful for communicating information about changes in the landscape, but they do not reflect the way people experience the real world.

In recent years, the demand for higher fidelity visualization and simulation has led to the emergence of a combination of specialized computer hardware and computer technology dedicated to providing real-time graphical environments. This allows designers to create more complex interactive 3D landscape models, ultimately allowing people to choose their preferred perspective to observe and wander through the virtual landscape. These provide a broader and deeper exploration of the spatial nature of future design. So, the main question is how to optimally use these interactive 3D technologies to translate appropriate visualization techniques combined with site design into examples that better support landscape design and communication. In order to answer this question, it is necessary to understand the integration of visualization techniques with landscape, how complex procedures support the landscape design process, and how visualization tools can give a different landscape experience from the preliminary design to the detailed design stage.

**Figure 2.** The influence of the environment on people's perceptions

#### 3.3.2. VISUALIZATION COMBINED WITH LANDSCAPE MODELING

The term 3D visualization is defined as a simulation that uses real-time 3D images to represent a visual form of a landscape area, allowing the user to control the view position to freely view and explore the topography of all areas. The ideal 3D visualization model is a real-time 3D landscape model that can be constructed when given design instructions, so it is important that we know how to incorporate these technical tools into landscape design theory. The use of interactive 3D visualization techniques in the design process makes it easier to design visual 3D models. A flexible 3D model allows the design to modify the 3D landscape model. Landscape design consultation has always been supported by visualization techniques such as: plan, section, aerial view, rendering, etc. In interactive 3D landscape

visualization models people can control the visualization themselves, such as combining multi-sensory stimuli to create an immersive feeling and walking freely through the model.

Building a 3D landscape visualization model requires three basic elements, a 3D model of the area, software that can display this model in real time and can process it, and a computer that can run the software efficiently. There are more and more software packages available or computer engines that allow real-time 3D model transformation and increasingly inexpensive computer hardware, but the main difficulty remains in building 3D visual landscape models. When a 3D model is to be created, enough data needs to be collected to build the model to the level of detail required.

#### **4. CONCLUSION**

In this paper, we analyze the transformation history of landscape design expression thinking and find that visualization in different ways always runs through the scope of wind turbine garden design expression, and in order to meet the requirements of higher fidelity visualization and simulation, a 3D visualized landscape design model is constructed.

Landscape art is a living three-dimensional art, landscape design is a close combination of aesthetics and technology, science and environment, from nature and above nature. In the past landscape design, the proportion of artificial and experience is too large, making the landscape design has a high subjectivity, lack of unified standards, it is also difficult to convince the decision makers, its scientific nature needs to be improved. The emergence of visualization technology has improved this situation and provided a strong guarantee for the progress of the landscape business. Landscape itself is an industry that requires the perfect integration of art and science. Contemporary landscape has changed from beauty design to practical design, and the combination of technology and art of sustainable design is its inevitable trend. If we simply rely on the appearance of the gorgeous or the use of engineering technology, not only tarnish people's aesthetics but also lose the value of the landscape itself. Therefore, the landscape information model needs to integrate the beautiful environmental expression with the real accuracy of engineering technology, and what kind of quantified form of beauty exists in the model construction, in order to provide a better way for landscape design and provide a strong help to meet the needs of contemporary people for landscape design.

## ABSTRACT

This paper addresses the basic requirements for the management of commercial properties being developed today. A three-level schema structure of outer, conceptual and inner schema is provided for the database system. The real estate management system is constructed and tested for its performance using a computer, and the system performance is tested using LoadRunner 8.0. The test result is that the average response time of the system does not exceed 2 seconds, and when adding users to the number of concurrent users is 200, the response time of the system still does not exceed 3.5 seconds, and the analysis shows that its systemic performance meets the standard. The real estate sales management system has promoted the activity and development of the real estate market and played a role in promoting real estate sales management.

## KEYWORDS

Real estate market; Real estate management; Database technology; Data storage; System performance testing

## 1. INTRODUCTION

Nowadays, the rapid development of the Internet information industry, along with the rapid changes in computer technology and science, automated processing technology has penetrated into various fields and played an irreplaceable role [1]. Informationization, standardization and specialization of real estate industry management have become an inevitable trend in the development of the times [2-3]. The real estate industry has the following significant features, a higher degree of risk, is a larger amount of data, and is a complex industrial chain [4]. For real estate companies, the key to management is to build a standardized workflow based on their actual situation and make appropriate adjustments based on actual needs, which means that it is significant to standardize the management of business management and build an automated information system [5-6]. Relying on this system, it can be closely integrated with the general environment in which modern management is located, and promote the progress and development of building real estate management towards more standardization and standardization [7-8].

## 2. COMPUTER-BASED REAL ESTATE MANAGEMENT SYSTEM

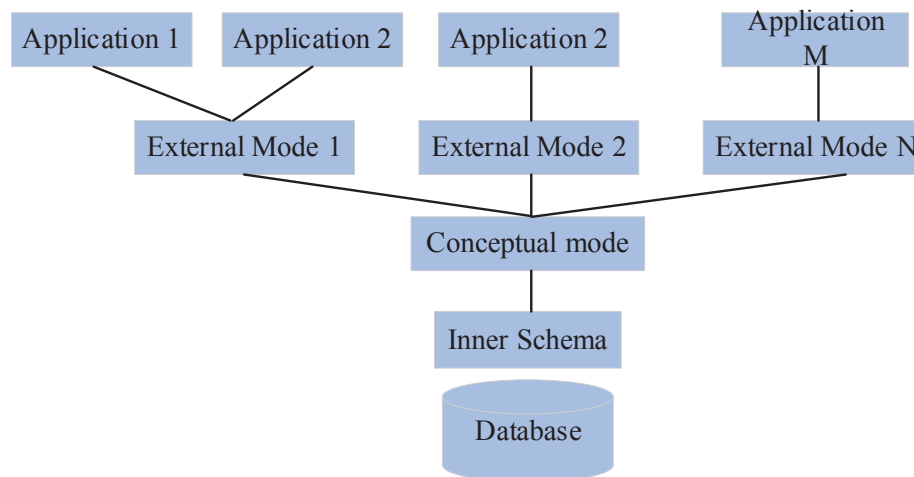

### 2.1. MANAGEMENT SYSTEM DESIGN

#### 2.1.1. DATABASE DESIGN

In the construction process of real estate information system, it is necessary to make a virtual construction of the actual real estate structure, including the scene and the size of the

building model, so it is necessary to make a comprehensive information collection of the real estate data information. In the process of design and implementation, it is required that each part should be organically combined, and the hierarchy and functional structure should be distinguished, so that users can access data, organize data and store data quickly and conveniently, and the database system provides a three-level schema structure of external schema, conceptual schema and internal schema, and the three-level schema structure of the database system is shown in Figure 1.

**Figure 1.** Three-level schema structure of the database system

### 2.1.2. SYSTEM FUNCTIONAL MODULE DESIGN

The real estate information system establishes the whole three-dimensional scene through the collection and collation of the basic geographic information data of the planning of the property, and realizes the browsing of the three-dimensional scene of the community from all angles through the human-computer interaction interface, which allows users to move and rotate the scene from front to back, up and down, left and right, through tools such as mouse, keyboard and joystick. Users can roam and walk in the district, browse the surrounding environment of the district and the surrounding schools, hospitals and other public infrastructure. Users can output dynamic video based on any customized roaming route. For large scale planning projects in real estate, the system can export existing plans as video files to produce multimedia materials for a certain degree of publicity, allowing the public to truly understand the project's expectations. In addition, the video output can also be used to create multimedia promotional videos for external publicity, etc.

## 2.2. SYSTEM CONSTRUCTION KEY TECHNOLOGIES

### 2.2.1. DATA STORAGE INTEGRATION BASED ON SPATIAL DATABASE TECHNOLOGY

One of the main features of today's GIS technology application is the use of relational database to manage spatial data. In terms of storage mechanism, there is no essential difference between spatial data and non-spatial data, so it is fully possible to integrate spatial data and non-spatial data to achieve storage integration, so as to realize the overall management of data in the system. In the process of implementation, the spatial database technology is mostly based on relational database for the extension of spatial data management, so that the storage method of relational database can be directly used to store spatial data, and through the association of key segments, to achieve both spatial data and non-spatial data can be stored in the same physical table.

The spatial database system has a huge amount of data covering earth surface information,

atmospheric confidence and geology as well as various complex information, and can mark the attributes of the operational database, establish complex spatial data models, store relational data using topological relationships, and can contain a large number of graphic images, figures, text and other various information to achieve efficient storage and fast and accurate access. There is a wide application space for other databases, and the concurrency is extremely controllable. Therefore, GIS application is currently an important measure in real estate systems.

### 2.2.2. LARGE BINARY OBJECT (BLOB) BASED MANAGEMENT OF HIERARCHICAL SUBFAMILY DIAGRAMS

An important object of property management is the house, how the house is landed on the GIS platform and how to store it effectively is a problem that needs to be solved first.

In the real estate management information system, houses are managed in the form of a building table, which is landed in the GIS platform by associating the latitude and longitude of buildings, and each housing unit exists in a building table, and each cell in the building table stores the property subdivision plan of the house, the mound plan, and the related housing properties. Figure 2 shows the storage process of the subdivision plan in the database. Each floor plan is stored directly in the graphics field of the floor table, which is a BLOB field that stores the complete graphic file of the split-level house plan. This BLOB field contains detailed graphic information of each stratum and subfamily. When using it, just find the floor (building) through the mound, and then index the strata floor plan and the subfamily floor plan respectively through the floor.

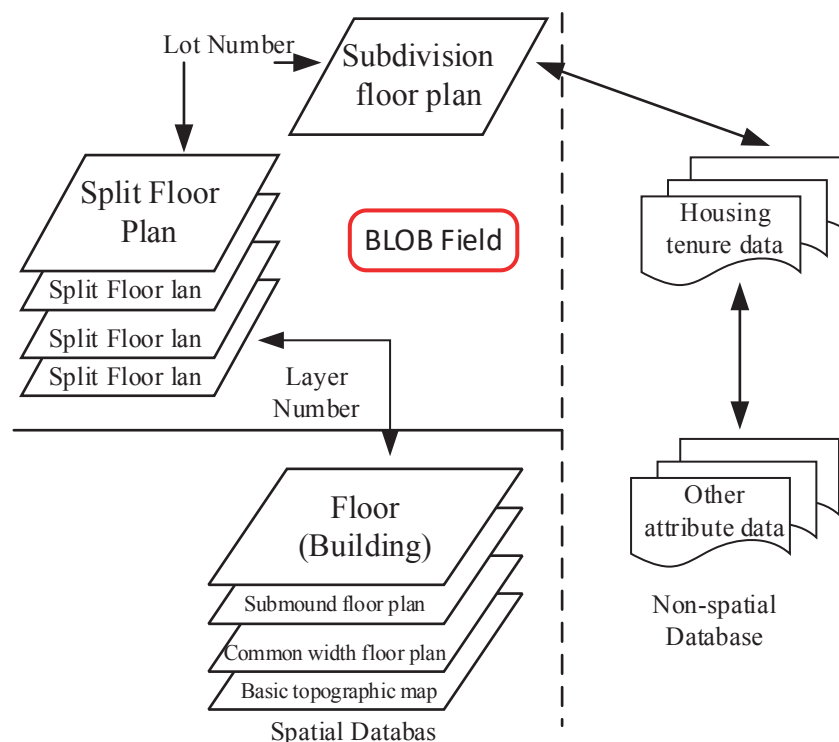

Figure 2. Storage of subdivision diagrams in the database

## 3. ANALYZE THE EFFECTIVENESS OF COMPUTER APPLICATION IN REAL ESTATE MANAGEMENT SYSTEM

### 3.1. FINANCIAL MANAGEMENT FUNCTION TESTING

The core function of the financial management system is to handle basic financial information. The smooth use of the financial management function is divided into four parts,

namely deposit management, prepayment down payment, installment payment and sales commission management. The financial management module is mainly for financial information modification as a test case. In this test, the test process is that the system administrator enters the financial management system, opens the financial management page, successfully enters the information that needs to be modified, and saves it to return. The system administrator can successfully complete the content of the test process, successfully enter the financial management page, make single-point corrections, enter in the financial management interface, and automatically enter the financial management interface after successful modification. The actual result matches with the expected result and the test passes.

### 3.2. PERFORMANCE TESTING AND RESULT ANALYSIS

When performing system performance tests, the main purpose is to simultaneously perform simulation tests on the user software and specific tests on system response, processing speed, etc.

Under normal conditions, system performance testing is mainly concerned with the compression load threshold when the system crashes under high load conditions. Existing testing methods cannot be used for specific tests. Test procedures need to be reprogrammed. If user terminals are sent due to many user requests, the risk of errors and bugs increases. Therefore, the user terminals in this paper are chosen for transmission.

The system performance test was conducted using LoadRunner 8.0, a testing tool, and the stress test for the number of users was conducted using the simulation method, setting the user access line to 200 and accessing the system at the same time, and the test results are shown in Figure 3. After testing the system, it is found that the system response time does not exceed 2 seconds, and when increasing the number of users to 200 concurrent users, the system response time still does not exceed 3.5 seconds, and the indicators of the system meet the requirements of the interval, and the system works normally under a high intensity load, and the analysis shows that its systemic performance meets the standards.

**Figure 3.** Concurrent 200 user response time

#### 4. CONCLUSION

Currently, the continuous development of information technology databases, software and other technologies combined with real estate development provides a more comprehensive strategy for businesses. Analyzed the management system research process, the main management system software for a comprehensive analysis of user needs, the construction of a comprehensive analysis, while the different functions as well as the implementation. The data in the property management system is characterized by a large volume of data, frequent data changes and temporal and spatial type cavities. The introduction of computer technology into property management is a breakthrough in the traditional property management approach, which promotes the standardization and efficiency of real estate management, overcomes the shortcomings of focusing only on attribute information and ignoring graphic information in the past, and advances the modern real estate management model to deeper development. The comprehensive collection, collation, updating and improvement of property graphic data and attribute data, the establishment of unified data specification and the implementation of unified standards, thus establishing a more complete and open database, realizing data sharing and integration, and realizing dynamic management of the system. Uniform management of the real estate industry to avoid duplicate registration entries and improve the efficiency and motivation of grassroots staff. Promote the application and development of deep informationization in the real estate industry, and better reflect the function and nature of government services for the society. The real estate management system will become a new open system with comprehensive management, convenient inquiry and various forms of output to better provide comprehensive, efficient and accurate information services for the real estate administration and better management and decision-making.

## ABSTRACT

This paper proposes the use of big data for accurate targeting and the construction of an ecotourism marketing model, starting from the current situation of ecotourism. It also uses new media to expand product promotion and publicity and Internet information technology tools to improve consumer experience and achieve the integration of culture and tourism, and other strategic suggestions to generate a modern new tourism model. The results of the experiment show that the total weighted score of 2.75 for the tourism marketing strategy factor is greater than the average score of 2.5. Therefore, the Internet mindset and innovative marketing model should be relied upon in order to achieve sustainable development of ecotourism.

## KEYWORDS

ecotourism; marketing model; big data; precision targeting; weighted score

## 1. INTRODUCTION

With the advent of the new century, ecotourism, a new form of tourism that focuses on the harmony between people and nature, is developing rapidly around the world, gradually evolving into the mainstream of tourism in the new century [1-3]. Ecotourism is an open ecological and economic system, a tourism that respects, learns from and preserves nature and culture [4-5]. Ecotourism is an active means of environmental protection, and the construction of ecological civilisation is an important support for the development of ecotourism [6]. The wave of internet development has made mobile phone mobile clients the most important source of information channels for people to access, either through mobile phone booking or computer browsing, influencing the marketing model of ecotourism today [7]. Consumers can pick and choose places to visit according to their preferences, stay informed and plan their travel routes rationally. Operators can post the most popular places to visit, update their itineraries, etc.

Ecotourism has become a hot spot in the global tourism industry. The literature [8] examines how the marketing strategies of tourism providers can induce tourists to engage in different levels of adventure through fear appeal and conservation motivation. Literature [9] explored the use of social media in destination marketing by different age groups, particularly in the context of sustainable tourism. The literature [10] proposes a framework to validate the relationship between tangible and intangible measures of destination marketing and finds that destination attractiveness, service quality and destination image have a significant impact on marketing efforts in semi-rural tourism destinations. The above literature proposes a poor network infrastructure for ecotourism development, a lack of integrated marketing concepts for new media, and too single marketing tools.

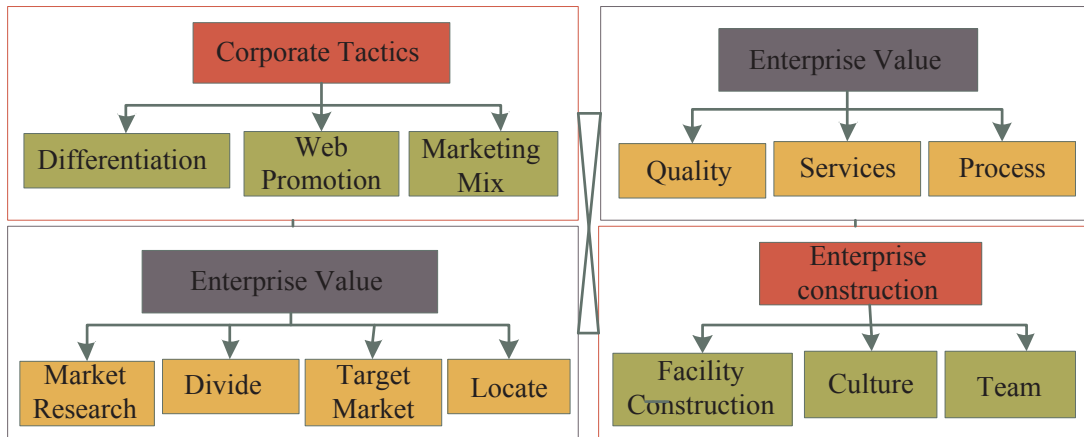

Therefore, this paper constructs a marketing model for ecotourism, analyses the current situation of ecotourism development, constructs a marketing mix design based on the concept of "ecological experience", and proposes specific marketing strategies. The results show that the total weighted score of tourism marketing strategy factors is 2.75. In the context of big data, the use of the internet to develop interactive, experiential and entertaining tourism marketing activities is of great importance to the development of the regional tourism economy.

## **2. BIG DATA AND ECOTOURISM DEVELOPMENT MARKETING**

### **2.1 ECOTOURISM MARKETING MODEL**

Ecotourism marketing is based on tourism marketing and is a green marketing approach to tourism that reflects the idea of sustainable development and the concept of social marketing. It requires individuals in the tourism economy to pay attention to the protection of the environment and resources in all aspects of production and management, to pay attention to the protection of the ecological environment in marketing, to build a unique competitive advantage, to actively use good marketing methods to market themselves, to create and find opportunities to be recognised and accepted by the market, and to achieve their goals by constantly meeting the needs of various tourists. As can be seen from Figure 1, ecotourism marketing is not only a specific part of the effective integration of ecotourism products and their markets, but also a central part of managing ecotourism. The main objectives of marketing ecotourism are to spread the concept and impact of ecotourism widely, to attract large numbers of ecotourists to the area and to get them to buy as much of the product as possible. To attract a large number of potential tourists to the region and to attract a large number of visitors. Analysis of the region's source markets and active development of specific potential markets and related tourism products. Segment and

analyse the characteristics of the target market according to the respective tourism products and develop targeted marketing plans, etc.

**Figure 1** Ecotourism marketing model

## 2.2 THE MACRO ENVIRONMENT OF ECOTOURISM MARKETING

"Ecotourism" is a key project that can combine sustainable development with economic development, as it caters for people who value environmental protection. The relevant authorities have developed a series of policies to promote the rapid development of ecotourism, indicating the direction, objectives and strategic layout of the ecotourism industry. It has been determined that ecotourism will be developed into a strong economic growth point. In traditional tourism marketing, the object is simply the tourism product, and it is sufficient for the marketing activity to inform the audience of what the specific product is. In contrast, ecotourism marketing is not only about marketing ecotourism products, but also about marketing the concept of ecotourism, so that all audiences can gain knowledge of environmental protection and the scientific concept of ecotourism through various marketing tools.

## 2.3 SPECIFIC INITIATIVES FOR THE DEVELOPMENT OF ECOTOURISM

Big data has changed the state of human existence and development. Ecotourism in the context of big data is a kind of intelligent tourism, through the accurate data analysis of big data, the target customer groups of enterprises can be effectively known, so as to carry out precise positioning and obtain higher revenue in this way. Through big data, the dynamic information and changing trends of various tourist areas, tourist attractions, tourist routes and different enterprises can be comprehensively grasped, which can enhance the systematic grasp and macro-control ability of tourism management agencies and governments. With the use of big data, enterprises engaged in the tourism industry can precisely find the tourist base and can accurately obtain comprehensive information on the interests, tastes, hobbies, personalities and needs

of tourists, and accordingly form the corresponding industrial policies, enterprise planning, product types and service methods, etc.

### **3. Ecotourism marketing strategies in the context of big data**

#### **3.1 PRECISE TARGETING OF CUSTOMERS**

At a time when data and intelligence have become popular hotspots, for ecotourism to make a breakthrough, operators need to use information technology to advance the marketisation process. For example, using customer relationship management systems, the regional characteristics and personality traits of target customers can be analysed based on customer information in databases such as their historical purchase records, which can then be used to pinpoint target customers, segment the market and ultimately find the target customer base on a large scale. Modern travel consumers make extensive use of social media, particularly in the search for information and decision making about destinations. It can be seen that the use of social media for target customer pinpointing is scientific and necessary for the precise marketing of ecotourism.

#### **3.2 PRECISION MARKETING PROGRAMME RECOMMENDATIONS**

With the application of big data technology to analyse the personal preferences, consumption habits and shopping needs of tourism consumers, operators can recommend matching tourism products to tourism consumers based on their different trajectory preferences. At the same time, when a tourist's trajectory desire is detected towards tourism activities, offline tourism activities in their vicinity can be recommended to them.

#### **3.2 ACCURATE FEEDBACK ON TRAVEL**

Accurate feedback on tourism is also particularly important after the implementation of big data precision marketing programmes. Accurate feedback on tourism can contribute greatly to the quality of the destination. Accurate feedback data is relatively standardised and easy to collate, allowing for the effective formation of a data warehouse and the mining of richer, more diverse information based on scientific algorithms. In terms of accurate marketing, information such as the quality of tourism resource structure and configuration can be obtained through accurate tourism feedback, and the corresponding tourism resources and facilities can be improved accordingly to provide better quality tourism products to customers.

### **4. ANALYSIS OF ECOTOURISM MARKETING STRATEGIES**

This paper constructs a quadratic model of ecotourism marketing to summarise the development and marketing strategies of ecotourism and to provide a basis for determining the relationship between them. The internal evaluation matrix is introduced

into the study of ecotourism marketing strategies, and the weights and scores of each information are obtained using a scoring method with a range of 1-5, with weights accurate to two decimal places. Analysis of Table 1 shows that the total weighted score for the eco-tourism marketing strategy factor is 2.75, which is greater than the average score of 2.5. Therefore, the government should invest more in the ecotourism market, help tourism companies with publicity and invest funds in promotional activities to promote the rapid development of tourism. An important factor in the development of ecotourism is the promotion of tourism products. Relevant departments should start from multiple angles, strengthen research on relevant ecotourism products, and motivate other companies to develop new types of products.

**Table 1** Ecotourism marketing strategy scores

	Marketing key internal factors	Weights	Rating	Weighted score
Advantages	Convenient transportation	0.3	5	0.9
	Rich tourism resources	0.2	4	0.4
	Pleasant ecological environment	0.25	4	0.25
	High priority for tourism by local governments	0.3	5	0.7
Total		1.0		2.75

## 5. CONCLUSION

This paper proposes that ecotourism precision marketing in the context of big data will be a more economical and accurate marketing tool. Through a variety of ways from a number of social media sites automatically collect, analyze and integrate various forms of tourism activity data, using relevant data mining techniques to predict the various consumer hi-numbers, travel preferences of users. The results of the experiment show that the total weighted score of 2.75 for the internal environmental factors of ecotourism marketing is greater than the average score of 2.5. Therefore, the value and significance of developing ecotourism is multifaceted; it not only creates considerable economic value, but also realises the social value of environmental and ecological protection, enabling harmonious economic and social development and contributing to a harmonious relationship between humans and nature, and between humans and society.

# IMPROVEMENT AND INNOVATIVE MEASURES FOR THE EDUCATION MANAGEMENT SYSTEM OF UNIVERSITIES IN THE CONTEXT OF BIG DATA

---

Huan Li\*

Chongqing City Vocational College, Chongqing, 402160, China

[hhuanabc@163.com](mailto:hhuanabc@163.com)

## ABSTRACT

This paper first constructs a big data education management model, uploads course resources to an interactive online teaching platform, and in for classroom teaching or after-class student self-study. It also analyzes the impact of big data in the educational work of colleges and universities, and puts forward reasonable measures for the improvement and innovation of college education management system. The results show that in the index innovation evaluation of the university education management system based on big data technology, the first-level index of self-management ability can reach 14. Therefore, by combining the essence of education management and exploring the impact brought by big data technology on the university education management system, it can help promote the modernization of the university education management work.

## KEYWORDS

big data; education management; indicator innovation; innovation response; management capacity

## 1. INTRODUCTION

The application of big data resources and technical means in the process of university education management has a certain value [1-3]. This includes, continuously collecting, storing, transmitting, applying and mining the intrinsic value of data and information related to education management in the government, enterprises and university education reality, and then providing the basis for education management innovation [4-5]. Secondly, the application means to analyse education management trends, disadvantages and advantages, so that it can clarify the direction of education management change, find the right pivot point, scientifically deploy resources required for education management innovation and support universities to carry out education management work [6-7]. Big data technology can quickly respond to changes in the

content of education management in universities, acquire data, management information and other tasks in a reasonable time frame, and quickly collate the educational information that is constantly generated.

Colleges and universities need to base their education and teaching management on information data. The literature [8] emphasises the importance of ideological and political theory classes in higher education and proposes a specific method for classroom supervision through intelligent identification of student status, which effectively solves the problems in the management of ideological and political theory classes in higher education. The literature [9] discusses a web-based examination management system with strong multi-factor authentication and authorisation features to detect impersonation and prevent cheating. The system has been successfully used to organise several semesters of online examinations. A joint project was undertaken in the literature [10] to develop a new process for internal quality management focusing on student competencies. The process raises awareness of the quality of study programmes and encourages discussion between students, teachers and academic staff, enhancing the competency profile of research projects. This project is driven by the "teaching to learning" approach in the European higher education sector. The educational management systems proposed in the above literature lack flexibility, diversity and adaptability and are difficult to centralise.

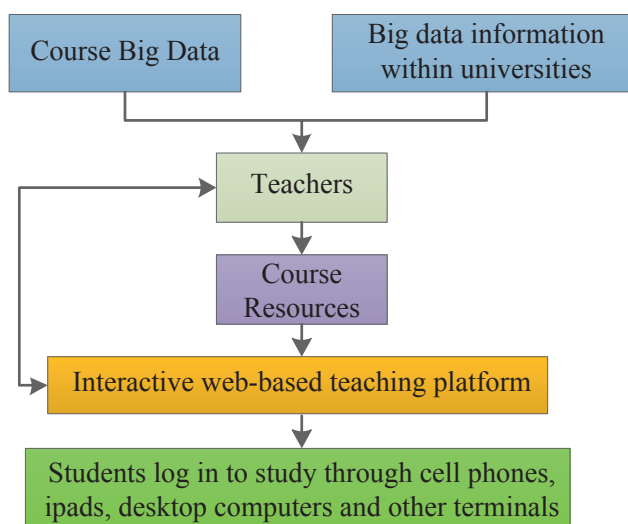

Therefore, by constructing a model of education management, this paper firstly analyses the influencing factors in the education management of universities, and secondly discusses the measures related to using big data to innovate the management system from the aspects of "formulating information preservation standard", "optimizing teaching mode", "cultivating practical talents and expanding data management team". This paper discusses the measures of using big data to innovate the management system in terms of "developing information preservation standards", "optimizing teaching mode", "cultivating practical talents and expanding data management team" and "innovating education management system improvement strategies". This paper evaluates the index innovation of university education management system and considers the system, management and management team.

## **2. THE IMPACT OF BIG DATA ON EDUCATION MANAGEMENT SYSTEMS**

### **2.1 BIG DATA EDUCATION MANAGEMENT MODEL**

In the era of Big Data, teachers can accurately analyse various teaching issues by collecting educational data in a fast, timely and massive manner without changing their original teaching habits, and can change their teaching strategies in the first instance to make the teaching process more efficient and relevant. Students can use the information revealed by the big data to learn on their own, check the gaps and

implement self-management. The education management model constructed in this paper is shown in Figure 1. Teachers prepare course resources according to the professional talent cultivation plan formulated by the university, which include: course standards, teaching plans, overall course design, course unit design, electronic lesson plans, case libraries, test banks, etc., and upload all these course resources to the interactive online teaching platform for classroom teaching or after-class student self-learning. With rich types of big data, it can collect and store and use information resources in different categories from the perspectives of university faculty management, teaching and research management, assessment management, etc. On the other hand, the data categories are flexibly set according to the innovative needs of university education management to ensure that the data information is real and available, real-time and efficient, and as an important resource for university education management to help it carry out specific activities, making it more developmental, relevant and effective.

**Figure 1** Big data education management model

## 2.2 APPLICATION CHARACTERISTICS OF BIG DATA

The value of big data is closely related to its scale, depth, breadth and size. Because of the large capacity of information resources and the dynamic expansion process, big data can comprehensively and systematically integrate information related to university education management, so that universities can analyse it in time, find the direction of education management innovation and give support to its education reform. Big data is integrated together on the basis of information systems to form valuable data clusters, so its circulation, collection and analysis efficiency is better than the human-based form of comprehensive information utilisation. It will improve the rate of information flow in the educational management system of universities, eliminate management delays and

support the timely resolution of complex and sudden management problems, so that the innovation path can be unimpeded and effective.

### **2.3 APPLICATION OF BIG DATA TECHNOLOGY**

In the context of big data, the easy dissemination of and access to information provides new directions for innovation among university teachers. For the process of implementing educational management in universities, the relevant working methods currently established can only be considered professional if all the results are scientifically sound, reliable and complete. For the management phase of the results, it is important to anticipate and analyse the professionalism and standards of work that will be achieved over time, and the management system established can only be considered scientific and effective if it is determined that the final results achieved are identical to the work standards set.

## **3. INNOVATION OF UNIVERSITY EDUCATION MANAGEMENT SYSTEM IN THE CONTEXT OF BIG DATA**

### **3.1 STRENGTHENING EDUCATION MANAGEMENT TEAMS IN UNIVERSITIES**

Big data brings opportunities for education and helps to improve the effectiveness of management work. However, it is still under active exploration, and universities do not yet have a complete system that works effectively, which requires exploration under the system of innovation in the management of university education under big data. From the current composition, the proportion of staff with information management background is relatively small, which requires the management department to absorb professionals with information management background into it on the one hand. On the other hand, it is necessary to strengthen the training of information literacy of the existing staff and enhance the ability of the education management workforce to carry out various business tasks.

### **3.2 STRENGTHENING THE HARDWARE AND SOFTWARE INFRASTRUCTURE OF UNIVERSITY EDUCATION MANAGEMENT**

A standard-compliant infrastructure is a material prerequisite for the enhancement of education work under big data. Some universities have initially realised the hardware and software foundation for digital campus, which provides the basis for carrying out education management work under big data. On this basis, universities should adopt stable, advanced and secure technologies to promote convenient data transmission, and should have a certain degree of foresight in equipment and wiring, while the capacity and convenience of data can be promoted.

### **3.3 DEVELOP A BIG DATA MANAGEMENT MINDSET TO OPTIMISE TEACHING AND LEARNING MODELS**

The teaching and learning process should be dynamically analysed for students' interests and targeted educational management. At the same time, the teaching of the course has been optimised in the sense that, although it is open-ended, the learning resources are concentrated and students have limited access to them and their use. The teaching model is optimised so that teachers can upload the knowledge students need to master to the internet, allowing students to focus on understanding the course knowledge and broaden their knowledge in accordance with the networked model. Universities are vigorously introducing hybrid concepts in the innovation of teaching models, including an online + offline structure, where online teachers give students 80% of what they need to learn and deepen their impressions of knowledge points.

#### 4. ANALYSIS OF THE INNOVATION OF EDUCATION MANAGEMENT SYSTEM IN HIGHER EDUCATION

This paper constructs a model of education management system based on big data technology, and integrates big data technology into the education management of universities. The actual evaluation factors are calculated with weighting coefficients, and the indicators are 1-14. The evaluation results can be seen in Figure 2, which shows that the primary indicator of self-management ability in the evaluation of indicator innovation reaches 14, followed by teacher management ability reaching 13. The secondary indicator of self-management ability is the lowest, reaching only 8 points. In summary, the application of technology and data resources to the management system innovation process can strengthen the university's faculty and improve the overall quality of human resources. In this regard, the introduction of big data systems, equipment, software and other necessary conditions, the implementation of data analysis results in the areas of "school-based" textbook development, pedagogical reform, school-government-enterprise cooperation, teaching evaluation and other areas, to help transform university teaching management.

## Figure 2 Innovation index system

### 5. CONCLUSION

This paper proposes to strengthen the education management system in the context of big data, and to innovate in three aspects: team building, hardware and software infrastructure, and optimising the teaching model. The results show that the index innovation evaluation of the education management system of universities, in which the first-level index of self-management ability reached 14. Therefore, in the management system of the new era, it is necessary to scientifically obtain, summarise and process the management information within the school, improve the working ability and moral standard of teachers, and improve the quality and effectiveness of management.

---

## ABSTRACT

This paper constructs the framework of big data talent training mode and elaborates a new talent training idea. It puts forward the innovative ways to clarify cultivation objectives, take market demand as the guide and deepen the reform of teaching mode. It is able to cultivate practical technical talents and set up professional curriculum system scientifically to promote the development of talents in higher vocational education. The experiment results show that there will be more than 10 million students enrolled in higher vocational education in China in 2022. It shows that the concept of big data should be introduced into higher vocational education, based on competency analysis, to update the goal of talent cultivation and adjust the professional settings, so as to truly achieve the ultimate goal of talent cultivation.

## KEYWORDS

big data; talent training; market demand; innovative ways; curriculum system

## 1. INTRODUCTION

Vocational education management has a key role in helping students to improve their learning ability, to train more talents with excellent skills for society, to promote industrial development and to drive the progress of society [1-3]. Its aim is to cultivate new types of skilled talents for the purpose of socialist modernisation. "Taking service as the purpose, taking employment as the guide and following the road of combining industry, university and research" is the basic orientation and the way to go for the talent cultivation strategy of modern higher vocational education. Using big data technology in it, improving teaching management methods, effectively strengthening education efficiency and making efforts to cultivate excellent skilled talents for society [4-6]. The change of talent training mode in higher vocational education is the demand of the times in response to the changes in the world of work. From "Internet+" to "artificial

intelligence", various new technologies based on digitalisation and information technology are rapidly penetrating into all corners of the human world.

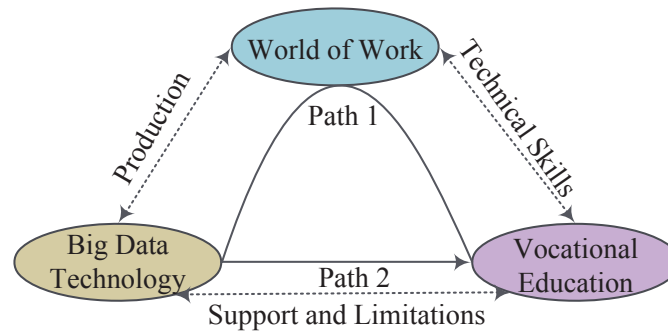

The talent development model is an exploratory practice on the path of higher vocational education talent development. The literature [7] points out that teachers face constraints such as lack of curriculum guidelines, knowledge and time, resulting in possible biases in their teaching methods when developing students with sporting talents. The literature [8] suggests that despite talent development being at the forefront of research in sport, female athletes are still underrepresented in sport. To close this skills gap, there is a need to improve coaching practices and support at the amateur level of cricket. The literature [9] presents two theories, the work adjustment theory and the larger model of talent development, while also highlighting the effect of 'brain drain'. The changes to the talent development model proposed in the above literature lack a philosophy, are not clearly targeted and do not adapt to changing needs.

Therefore, this paper constructs a framework for talent cultivation mode and explores how the talent cultivation mode of higher vocational education should be changed in the era of big data. It discusses a scientific and systematic mode of cultivating skilled and innovative talents, and gradually improves the effectiveness of cultivating skilled and innovative talents through the innovation of educational philosophy, innovative strategies of management mode, analysis of competence of talent cultivation programmes, reform of teaching methods and enrichment of teaching contents. The study finds that big data not only provides more support by putting forward new requirements for changes in the training model, but also as a technical tool.

## **2. HIGHER VOCATIONAL EDUCATION IN THE ERA OF BIG DATA**

### **2.1 TALENT DEVELOPMENT MODEL FRAMEWORK**

Big data technology has always been an important force influencing education, especially the unique type of attributes of higher vocational education, which makes the impact of big data technology on higher vocational education has more paths [10]. The change of higher vocational education talent cultivation model acts in different ways on the objectives, processes and subjects of vocational education talent cultivation, etc. The framework of the talent training model is shown in Figure 1 below, which shows that the development of education as a whole must be in line with social development. Cultivating talents is the purpose of higher education, and the structure of cultivating talents must be the same as the structure of talent development, because the whole economic and social development demand for talents is multi-type, multi-level and multi-faceted. Only in this way can higher education develop better.

**Figure 1** Big data talent training model framework

## 2.2 TALENT DEVELOPMENT IDEAS

The reform of the higher vocational education model should take the development of the current social situation as a reference for programme development, and should be more student-oriented, after all, the purpose of the reform is to cultivate talents and add bricks to their future development. There are two main sources of data for big data in higher vocational institutions. The first is the information data obtained by students independently, the quality of these data varies and it is difficult for schools to control them. The second is the information provided by the school to students, which in theory should be safe and secure, and for which the school must ensure that the quality of the information is maintained to ensure that students learn and live in a good environment. However, from the point of view of students' own access to information, it is difficult for schools to make the security of students' access to information secure. But schools still have to take the necessary measures. The educational reform work in higher vocational institutions should therefore focus on student education, and on the basis of mastering the laws of teaching, further enhance students' ability to distinguish information and reduce the impact of undesirable information on students from the source.

## 2.3 PROMOTING THE DEVELOPMENT OF HIGHER VOCATIONAL EDUCATION MANAGEMENT

The application of big data in higher vocational education promotes the transformation of traditional education methods in vocational institutions and the use of big data to propose scientific and reasonable strategies. In its application, institutions are required to seize opportunities in the general environment of the market, to draw on advanced management methods in line with international standards, and to better offer the technical professional courses needed in the market. In the process of construction, rational planning, listening to different opinions, building big data associated with students, and promoting the improvement of students in professional skills.

### **3. INNOVATIVE CHANGES IN THE TALENT CULTIVATION MODEL OF HIGHER VOCATIONAL EDUCATION**

#### **3.1 CLARIFY TRAINING OBJECTIVES**

As the economic system becomes more sophisticated, vocational jobs change frequently. This calls for the need to combine specific teaching realities with clear training objectives to cultivate the practical talents needed by society. At the same time, the difference between higher vocational training and general higher education and secondary education is that skilled personnel should constantly update their knowledge and have a strong capacity for self-development and problem-solving. The emphasis is on the improvement of vocational knowledge and skills, so as to have a strong ability to master new equipment and technology. In short, the setting of talent training objectives should highlight the characteristics of advanced, vocational and technical.

#### **3.2 GUIDED BY MARKET DEMAND**

Higher vocational institutions should adjust the professional curriculum system in the light of the current situation of society and cultivate students' innovation. They should aim at the job market, and in the process of optimising the setting of majors, they should especially highlight the characteristics of vocationalism. Starting from the characteristics of higher vocational institutions, focus on the special economy of the region, so as to build specialties. At the same time, investigate the social demand and the actual employment of graduates, etc., and then adjust the setting of professional curriculum system in time. In addition, it is necessary to deal with the issue of broad and narrow professional calibre. Cultivate students' love, dedication, persistence, commitment and firm professional beliefs, and cultivate high professional ethics and innovative professional spirit.

#### **3.3 DEEPENING THE REFORM OF THE TEACHING MODEL**

The content of higher vocational education should highlight the theoretical and comprehensive nature and the systematic nature of knowledge. With the development of higher vocational education, the traditional teaching form is single and does not meet the diversified needs of students in the new era. Therefore, it is necessary to actively innovate and build a new mode of talent cultivation that focuses on skill cultivation, has relevance, gives full play to students' individuality and makes full use of social resources. In teaching practice, students should be the centre of attention and fully mobilise their enthusiasm. In terms of teaching methods, multimedia etc. should be fully utilised; in terms of teaching evaluation, an equal and scientific evaluation system focusing on the enhancement of abilities should be established. In addition to theoretical learning, students need to practice and enhance their hands-on skills. Arrangements can be made for students to take part in internships in society in their final year after

two years of schooling. After the innovative talent model, a realistic talent training programme is developed between schools and enterprises and applied to the whole process of talent training, thus improving the overall quality of higher vocational students

#### 4. ANALYSIS OF THE CHANGE OF TALENT CULTIVATION MODEL IN HIGHER VOCATIONAL EDUCATION

This paper constructs a framework of talent cultivation model based on the background of big data, and brings big data technology into the study of the change of talent cultivation model of higher vocational education, so as to cultivate excellent skilled talents for the society. The results of analyzing the current scale of higher vocational education talent cultivation in Figure 2 show that the current scale of higher vocational education system is among the top in the world, with about 13,300 vocational institutions and 30 million students. From 2006 to 2013, the growth rate was high, and from 2013 it began to slow down, but the number of students in general is increasing. It can be concluded that the scale benefits of higher vocational education have been formed, for talent training, should use big data technology, timely transformation, to promote change and innovation.

Figure 2 Scale of talents in higher vocational education

#### 5. CONCLUSION

This paper points out that higher vocational education pays more attention to the use of practical resources and practical projects in the cultivation of skilled and innovative talents. Through the rational use of projects and bases and other resources, the innovative literacy and skills of students can be improved. The experimental results

show that there are up to 10 million students in higher vocational education in China in the era of big data. Therefore. The effectiveness of talent cultivation can be enhanced by promoting the innovation of management mode, the innovation of education concept, the increase of teaching reform, the concern of quality and literacy, the expansion of practical training resources and the enrichment of teaching contents. Cultivating skillful and innovative talents with comprehensive quality to serve the industry and enterprises is a necessary path for the adaptive development of higher vocational institutions.

**ABSTRACT**

This paper analyzes the development trend of big data according to the current situation of the application of big data technology in the process of physical education in colleges and universities, combined with the content of physical education classroom teaching, and proposes three innovative development models, including open network resource platform, intelligent carrier teacher-student interaction, and the adoption of a diversified evaluation system. The results show that the physical education teaching model is evaluated by indicators, of which the teaching effect indicator score is 13. Therefore, by combining the information collected by big data for comprehensive analysis, the optimization of personalized teaching of resource allocation is done, which in turn will lead to better development and enhancement.

## **KEYWORDS**

big data; university physical education; network resources; intelligent carrier; teacher-student interaction

## **1. INTRODUCTION**

As an important part of college education, physical education in colleges and universities has a positive impact on the physical and mental health of college students [1-4]. With the help of sports, colleges and universities nowadays focus on cultivating students' sportsmanship, exercising their physical fitness and promoting quality education [5-7]. With the development of a series of high-tech for education, it brings more opportunities and challenges for the innovation of physical education teaching mode. Big data technology, as one of the rapidly developing high technologies nowadays, is widely used in various industries.

Physical education is an integral and important part of teaching and learning. The literature [8] provided information on the impact of physical education on children's weight, cognitive and non-cognitive achievement. Physical education class time was found to have essentially no effect on weight and human capital outcomes for US primary schools students. The literature [9] analysed the relationship between physical education class time requirements and physical activity among high school students in various states. The results of this study help to support the role that physical education state requirements play in increasing the ability of youth to meet the recommended amount of daily physical activity. The literature [10] suggests that one of the core goals of school sport is to improve the physical literacy of young people in order to develop their ability, confidence and desire to be physically active throughout their lives. The aim is to examine selected physical education-centred indicators of physical literacy. The concepts of physical education presented in the above literature are too old-fashioned, with vague and non-student-centred teaching objectives.

Therefore, this paper begins with a conceptual overview related to the connotations of big data and goes on to point out the challenges facing the physical education classroom. On this basis, it points out the ways to develop the physical education classroom in colleges and universities. The application of technologies related to big data can lead to richer teaching content and effective improvement. This paper discusses the current situation and resource allocation of the innovation and development of university physical education teaching in the context of big data through the analysis of the index evaluation of the teaching mode, in order to provide some theoretical reference for the innovation and development of university physical education teaching.

## **2. THE ROLE OF BIG DATA IN THE PROMOTION OF PHYSICAL EDUCATION IN HIGHER EDUCATION**

### **2.1 DIGITISATION OF TEACHING CONTENT CARRIERS**

The teaching and widespread use of big data and its facilities has greatly enhanced the performance of university physical education and its innovative reforms. Firstly, the content of sports culture is digitalised. The history of sports development, sports culture carriers, the history of the development of various sports and sports equipment and other public sports culture is used as content. The digitisation of electronic teaching materials and other related resources can effectively avoid the perishable nature of paper-based text, photo and picture storage, and achieve effective and durable preservation as well as simple and efficient resource integration, etc. Secondly, the digital construction of various sports skills and movement practices. Big data in the construction of innovative teaching content can effectively overcome the limitations of paper pictures, with digital audio-visual comprehensive recording and exhibition functions to fully demonstrate the practical, performance, process and other characteristics of sports itself. For example, the use of digital technology to record the performance process of outstanding successors in various martial arts disciplines and clips of exciting movements during a certain event can be used directly as teaching resources for skills and movements.

## **2.2 TEACHING CLASSROOM CONTEXTUAL NETWORKING**

The realisation and popularisation of modern teaching with information, intelligence and networking has led to revolutionary improvements. Firstly, the teaching classroom webcast is innovative. Both in the traditional stadium classroom teaching, but also open up intelligent classrooms. The creation of online classroom 'classrooms' supported by the internet is one of the most operational and replicable practices. This means that students working on the same project can enter the same teaching 'room' and receive teaching from the relevant teacher, and interact with the teacher and other students online. Secondly, there is the innovation of interactivity in the teaching classroom. This means that teachers can interact with each other at a particular time, with the support of social software. As this approach is limited by the strength of the network signal, the number of people involved in the activity and the functionality of the facilities held by the students, the teaching is dominated by the explanation of a certain skill action or the demonstration of a complete sport action.

## **2.3 BIG DATA FOR TEACHING EVALUATION**

As universities have a team of professionals who develop and use big data, the direct integration of big data into university physical education to carry out relevant teaching evaluations is an effective initiative to help teaching and improve performance. Firstly, big data performance modelling is used to analyse students' physical education performance. After physical education teachers have entered various student performance data into some modelling software, they directly analyse students' performance in various sports. This can be used to analyse individual and common learning problems for the PE department or subject group to conduct more targeted research, by providing an individual understanding of students' learning and quantitative performance in various sports, as well as a class-wide or even school-wide comparison of students' learning as a whole. Secondly, Big Data fitness modelling and analysis software is used to evaluate students' physical fitness. Based on the data collected by teachers in their daily teaching, testing and assessment, the modelling software can be used to accurately analyse students' fitness levels in order to accurately capture their

fitness status in terms of speed, endurance, explosive power, cardiorespiratory fitness, pulse rate, flexibility and acuity. This will enable the students to understand the relationship between their physical fitness status and their related skills, and to actively explore innovations that will directly contribute to the physical fitness of students.

### **3. INNOVATIVE REFORM OF UNIVERSITY PHYSICAL EDUCATION TEACHING IN THE CONTEXT OF BIG DATA**

#### **3.1 OPEN TEACHING ON THE WEB RESOURCE PLATFORM**

The application of big data to achieve more open network teaching practices, universities should establish open sharing platforms for public resources and apply them. Students can browse resource websites and conduct targeted learning activities on their own, using the physical education teaching resources of professional sports training institutions, sports research institutions, universities and national education-related administrative departments, and national sports-related administrative departments as content. In the actual teaching process, students enter the resource site and watch videos in a certain area, learn and are required to complete the learning tasks according to the criteria, and the site assesses the learning according to the students' learning situation.

#### **3.2 INTELLIGENT VEHICLES FOR TEACHER-STUDENT INTERACTIVE TEACHING**

With mobile smart devices as the carrier platform, teachers and students can conduct more effective and direct teaching activities. For example, when using web technology, students can use messages or consultations to ask questions about problems they face in the learning process, and teachers can provide timely answers. The teacher can also provide timely guidance to students on irregularities in their training activities through online videos and praise students who perform well. In addition, teachers and students can work together to improve specific aspects of the teaching process.

### 3.3 ADOPT A DIVERSIFIED EVALUATION SYSTEM

The assessment of the quality of student learning is primarily an assessment of the quality of student movement. Students' movement in the final assessment is more mechanical, for example basketball assessment is evaluated by the number of balls shot and tennis by the number of strokes. Therefore, the evaluation system needs to be reformed, with teachers using students' physical and special qualities as two parts of the assessment. In addition, a comprehensive assessment of daily learning attitudes and the quality of training should be carried out to improve students' motivation and to strengthen the assessment of theoretical knowledge.

### 4. ANALYSIS OF THE INNOVATIVE DEVELOPMENT OF PHYSICAL EDUCATION MODE IN COLLEGES AND UNIVERSITIES

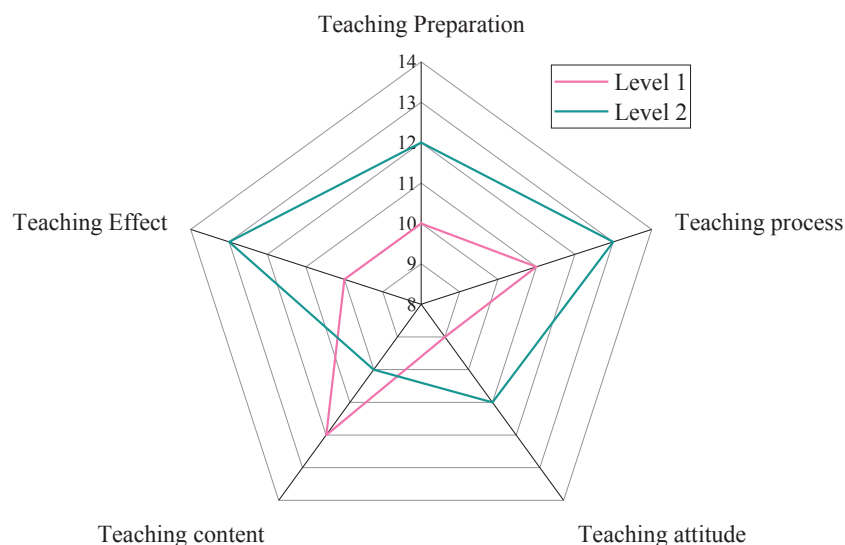

This paper analyses the innovative development of university sport in the context of big data, with the aim of strengthening the concept of continuous progress in education between teachers and students, applying modern sociological, pedagogical, physical education and mathematical theories to each condition and its associated aspects. The evaluation of the indicators was carried out through big data techniques. The results of the judgement are shown in Table 1. The mean of all indicators exceeds 4, the coefficient of variation is less than 0.25, and the evaluation results are consistent.

**Table 1:** The importance of secondary indicators of physical education evaluation

Indicators	Average number	Standard deviation	Coefficient of variation
Teaching Preparation	4.10	0.80	0.30
Teaching process	4.85	0.54	0.10
Teaching attitude	4.54	0.61	0.11
Teaching content	4.72	0.55	0.20
Teaching Effect	4.75	0.51	0.12

The indicators were thus subjected to weighting coefficients, and Figure 1 shows the results of the coefficients obtained for the innovation development indicators. It can be

clearly seen that the weight coefficient of teaching content in the primary evaluation index is the highest, reaching 12 points, and the score of teaching effect in the secondary evaluation index is the highest, at 13 points, at this time the weight coefficient can reflect the degree of the index better. To sum up, it has broken through the disadvantages of traditional physical education which was limited by time and space, and has broadened the depth and breadth.

**Figure 1:** Innovation development index coefficient

## 5. CONCLUSION

This paper proposes that big data has a catalytic effect on university physical education, which can digitize the teaching content carrier, network the teaching classroom situation and evaluate big data. Accordingly, a platform for the innovation and development of university physical education teaching under the big data facility software is constructed. The results showed that the index evaluation of the physical education teaching model resulted in the highest score of 13 for teaching effectiveness in the secondary evaluation index. Therefore, the proposed innovation pathway can achieve more comprehensive and stable protection for various sports programmes, and can better support the development of more diversified resource integration, and make good data exploration and support for each programme to play a leading and diversified function.

## ABSTRACT

This paper designs a model of how to educate music majors in higher education, by carrying big data information, maximizing effective information density and improving skill knowledge. The ability to retrieve information about oneself, develop a multi-level and diverse curriculum of characteristics, and thus educate students efficiently. The results show that less than 11% of students are fully able to identify short and pentatonic scores, and only 16% are able to complete classical music appreciation independently. The frequency of perceived music education methods was slightly higher in the lower grades ( $m=4.56, sd=0.77$ ) than in the upper grades ( $m=4.40, sd=0.85$ ). This indicates that in the field of music and arts education, big data is leading the innovation of a new generation of music and arts education teaching concepts, thus meeting the needs of music professional teaching and facilitating the realisation of the concept of 'lifelong education'.

## KEYWORDS

university music; parenting styles; information density; skills knowledge; retrieving information

## 1. INTRODUCTION

With the rapid development of big data technology, school education is undergoing a comprehensive systemic change, which brings both unprecedented opportunities and great challenges, and has an important impact on the future development of school education [1-2]. Universities should deeply understand the impact of "big data + education" on the quality of music education, give full play to the optimisation and integration of big data, and flexibly and diversively penetrate big data technology into all aspects of education [3-6].

Big data education is personalized learning and open learning, which can effectively solve the current problems of split teaching inside and outside the classroom, lack of teacher-student teaching interaction and low student learning motivation in music professional education in universities. Literature [7] shows that the types and contents of music teaching evaluation are being updated and changed, and teaching quality evaluation plays an important role in the development of music teaching and influences the quality of educational evaluation. The literature [8] shows that the use of pedagogical techniques and modern educational tools is one of the important criteria for the modernisation of education. Modern teaching implies participation in music teaching, which brings dynamism to traditional teaching. The literature [9] constructs a music classroom support teaching system supported by intelligent speech recognition technology in order to improve the effectiveness and informatization of music classroom teaching. To sum up, the new mechanism of talent training is unable to find the real crux of the problem and crack the problem, making it difficult to achieve the healthy development of music professional education.

Based on this, this paper designs a model for the way music majors are educated in universities in the context of big data. Firstly, through the influence of big data on the education and teaching mode, the information is stored to improve the density of effective information. Secondly, it fully improves the knowledge and information of skills, systematizes and scientifically cultivates talent goals, and innovates the training of music majors. Finally, through experiments, the model has proved that it can serve the purpose of enriching the form of aesthetic education in schools, improving students' comprehensive literacy and promoting their career choice and lifelong development.

## **2. TEACHING MODELS IN THE CONTEXT OF BIG DATA**

For the impact of big data on the education and teaching mode, big data is characterized by its own large information carrying capacity, easy information retrieval, diverse information modes and strong sharing [10]. It provides great convenience for education and teaching information sharing, and is also a huge development opportunity for the talent training mode. The traditional education model is taking advantage of the rapid development of information technology to innovate and enrich itself, and will certainly be given good opportunities for development.

### **2.1 EXPLORING THE CHARACTERISTICS OF BIG DATA**

Big data has the characteristics of greater data storage, higher timeliness of news messages, more variety of data, higher information density but less effective information [11]. Applying the information storage model with such characteristics to the cultivation of talents in real universities requires teachers to use various ways to maximise the density of effective information. It also requires teachers to improve their own ability to

retrieve information, increase the amount of preparation for lessons and take the initiative to search for information that is useful for students' own development. The advent of the big data era does provide new ways to personalise talent training, more options for information technology and valuable development opportunities for innovative talent training models by fully improving the knowledge and information of skills.

## **2.2 THE CURRENT STATE OF MUSIC EDUCATION IN HIGHER EDUCATION**

In order to make the training of music professionals more systematic and scientific, universities must develop plans and related talent training objectives, which require a training model that responds to current trends, meets practical needs, is tailored to the needs of the students, and constantly broadens and extends the horizons of learning. It is important to have a clear plan and not to aim too high or too low, so as to avoid the absence of a plan at a certain stage of the training process.

## **2.3 INNOVATIVE APPROACHES TO MUSIC EDUCATION IN HIGHER EDUCATION**

Colleges and universities must cultivate talents in line with the characteristics of the big data era, which has multi-level and diversified demand for talents. Colleges and universities can set up more slots in the admissions process, enrolling students at different levels and training them in different tiers. The study of music and arts should not only focus on learning professional knowledge and skills, but cultural subjects are also necessary as a foundation. The diversity of talent requirements is showing us clearly that the art of music has to be based on correct and healthy concepts and ideas.

## **3. BUILDING A MODEL FOR THE WAY MUSIC MAJORS ARE EDUCATED IN HIGHER EDUCATION**

In the big data environment, students are more in pursuit of some modern values and self-development. Only by establishing and adhering to a student-centred philosophy of education can we gain the recognition of students in teaching and management, as well as their support and cooperation. It is important to establish a variety of forms of teaching courses through new media network technology to enhance students' overall musical literacy. Teachers should guide students to establish good professionalism in conducting music major courses. By building a model of the way music majors are educated in colleges and universities, music teachers can purposefully guide students to give play to their rich imagination, and those various fantasies in a thousand variations will be transformed from people's subconscious to their consciousness, and students' potential creativity will be better developed.

#### 4. ANALYSIS OF THE EFFECTIVENESS OF MUSIC PROFESSIONAL EDUCATION

With the implementation of quality education, aesthetic education has been highly valued, prompting music education to gain rapid development, with significant improvements in terms of teachers and student quality. In this paper, a model of the way music majors are educated in colleges and universities is designed in the context of big data, and experimental analysis of basic music literacy and music perception education is conducted for music majors in colleges and universities.

##### 4.1 ANALYSIS OF BASIC MUSIC LITERACY IN HIGHER EDUCATION

In this paper, an experimental analysis of the basic music literacy of 300 students of higher music majors was conducted, and the analysis is shown in Table 1. 12% of the students could fully identify the simple score, 11% could fully identify the pentatonic score, only 14% could play musical instruments, only 16% could independently complete the appreciation of classical music, 38% could sing folk songs, and 65% could distinguish between American and folk songs. This shows that students' music literacy is relatively low, and it is urgent to improve the effect of music education in universities and cultivate high-level applied talents.

**Table 1** Survey of Basic Music Literacy of College Students

Content	Completely Capable	Number of People	Partial Energy	Number of People	Cannot	Number of People
Identifying a Simplified Spectrum	36	15	168	48	116	49
Identify the Staff Spectrum	27	11	162	47	127	43
Discriminative Singing	149	68	105	36	45	15
Singing Folk Songs	73	38	113	41	91	36
Play a Musical Instrument	39	11	86	34	157	57

##### 4.2 ANALYSIS OF STUDENTS' MUSIC PERCEPTION EDUCATION

Differences in school levels significantly affect students' perceptions of the frequency of educational approaches used in music education. Differences between school levels had a significant impact on the frequency of perceived educational approaches used by students when it came to everyday music education. The analysis of students' perceptual music education is shown in Figure 1. grade level differences significantly influenced the frequency of students' perceptual music education methods in the music curriculum. The frequency of perceived linguistic, visual, practical, research, interactive and emotional educational methods was significantly higher in the lower grades of the

upper school than in the upper grades ( $p < 0.05$ ). The frequency of perceiving music education methods was slightly higher in lower grades ( $m = 4.56, sd = 0.77$ ) than in higher grades ( $m = 4.40, sd = 0.85$ ). This indicates that the frequency of using various educational methods perceived by students in higher education decreases significantly with the increase of students' grades. Music and art colleges should follow the development of the current trend, constantly innovate the talent training mode, and develop a more scientific and complete talent training plan to truly cultivate the music and art talents needed by the times.

**Figure 1** Perceived educational methods of students due to grade differences

## 5. CONCLUSION

This paper presents an active research on the ways and means of nurturing music majors in colleges and universities in the context of big data. In the course of the study, a model of the way in which music majors are educated in colleges and universities is designed, and the results are analysed to verify the practical application effect. The results show that less than 11% of students can fully recognise simple and pentatonic scores, and only 14% can play musical instruments. The frequency of perceived music education approaches was slightly higher in the lower grades ( $m = 4.56, sd = 0.77$ ) than in the upper grades ( $m = 4.40, sd = 0.85$ ). This indicates that music education is fully integrated with the professional characteristics of students in higher education to accelerate music education in higher education and truly reflect the value of music education.

## ABSTRACT

This study makes use of intelligent learning resources to develop a comprehensive teaching scheme that combines the efforts of teachers and students. By combining the benefits of both conventional and intelligent physical education, we may execute integrated physical education in accordance with the circumstances of a given classroom, and integrate traditional physical education and intelligent physical education into each other's development to build a new college physical education SCT teaching mode. According to the SCT teaching model results, the experimental group's average performance was 67.42, which is considerably better than the control group's average performance, which was 51.27. The experimental group's average performance is 75.28, which is much better than the control group's average performance of 60.15. This demonstrates that there is a substantial difference between the experimental group's and the control group's learning performance, and that the experimental group's pupils' learning performance has been significantly enhanced. The experimental group was successful in enhancing the standard of physical education at colleges and universities, ensuring that students exercised for the recommended amount of time and intensity, and improving their physical fitness.

## KEYWORDS

Smart learning; teacher activities; traditional sport; smart sport; integration development; SCT teaching model

## 1. INTRODUCTION

Big data, artificial intelligence, 5G, and other new generation information technologies are all developing quickly. The age of scientific and technical innovation and growth of change already affects the future of education and teaching in schools.

[1-2]. With the integration of physical education into "wisdom" means, physical education is characterized by "informatization" and "wisdom", and the development pattern of physical education has also undergone a new change - smart physical education [3]. Smart physical education is not a simple addition of modern information technology and physical education, but a deep integration of modern information technology in all aspects of physical education, making fundamental changes [4-5]. Smart physical education is characterised by a technological teaching platform, a highly open teaching environment and a high degree of sharing of teaching resources, and students' learning will be task-oriented in a smart teaching classroom [6]. The teacher becomes the leader of students' learning and makes efficient use of classroom time to improve the efficiency of teaching and learning [7]. Smart physical education takes the development of the current era as the background, and uses various modern information technologies as the carrier to further its thorough integration with physical education, in order to advance physical education development and reform [8].

The qualities of teaching physical education courses are combined with pertinent research on smart classroom instruction in this study., and designs and completes the SCT model unique to university physical education teaching based on seven elements: theoretical foundation, realisation conditions, teaching objectives, teaching process, teaching evaluation, teaching feedback and informationization of the whole teaching process. Following is a summary of the benefits and drawbacks of smart physical education against standard physical education methods, and the strengths and weaknesses of each are taken into account, in order to combine smart physical education with traditional physical education to develop a new model of smart physical education that is more successful and based on science in colleges and institutions.

## **2. SMART PHYSICAL EDUCATION**

### **2.1 SMART PE TEACHING OBJECTIVES**

Teaching objectives are precise predictions of the changes that will take place in pupils and the specific learning results that will be attained as a result of teaching activities. The overall direction of the teaching process is greatly influenced by the teaching objectives. The attainment of teaching objectives should always be the focus of teaching and learning activities, which can be guided by the objectives. In order to optimize classroom instruction based on the real requirements of the students, the teaching goals of a smart classroom should be in line with the training goals.

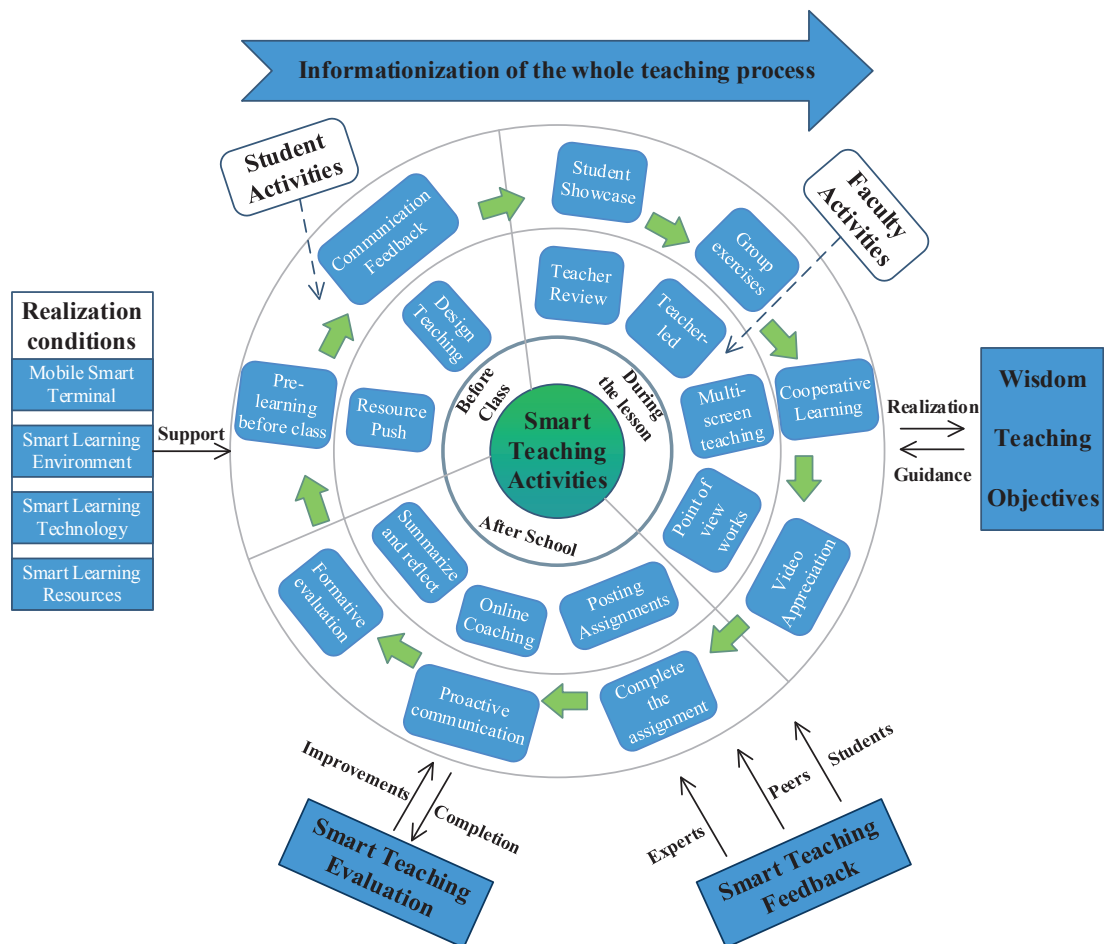

The Sport SCT approach focuses on increasing students' capacity for learning and their comfort with using online learning materials. By asking students specific questions, enabling them to research the answers, and finally combining their knowledge structure to accomplish tasks and achieve creativity, teachers may foster creative learning and

the ability to create. Establish healthy exercise routines and become an expert in one or more scientific exercise areas. Enlightening pupils' minds and fostering their intellectual development are the ultimate goals.

## 2.2 SMART TEACHING PROCESS

The main focus of this chapter is the process design of instructional activities for smart classrooms. The exercises are made to cater for learners' unique variations, increase the variety of instruction, and help pupils learn more effectively.

Before, during, and after class are all aspects of the study's smart classroom teaching activities. A full teaching system that includes both instructor activities and student activities is realized with the help of a smart learning environment and smart learning materials, Under the guidance of the instructor, students complete learning activities and teaching evaluations on their own, fostering positive thinking and innovation while also meeting the objectives of smart teaching. The particular material is displayed in Figure 1.

**Figure 1** The design of SCT model and its process in college sports

### **2.2.1 PRE-COURSE RESOURCE PUSH WITH DATA FEEDBACK**

In the era of big data, teachers release teaching videos to students through the online teaching platform, and students use the preview video resources to initially imitate the actions they have learnt and provide feedback to the teacher on any problems they encounter in the learning process through the use of questions. The platform processes student learning data and presents it to the teacher in the form of visual charts and graphs. The teacher uses the students' pre-study and feedback information to prepare the lesson, changing the status quo of teachers teaching according to their experience and achieving a truly 'people-oriented and student-focused' approach.

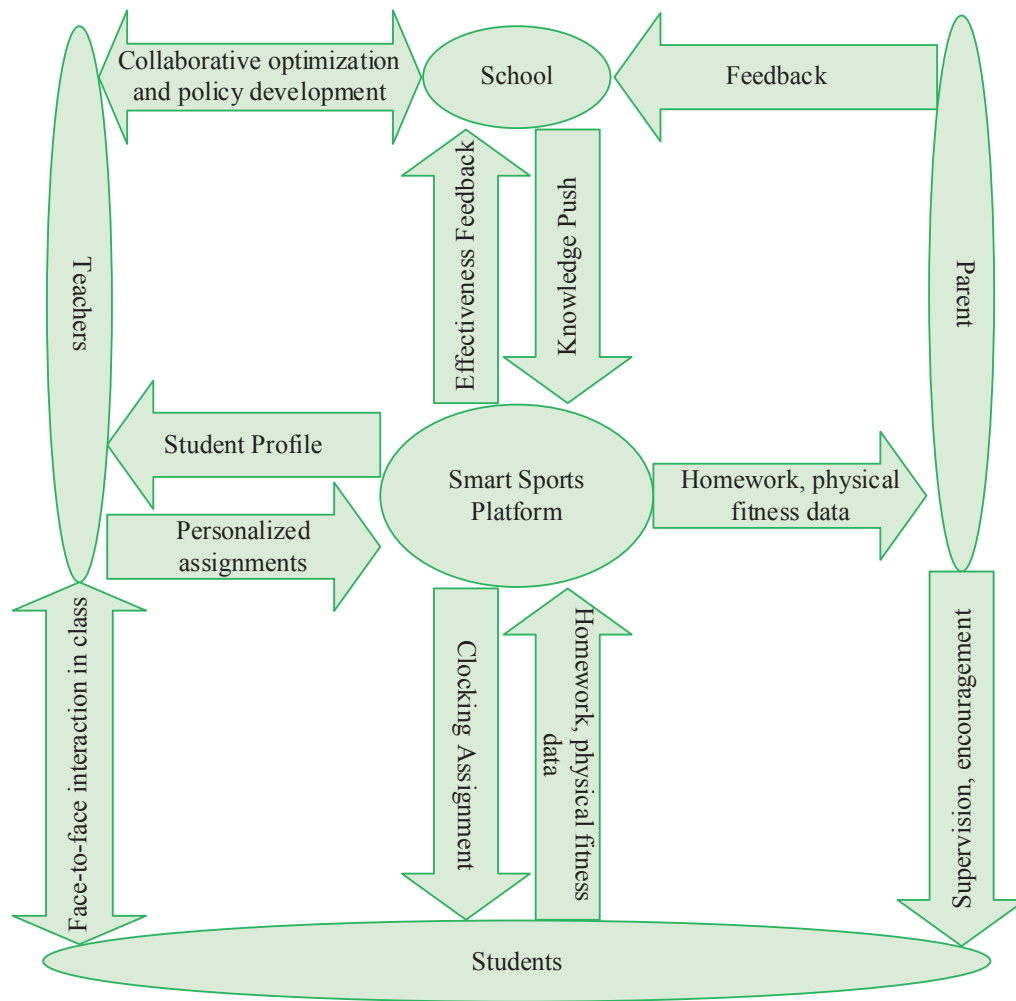

### **2.2.2 IN-CLASS TEACHER-STUDENT INTERACTION AND MULTI-SCREEN TEACHING**

The teacher's explanations and demonstrations, as well as the students' imitation and practice, take center stage in the conventional classroom. In the classroom, the instructor takes charge and the pupils are viewed as obedient knowledge storage devices. Students lack initiative and are less motivated to study since there is a lack of connection and communication between professors and students. In the PE classroom, firstly, students are of varying levels of physical education, with some students being able to grasp the skills quickly, while others with poor coordination take a long time to master the movements, and teachers are not able to focus on all students in the class.

## **3. BUILDING A MODEL FOR INTERFACING SMART SPORT AND TRADITIONAL PHYSICAL EDUCATION**

### **3.1 BUILDING AN INTEGRATED SMART SPORTS PLATFORM**

The incorporation of smart sports platforms is an interactive method for integrating resources and disseminating information, allowing information accessors to establish relationships both online and off-line through a network platform, and the platform can also carry out business cooperation and provide diversified services to the community. Smart wearables, which are portable electronics incorporated into a user's clothes or accessories or worn directly on the body, are the most widely used IoT application in sports. Figure 2 depicts the integration of traditional physical education with smart sport in higher education.

**Figure 2** New college physical education smart teaching model

### 3.2 PUSH EXERCISE PUNCH CARD PROGRAMME

Through active interaction between the platform, policies, services, and data, the smart sports platform is evolving toward informationalization, functionalization, and personalization to support the creation and execution of pertinent work and policies. Different exercise suggestions are made and different exercise programmes and plans are developed according to students' different physical conditions and pursuits, so that students can choose their punch card items and actively punch their cards against their physical conditions and target pursuits. To assist students in exercising and tracking their time scientifically, promote accurate and safe instructional videos that cover techniques for building core strength, building cardiorespiratory endurance, building limb strength, and treating sports injuries to particular body parts.

### **3.3 IMPLEMENTING "ONLINE AND OFFLINE" INTEGRATED PHYSICAL EDUCATION**

A two-pronged strategy using both online and offline components to maximize the instructional value of university athletics. The students' heart rate will be monitored throughout the class to ensure that the intensity of exercise is reasonably grasped and face-to-face teaching is carried out safely. The whole process uses the sports bracelet to present the classroom effect in a real and intuitive way, and to complete the offline teaching scientifically and effectively. At the end of the class, students send in a comparison video of themselves and the content of the platform to complete the assignment. The video comparison makes it easier for students to identify their own shortcomings and helps to improve their self-confidence and self-learning ability.

### **4. CONCLUSION**

In this paper, the advantages and disadvantages of smart PE teaching and traditional PE teaching were sorted out, so that traditional PE teaching and smart PE teaching could be integrated with each other and a new, more scientific and effective smart PE teaching model in universities could be built. After using the SCT model, the experimental group's average performance for movement skills was 67.42, which was noticeably better than the control group's average performance of 51.27. The experimental group performed both movement choreography and formation choreography on average at a level of 75.28, which was considerably higher than the control group's performance level of 60.15. The learning performance of the experimental group's pupils significantly improved over that of the control group, and there was a significant difference between the two groups' learning outcomes. It demonstrates that, in comparison to the conventional teaching method, the Smart Sports and conventional sports integration teaching method (SCT) models have a wealth of learning materials and more defined learning objectives, more convenient learning methods, more frequent teacher-student interaction, more varied teaching methods, and higher learning interest, participation and learning efficiency.

## ABSTRACT

There is a lack of standardisation and standardisation of health management services in China. In this paper, the analysis and mining of medical examination data under the electronic health technology in the information age can lead to the health differences of different regions and populations, and use this to build a personalized and regional health assessment model. The correlation coefficients of the other four dimensions are all greater than 0.5 and  $p < 0.01$ , except for the correlation coefficient of barrier cognition, which is slightly less than 0.5. The application of health management model by electronic health technology in the information era has improved the efficiency of community health services and enhanced the health care awareness of the group.

## KEYWORDS

health management; demand awareness; information age; health disparities; service efficiency; health awareness

## 1. INTRODUCTION

Health management is the process of managing health resources throughout the life cycle [1-2]. A more complete definition of health management is the whole process of monitoring, analysing and evaluating the health status and health risk factors of individuals or groups in a comprehensive manner, providing health advice and guidance, and intervening and managing health risk factors, oriented to the health needs of people with different health conditions [3]. Health management as an emerging health service concept and service approach [4-5]. It has a great role in solving the current problems of controlling medical costs, chronic diseases and ageing

in China, meeting the demand for high-quality health services and building a healthy China [6]. Relying on the development of health management technology in the age of information technology can break the restrictions of time and space for users, and also cultivate patients' self-management awareness [7-8].

In this paper, the application of electronic health technology in health management in the age of information technology is used to provide more effective and better personalised health management.

## **2. APPLICATIONS FOR HEALTH MANAGEMENT**

Health management is the process of providing comprehensive services such as physical health monitoring, health risk assessment, disease prevention, rehabilitation care, mental health intervention and health promotion to individuals or groups through various means and methods. Through the assessment of physical health, mental health and lifestyle, we can grasp our own health status and formulate personalised health management plans. Based on the results of the health assessment, appropriate health interventions are developed for the individual's health problems, including guidance and support in diet, exercise and psychological counselling. The individual's health status is monitored and tracked, health problems and disease risks are identified in a timely manner, and appropriate measures are taken to intervene and treat them. The aim of health management is to improve people's health awareness and health literacy, prevent the occurrence and development of diseases, maintain physical health and psychological well-being and improve the quality of life.

### **2.1 CURRENT STATUS OF HEALTH MANAGEMENT**

At present, health management has become a hot topic of global concern, but there is a lack of standardisation and standardisation of health management services in China. The popularity of health management services is not yet high, mainly because people do not have a deep enough understanding of health management services and lack awareness of the demand for health management services. The professionalism of management services is still relatively low, and the professional competence and service level of service providers need to be further improved. The price of health management services is too high. The current prices of health management services are high and unaffordable for the general population.

### **2.2 TRADITIONAL HEALTH MANAGEMENT**

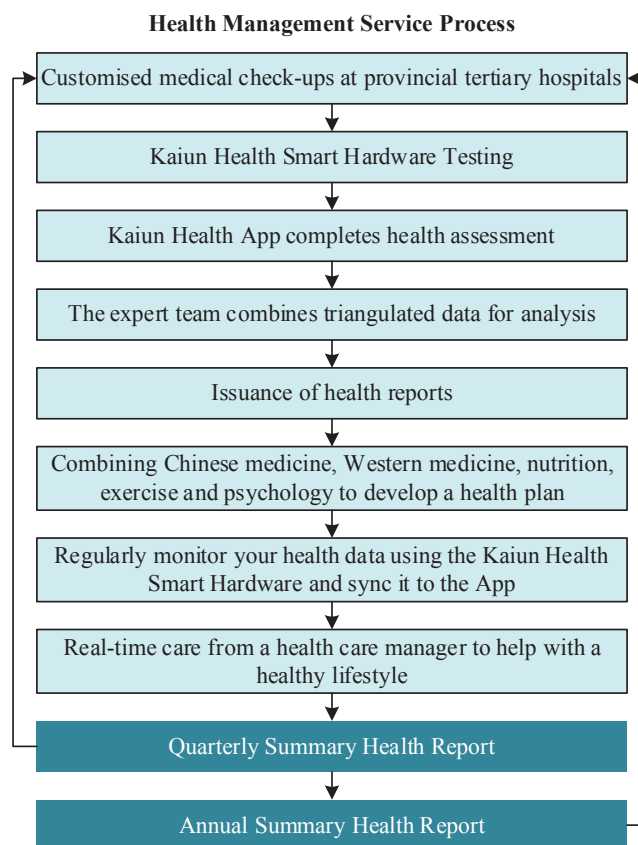

The traditional health management model is a one-to-one health management service, but in terms of data collection, it requires a health manager to visit your home to take measurements or communicate with you by phone to collect data. The cost of travel is also factored into the labour cost if the measurements are taken at home.

During the management process, records related to guided examinations, consultations, follow-up visits, guidance programmes, etc. need to be provided in paper form. The large amount of paper and USB sticks to keep electronic files are prone to loss and leakage. The number of people managed by health managers is limited. According to relevant statistics, the number of people served by health managers is limited for high-end VIP services.

### 2.3 HEALTH MANAGEMENT PROCESS

With the development of technologies such as the Internet of Things, sensing and Bluetooth, new intelligent testing devices have emerged on the market to achieve the collection of various physiological data from the human body. The various hardware devices developed so far, body fat meter, blood pressure meter, blood glucose meter, smart bracelet, blood lipid meter, etc., are comprehensive and accurate measurements, greatly reducing labour costs and time costs, simple operation methods, customers can measure directly at home, and can synchronise testing data directly to the mobile APP, eliminating the tedious manual recording, historical data cloud storage, permanent backup. The mobile phone APP is also used to complete the initial screening of chronic diseases, assessment and grading and communication between doctors and patients as shown in Figure 1.

**Figure 1** Flow of health management services

## 2.4 VALIDITY ANALYSIS OF HEALTH MANAGEMENT BELIEF CONTENT

The correlation coefficients of the five dimensions of the Health Beliefs Scale and the total scale were in the range of 0.296-0.731, as shown in Table 1, with the exception of the correlation coefficient of disorder perception, which was slightly less than 0.5. The correlation coefficients of the other four dimensions were all greater than 0.5, and  $p < 0.01$ , indicating that all five dimensions were correlated with the total health beliefs scale.

**Table 1** Belief scales for the dimensions of health

Dimension	Correlation coefficient of the summary table
Susceptibility Cognition	0.584
Severity cognition	0.675
Effectiveness perception	0.731
Impairment perception	0.296
Benefit perception	0.715

## 3. INFORMATICS EHEALTH TECHNOLOGY AND HEALTH MANAGEMENT

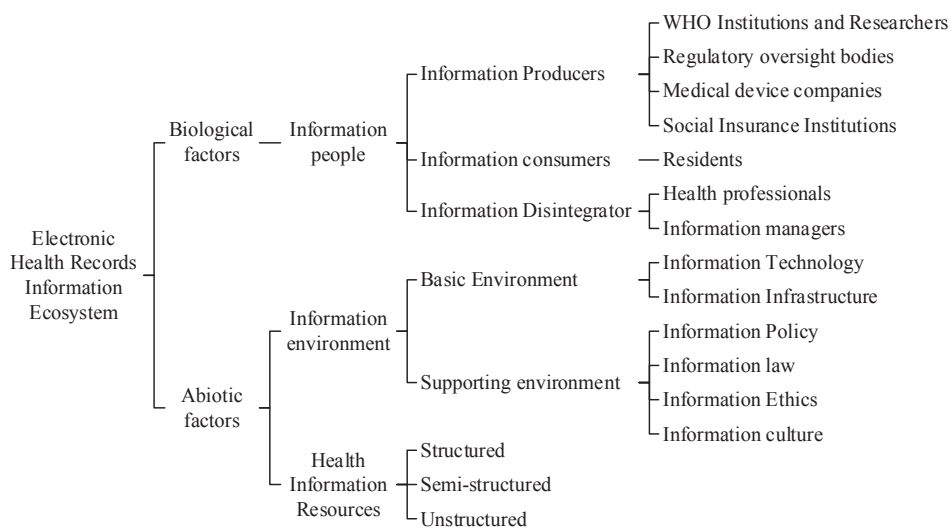

With the rapid improvement in the performance of mobile devices and the extensive coverage of wireless networks, as well as the development of wearable devices and technology and the widespread promotion of mobile applications, mobile communication technology, Internet technology and health services are gradually moving towards convergence, and Health IoT has come into being. Health IOT is a product of the integration of mobile, internet and health services, and is a new extension of e-health and telemedicine. Health IOT devices consisting of biosensors are the basic devices for obtaining individual health information and are the source of health management data collection. Health IOT devices can be divided into health collection terminals, health application terminals, composite health terminals and intelligent health terminals. Health IOT devices worn by individuals or implanted in the body are able to collect important vital signs signals from the body. ECG tests from traditional ECG machines can achieve signal collection at the user's end in a home-based manner; as well as the monitoring of respiratory rate done with capacitive sensors, continuous monitoring of blood pressure with wearable devices and the monitoring of vital signs parameters using cameras. This information is sent through technical processing to the health management back office service centre, where a professional health manager provides services, thus enabling remote sensing of vital signs conditions and implementation of health management. Users can also access individual health information, health assessment, health advice, exercise status, health tracking and chronic disease management through IOT devices at any time, anywhere and on the go.

### 3.1 STUDY ON THE APPLICATION OF INFORMATION-BASED E-HEALTH TECHNOLOGY IN HEALTH MANAGEMENT

Through the analysis and mining of medical examination data under the information technology of electronic health, the health differences of different regions and populations can be derived and used to build personalised and regionalised health assessment models and to formulate scientific methods of disease prevention and treatment as well as prognostic standards. The cloud health monitoring and early warning system based on IoT technology monitors the environmental parameters around the human body, vital signs parameters, movement status, video and other information in real time through intelligent sensors, and the monitoring centre stores, analyses and processes the collected information accordingly, and uses network technology to upload the data to the cloud server for cloud storage, management and sharing, which facilitates the health management organisation to remotely manage and This allows health management agencies to manage individuals remotely and provide advice and guidance. The big data framework of the health service remote system based on the collection and analysis of vital signs provides real-time data transfer analysis and real-time health care services, and uses an open standards platform to ensure interoperability between data and different devices.

### 3.2 COMPONENTS OF AN INFORMATION ECOSYSTEM FOR INFORMATIVE E-HEALTH TECHNOLOGY RECORDS

Similar to an information ecosystem, an electronic health record information ecosystem is an organic whole composed of information people, information environment and health information resources within the information ecology of a certain region. The specific components and structure are shown in Figure 2.

**Figure 2** Structural composition of the information ecosystem of the eHealth

#### 4. CONCLUSION

With the rapid development of the information technology industry, the application of information technology electronic health technology to health management is the general trend, compared with traditional health management, information technology electronic health management mode has the advantages of convenience, high efficiency, intelligence and popularity, the application and promotion of information technology electronic health management requires the organic unification of policy, scientific research, funding and medical treatment, the effect of management cannot be separated from the government-led, community health care, medical institutions, technology research and development institutions, universities, insurance institutions and other multi-party collaboration, so as to achieve a comprehensive, whole process, whole staff, whole cycle of health management.

## **ABSTRACT**

With the promotion of quality education and new curriculum reform, college physical education also needs to actively change teaching philosophy and teaching methods, promote the effective integration of online and offline teaching with the help of information technology, realize the reasonable allocation of high-quality physical education resources, promote the improvement of physical education classroom teaching quality and teaching efficiency, and realize the smooth change of college physical education so that students can really strengthen their physical exercise and improve their psychological. This paper utilizes online and offline hybrid teaching. This paper uses the advantages of online and offline hybrid teaching mode to create a more diversified learning environment for students. It can relieve students' psychological stress and build students' healthy body and mind. Finally, the chi-square test shows that there is a significant difference between the psychological stress level of college students in the three groups of exercise time, and the level of difference reaches the level of  $P < 0.01$ , which indicates that the level of academic psychological stress is effectively reduced through physical exercise. The study of this paper is conducive to promoting the development of students' physical and mental health and improving their comprehensive literacy.

## **KEYWORDS**

Blended learning; Healthy mind and body; Information technology; Effective integration; Physical education resources; Cardinality test

## **1 INTRODUCTION**

Stress is defined as a state of physiological and psychological stress that results when life circumstances do not meet one's needs and one's learning and experiences do not match the demands of real life [1-2]. Stress is thought to be the cause of many physical and mental illnesses. Therefore, reducing or controlling stress is an important element in maintaining physical and mental health [3-4]. College students are faced with studies, exams, employment, heavy academic burdens, long study hours, and high levels of mental stress [5]. In some schools' students have shown many negative emotions, such as anxiety, depression, low self-esteem, boredom, abandonment of school, and even suicide [6]. In recent years, the prevalence of psychological abnormalities among college students has been on the rise [7]. Therefore, the issue of mental health education and intervention for college students has attracted widespread attention from all walks of life [8].

In this article, exercise has been shown to be an effective and positive means of promoting students' mental health and regulating their emotions. The psychological health-promoting effects of exercise have been confirmed by many studies. However, it is difficult to conduct experimental research on this topic in a classroom setting and the conditions are not easy to control. The aim of this study was to compare the emotional well-being and psychological stress of students who exercised regularly with those who did not. The study was designed to demonstrate the effects of sports on psychological stress in college students.

## **2. ONLINE AND OFFLINE PHYSICAL EDUCATION TEACHING**

### **2.1 ONLINE AND OFFLINE SPORTS TEACHING MODEL**

In the new era, information technology in education has taken on a more important historical mission and has also had a strong impact on traditional sports, pushing university sports to change and innovate, finding new sports models, promoting further integration of classroom teaching and information technology, and exploring effective measures to practice the integration of online and offline teaching models.

The subject of physical education has certain special characteristics, in addition to mastering theoretical knowledge of physical education, it is more dependent on "physical participation" and "practical practice". Therefore, in the post-epidemic era, the key to improving the quality of physical education is to explore the connotation and value of the hybrid teaching mode of "online + offline" and to find a reasonable path to achieve it.

## 2.2 THE NEED FOR BLENDED LEARNING IN PE

With the promotion of science and technology, more and more people are concerned about online education. Universities have transferred physical education teaching from traditional offline teaching to online education platforms, allowing students to obtain quality learning resources through the Internet, but only online education is unable to meet today's teaching needs, the new hybrid teaching can not only allow students to improve their theoretical knowledge, but also get practical exercises and teacher's guidance, the hybrid teaching mode provides a new path for physical education teaching reform.

### 2.2.1 THE CURRENT STATE OF DEVELOPMENT OF ONLINE AND OFFLINE HYBRID PE TEACHING MODELS

Students' demand for physical education courses tends to be more personalised, informative and comprehensive. With the introduction of the new teaching model, although students have more opportunities to learn the basic theoretical knowledge of physical education, teachers still use the traditional skills testing method to test the learning effect, which does not reduce the pressure of students' class work and does not cause students to pay enough attention to physical education classes. There are more factors that affect students' participation in physical education and exercise as shown in Figure 1:

**Figure 1** Proportion of factors affecting students' participation in physical activity

### 2.2.2 INTEGRATING ONLINE AND OFFLINE HYBRID PHYSICAL EDUCATION TEACHING RESOURCES

Traditional offline teaching resources mainly include sports venues, equipment and equipment, physical education teachers, physical education teaching materials and sports items, etc. They need to be taught at a fixed time and place, and students can

master sports skills on the spot. Online teaching resources include network resources, intelligent equipment, digital courseware, etc. There are no fixed requirements for venues and time, and teaching resources are abundant and can be freely chosen according to their own situation. The use of hybrid teaching ideas, the integration of online and offline, enhances the flexibility of physical education and is conducive to stimulating students' enthusiasm for sports, increasing teachers' motivation and creating a good atmosphere for 'teaching' and 'learning'.

### **2.2.3 TEACHING MODEL IN PRACTICE**

Teachers can pre-record micro-lesson videos based on the specific content of the online teaching and find relevant teaching resources on the internet and push these resources to students through the learning platform for them to preview. In the process of finding in teaching resources, teachers should focus on the dissection of the four movements in this combination in the teaching resources, providing students with slow motion breakdown videos to guide them in observing the movement structure and key movements, and allowing them to watch with questions. In the offline teaching process, teachers can use group work, group learning and tiered teaching to create an environment for students to practice and compete, so that students can develop a spirit of solidarity, enterprise and challenge, so that each student can see their own progress through their own efforts, develop their psychological resistance to stress, improve their confidence in sport and lay a good foundation for more difficult sports movement training in the future.

### **2.3 BUILDING A PSYCHOLOGICALLY ADAPTIVE HYBRID PHYSICAL EDUCATION MODEL**

Blended teaching breaks the old traditional teaching mode and gradually forms a new mode of delivery. It requires students' independent learning ability extremely high, and students have a psychological adaptation process to the new teaching mode, which is not only a change of teaching style, but also means the reconstruction of teacher-student relationship. Therefore, teachers should adjust the way they teach physical education by adding some content about easing students' psychological aspects or by creating a relaxing and pleasant atmosphere. Physical exercise itself can play a role in reducing stress, cultivating a strong will, regulating emotions, etc. Therefore, teachers can promote students' physical exercise through cloud supervision, and give students as much humanistic care as possible in the classroom, by enhancing the interactivity of the classroom in order to achieve the exchange of emotions between teachers and students, which can effectively relieve students' psychological stress.

### 3 . RESEARCH ANALYSIS OF HYBRID ONLINE AND OFFLINE HYBRID

#### PHYSICAL EDUCATION

##### 3.1 STUDENT SPORTS AND EXERCISE STATISTICS

According to the questionnaire survey on students' participation in exercise activities conducted before the experimental grouping. The students were divided into regular exercise group and no exercise group, and statistical analysis was conducted on the distribution of sports participation items, the time of each exercise and the frequency of weekly exercise of the students in the regular exercise group, and the results are shown in Table 1.

The results of the survey on students' sports participation show that the number of students who engage in regular exercise during college is low, with less than 50% of both males and females. In the group of regular sports, there were more boys than girls. Boys mainly played basketball and football, while girls played sports, and the distribution of sports activities was more dispersed. The "other" sports in the sports column in Table 1 include swimming, badminton, physical dance, aerobics and volleyball. As the number of participants in these sports is scattered, they are grouped together as "other". As shown in Table 1, the distribution of sports and exercise for boys was significantly more concentrated than that for girls. There was a significant difference between boys and girls in terms of time spent per exercise session and frequency of exercise per week. The significance level of the differences reached  $P<0.01$  and  $P<0.05$  respectively.

**Table 1** Statistics on the degree of students' sports and exercise participation

	Number of people in the program					Time/minute	Frequency/time
	Basketball	Soccer	Running	Roller Skating	Other		
Male	43	23	9	5	3	48.22±21.34	3.15±1.02
Female	12	0	18	19	29	33.34±30.21	2.99±2.46

##### 3.2 THE EFFECT OF TIME SPENT EXERCISING ON PSYCHOLOGICAL STRESS

In this study, students' exercise time was divided into three levels of 30 minutes, 30-60 minutes and more than 1 hour in the questionnaire, and the exercise time was compared with their psychological stress level as shown in Table 2. The chi-square test showed that. There was a significant difference between the psychological stress levels of the students in the three exercise time groups, with the level of difference reaching the  $P<0.01$  level. In total, 62.43% of the subjects in the male and female exercise groups exercised for 30-60 minutes per session. Among the students in this exercise period,

81 of them had low levels of psychological stress, accounting for 76.91% of the total number of students with low levels of psychological stress. Only one student was too stressed out. Among the students who exercised for 30 minutes, 20.63% of them were at a low level of psychological stress, while 4 were at an excessive level of psychological stress. In the group of more than 1 hour, 12 students were at a low level of psychological stress, while 8 students were at an excessive level of psychological stress. In this study, 62.43% of the students who exercised regularly chose this time, indicating that most of the students' exercise behaviour was reasonable. At the same time, 30 minutes of exercise seems to be superior to more than one hour of exercise.

**Table 2** Statistical table of exercise time and psychological stress level of college students

Duration	Stress Score							
	Less than 43 points		43~65 points		More than 65 points		Total	
	n	Proportion/%	n	Proportion/%	n	Proportion/%	n	Proportion/%
30 minutes	23	20.63	16	30	4	35	46	24.65
30~60 minutes	81	76.91	24	53	2	16.4	98	62.43
More than 1 hour	17	15.72	15	29	8	71.3	33	18.98

#### 4. CONCLUSION

This paper brings greater scope for progress in physical education by integrating the advantages of both in the new blended education model. Teachers should focus on the enhancement of physical education expertise and skills, should make full use of technology, improve information literacy, provide a multi-faceted teaching model for physical education, help improve students' physical education professionalism and curriculum thinking literacy, and motivate students to achieve the purpose of strengthening their bodies and bodies. In the context of the information age, the online and offline integration teaching mode is a new way to promote the reform of physical education, which can effectively improve the teaching efficiency of physical education courses, increase students' enthusiasm and confidence in physical exercise, cultivate students' independent learning ability, help students establish the sports spirit of not being afraid of setbacks, being brave to challenges, and striving hard, which is conducive to promoting students' physical and mental health development, improving their comprehensive literacy, and enhancing their lifelong participation in physical exercise.

## ABSTRACT

The integration and development of Japanese language course teaching and information technology in colleges and universities has become a key direction of classroom teaching reform nowadays. In this paper, teachers in the context of information technology should learn to psychologically regulate themselves, recognise that it takes a process to become proficient in the use of online platforms, and take the initiative to learn new teaching techniques and actively adapt to new teaching modes when first encountering online teaching platforms. The innovative reform of Japanese language teaching in higher education in the context of information technology will result in a significant improvement in students' communication and reading comprehension skills, as well as their intercultural and practical Japanese language skills. Finally, by making full use of the rich resources brought about by information technology, the teaching is helped to change dynamically in line with the content, target audience and objectives of teaching, further improving the quality of teaching.

## KEYWORDS

classroom reform; psychological adjustment; new models of teaching; full use; enrichment resources; teaching quality

## 1. INTRODUCTION:

With the development and maturity of information technology and the reform and innovation of educational concepts, how to combine speech and information technology with educational methods and approaches has become a hot research and practical trend in the field of education [1-2]. Informatization of Japanese language course teaching has become an inevitable trend in the current Japanese language course

teaching [3]. Informatization has become a major trend in the current economic development, and the future demand for Japanese language personnel is bound to change significantly [4]. This has also put forward new requirements for the reform, innovation and development of the Japanese language industry, and has constantly influenced the training objectives and training modes of Japanese language personnel [5]. The informatization requirements of Japanese language courses in higher education institutions have led to new changes in the content and methods of professional teaching [6]. The role of "Internet+" in the process of Japanese language teaching in colleges and universities is mainly reflected in the rapid organization and dissemination of Japanese theoretical knowledge and the comprehensive use of Japanese teaching practice[7]. With the diversification of the means of information technology in education, the reform of Japanese language courses in colleges and universities has taken the path of information technology[8].

This paper combines the use of Japanese language course teaching reform in the context of information technology should take advantage of the Internet information resources, improve the level of teaching hardware, enhance the digital teaching concept of teachers, reasonably choose teaching methods, through the continuous search for a new mode of teaching to adapt to the current Internet era of the Japanese language course new composite talent requirements, to lay a good foundation for students to work in the future Japanese language related work.

## **2. INNOVATIVE REFORM OF JAPANESE LANGUAGE IN HIGHER EDUCATION**

### **2.1 STUDENT NEEDS**

Nowadays, students are more interested in self-fulfilment, so teaching methods should also meet their individual needs. The flipped classroom puts learning outside the classroom, allowing students to choose their own time and place of study, and to control the content and amount of learning, making it easier for students to accept and enjoy the course. Students are also more likely to be motivated by the conversations, group work and problem solving in the classroom. Questionnaires show that the flipped classroom model can meet these needs.

### **2.2 THE TEACHING MODE IS RELATIVELY HOMOGENEOUS AND LACKS PRACTICAL TEACHING EXPERIENCE**

The traditional teaching mode is teacher-centred, with students being the passive recipients of knowledge in the teaching process, and teachers simply instil teaching content into students through such means as knowledge explanation, teaching boards and traditional multimedia equipment. Throughout the teaching process, students are always passive recipients, and the multimedia equipment only plays a supporting role.

Although this approach can enhance the teaching ability of teachers, it is difficult to mobilise students' individual initiative and creativity, thus limiting the cultivation of students' innovative ability and subjective initiative. In this way, the practical and comprehensive nature of the course itself will be diluted, making it difficult to train Japanese language personnel to meet the needs of the current information society. The modern Japanese language teaching work should make full use of the advantages of "Internet+" to cultivate students into the composite practical talents needed by society by means of engineering practice and school-enterprise cooperation.

### **2.3 APPLICABILITY OF INFORMATION-BASED TEACHING**

The Japanese course uses the new version of Standard Japanese as the textbook. In accordance with the requirements of the School of Foreign Languages and the Japanese syllabus, the Japanese course is now taught in 4 hours per week, one lesson per week. 2 hours are devoted to vocabulary and grammar, and 2 hours to the text, and although I try to involve students in classroom activities, the teacher still takes up most of the class time. The content of Beginner Japanese is relatively simple, starting with the most basic pronunciation and covering mostly the most basic grammar and conversation in Japanese. Each lesson has a main grammatical content and students are able to learn it on their own by watching the instructional videos. Class time is devoted to the internalisation of knowledge, with the teacher being not only the transmitter of knowledge but also the guide of the class, giving full play to the students' subjectivity through situations, collaboration and conversation. As we all know, language learning requires constant practice and reinforcement, so putting practice in the classroom will enhance practice and improve expression.

#### **2.3.1 TAKING ADVANTAGE OF THE INTERNET TO CONTINUOUSLY IMPROVE THE EFFECTIVENESS OF MOOC CONSTRUCTION**

Raise the awareness of Japanese language teachers in colleges and universities to build MOOC, and stimulate the enthusiasm of Japanese language teachers in colleges and universities to develop MOOC. When teachers have certain knowledge related to MOOC, schools should focus on improving the promotion of MOOC construction and stimulating the enthusiasm of Japanese language teachers to build MOOC, create MOOC and learn MOOC. Teachers use catechism resources to continuously improve students' initiative in learning Japanese and focus on making the MOOC a golden course. As the form of MOOC is evolving and developing, teachers can actively use online open courses represented by MOOC, integrate course applications and teaching services, and actively develop quality online courses for Japanese language students in universities.

### 2.3.2 ANALYSIS OF TRADITIONAL JAPANESE LANGUAGE TEACHING IN HIGHER EDUCATION

Firstly, the information knowledge of teachers is not sufficient. As most teachers are relatively lacking in information technology knowledge, they have generally adopted traditional teaching modes in their past teaching work, and are less likely to use online teaching formats such as catechism, live streaming and recording to teach their students. Faced with modern teaching platforms and teaching tools, about 40% of teachers feel more stressed as shown in Figure 1. In this context, teachers should learn to psychologically regulate themselves, recognise that it takes a process to become proficient in online platforms, and take the initiative to learn new teaching technologies and actively adapt to new modes of teaching when first encountering online teaching platforms. At the same time, for teachers with information knowledge needs, the college should provide them with uniform training on online teaching before the start of classes. Secondly, the interaction between teachers and students in classroom teaching is insufficient. Teacher-student interaction is a key aspect of the teaching process. In traditional classroom teaching, teachers tend to grasp students' mastery of knowledge by encouraging students to speak actively and observing students' micro-expressions, but in the Internet mode, teachers and students cannot communicate with each other face-to-face, so they cannot observe students' online learning status in time, making it difficult to adjust teaching methods and progress according to students' dynamic responses. Adjusting teaching methods and progress.

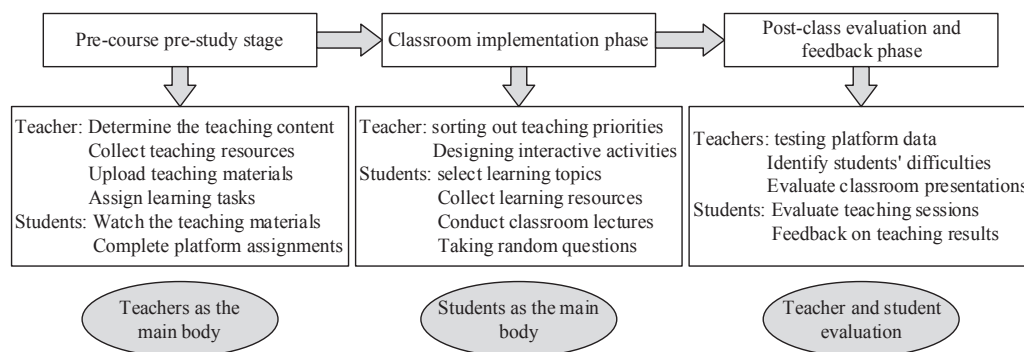

Figure 1 The level of pressure teachers feel about online teaching

### 3. DESIGN OF AN INFORMATION-BASED TEACHING MODEL FOR JAPANESE LANGUAGE COURSES IN COLLEGES AND UNIVERSITIES

As one of the most popular minor languages in foreign languages, there are a large number of institutions offering Japanese as a major. As of 2021, there are 473

universities offering Japanese as a major, and Japanese is now the second most popular foreign language in China. Faced with students who choose Japanese as their major, schools aim to teach Japanese language expertise while enabling students to grow into people with both foreign language and intercultural communication skills. In the current situation, then, it has become a new topic to optimise the drawbacks of online teaching and to achieve a deep integration of online and offline courses. Therefore, the three stages of pre-course, in-course and post-course Japanese teaching activities are designed as shown in Figure 2.

**Figure 2** Blended teaching process design

### 3.1 CLARIFY TEACHING DIRECTION AND STRENGTHEN TEACHERS' AWARENESS OF INFORMATION TECHNOLOGY

Under the background of information technology, how to cultivate Japanese language professionals who meet the needs of enterprises and society is a question worthy of in-depth consideration. At present, the teaching direction of Japanese language courses in higher education institutions should aim to cultivate talents and serve job positions as the core, and constantly infiltrate application knowledge in the process of teaching Japanese, so as to strengthen the cultivation of students' practical ability. Teachers should also enhance their awareness of information technology and make full use of the rich resources brought by the Internet to help teaching with the dynamic changes in teaching content, objects and goals. In order to further improve the quality of teaching, teachers should change their traditional teaching thinking, and only when teachers have a firm grasp of information technology can they teach students better. Therefore, teachers should adopt appropriate teaching media and make scientific and reasonable use of Internet resources to cultivate students' thinking skills in a targeted manner. At the same time, teachers should also learn more from new knowledge in the teaching process and constantly enhance their own ability to acquire and process information in order to enhance their multimedia teaching skills in a better way.

### **3.2 INNOVATIVE INFORMATION-BASED TEACHING MODELS**

The innovative teaching model integrates integrated course content based on the adaptation of the original basic Japanese course content. This is because many higher education institutions offer Japanese listening, speaking and audiovisual courses separately, and the number of hours available for different types of Japanese courses is limited. At the same time, if a single training approach is adopted for each course, it will increase the coursework burden of students. Therefore, it is recommended that a unified textbook be used to integrate the content of the listening, speaking and audiovisual courses, presenting the essence of the course in its entirety, stimulating students' senses aurally and visually, and continuously improving students' Japanese speaking skills and applications in an integrated teaching process. In the teaching process, teachers should be adept at incorporating industry and employment-related knowledge into their teaching to create certain conditions for students' future career planning. With the continuous development of information technology, it is difficult to meet the needs of future Japanese language related jobs in a single teaching place. In the process of teaching reform, teachers need to digitally transform the teaching place of Japanese language courses and make use of internet resources such as WeChat and micro-lessons to improve the quality of teaching, facilitate teachers' teaching and exercise students' ability to apply their knowledge. In practical work, it is important to ensure that the materials for different communication scenarios are informative and rich, not only to stimulate students' interest in learning, but also to fully connect with conversation training, listening and practising skills, and to master comprehensive Japanese skills.

### **4. CONCLUSION**

This paper has changed the traditional teaching methods through innovation and reform of Japanese language course teaching in colleges and universities, and can also guide students to take the initiative to learn. Finally, through the use of Japanese language course teaching reform in the context of information technology should take advantage of the Internet information resources, has improved the level of teaching hardware, enhance the digital teaching concept of teachers, and reasonably select teaching methods. By constantly searching for new modes of teaching to meet the current requirements of the Internet era for new composite talents in the Japanese language course, and by making full use of the resources of the Internet platform, the comprehensive teaching of information technology has been achieved thus improving teaching efficiency.

## ABSTRACT

In this paper, the importance of intelligent education has been widely emphasized by universities through the close integration of modern information technology and education teaching in the context of deep learning. The promotion of the "flipped classroom" has led to significant results in the construction of resources, innovation in teaching methods and information technology support in the curriculum. The proportion of intelligence professionals in public libraries is 10-20%, with over 50% of staff with a bachelor's degree or above. The study concluded that deep learning in education is an important way to solve the deep-rooted problems of intelligence education reform in universities because its competency framework is highly compatible with that of intelligence education.

## KEYWORDS

smart education; teaching methods; information technology; deep learning; significant results; enhancing talent

## 1. INTRODUCTION

The urgency and problems of training library and intelligence talents The training of library and intelligence talents in China began in the late 1950s, and for historical reasons, for more than 20 years in the middle, the training work was forced to stop until 1978, when the science and technology intelligence major of Wuhan University began to enroll, and only then did the training work of talents, which had been interrupted for many years, resume [1-2]. In the short 10 years since then, although the training of library and intelligence talents has achieved promising results, there are still many problems, such as a single knowledge structure of talents, poor ratio of education levels, confusing and lagging education contents, and a single flow of talents [3-4].

The gradual integration of modern science and technology with library and intelligence work has put forward completely new requirements for library and intelligence professionals in terms of breadth and depth of knowledge [5-6]. In the past, library and intelligence staff were managing print literature resources, and the processing, retrieval, provision and use of literature were mainly manual operations [7]. Nowadays, digital information resources are the object of management, and the operation of modern technical equipment such as computers is the main focus, which is a completely new field of work, and library and intelligence staff need to learn new theories, new methods and new technologies [8].

To sum up, the training of library and intelligence professionals in universities should be closely integrated with deep learning technology to enhance the level of deep learning technology and practical ability of students and help them better adapt to the needs of rapid development of information technology.

## **2. ANALYSIS OF THE TRAINING NEEDS OF LIBRARY AND INTELLIGENCE PROFESSIONALS IN COLLEGES AND UNIVERSITIES**

### **2.1 DEMAND FOR LIBRARY AND INTELLIGENCE PERSONNEL WITH A COMPREHENSIVE KNOWLEDGE STRUCTURE**

Library and intelligence talents have to provide services such as information resource development and utilisation, information organisation and information navigation, which places new requirements on the knowledge structure of library and intelligence talents compared to traditional services. They must master basic library and intelligence theory and technology, as well as information technology, management knowledge and certain research capabilities. Library and intelligence personnel must have profound professional knowledge, while having a broad knowledge base, solid basic knowledge of social and natural sciences, extensive knowledge of philosophy, economics, law, history, literature and science and technology, etc., with special emphasis on learning new knowledge in various disciplines reflecting the new economic and cultural developments in contemporary society. Computer and foreign language training should be strengthened and skills improved in order to meet the needs of academic internationalisation, knowledge globalisation and market informatisation. Of course, in the information age, library and information technology staff play the role of information technology platform, whose responsibility is to use electronic computer technology to automate the work; use optical technology to miniaturise and CD-ROM literature and information; use computer multimedia technology to integrate graphics, text, sound and image information; use modern communication technology to network reference services and high-speed information transmission.

## **2.2 THE URGENT NEED FOR THE DEVELOPMENT OF THE LIBRARY AND INTELLIGENCE INDUSTRY ITSELF**

The number of people employed in the library and intelligence industry in the traditional sense is rapidly declining and a similar situation has emerged with regard to the employment of library and intelligence graduates from other universities. Another survey data shows that the library and intelligence graduates assigned to work in university libraries are not interested in the work and more than a thousand non-library and intelligence graduates have more than a thousand people outflow, the brain drain has long become the library and intelligence sector with a universal and urgent problem to be solved. The current structure of professional staff is unreasonable, with a large increase in non-professional staff and a serious lack of backbone strength. Library and information institutions are service and academic institutions, requiring staff to have a high degree of professionalism, broad scientific and cultural knowledge, skilled professional skills, but most of the libraries in China, especially public libraries and school libraries have become places for the elderly, the weak, sick, disabled and their families and children, a veritable “hodgepodge of talent”.

## **2.3 COMPETENCE REQUIREMENTS FOR LIBRARIANSHIP AND INTELLIGENCE PROFESSIONALS IN HIGHER EDUCATION**

Library and intelligence professionals should be able to provide information products and services at the right time and in the right way, according to the information needs of specific clients. Library and intelligence professionals should also be able to take targeted measures to promote the generation, flow, sharing and use of information in accordance with the needs of the organisation they work for and the actual situation of the organisation itself, and encourage the staff in the organisation to actively participate in information management activities. Library and intelligence talents have to be creative in coming up with new ideas based on learning from the experiences and lessons of their predecessors and carrying out innovative activities based on theoretical learning and practice. Therefore, the current requirement for library and intelligence talents is not only to master solid professional basic theoretical knowledge, but also to understand technology, management and dare to innovate.

### **3 . CURRENT SITUATION AND COUNTERMEASURES OF CULTIVATING LIBRARY AND INTELLIGENCE TALENTS IN COLLEGES AND UNIVERSITIES**

#### **3.1 THE CURRENT SITUATION OF LIBRARY AND INFORMATION PERSONNEL IN HEBEI UNIVERSITIES**

The author investigated the most representative libraries in a province, such as City A Library, City B Library, Library C, Library D and City E Library, through online surveys and other forms, and compared the current situation of intelligence professionals in these libraries item by item, and tabulated and analyzed them as shown in Table 1. From an overall perspective, the proportion of intelligence professionals in the major municipal public libraries in province H ranges from 10% to 20%, with those with bachelor's degrees and above accounting for more than 50% and those with intermediate titles and above accounting for more than 50%. The proportion of intelligence professionals with a comprehensive knowledge structure and those who have studied library intelligence is very low. From the data in Table 1, it is easy to see that although the educational level of public librarians and intelligence professionals is high, their professional quality still cannot meet the requirements of modern library intelligence work, and their knowledge structure, information technology level, foreign language level and management ability are all shortcomings in the training of intelligence professionals. This talent structure reflects that the traditional mode of training library and intelligence talents has failed to meet the current needs of library intelligence work, and the continuing education of intelligence professionals is weak, so it is urgent to update the training mode to meet the requirements of improving the quality of library patron services in the new era.

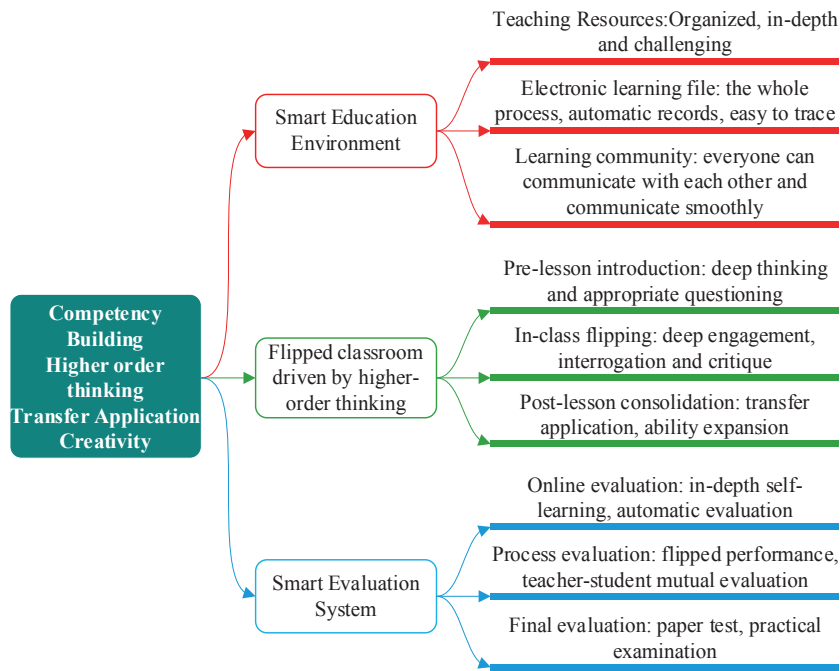

**Table 1** Survey of intelligence professionals in public libraries in some prefectures of province H

Public Library Name	Total number of librarians table	Bachelor's degree or above Number and proportion		Intermediate title or above and the proportion of		Number and percentage of people who have studied Library and Information Technology		Number and proportion of people with comprehensive knowledge structure	
		Number	Proportion	Number	Proportion	Number	Proportion	Number	Proportion
City A Library	49	27	53.45%	28	56.38%	7	13.61%	6	9.35%
City B Library	58	32	55.15%	37	64.86%	4	6.52%	3	4.56%
City C Library	65	37	57.46%	41	62.73%	8	12.12%	7	8.45%
City D ibrary	47	33	71.21%	37	79.54%	6	12.15%	5	7.61%
City E Library	61	36	63.43%	42	69.53%	4	5.89%	5	6.89%

### 3.2 DEEP LEARNING-BASED INTELLIGENT EDUCATION FOR UNIVERSITY LIBRARY INTELLIGENCE

Library and intelligence education is a systemic project, and this is especially true of smart education for library and intelligence. The teacher's in-depth teaching organisation provides a solid foundation for the students' in-depth learning, and the students' in-depth learning is a necessary way to reach higher-order thinking and competence development. Therefore, this study proposes a three-tier design for intelligent education as shown in Figure 1.

**Figure 1** Deep Learning Library Intelligence Teaching Organization

According to the three core elements of smart education, teachers' deep teaching organisation, as the foundation of the high-rise, needs to be built in three dimensions, including a smart education environment that points to deep learning, a flipped classroom driven by higher-order thinking, and a smart assessment system that cares for the effectiveness of deep learning. A smart educational environment for deep learning in library intelligence can be constructed in the following four aspects:

(1) Teaching resources for deeper learning.

In order to achieve the educational goals of higher-order thinking and creative development, the intelligent learning space for library intelligence needs to provide highly integrated, high-quality digital resources with depth, relevance and challenge to promote collaborative learning and deep participation. At the same time, students can broaden their horizons and ideas by providing links to quality resources or social practice windows, and use open learning resources to guide them to establish the right values.

(2) A deep learning smart education environment needs to promote collaborative learning among learners in addition to facilitating deep participation by individual learners. Therefore, the Personal Wisdom Deep Learning Terminal should provide a learning community that is "interoperable for all" and a natural, simple and real-time communication tool to facilitate shared learning.

(3) Space for creativity and demonstration of competence. A creative space for each individual learner, driven by creativity, encourages students to transfer and apply their knowledge, and to demonstrate their work. Not only does it provide learners with opportunities for higher-order learning, it also provides a window for learners to showcase their higher-order thinking skills and creative abilities.

#### **4. CONCLUSION**

The training of library and intelligence personnel has gone through four periods: compilation and reporting, professional research, systematic research and policy-making research, each of which has closely linked its own development to the changes of the times, constantly enriching its research content and improving the theoretical framework of intelligence research. Now, under the impetus of deep learning, intelligence studies should also keep pace with the times, take the initiative to seek changes and adapt, establish new growth points for the discipline and open up new horizons, so as to achieve the purpose of promoting its own development. This requires the intelligence disciplines of domestic universities to adjust the training objectives of talents in a timely manner, to follow the development of society, to adjust the curriculum and practical aspects in real time, to clarify the theoretical curriculum in the training of intelligence talents, to focus on practical education and training of talents, and in the information age, with the In the age of information technology, with the continuous improvement of the information level of library intelligence institutions, the requirements for talents are also gradually improved, in the transformation of the traditional teaching methods, innovative library intelligence talents training mode, cultivating compound and innovative talents in line with the development of society, thus promoting the good development of library intelligence professional talents training in the context of deep learning.

## ABSTRACT

The state and colleges and universities have given ideological and political education significant attention since it is a crucial practical activity for the growth of college students. With the beginning of the Internet era, the ease of integrating resources, the quickness of information transmission, and the depth of resources have all greatly enhanced the substance of ideological and political education. 2.4% of students believe they utilize big data technologies sparingly, while 3% of college students believe big data is ineffective for informing college students' political and ideological views. This study uses the ideological dynamic prediction and educational decision-making capabilities of big data to raise the ideological level and political literacy of university students.

## KEYWORDS

Ideological and political education;big data era;information dissemination;ideological level;political literacy

## 1. INTRODUCTION

Ideological and political instruction in higher education institutions has recently been faced with the problem of transformation and upgradation due to the rapid development and deployment of big data technologies. Big data as a new information technology has sparked in-depth analysis and investigation of ideological and political teaching in colleges and institutions [1]. In this paper, we will examine how to utilize big data to improve political and ideological education in educational institutions, starting from the standpoint of maximizing the application route of big data in the political and ideological educational environment of educational institutions [2].

Big data may be used to enhance the ideological and political education provided at colleges and universities [3]. An accurate student image may be created by examining a significant number of students' course selections, academic performance, social network usage, and other data in order to offer a foundation and point of reference for the ideological and political education that is taught at colleges and universities [4]. Personalized matching and resource recommendations may be made using artificial intelligence technology and algorithms, which can increase the efficacy and enjoyment of education [5]. Big data may also improve how ideologies and politics are taught at universities and colleges. Traditional classroom-based ideological and political teaching techniques sometimes lack adequate engagement and interactivity [6]. By using big data technology, virtual social network platforms and online learning resource libraries can be established to achieve interactive communication, academic cooperation and resource sharing between students and teachers[7]. This can successfully increase the available instructional space, enhance the educational strategy, and boost students' motivation and learning effectiveness [8].

## **2. THE CURRENT STATE OF THE IDEOLOGICAL AND POLITICAL EDUCATION ENVIRONMENT IN HIGHER EDUCATION**

### **2.1 NETWORK ENVIRONMENT**

The Internet has been an increasingly significant part of college students' everyday life since the dawn of the digital era. College students' lives have become much more convenient thanks to the Internet, but the ideological and political climate of education in institutions has also faced significant problems. Firstly, the convenience of the Internet makes it possible for people to learn about the world's affairs without leaving home, and university students can learn about the latest news and current affairs through the Internet, treating interpersonal relationships coldly and seldom communicating with others. Secondly, being influenced by a variety of online information, views, and ideals, the not yet sound value system of university students has been destroyed, and different values affect the shaping of young students' literacy. In particular, some foreign forces, taking advantage of the enthusiasm, vitality and trustworthiness of university students, have been feeding them with wrong values and even establishing contact with them through the Internet, falsely claiming to be "making friends" but in fact stealing national information. Thirdly, the universities have not yet taken mandatory measures to manage the complex network environment. Although some network supervision organisations have been established to supervise the network environment, the network supervision work in universities has not yet reached an ideal level. On the one hand, the network supervisors in universities lack professional theoretical knowledge and on the other hand, they lack technology and are unable to filter the information on the network, it results in a subpar climate for ideological and

political teaching in colleges. Fourth, in addition to having an impact on the atmosphere of political and ideological discourse in colleges and institutions, the Internet also unknowingly erodes students' ideological system and disintegrates their positive attitude towards life, making students addicted to the Internet and unable to extricate themselves, and eventually eliminated by the times.

## **2.2 CULTURE BUILDING**

In order to improve the climate for ideological and political education, many colleges fly the flag of encouraging cultural construction and engage in a variety of cultural construction on campus. However, very few colleges have really put cultural building into practice. Some colleges forget to foster a cultural atmosphere and conduct ideological and political teaching through a variety of media in order to reap the economic rewards from the cultural creation. The following factors are also indicative of the issue of single culture construction in colleges and universities.

Firstly, the funds distributed by the university in the construction of clubs are limited, and some clubs are unable to carry out diversified, modern and interesting cultural activities due to the financial problems, which leads to the lack of a strong cultural atmosphere in the university.

Secondly, the operation of student organisations is not scientific enough. The student organisations in the school are mainly managed by the students themselves, who lack experience in management and operation, resulting in the student organisations not contributing much to ideological and political education.

Thirdly, cultural activities in the school are organised in a single form. Apart from sports events, singing competitions and cultural activities based on traditional festivals, there are no other types of cultural activities, and students are not very active in participating in cultural activities. The adoption of a single kind of cultural activities over an extended period of time causes students to become quickly fatigued and unable of acting as cultural builders for ideological and political education, which is detrimental to the development of students' ideological and political literacy.

Fourthly, students have no way to express their good ideas about the cultural construction of the school, and the cultural activities in the school lack the vitality, dynamism and creativity of the new generation, resulting in a negative cultural setting for the campus's atmosphere for political and ideological education.

## **2.3 MANAGEMENT SYSTEM**

The school's management system represents the opinions and preferences of the administration, but it does not take into consideration the views of the pupils or the desires of the instructors. As a result, the management system lacks scientific rigor and

provides little support for the work of ideological and political education, and students are not particularly aware of the ideological and political education they are getting.

### **3. ANALYSIS OF THE PATH OF IDEOLOGICAL AND POLITICAL EDUCATION WORK IN HIGHER EDUCATION**

#### **3.1 CONTENT OF CIVIC EDUCATION IN HIGHER EDUCATION**

The adage "content is king" has gained prominence in the age of big data, and the integration of the media has greatly increased the usefulness and efficacy of the content. The big data platform gathers a variety of high-quality resources related to academics, social life, and recreational activities for university students. Big data technology enhances ideological and political education resources at universities while giving theoretical knowledge its due. With the advent of the network era, the speed with which information is shared, the depth of resources available, and the ease with which resources can be combined have all greatly enriched the content of ideological and political education, extending the field of students' access to knowledge, offering a larger learning environment, enhancing university ideological and political instruction, and broadening the scope of educational coverage. The groundwork for additional intellectual and political education efforts is laid forth.

#### **3.2 OPTIMIZATION OF THE PATH OF USING BIG DATA IN THE IDEOLOGICAL AND POLITICAL EDUCATION OF COLLEGE STUDENTS**

In Figure 1, the statistical findings based on the significance of Big Data in Civic Education are displayed. It is evident that practically everyone uses big data technology for educational purposes and application, with just 2.4% of students believing that they barely utilize big data technology. A thorough and comprehensive analysis of the responses from those who claim not to use big data technology revealed that this group is skeptical of its use, believes that political and ideological education may be rendered ineffective by the data development process moving too quickly, and that some members of the group did not understand the specific application of data technology. However, in general, university students and ideological educators are more open to using big data technology.

**Figure 1** Importance of Big Data in Civic Education

Figure 2 displays the statistical findings of the level of ideological and political education based on big data. Only 3% of college students believe that using big data for political and ideological instruction of college students is useless. This is primarily because they use big data technology less frequently than other students and prefer traditional ideological and political methods of instruction in their studies. They also believe that face-to-face communication is the most effective form of communication, especially the group who believe it is very useful. As a result, the marriage of big data technology, ideological and political education, and is a real embodiment of inner ambitions.

**Figure 2** The extent to which big data is needed for Civic Education

#### 4. CONCLUSION

Big data technology is currently being used to educate university students about ideologies and politics. It is crucial to have a firm understanding of the relevance of big data and the correlation between personal data, but even more crucial is to rely on traditional education's experience with macro-level decision-making, use the effectiveness of current ideological and political education as a guide, and continuously use big data technology to improve the organization of the educational system. Throughout the process, a human-centred education objective is established, the basic rights and wishes and needs of students are fully respected, and a friendly and open environment of fair competition and collaborative progress is created for students. By relying on data resources and online education platforms, we can enhance the political literacy and leadership skills of Civic Education staff, as well as strengthen students' ideological awareness, enabling them to transition from practical and interactive learning to active learning, and truly realise learning for its own sake and application.

## **ABSTRACT**

In the era of rapid changes, molecular biology has penetrated into all fields of life science and gradually become an important tool in biology, agronomy, forestry, herbology, animal husbandry and other fields. This paper analyzes the characteristics and shortcomings of contemporary experimental teaching in molecular biology courses based on big data, and proposes follow-up experimental teaching systemic projects from the perspectives of teaching effectiveness and teaching mode. The flipped classroom teaching chapters of the course construction in the context of big data take up 12 marks in the examination paper for PCR technology, 6 marks for gene therapy and 12 marks for genetic engineering respectively. In this paper, through the innovation of the experimental teaching mode of molecular biology in colleges and universities in the context of big data, it not only improves students' performance, but also helps to build the cultivation of independent learning ability.

## **KEYWORDS**

molecular biology; classroom knowledge; interest in learning; enhanced analysis; collaborative skills

## **1. INTRODUCTION**

Molecular biology is a very practical subject. Compared with the experiments of other disciplines, molecular biology experiments are complex and finely technical, and are a typical course combining theory and practice and requiring students to feel and understand the process of knowledge generation and development in experiments, and to cultivate students' ability of independent thinking and innovation[1-2]. For a long time, the content of molecular biology experimental teaching is biased towards verification experiments comprehensive, design experiments less [3]. Teachers write the designed content and steps to students, students can only operate and verify the whole experiment according to the teacher's way of thinking is too programmatic [4]. Teachers' requirements for experimental teaching are also limited to the completion of experimental data and experimental reports. This kind of experiments, which are conducted strictly according to this book and box, restrict students' behavior and limit their thinking development, which hinders students' understanding of the nature of things and stifles their creativity [5]. In order to achieve the three functions of verification, synthesis and exploration of the molecular biology experimental teaching system [6]. to meet the needs of higher education reform and development, the author has taken the experimental teaching content, experimental teaching methods and evaluation system [7-8].

## **2. EXPERIMENTAL TEACHING MODE OF MOLECULAR BIOLOGY IN HIGHER EDUCATION**

### **2.1 CONTENT OF LABORATORY TEACHING IN HIGHER EDUCATION**

The supplies for molecular biology experiments are relatively expensive, and the equipment is expensive, resulting in insufficient sets for students. Students usually work in groups of four to six to do an experiment together, so it is not possible to guarantee that every student can do the experiment, which naturally results in some students who are often hands-on doing the experiment, while some students are unable to intervene and are in the miscellaneous or spectator phenomenon. This phenomenon eventually leads to some students having relatively strong hands-on skills, while others are not able to participate in the experimental process because they are not exercised. The lack of laboratory practice can easily lead to a vicious circle of "lack of interest in laboratory classes → lack of understanding of course theory → lack of motivation to learn → classes become metaphysical". The content of molecular biology laboratory courses is relatively old, and the experimental consumables for cutting-edge and advanced experimental techniques are more expensive, usually more than 10 times or even 100 times the cost of conventional molecular experimental consumables; and these advanced experimental techniques also require the laboratory teachers to spend a lot of time on serious study and pre-laboratory operations, while the workload of the laboratory teachers is only the class fee of the experiments, which cannot reflect the actual workload. For these reasons, in order to make students' experimental skills achieve better experimental effects, the experimental contents are still chosen as conventional, such as DNA extraction, PCR amplification of conserved genes and electrophoresis and other routine basic experiments, but rarely involve advanced experimental techniques, which naturally cannot meet the pace of rapid development of molecular biology. Some universities have established virtual simulation laboratories for molecular biology, which can solve the problems of timely updating of content and workload of teachers in laboratory courses.

### **2.2 CURRENT STATUS OF LABORATORY TEACHING IN HIGHER EDUCATION**

Under the advocacy of reducing the burden of university students, the total number of hours of university students has been significantly reduced, and there is no time to integrate some related experiments or some experiments cannot be integrated due to the long duration of the experiments, resulting in most of the experiments being isolated from each other and not coherent. It is also difficult to concentrate on a continuous schedule of experimental classes, as students have a fixed schedule of theory classes and a relatively fixed schedule of experimental classes, which makes it impossible to carry out coherent experiments. Under these conditions, experiments that could

normally be completed in one week are divided into more than four weeks. The intermittent duration of the experiments not only makes students' memory of the principles, content and steps of the experiments blurred, or even confused with other experiments or knowledge, but also makes the intermediate products of molecular biology experiments, such as DNA and RNA, susceptible to degradation or contamination, leading to unreliable results or experimental failure. The reduction of class time and the scattering of time for the course experiments also lead to a significant decrease in students' participation in the preparation of the experimental teaching process, the commissioning of the experimental apparatus, etc., or even the absence of it. Naturally, students only do part of the experiments, most of which are completed under the instructions of the teacher, it is difficult to form a complete and clear understanding of the experiment, and it is difficult to mobilise students' subjective initiative, which is not conducive to the combination of theory and practice.

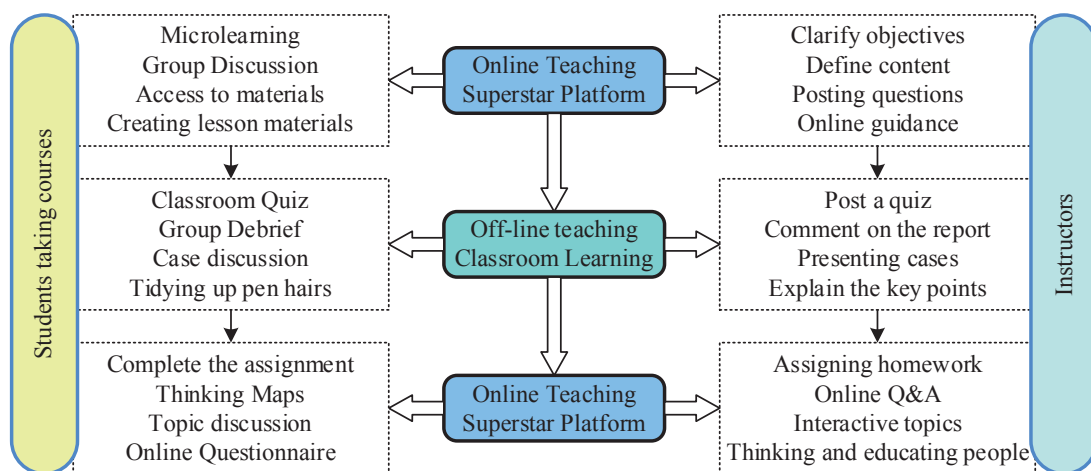

### **3. ANALYSIS OF BIOLOGY LABORATORY TEACHING UNDER THE BIG DATA MODEL**

#### **3.1 TEACHING METHODS AND PROCESSES FOR THE CONTROL GROUP**

The control group implemented traditional teaching, with the teacher's lecture as the main focus. The teacher introduced the course content through introductory questions, then taught the knowledge points according to the syllabus and lesson plan, combined with the course cases in the course of teaching construction of molecular biology, and finally summarized the important and difficult points and answered questions. Students mainly receive and memorise knowledge in class, and complete microlearning and assignments on the Super Star platform in class.

#### **3.2 EXPERIMENTAL GROUP TEACHING METHODS AND PROCESSES**

The experimental group implemented flipped classroom teaching in molecular biology. The teacher posted guided learning questions on the Chaoxing platform before the class. Students logged into the Chaoxing platform to study the micro-lessons and other resources on their own. 5-6 students worked in small groups to discuss the questions and prepare slides for the class report. During the lesson, the teacher first issues a quiz to find out how well the students have mastered the knowledge, and then the group reports on the guided learning questions. Finally, the teacher summarises the key points and answers questions. After the lesson, the teacher posts the assignment on the Chaoxing platform and interacts with students to answer questions as shown in Figure 1.

**Figure 1** Flipped classroom teaching process

### 3.2.1 TEACHING EFFECTIVENESS

Includes questionnaire and final exam evaluation. A self-administered questionnaire was used to understand students' satisfaction with the flipped classroom model and the effectiveness of teaching in the context of big data. The "Self-directed Learning Ability Scale for College Students" was used to evaluate the improvement of students' self-directed learning ability as reported in the literature. The final exam was administered by a medical school through a web-based question bank and was completed by machine testing. The questions included A1, A2 and X-type multiple-choice questions, of which the implementation of the classroom chapter of molecular biology was worth 12 points for PCR technology, 6 points for gene therapy and 12 points for genetic engineering.

### 3.2.2 TEACHING MODE

The results of the questionnaire survey showed that the experimental group was significantly more satisfied with the teaching mode than the control group  $p < 0.05$  as shown in Table 1. Most of the students in the experimental group believed that the flipped classroom teaching mode was conducive to the mastery of classroom knowledge and stimulated interest in course learning, enhanced analytical and problem-solving skills, improved teamwork skills and enhanced classroom participation.

**Table 1** Students' evaluation of teaching mode in both groups

Grouping	Good for knowledge acquisition	Stimulate the interest of learning	Enhanced problem-solving skills	Improved teamwork skills	Increased classroom participation
Control group	115(56.9)	119(58.9)	101(50.0)	83(41.1)	105(52.0)
Experimental group	165(83.8)	165(83.8)	146(74.1)	160(81.2)	174(88.3)

#### 4. CONCLUSION

Innovation in the context of big data is the soul of a nation's progress and the inexhaustible power of a country's prosperity. Molecular biology is a very important and fundamental subject in the field of life sciences, and laboratory teaching occupies a very important position. Therefore, it is necessary to carry out a series of reforms to the experiments of molecular biology courses. The teaching process is based on the use of online and offline platforms to achieve a high degree of integration between information technology and education teaching, which improves teaching efficiency and truly realises the "student-centred" teaching concept. Through the innovation of the experimental teaching mode of molecular biology in the background of big data, we have implemented the concept of all-round education for all staff and improved the independent learning ability of university students, which has achieved a good practical effect.

## ABSTRACT

The luxury goods supply chain system is integrated through information technology and management methods to realise the whole process of monitoring and management from suppliers to consumers and improve the efficiency and quality of the supply chain. The cross-border e-commerce platform supply chain fast-ripening response system uses information systems to establish a complete project material management system to meet the centralised management of materials and achieve reasonable deployment and use. Only 40%-50% of the goods launched by luxury brands each season are consumed in the current season, and the remaining 50%-60% are mostly sold in the form of tail-end goods through discount shops, duty-free shops and factory shops. By establishing such a fast-maturing supply chain response system, this paper improves the supply efficiency and commodity quality of luxury suppliers, and also provides strong support for the development of luxury supply chains on cross-border e-commerce platforms.

## KEYWORDS

supply chain systems; cross-border e-commerce; luxury goods; information systems

## 1. INTRODUCTION

The current luxury goods supply chain is a complex system [1-2]. It includes a number of links from raw material procurement, production, warehousing, logistics and sales [3-4]. As consumer demand changes, the luxury goods supply chain is constantly adapting [5]. The luxury goods supply chain faces challenges and opportunities in terms

of technology, management and social responsibility [6]. With the accelerated globalisation and growing consumer demand for luxury goods, cross-border e-commerce platforms have become one of the important channels in the luxury goods supply chain [7-8].

By establishing such a fast-ripening response supply chain management system, this paper can improve the supply efficiency and product quality of luxury goods suppliers and enhance consumers' purchasing experience, as well as reduce the risks and costs in the supply chain management process, providing a strong support for a fast-ripening response system for luxury goods supply chain.

## **2. CURRENT DEVELOPMENTS IN THE LUXURY MARKET**

According to the Luxury Goods Association's China Luxury Report, consumers spent \$955 billion on high-end consumer goods worldwide in 2014, accounting for 21.9% of the global high-end consumer goods market, and more than 46% of the global market for personal consumption products. Consumers have become the undisputed buyers of the global high-end consumer goods market. In terms of consumption channels, in 2014, the proportion of Chinese consumers spending through domestic shops, proxy purchases and outbound purchases remained at around 30%, 15% and 55% respectively, with outbound purchases remaining the main channel for high-end consumer goods sales.

### **2.1. LUXURY SUPPLY CHAIN STUDY**

Many scholars have put forward their views and opinions on supply chain management, and many theories have been combined with actual cases of enterprises. However, most of the enterprises they have chosen are manufacturing enterprises with domestic production, assembly and warehousing as the mainstay, and the research issues are mostly about how to improve the production efficiency of enterprises through supply chain management. There are few studies on the supply chain management of multinational conglomerates involving two or more companies with the same or different departments, and even fewer studies on the optimisation and implementation of supply chain strategies for the whole supply chain at home and abroad, as proposed by the person in charge of the domestic company, and almost none in the field of fashion and luxury goods.

### **2.2. THE STATE OF THE LUXURY SUPPLY CHAIN**

The luxury goods supply chain is a complex system, which includes multiple links from raw material procurement, production, warehousing, logistics and sales. The luxury goods market is currently brand-driven with a high degree of brand concentration. Some large luxury groups own multiple brands and control the supply chain through

vertical integration to ensure product quality and scarcity. The production chain is diverse and includes hand-made, semi-mechanised and fully automated production. The different levels of technology and craftsmanship in each segment place greater demands on supply chain management. Supply chain transparency is low, with some brands not disclosing information about their supply chains. This poses a buying risk to consumers and makes supply chain management more challenging.

## 2.3. THE MAIN MODES OF ONLINE TRADING OF LUXURY GOODS IN CHINA

### 2.3.1 CROSS-BORDER SURROGACY MODEL

The so-called luxury goods cross-border agency is a luxury goods buyer who buys specified styles of luxury goods for domestic customers through his or her own channels. The main form is that the buyer relies on large online shopping platforms or social networking platforms to operate his or her own online shop, publish agency information, negotiate agency orders and fulfill agency transactions as shown in Figure 1. In recent years, the advantages of domestic luxury shops have been gradually weakened by the surging reversal of the cross-border buying boom. According to the report of China Electronic Commerce Research Centre, since 2014, the scale of luxury goods cross-border agency shopping has exceeded 100 billion, and has been growing year by year, and the sales have been forced to the traditional mainstream sales channels.

There are three main reasons for this phenomenon: Firstly, the price difference between luxury goods at home and abroad is huge, and cross-border agency shopping has obvious advantages over domestic counters in terms of price. Secondly, online shopping has broken the barriers to consumers' consumption abroad, allowing buyers to buy all the styles of major brands without leaving the country, and avoiding the risks that consumers may encounter in the process of cross-border shopping in terms of language communication, international settlement, security of funds and customs clearance; thirdly, cross-border buyers can purchase specified goods for buyers, and will provide services to meet the differentiated needs of buyers, with a high degree of Personalisation and flexibility.

**Figure 1** sketch of online trading of luxury goods

## **2.4. CROSS-BORDER E-COMMERCE PLATFORMS FOR LUXURY GOODS DEVELOPMENT**

Compared with foreign countries, the luxury goods consumers in China are young and, compared with traditional luxury goods consumers, Chinese luxury goods consumers pay more attention to the convenience and speed of the shopping process. It is evident that Chinese luxury consumption has a lot to do with the development of the internet. As early as six years ago, Chinese e-commerce companies started to explore in the luxury sector, with Go.com, Vipshop and Shangpin.com receiving a lot of investment support one after another. From the brands' point of view, foreign luxury brands that wanted to open a large number of physical shops in the Chinese market had to face huge operating costs brought about by high shop rents.

When the physical shops develop into relatively underdeveloped cities in China, it is difficult to guarantee the same service quality of the same brand physical shops in different areas due to the differences in infrastructure and people's consumption level and consumption psychology. The luxury purchase process and after-sales service is an integral part of luxury consumption, yet most luxury brand physical shops do not recognise goods purchased through online channels, and most brand shops do not have after-sales inspection services, which seriously undermines consumers' trust in online luxury purchases.

## **3. CROSS-BORDER E-COMMERCE PLATFORM MODEL**

A luxury cross-border e-commerce platform is an e-commerce platform that sells goods mainly or exclusively in luxury goods, and is also known as a luxury online shopping platform or luxury shopping website. These platforms generally have independent online domain names and provide one-stop services such as sourcing, consulting, warehousing, logistics and delivery, and are also known as self-operated luxury shopping websites. Sales data shows that only 40%-50% of the goods launched by luxury brands each season are consumed in the current season, while the remaining 50%-60% are mostly sold in the form of tailor-made goods through discount shops, duty-free shops and factory shops. Most of the luxury shopping websites cooperate with foreign tailor companies or buyer-type purchasing companies to make purchases, so that luxury goods sales are connected with domestic e-commerce, and most of the goods sold on the websites are not new in season but attract many consumers with their high cost performance. Due to the relatively special business scope and the relatively niche audience, luxury cross-border e-commerce platforms are significantly different from ordinary e-commerce platforms, as shown in Table 1.

**Table 1** Comparison of luxury and general merchandise e-commerce platforms

	Luxury e-commerce platform	General merchandise e-commerce platform
Product Price	Basically, they are above 2000 RMB	Most within 2000 RMB

We do not pursue luxury and design. Pictures focus on the presentation of the product itself. Copywriting to introduce the detailed parameters of the product. Strive for Intuitive and comprehensive

### **3.1. CROSS-BORDER E-COMMERCE PLATFORM SUPPLY CHAIN FAST-RIPENING RESPONSE SYSTEM**

The cross-border e-commerce platform supply chain fast-ripening response system takes engineering projects as the service object, material plans as the management object and procurement contracts as the tracking object, integrating business functions such as demand plan management, procurement management, inventory management, supply quality management and supplier management, forming a management system covering the whole process of project material supply. Convenient access to various business documents and reports, providing information support for the preparation of procurement plans.

### **3.2. CROSS-BORDER E-COMMERCE PLATFORM SUPPLY CHAIN FAST MATURITY SERVICE**

Cross-border e-commerce platform supply chain fast-ripening service is the use of information management system, the international trade guarantee, logistics

technology solutions for the whole process of data statistics and management of the integrated use of the system, through the system can control and track the entire process of supply. The system combines the transmission and processing of business information very well, and the employees of the enterprise can directly complete the business processing through simple operations, and the enterprise control department and leaders make decisions based on the system query statistical information. The information service system can optimise international trade business processes, improve the overall level of risk control of international logistics technology, improve efficiency, enhance the management level of enterprises, help enterprises to use resources more effectively, reduce costs and enhance core competitiveness.

#### **4. CONCLUSION**

The fast-ripening response system for luxury goods supply chain of cross-border e-commerce platform will undoubtedly become the development needs of the world, especially in the current global environment, the global supply chain system is facing unprecedented challenges, the application of integrated technology development, big data exchange, information security and risk control, will change the pattern of the global supply system.

## ABSTRACT

The textile supply chain is a functional network chain structure established by core enterprises through the control of information flow, logistics and capital flow from raw material procurement, product processing and production and subsequent sales links, including raw material suppliers, manufacturers and sellers as well as consumers. According to the China Cotton Association, China will consume approximately 8.1 million tonnes of raw cotton in 2020, accounting for 30% of global consumption, up 5.9% year-on-year in 2019, and imports of raw cotton amount to 3 million tonnes, up 87.5% year-on-year. Build a basic framework for the circulation system of agricultural products based on a fourth-party logistics information platform to integrate the logistics and information flow of the textile supply chain, thereby achieving the goal of reducing circulation costs and improving circulation efficiency.

## KEYWORDS

textile supply chain; material sourcing; network chain structure; circulation efficiency; fourth party logistics information platform

## 1. INTRODUCTION

The current textile supply chain has many participating members in each link, the degree of information disclosure at each node in the supply chain is low and there is a lag in information transfer, which makes textile supply chain management more complex [1-2]. With the development of the global economy and the acceleration of globalisation, textile supply chain management is facing increasingly high challenges [3]. China's textile industry is still one of the industries with a relatively high level of

pollution, and the main sources of pollutants are water pollution and soil caking caused by the use of pesticides and fertilisers in the planting process, industrial waste emissions caused by the production of cotton textiles and waste of resources caused by the sales process [4]. The textile industry is a labour-intensive manufacturing sector with a complex supply chain and covering many enterprises [5]. The original crude growth approach of pursuing economic benefits at the expense of environmental quality is being replaced at an accelerated pace, and advanced high-quality green development is putting forward new requirements for the cotton textile supply chain [6-7]. In order to improve the efficiency and effectiveness of the textile supply chain, the concept of a fourth-party logistics information platform has emerged [8].

By analysing the problems of China's textile supply chain, this paper constructs the basic framework of textile supply chain based on the fourth-party logistics information platform from the perspective of the fourth-party logistics information platform, integrates the logistics and information flow of textile supply chain, and realises the optimisation of textile supply chain.

## **2. TEXTILE SUPPLY CHAIN CONNOTATIONS AND TYPES**

### **2.1 INSIDE THE TEXTILE SUPPLY CHAIN**

The supply chain is a functional network chain structure established by the core enterprise through the control of information, logistics and capital flow from raw material procurement, product processing and production and subsequent sales chain, specifically including raw material suppliers, manufacturers and sellers and consumers. The textile supply chain is centred on textiles, including cotton cultivation upstream and textile sales downstream.

### **2.2 TYPES OF TEXTILES**

From the textile use point of view, can be divided into clothing and apparel textiles, decorative textiles and industrial textiles three categories, clothing textiles mainly refers to cotton clothing, gloves, socks, etc.; decorative textiles usually include indoor decorative products, home textile bedding and outdoor products, such as curtains, towels, bed sheets and covers, etc.. The main consumer demand for cotton in China is in the field of clothing textiles and home textiles, and China's population base determines that the demand for cotton remains high.

Currently commonly used fibres mainly include cotton, wool, silk, hemp four types of natural fibres, hemp fibres are complicated to process, the need to separate the fibres from liquid and gum-like substances, the more gum content, the higher the cost of its initial processing will be, the lower the possibility of bulk textile fibres, followed by poor comfort because of hemp fabrics, so hemp fabrics are mainly used in summer clothing;

the use of silk made of clothing follow-up maintenance complex The four major natural fibres account for the highest proportion of cotton fabrics in home textiles and garment fabrics, as the cost of garment processing and maintenance is high and the unit price of products is high; wool fibres are subject to greater restrictions on the use of scenarios.

According to the China Cotton Association, China's 2020 raw cotton consumption of about 8.1 million tons, accounting for 30% of the total global consumption, up 5.9% from 2019, raw cotton imports amounted to 3 million tons, up 87.5%. Cotton textiles are widely used and the total amount used is larger.

### **2.3 TEXTILE SUPPLY CHAIN PROCESSES**

Textile supply chain management is further complicated by the large number of members involved in each link of the textile supply chain, the low level of information disclosure at each node in the supply chain and the lag in information transfer. The textile supply chain can be divided into cotton growing, textile production and textile distribution. In the subsequent use phase of textiles, there are also different environmental impacts due to consumer behaviour such as washing, but this part is determined by consumption habits and is difficult to measure and track.

## **3. FOURTH-PARTY LOGISTICS INFORMATION PLATFORM CONSTRUCTION**

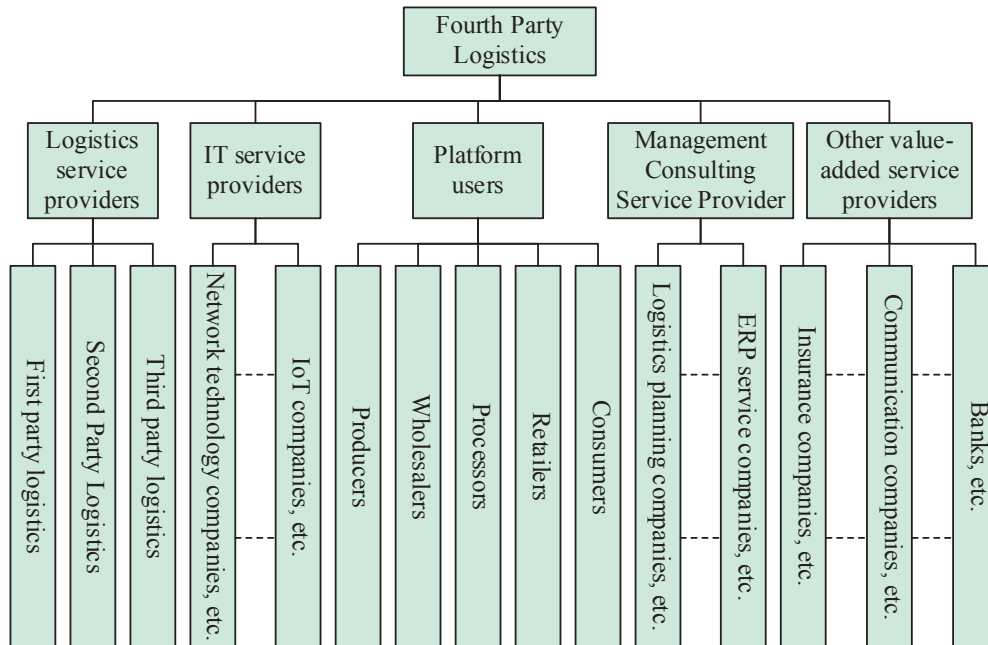

### **3.1 THE CREATION OF A FOURTH PARTY LOGISTICS INFORMATION PLATFORM**

Fourth party logistics is essentially a supply chain integrator based on a modern logistics service model, and the fourth party does not actually undertake specific logistics operational activities. Fourth party logistics is designed to improve the efficiency of material flow and help economic entities reduce costs through the effective integration of resources. After integrating all its resources and information, the provider ultimately offers a complete supply chain solution. Compared to third-party logistics, fourth-party logistics is more focused on providing supply chain optimisation solutions for economic participants in the distribution market, so it is also a very systematic information integration platform for logistics management.

### **3.2 ORGANIZATIONAL COMPONENTS OF THE FOURTH LOGISTICS INFORMATION PLATFORM FOR THE TEXTILE SUPPLY CHAIN**

Our national situation determines agricultural policy, and neither agricultural producers nor enterprises reflect the scale effect. With the development and popularity of information technology such as mobile internet, it has become possible to optimise the textile supply chain by relying on fourth-party logistics. Integrating diversified market players, information resources as well as operation methods in a system-integrated manner effectively solves the problems of small scale of operation, small market share,

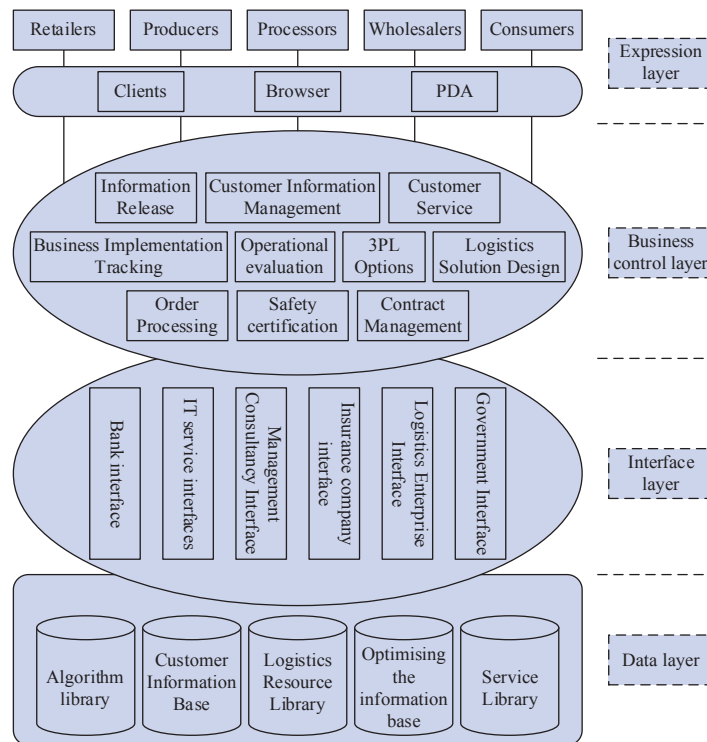

few service functions and weak competitive ability of textile supply chain entities. To break through the circulation framework dominated by third-party logistics, fourth-party logistics is undoubtedly a more efficient model and more in line with current practice. Fourth-party logistics has the advantages of information integration, resource integration and a large number of logistics subjects, which are incomparable to other circulation models. As shown in Figure 1.

**Figure 1** China's agricultural products distribution 4PL organization composition

### 3.3 A FOURTH-PARTY LOGISTICS INFORMATION PLATFORM SYSTEM FOR THE TEXTILE SUPPLY CHAIN

Based on the logistics and information flow of agricultural products circulation, the supply chain resources are integrated together to build the structure of agricultural products 4PL information platform, and the functions are divided into four levels: performance layer, business control layer, interface layer and data layer, as shown in Figure 2.

**Figure 2** Agricultural Product Distribution 4PL Information Platform

#### 4. CONCLUSION

With rapid economic development, more attention has been paid to the negative issues brought about by economic development, such as environmental pollution and waste of resources. With the progress of society and the development of economy, the traditional textile supply chain system is no longer adapted to the needs of textile supply chain. The textile supply chain system based on the fourth-party logistics information platform constructed in this paper will become the development trend of the textile supply chain. Under the background of China's agricultural supply structure reform, this agricultural products circulation system will definitely be improved and eventually realise the optimisation of the agricultural products supply chain. Managing the supply chain by building a fourth-party logistics information platform will become a new competitive advantage for enterprises, which is also the key to achieving sustainable development of the textile supply chain.

# A SIMULATION STUDY ON MODELLING THE OPTIMISATION OF MENTAL HEALTH QUALITIES OF UNIVERSITY STUDENTS

---

**Qing He\***

Sanya Aviation and Tourism College, Sanya, Hainan, 572000, China

[hqlj13579@126.com](mailto:hqlj13579@126.com)

**Jun Liang**

Sanya Aviation and Tourism College, Sanya, Hainan, 572000, China

---

## **ABSTRACT**

At present, there is a lack of effective guidance mechanisms, and the improvement of university students' psychological quality cannot be achieved without external guidance mechanisms that stimulate psychological health, especially higher education is the main stage that shoulders this responsibility. A fuzzy clustering-based optimization of college students' mental health quality is proposed, fused with the theoretical idea of fuzzy clustering to analyze the characteristics of the interrelationship between college students' rebelliousness and behavioral hindrances. The  $\Delta CFI$  and  $\Delta TLI$  of the weak equivalence test were equal to 0.001 and 0.003 respectively, both of which were less than the critical index of 0.01. This paper shows that the proposed model provides a strong basis for enhancing the mental health of university students by examining the simulation results of optimising the quality of mental health of university students.

## **KEYWORDS**

university students; mental health; modelling methods; fuzzy clustering; interrelationships

## **1. INTRODUCTION**

The university stage is an important stage in the formation of one's personality [1]. It is an important period for the formation and development of self-awareness, as well as a critical period for mental health education and psychological quality enhancement [2-3]. General Secretary Xi Jinping stressed the importance of mental health services and psychological counselling at the National Conference on Health and Wellness [4-5].

The General Secretary's far-sighted and incisive analysis has pointed out the direction for our work in colleges and universities and the improvement of the psychological quality of college students [6]. We must raise our political standing and make every effort to do a good job of improving the psychological quality of college students for the height of educating people for our country [7]. With the continuous and rapid development of China's economy, mental health has attracted unprecedented attention from the whole society. In the face of the new requirements and challenges of mental health education in the new era, we need to innovate and develop new paths that are more contemporary, practical and operable. to improve the quality of mental health of college students and cultivate young college students who meet the requirements of the new era[8].

## **2. MENTAL HEALTH QUALITIES OF UNIVERSITY STUDENTS**

### **2.1 THE IMPACT OF THE QUALITY OF MENTAL HEALTH OF UNIVERSITY STUDENTS**

University students should have ambitious aspirations and ambitions, which are the main internal motivation for young people to improve their mental health. "During the Three Kingdoms period, Zhuge Liang taught his sons and nephews to have "high aspirations". High aspirations can make young people carry dreams and ideals to fly upwards into the blue sky. On the basis of the completion of the reflection of the basic condition of the psychological quality of college students nationwide, we will further examine the functional role of the psychological quality of college students. As mentioned earlier, a large number of empirical studies have shown that the psychological quality of young people significantly predicts their psychological health, social adjustment and academic development. Therefore, we will also examine the functional role of psychological quality among university students in terms of multiple indicators of psychological health, social adjustment and academic development, and explore how psychological quality influences these indicators as shown in Figure 1.

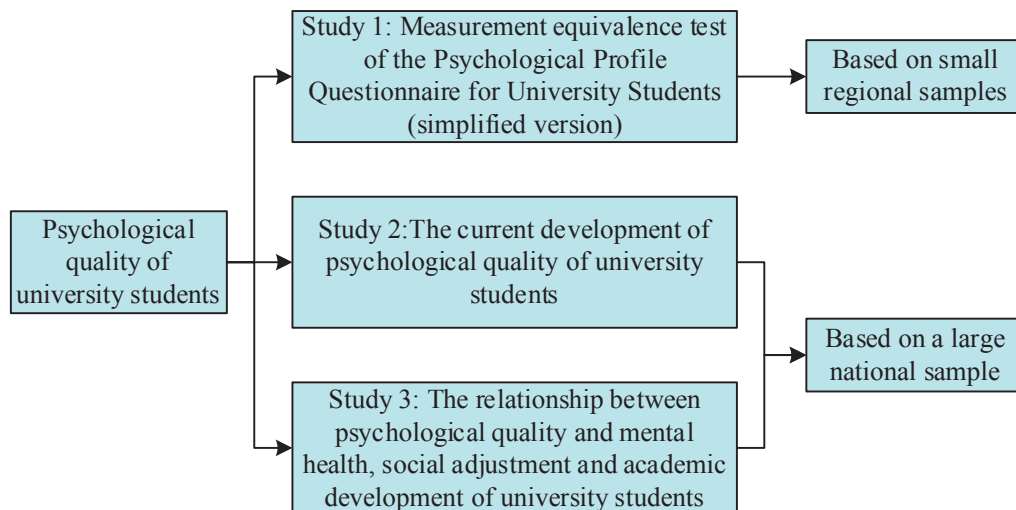

Figure 1 Pathway diagram of college students' psychological quality research

## 2.2 PERCEPTION OF MENTAL HEALTH QUALITIES

As the old saying goes, "There is a sequence of knowledge, and there is a specialisation in each profession", and any great achievement and learning must be based on the accumulation of knowledge over time. Although the ultimate success is influenced by various opportunities, when the accumulation of knowledge reaches a certain amount, the leap from quantitative to qualitative change will be achieved, and only then can the opportunities be favoured. This process is in fact the process of improving the psychological quality of every successful person, and there is no other way. The country and society need a large number of outstanding talents in various fields, without the accumulation and precipitation of a large amount of knowledge, it will not be possible to analyse and compare complex phenomena and research innovations. The lack of an effective guidance mechanism, the improvement of the psychological quality of university students is inseparable from the external guidance mechanism to stimulate mental health, especially higher education is the main stage to shoulder this responsibility. At present, there are certain gaps in this regard, no matter from the scientific system of all-round, all-field and all-factor, or from the main channel, synergy and responsibility.

## 2.3 DEVELOPMENT OF MENTAL HEALTH QUALITIES

The development of mental health qualities is a process of socialisation. In a certain social environment, university students develop both physically and psychologically, form a personality adapted to society and acquire socially acceptable ways of behaving. The psychological development of university students, in particular, emphasises the role of the social environment. Childhood and adolescence, which are periods of rapid physiological development, are also key periods in the psychological development of the individual, during which the solution of a series of problems in the growth of the

individual becomes necessary and important. All achievements in life are the result of struggle, and outstanding talents are the best of the best who have gone through many trials and tribulations, are indefatigable, have their feet on the ground and are constantly striving. Cherish the youthfulness, work on the ground, put ambitious ideals into small, detailed and practical actions, let diligent learning become the driving force of youthful flight, let the growth of skills become the energy of youthful combat!.

### **3. A SCHEMATIC MODEL OF A PSYCHOLOGICAL INFORMATION SYSTEM FOR UNIVERSITY STUDENTS**

In the process of forming the principle model of the psychological information system of university students, the psychological and physiological outstanding performance characteristics produced by university students are first obtained, and the objective factors of the external environment and the subjective factors of the university students' own psychological production are analysed through this characteristic to form the principle model of the psychological information system of university students. When using the principle model of the psychological information system of university students to optimise the modelling of mental health quality, the relationship between the psychological phenomenon performance characteristics of university students and the hindering effect of psychology on behaviour should be analysed in detail, but the traditional method completes the modelling by setting the attributes of different mental health quality categories based on the citation mapping table and the broad value of misclassification rate, but it is difficult to accurately extract the psychological phenomenon performance characteristics of university students, and there is a modelling error. The problem of large modelling error. A method based on fuzzy clustering is proposed to optimize the modelling of mental health quality of university students.

#### **3.1 MENTAL HEALTH QUALITY OPTIMIZATION MODELING SIMULATION MEASUREMENT EQUIVALENCE TEST**

The factor loadings were set to equivalence, i.e. the same indicator loaded consistently across gender and disciplinary categories. The  $\Delta CFI$  and  $\Delta TLI$  for the cross-gender weak equivalence test were equal to 0.001 and 0.004, respectively.  $\Delta CFI$  and  $\Delta TLI$  for the cross-disciplinary category weak equivalence test were equal to 0.001 and 0.003, respectively. both were less than the critical indicator of 0.01. This indicates that there are no significant differences in the loadings of the same indicator across gender and across disciplinary categories. The results of the single-group validation factor analysis for the gender and subject category groups of students showed that the two-factor structural model of the Student Psychological Profile Questionnaire showed good fit indicators for the total sample as well as for the male and female student

samples. The results of the analysis at the subject category level showed that the humanities and social sciences samples also fit well with the total sample.

### **3.2 A SIMULATION STUDY BASED ON OPTIMAL MODELLING OF MENTAL HEALTH QUALITY OF UNIVERSITY STUDENTS**

In the process of modelling the role of college students' rebelliousness on behavioural hindrance, fused in a kind of fuzzy theory of college students' mental health constraints based on granularity transformation from subjective and objective reasons, to get the nature of college students' psychology, quality optimization modelling method. Based on the introduction of the characteristic tendency to give the different stages of college students' rebellious psychology, to get the college students' rebellious psychology of each of the college students' mental health quality optimization modeling method. The corresponding information entropy of the behavioral hindrances produced by each stage is calculated, and the optimal modeling method for the quality of college students' mental health of college students who produce rebelliousness in nuclear clustering is calculated, and the behavioral tendency threshold of these traditional parties of rebelliousness.

## **4. CONCLUSION**

The average amount of information generated by each stage of rebelliousness of college students, the subjective reasons for the formation of rebelliousness of college students, and the broad value of the behavioral tendency of college students to generate rebelliousness were calculated. The theoretical idea of fuzzy clustering is integrated to analyze the characteristics of the interrelationship between rebelliousness and behavioural hindrances among university students, and the results are used to form a model of the effect of rebelliousness on behavioural hindrances among university students, and the ant theory is used to solve the model of the problem. Using the results of the calculations, the university students' mental health quality optimization model was developed. The results of the study show that the study has a great advantage in terms of modeling efficiency stability and time complexity for the improvement of college students' mental health.

Laboratory and Equipment Division, China University of Geosciences, Beijing,  
100083, China

[miaoyang@cugb.edu.cn](mailto:miaoyang@cugb.edu.cn)

---

## ABSTRACT

The root cause of the inefficient use of large instruments and equipment in universities is mainly due to the lack of a comprehensive, systematic and complete instrument and equipment management system. The centralized and intensive management of large instruments and equipment in universities in the Internet era promotes their open sharing and efficient use, as well as better cultivation of students' hands-on skills. Looking at the funds for the acquisition and maintenance of instruments in province H, the funds for the acquisition of instruments in universities under the ministry were RMB 900,228,200, accounting for 53% of the total funds for the acquisition of instruments in universities in the province, and the survey data showed that the funds for the acquisition of instruments in universities under the ministry were huge. By studying the construction and application of the network sharing platform in the Internet era, the efficiency of the use of large instruments and the innovation of the management mode in universities has been effectively improved.

## KEYWORDS

manual skills; centralised and intensive management; efficient use; web-based sharing platform

## 1. INTRODUCTION

Strengthen the scientific use and management of large instruments in colleges and universities to improve their use efficiency and use effectiveness [1-2]. Make large instruments play a greater role in teaching and research in colleges and universities [3]. This is an important symbol of the management of large instruments in colleges and universities, and also a basic condition for continuously improving teaching and

scientific research [4-5]. With the development of China's higher education and the change of college asset management mode, the use and management of large instruments in colleges and universities need to be put on a scientific, institutionalized and standardized track [6]. On the basis of the milestones already achieved in the management of large instruments, we analyze and summarize the problems that still exist in the management now, and put forward scientific countermeasures and suggestions with timeliness in the Internet era [7-8].

In this paper, through the construction and application of the network sharing platform in the Internet era, the efficiency of the use of large instruments and the innovation of the management mode in universities are effectively improved, so that universities can better use large instruments to accomplish the mission of talent training, scientific research and social services.

## **2. REASONS FOR INEFFICIENT USE OF INSTRUMENTS AND EQUIPMENT IN HIGHER EDUCATION**

### **2.1 LACK OF A COMPREHENSIVE, SYSTEMATIC AND COMPLETE INSTRUMENT AND EQUIPMENT MANAGEMENT SYSTEM**

The management of instruments and equipment in higher education includes long-term planning, annual planning, scientific proof, reasonable procurement, careful acceptance, installation and commissioning, technical training, use performance, maintenance status file management and responsibility for use and other aspects. However, in practice, there is almost no long-term planning system for the management of instruments and equipment, annual plans are big and general, and scientific proofs are formalistic. The systems for rational procurement, careful acceptance, installation and commissioning are fairly well developed. The lack of a technical training system, the state of maintenance and file management are not given enough attention, and the use of performance is not only lacking in institutional safeguards, but also uncared for. Likewise, the lack of accountability for the use of instruments and equipment has led to dangers in terms of safety.

#### **2.1.1 LOW LEVEL OF OPEN SHARING**

The lack of the concept of sharing, free use or use is not linked to the income of the reporting department and individuals, resulting in the idea of "don't want it for nothing, want it for nothing" is quite common, and the phenomenon of competing for funds, occupying the equipment, making it convenient and light on performance is very serious, resulting in the exclusive use of units and individuals, and the difficulty of borrowing from each other between departments, and it has been difficult to substantially improve the utilization rate of instruments and equipment.

## 2.1.2 INSUFFICIENT OPENNESS AND SHARING WITH THE OUTSIDE WORLD

The open sharing of university instruments and equipment includes not only the interoperability between universities, but also the open sharing between universities and various enterprises and institutions in society. This kind of open sharing is not only theoretically feasible, but is actually being carried out. For example, a similar university has proposed to use the instruments and equipment of the author's school for a fee. The data after the survey shows that the annual average opening of large instruments and equipment in universities nationwide is less than 1200h, while the society's demand for university instruments and equipment is very strong.

## 2.2 THE CURRENT SITUATION OF THE MANAGEMENT MODE OF LARGE INSTRUMENTS AND EQUIPMENT IN UNIVERSITIES

The stock of large instruments is large, and the large instruments of the universities in H province are mainly concentrated in the universities under the ministry, with the number of units and original values exceeding 70% of the province's total. As shown in Table 1. The number and value of instruments and equipment owned by the universities under the ministry accounted for 42.34% and 57.51% respectively, of which the proportion of the number of large instruments and the total value were 78.62% and 81.76% respectively, which were obviously higher than the proportion of all the two items of equipment. The total number of large instruments in the five universities under the ministry was 1,422 units, amounting to RMB 140,824,000. The number of large instruments in comprehensive universities and polytechnics is on the high side, followed by agriculture and forestry colleges, and there are fewer large instruments in teacher training and finance colleges, which are mainly in the liberal arts.

**Table 1** Instrument and equipment units and amount

Unit Name	Instrumentation			
	Tableware	Amount	Large-scale instruments	Amount
A University	134925	208631.12	412	46211.7
B University	136542	235422.51	465	52486.1
C University	41563	55173.7	133	22731.6
D University	77214	105623.52	227	15752.3
E University	51237	74581.3	185	3642.8
H Province	1273587	1302481.5	1863	191284.6
Percentage of	42.34%	57.51%	78.62%	81.76%

## 2.3 HIGH INVESTMENT OF FUNDS AND UNSCIENTIFIC ALLOCATION

The data show that the Ministry's universities have huge funding for instrument acquisition and significantly insufficient funding for maintenance as shown in Figure 1. In terms of the expenditure on the acquisition and maintenance of instruments in

province H, the expenditure on the acquisition of instruments in the universities under the ministry was RMB 900,228,200, accounting for 53% of the total expenditure on the acquisition of instruments in the universities in the province, and the expenditure on the maintenance of instruments was RMB 355,662,200, accounting for 50% of the maintenance expenses in the universities in the province, which seems to be reasonable. However, if we compare the acquisition and maintenance expenses horizontally, it is obvious that the ratio of the two expenses is not coordinated. According to the international practice, the budget for the purchase of instruments and equipment should be supplemented by 20% of the purchase cost of the instruments or through fund projects to ensure that the annual operating cost of about 6% of the original value of the instruments will be used for the maintenance and operation of the instruments. In seven universities in one region, the highest ratio of annual instrument maintenance to acquisition costs was 11.7% and the lowest 0%, both below the international standard of 20%.

**Figure 1** Use case for school maintenance and purchase

### 3. IMPLEMENTING PLATFORM BUILDING IN THE INTERNET ERA

Shared platforms are the basic conditions for teaching and research formed by the graded allocation and integration of high-quality large instruments, and are an important support for high-level scientific research. The construction of a shared platform is

different from the acquisition of instruments required by individual disciplines or subject groups, and has a clear public service character.

### **3.1 SHARING AND COMMON SYSTEMS**

The shared use system is to break the status quo of a closed, compartmentalised system in which the user submits a purchase application, the asset management department conducts an acquisition demonstration, and the purchased instruments are stored in the laboratory where each subject group is located and used and managed by the members of that subject group. The management model of shared use of large instruments is based on the premise of satisfying the needs of teaching and research in the university, carrying out expert verification, centralised procurement, entering the shared management system, disclosing instrument information, accepting appointments for use, implementing paid use, and finally carrying out scientific evaluation. It should be open and shared not only between the secondary schools within the university, but also to various disciplines and subject groups. It should be open and shared not only between teaching departments, but also between teaching and research. It should be open and shared not only between teachers, but also to students. It should be open and shared not only within the university, but also to similar institutions and various enterprises and institutions. It should be open and shared not only during working hours, but also during break times. The university should not only open up and share during working hours, but also during breaks. In this way, the use of instruments and equipment can be increased and the efficiency of the use of instruments and equipment can be improved.

### **3.2 . BUILDING A NETWORK PLATFORM**

Each shared instrument and equipment is in a grid point in the resource network, which is both an independent instrument and equipment use system and interdependent with related instruments and equipment, forming a three-dimensional instrument and equipment network to maximise the benefits of instrument and equipment use. At the same time, an information management system with functions such as daily management, online booking, information feedback, benefit evaluation, fund management, repair and maintenance, and end-of-life elimination should be developed.

### **3.3 NETWORK SHARING PLATFORM IN THE INTERNET AGE**

The most distinctive feature of a networked shared platform is that it provides strong technical support for cutting-edge scientific research. Relying on researcher project funding and instrument testing fees to fully fund the operation of the platform will result in a large number of basic and repetitive experiments that are in their infancy and will restrict young teachers and students who need access to instruments with limited funds.

Therefore, the university should raise continuous support for the operation of the platform to guarantee its sustainable development and operation. The platform's fund can be broadly divided into two areas, maintenance and operation. The university relies on the repair costs of large instruments in large research projects and establishes a large instrument maintenance fund, which is managed and used by the university in a unified manner for subsidizing the funds for the operation of large instruments, upgrading and renovation of instruments, and updating and replacing accessories.

#### **4. CONCLUSION**

As the state continues to increase its investment in education, the scientific research conditions of universities have been further improved, and the quantity and quality of large instruments and equipment in universities are also being rapidly enhanced. At present, the inefficiency of the use of large instruments and equipment in universities is mainly due to the lack of a comprehensive and systematic management system for large instruments and equipment, the lack of systematic and comprehensive pre-purchase demonstration of instruments and equipment, the low degree of open sharing, insufficient maintenance costs and backward management of large instruments and equipment, etc. Only by changing the concept can the efficiency of the use of large instruments and equipment in universities be improved. In this paper, through the construction and use of a network sharing platform in the Internet era, the original management concept is changed, making it possible to effectively improve the efficiency of the use of large instruments in universities and the innovation and optimization of the management mode.

# THE CONSTRUCTION OF AN INNOVATIVE TEACHING MODEL BASED ON FUZZY NUMERICAL ANALYSIS FOR THE INTEGRATION OF UNIVERSITY LANGUAGE AND CIVICS EDUCATION

---

Jingang Su\*

Linfen Open University, Linfen, Shanxi, 041000, China

[sujg2022@163.com](mailto:sujg2022@163.com)

---

## ABSTRACT

University language education is highly humanistic and rich in spiritual resources, which can cultivate students' humanistic qualities with beautiful literary works, and is unique in its function for ideological and political education of university students. This paper explores the integration strategy of university language and ideological and political education, and the innovative teaching model based on the fuzzy numerical analysis method for the integration of university language and ideological and political education to jointly promote the development of ideological and political education in universities. The analysis of the excavation of ideological and political education in university language only half of the students could find out the ideological and political elements contained in the selected texts, 25.6% of the students only found out partially, and 19.3% of the students were still not sure what the ideological and political elements were. This paper shows that the innovative teaching mode construction of the integration of university language and thought politics education promotes the development of ideological and political education in universities through the method based on fuzzy numerical analysis.

## KEYWORDS

humanities literacy; integration strategies; fuzzy numerical analysis; innovative teaching; educational resources

## 1. INTRODUCTION

With the increasing number of university students, university language and Civics education are becoming increasingly important in the university classroom [1-2]. The two courses are taught very differently, but they also have much in common [3]. In order to better integrate the two courses, innovative teaching models need to be constructed

[4]. In this regard, a method based on fuzzy numerical analysis can be used to guide the construction of an innovative teaching model for the integration of university language and Civics education [5]. In order to construct an innovative teaching model for the integration of university languages and Civics education through the fuzzy numerical analysis method, scholars need to first find the starting point and basis for the construction process, and collect data and information related to the two subjects [6]. Subsequently, fuzzy numerical analysis is used to construct and optimise the teaching model [7]. This method allows the performance, relevance and importance between the two courses to be determined through a fuzzy numerical analysis of the teaching process and the course objectives [8].

## **2. FEATURES OF UNIVERSITY LANGUAGE COURSES AND IDEOLOGICAL AND POLITICAL EDUCATION IN HIGHER EDUCATION**

### **2.1 THE IMPLICIT CIVIC FUNCTION OF UNIVERSITY LANGUAGES**

Civic education is the foundation of moral education in universities, and it is closely linked to personal development and the political, economic and cultural development of society. The university language is highly humanistic and has functions such as nurturing the awareness and aesthetics of university students. This is equally closely linked to the development of the individual student and society. And the implicit function of university languages in the function of ideological and political education is thus expressed. This implicit approach to ideological and political education. Although it does not directly educate students in ideology and politics, it helps them to understand the ideological views of different periods, the charm of different authors and the content of different texts through the study of literary works, for example, through the teacher's analysis of the context and artistic characteristics of different works. It can cultivate students' sentiments and deepen their love for the rich culture of their country and enhance their national pride and self-confidence. This provides a wide space for students to identify with and empathise with in the process of learning. It can be described as silent.

#### **2.1.1 A UNIQUE CIVIC RESOURCE FOR UNIVERSITY LANGUAGES**

The main purpose of university education is to guide students to establish a correct outlook on the three concepts, and the unique resources of university languages provide a good basis for this. The charm of university languages is that they allow students to experience the charm of different times. The summaries of the theoretical essence of the sages help students to establish a correct outlook on life and to cultivate patriotic feelings among students. The university language provides a rich resource for the ideological and political education of students, broadening their horizons and

guiding them to understand themselves and the world. It also helps students to think about life.

### 2.1.2 MINING CIVIC EDUCATION IN UNIVERSITY LANGUAGES

Students' awareness of tapping into the ideological elements of the textbook content is shown in Figure 1. It is possible to see that teachers were largely able to find the ideological elements of each text when they tapped into them, but only half of the students were able to discover the ideological elements embedded in the selection, 25.6% only partially, and 19.3% were still unclear about what the ideological elements were. Teachers are inherently more capable of understanding and comprehending than students, so we need to see that teachers who are largely able to tap into the Thinking and Politics elements on their own will hopefully be able to enable those students who are not yet clear about what they are to understand the Thinking and Politics elements conveyed in the selections and to better guide their practice and build strong ideals and beliefs.

**Figure 1** Students' awareness of the ideological elements of tapping into textbook content

### 2.2 THE INTEGRATION OF UNIVERSITY LANGUAGE AND UNIVERSITY THINKING AND POLITICAL EDUCATION

Despite the uniqueness and advantages of university languages, there are still a number of problems in university language education, one of which is misplacement. University students still lack awareness of university language courses and still define them only as a part of learning their mother tongue. In fact, university languages are much more than a basic knowledge course that trains students to read, write and speak;

they are an education in nationalism, traditional culture and humanism. It is therefore important that we study the integration of university language courses and university political education as a diversified teaching method, and understand the positioning of university languages, which can only be useful in ideological and political education if they are correctly positioned.

Teachers of university languages play a leading role in the teaching of university language courses, which is the guarantee that the ideological and political functions of university languages can be brought into full play. Teachers use the literary works in university language textbooks as a basis to create the situation of the author at the time, to infect and educate students. At the same time, the full play of the ideological and political function of university languages. It is not only the professional knowledge and skills of teachers that are needed. What is more important is the ideological and political quality of the teacher, as well as his or her noble personality. A university language teacher is not only a transmitter of knowledge, but also a sower of students' souls. Therefore, university language teachers need to improve not only their professional skills but also their ideological and political qualities. In this way, they will be able to understand and grasp more accurately the ideas conveyed by the different authors in the textbooks. In this way, students can be led into a sublime context. This will lead students into a noble context. In the training of university language teachers by the state and universities. The language teachers should also be guided to pay attention to the improvement of their own ideological and political quality, to educate and guide students to do a good example to truly be a teacher, for the construction of socialism with Chinese characteristics to train qualified builders and reliable successors of both moral and talent.

### **3. DESIGN OF AN EVALUATION INDEX SYSTEM FOR THE INTEGRATION OF INNOVATIVE TEACHING MODELS**

Innovative teaching requires teachers to prepare teaching materials, teaching materials and lesson plans before they begin teaching. These tasks will determine whether the teacher is able to stimulate students' interest and raise their awareness of the classroom. The most crucial part of the innovative teaching model is the teaching process, which includes the teacher's familiarity with the content, his or her ability to control the classroom, his or her use of teaching methods, and his or her ability to link theory to practice and to solve students' practical problems in the project. The effectiveness of teaching refers to the degree to which teachers have achieved their teaching objectives, the degree to which they are satisfied with the results, and the degree to which students have completed their projects and gained experience in the innovative teaching mode of curriculum integration.

Fuzzy hierarchy analysis is used to evaluate the innovative teaching model of curriculum integration. Based on the analysis of the evaluation objects, a reasonable and feasible project teaching evaluation index system is determined.

( 1 ) Use hierarchical analysis to determine the weights of each indicator.

( 2 ) Define the rubric set. Measurements are made for each tier of indicators to

determine a grade and form a rubric set  $V = (V_1, V_2, V_3, \dots, V_5)$  .

( 3 ) Building a fuzzy evaluation matrix.

$$R = \begin{bmatrix} R_{11} & R_{12} & \dots & R_{1n} \\ R_{21} & R_{22} & \dots & R_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ R_{m1} & R_{m2} & \dots & R_{mn} \end{bmatrix}, \text{ of which } R_i (i = 1, 2, \dots, n; j = 1, 2, \dots, m)$$

denotes the degree of affiliation to the  $j$  th level of the rubric, i.e. the affiliation vector

o

( 4 ) Constructing a fuzzy comprehensive evaluation model. According to the

synthesis algorithm of fuzzy matrix, its comprehensive evaluation model  $A$  for :

$$A = W' \cdot R = (A_1, A_2, \dots, A_n) \quad , \quad \text{if } \sum A_i \neq 1 \quad , \quad \text{then } A' = (A'_1, A'_2, \dots, A'_n) \quad ,$$

$$A' = A_j / \sum A_j, (j = 1, 2, \dots, n) \quad .$$

( 5 ) Determining the set of scores。 set  $K = (K_1, K_2, \dots, K_n)T, n$  Equivalent to the

number of levels in the rubric set ,  $K_i$  denotes the score of the level  $i$  rubric , With a

score out of 100, the  $K_i = i \times 100 / n (i = 1, 2, \dots, n)$  .

( 6 ) Calculation and evaluation of results.  $B = A \times K$  或  $B = A' \times K$  , This is the score

of the evaluation object, and the project-based traction teaching is evaluated according to the magnitude of the B-value. The evaluation can be divided into three levels, i.e. preparation for teaching, teaching process and teaching outcomes.

#### 4. CONCLUSION

University language and Civic Education are becoming increasingly important in the classroom, and the two courses are taught very differently, yet they have much in common. By using fuzzy analysis to construct an innovative teaching model that integrates university language and Civic Studies education, teachers can better integrate the two subjects and enable students to gain more benefits in the learning process. In the construction of the innovative teaching model, the fuzzy numerical analysis method can take the students' learning experience and learning effect into consideration, so as to achieve a more comprehensive and scientific teaching, making the university language contains valuable educational resources to mention the ideological and political quality of the students, so that the students can really become a moral and talented person.

# AN ACCELERATED GENETIC ALGORITHM-BASED MODEL FOR GUIDING PUBLIC OPINION IN MAJOR PUBLIC CRISIS EVENTS

---

Fang Ye\*

Department of Cultural Communication and Design, Guangdong Polytechnic  
Institute, Guangzhou, Guangdong, 510091, China

[emma200820@126.com](mailto:emma200820@126.com)

---

## ABSTRACT

At the present time when we are in the transition period of social development, all kinds of major sudden public crisis events are very likely to generate online public opinion. In this paper, we analyze the relevant literature on the risk of online public opinion in China, outline the current main research directions, and establish a dynamic grid public opinion risk identification system optimized by accelerated genetic algorithm based on big data analysis and grid modelling ideas. Genetic algorithm is used to predict the risk of public opinion in major public crisis events, and the prediction accuracy of the constructed risk prediction model is 94%.

## KEYWORDS

major sudden public crisis events; online public opinion; accelerated genetic algorithm; risk prediction

## 1. INTRODUCTION

At present, the Internet is the main forum for the brewing and fermentation of public opinion in major public crisis events, and the issue of public opinion governance in the interim has become a key area of relevant research [1-2]. Negative and uncontrolled online public opinion often intensifies conflicts, aggravates the situation and even endangers the public [3]. Online public opinion is a manifestation of social opinion, which is the public's remarks and opinions on hot events and topics in the Internet space [4-5]. And big data opinion monitoring is developed to adapt to the new features of public opinion in the era of big data [6]. Risk identification of online public opinion based on big data analysis technology can effectively identify the information sources of crisis events and social risks from massive online information, analyze public opinion views and emotional tendencies, and carry out risk assessment and strategy optimization

selection by matching similar events already in the database [7]. Discovering and identifying the hidden risks of online public opinion and analyzing its evolution and development patterns are the prerequisites for timely response to public opinion crises [8].

Based on the ideas of big data analysis and grid modelling, this paper initially establishes a dynamic grid risk identification system optimized by genetic algorithm, which can filter key information from the massive public opinion information obtained from the big data platform and effectively predict and evaluate public opinion risks.

## **2. CHARACTERISTICS OF ONLINE PUBLIC OPINION IN MAJOR PUBLIC CRISIS EVENTS**

### **2.1 RAPIDLY SPREADING**

The breakthrough of time and space boundaries and the speed of dissemination are the distinctive features of online communication. In major public crises, the widespread use of online instant messengers allows information to spread outward at an exponential rate, raising the level of concern and topic heat rapidly, and creating public opinion on the Internet. The emergence of inflammatory and misleading views and voices in online public opinion can be very destructive.

#### **2.1.1 PERIODIC DISSEMINATION**

Generally speaking, online public opinion in major public crisis events has its own development rules, and its basic direction is generally consistent with that of public crisis events. It is roughly divided into four stages of development: germination, development, outbreak and receding. The development of real-life events and the development of online public opinion interact with each other. Therefore, online public opinion is closely related to public opinion and public concern, and the management of online public opinion is inseparable from the resolution of real social conflicts and the handling of crises.

#### **2.1.2 DIFFUSION AND DISSEMINATION**

The Internet is characterised by the two-way interaction of information dissemination. Internet users are receiving information and sending it out at any time and anywhere, which has rapidly increased the speed and scope of information dissemination on the Internet compared to traditional media. In the case of a sudden public crisis, the breadth and speed of this diffusion allows a wider audience to be informed of the event and to participate in the discussion. In turn, the participation of a larger audience contributes to the increase in public opinion, which increases the probability of public crisis and the difficulty of public opinion management.

## 2.2 THE EVOLUTION OF ONLINE PUBLIC OPINION IN MAJOR PUBLIC CRISIS EVENTS

(1) Budding stage: The "fuse" of a crisis event has just appeared on the online platform and has not yet caused large-scale re-posting and comments, but its risk point has already taken shape and has aroused attention in a small area. The corresponding life sign of public opinion in this period is characterized by gestation. In other words, public opinion is relatively calm, but the number of people who have "discovered" the "trigger" of a crisis event is slowly increasing, and the number of people who are concerned about the event is gradually expanding. The top priority of public opinion management on the Internet should be to monitor public opinion, detect risks, provide early warning and prevent problems before they occur.

(2) Development stage: The impact of crisis events gradually expands, the public finds that crisis events are closely related to their own interests and even their lives, and the heat of online public opinion continues to increase. The life sign of public opinion at this stage is characterized by proliferation. A large amount of relevant information spreads outward on the online platform, forming extensive discussions, forwarding and comments, which also gives room for inaccurate information to survive.

(3) Explosive phase: This is the phase when the crisis event itself receives the most attention and the public opinion formed around it is the most heated. The life sign of public opinion at this stage is characterized by outbreaks. Internet users engage in large-scale discussions around important information related to the crisis event, expressing their concerns and basic attitudes towards the event in various forms, and these behaviours will show an explosive growth over time. During this period, the developing status of the crisis event and the behind-the-scenes information that continues to be revealed can easily stimulate the public's sensitivities and provoke conversation. The elicitation of one point of view evolves in a cascade into more points of view, which become entangled with each other, creating secondary public opinion and extending it volatily.

(4) Decaying period: As time advances, crisis incidents are gradually resolved, authoritative official information is fully disclosed, the truth of the incident and subsequent development dynamics gradually become clear, and rumors are cleared and combated. Under such circumstances, the vital signs of online public opinion also change, and decay becomes a typical feature. At this point, the public's attention is easily attracted by other hot events, the attention to the incident decreases, and the discussion around the incident becomes less and less, and the whole public opinion slowly falls back. It should be noted that the dissipation of public opinion does not mean that it disappears, and if there are new developments or new information is disclosed

about the crisis. If there is a new development or new information is disclosed, or even a similar incident suddenly occurs, it will stimulate public opinion and cause it to rebound.

### **3. GENETIC ALGORITHM OPTIMIZATION OF PUBLIC OPINION RISK MODELS IN MAJOR PUBLIC CRISIS EVENTS**

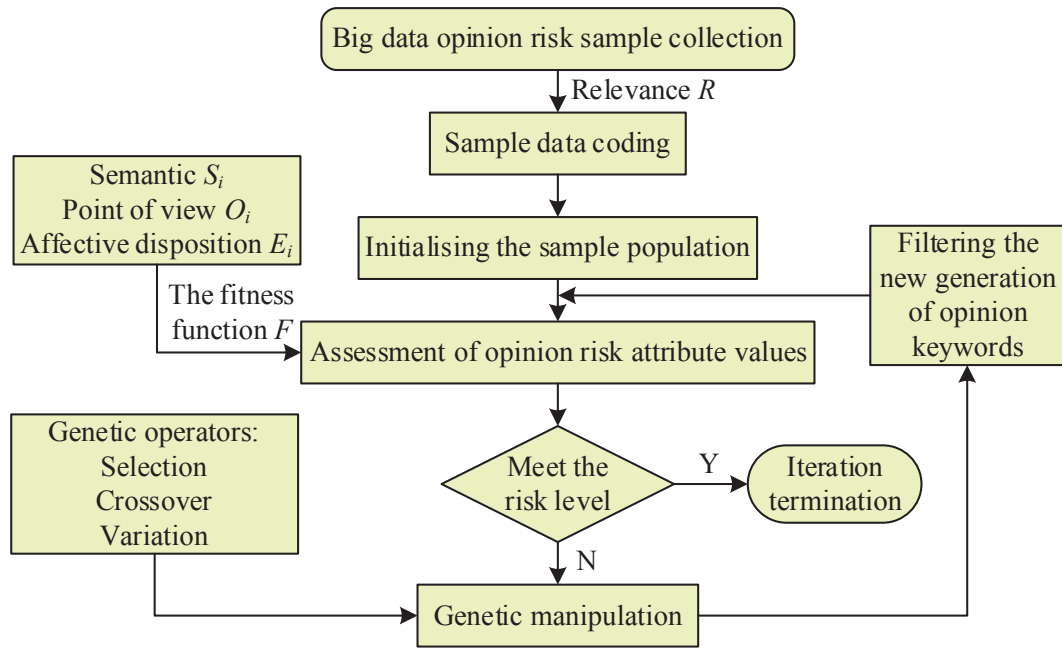

Unlike the traditional regular grid opinion model, the dynamic grid model based on genetic algorithm optimization established in this paper emphasizes that the connection relationship is probabilistic to a certain extent. Considering that the influence of various opinion factors is probabilistic, the edge connections of nodes in the opinion network should also be probabilistic to a certain extent. Complex dynamic grid models can effectively assess edge probabilities and changes over time in dynamic network analysis. The complex dynamic grid model analysis is built based on the relevant public opinion data collected by the public opinion monitoring platform. To build a risk evolution model for online public opinion, the primary task is to obtain information about online public opinion. As the information contains a large number of high-frequency keywords, it is necessary to integrate similar keywords and introduce probabilistic relationships.

#### **3.1 THE DRIVING RELATIONSHIP BETWEEN OPINION FACTORS**

As a complex social phenomenon, the formation and evolution of online public opinion risk also involves the interactions between the various drivers of online public opinion. The complex dynamic grid public opinion model can well describe the interrelationship between the elements in the development of a particular public opinion crisis, and to a certain extent reflect the mechanisms controlling the role of internal drivers of public opinion evolution.

#### **3.2 GENETIC ALGORITHM OPTIMIZATION**

In view of the parallel and non-linear requirements for mining and identifying massive public opinion information in the era of big data, this paper adopts a genetic algorithm with strong parallel search performance for risk model optimization. Genetic algorithm is a search and optimization mechanism based on the principle of natural evolution, which has good global search capability and can acquire and collect effective data in the search domain for optimal solution during the search process. The advantages of genetic algorithm can be fully utilized in the big data platform to better improve the grid model of online public opinion risk, improve the convergence effect of the model and better predict and identify public opinion risk. The flow of the genetic algorithm is shown in Figure 1.

**Figure 1** Genetic algorithm flow chart

### 3.3 GENETIC ALGORITHM-BASED PUBLIC OPINION RISK PREDICTION

In this paper, a genetic algorithm is used as the inference algorithm to obtain a conditional probability table. Due to space reasons, only some of the comparison data of the 6 validation results are listed as shown in Table 1. After 6 cross-validations, there are 2 events with inconsistent test results and actual results, such as event 1, where the probabilities of low, medium and high risk are all 35%, leading to incorrect results due to very close probabilities, and event 2 for the same reason. For such errors, the model accuracy can be optimised by further refining the risk classification levels. Overall, the prediction accuracy of the constructed risk prediction model was 94%.

**Table 1** Partial simulation cross-validation comparison data

Events	Event specific data	Test results	Actual results
Events 1	[p,c,2,3,1,u,1,1,2,1,s,1,s,1,n,1,1,2,1,2]	low ( 66%). medium(18%) , high( 18%)	Low Risk
Events 2	[t,s,3,3,2,u,3,3,1,3,s,3,sl,2,n,1,1,2 ,2 ,2]	low ( 35%),medium( 35%) , high ( 35%)	Low Risk
Events 3	[t,s,3,3 ,2,u,3,2,1,1,w,3 ,s,2 ,m,2,2,2,2,2]	low( 16%),medium(16%) , high( 68%)	High Risk

#### 4. CONCLUSION

From the perspective of the development and evolution of online public opinion, the research on dynamic grid public opinion modelling based on complex structures in the era of big data is reviewed. Considering the classification criteria of complex dynamic grid public opinion models and the ability to characterize the multidimensional structure of online public opinion risks in the era of big data, a particle interaction model on a regular grid is used to model online public opinion dynamically. Based on the attribute analysis of semantics, opinions and emotions of online keywords, an accelerated genetic optimization algorithm containing big data sample collection, opinion risk adaptation function, risk source identification selection and cross-variation is designed. At present, many scholars have conducted in-depth research on online public opinion from multiple perspectives. This paper proposes a dynamic grid public opinion modelling method based on genetic algorithm optimization, which can provide an important reference for coping with the risk of online public opinion of major public crisis events in the era of big data.

---

## ABSTRACT

This paper studies the characteristic attributes covered by the competitiveness of the recreation tourism industry, constructs the competitiveness influence factor index system from three aspects: thrust factors, gravitational factors and supporting factors, and studies the interaction relationship of these factors. Taking the recreation and tourism industry in Hainan Province as an example, the grey correlation method is used to explore the correlation development between the recreation and tourism industry, so as to propose the optimization path for the high-quality development of the industry. The integration degree of recreation industry and tourism industry in Hainan is only 0.6295, which is a low level, and the interaction degree of resources between recreation industry and tourism industry is insufficient.

## KEYWORDS

Recreation tourism industry; Industrial competitiveness; Gray correlation method; Integration degree; Resource interaction

## 1. INTRODUCTION

As an emerging industry, the recreation and tourism industry is gaining more and more attention from the general public and government enterprises [1-2]. With the development of the economy, the tourism industry has also emerged more and more problems in this process. To give full play to the tourism industry's main role in market competition and improve its own market competitiveness, it is necessary to vigorously develop the natural resources of recreation tourism and improve the development level of recreation tourism [3-5]. With the update and progress of the times, the main purpose of people's tourism is no longer as simple as sightseeing and playing, but they pay more and more attention to their own health level [6-8]. Wellness tourism has an increasingly important role in people's lives, and it is also very important for China to strengthen cooperation with other countries through cross-border tourism, give full play to its own location advantages, and improve the level of opening up to the outside world [9-10]. Therefore, this paper measures the level of industrial development by constructing the indexes of influencing factors of the competitiveness of recreation tourism industry, and proposes countermeasures for the high-quality development of the industry based on the industrial integration analysis of gray correlation method.

## **2. ANALYSIS OF THE COMPETITIVENESS OF RECREATION TOURISM INDUSTRY IN THE CONTEXT OF INFORMATIONIZATION**

### **2.1. ANALYSIS OF FACTORS INFLUENCING THE COMPETITIVENESS OF RECREATION TOURISM INDUSTRY**

#### **2.1.1. COMPOSITION OF INFLUENCING FACTORS**

The competitiveness of the recreation tourism industry has the characteristic attributes of general tourism activities, but also covers many industry features such as economic, social, cultural, health and ecological, etc. It needs to follow scientific research methods and principles to analyze and study the influencing factors affecting its development.

The thrust factor of recreation tourism industry is composed of a series of factors that affect the demand of recreation tourism industry, including policy tendency, economic base, tourism development and so on. The government plays an important role in promoting and publicizing the development of recreation tourism, expanding the influence of recreation tourism through a series of activities planned and promoted by the government, while a series of relevant policies and regulations formulated by the government can regulate the development of recreation tourism and guide the construction and development of recreation tourism on a macro level. The gravitational factors of the recreation tourism industry are composed of various tourism attraction elements, and on the basis of the traditional tourism industry, a variety of new business models are integrated, so that tourism resources, cultural environment, ecological environment and other elements are included. Tourism resources are the important basis of tourism, and its attraction as a direct impact on the willingness of tourists to travel. The support factors of recreation tourism industry are the development conditions that support recreation tourism, which are divided into infrastructure and service facilities guarantee. Infrastructure is the hardware guarantee for the development of recreation tourism, mainly including road facilities, transportation, etc. Tourism service facilities are the important guarantee for the development of recreation tourism.

#### **2.1.2. CONSTRUCTION OF THE INDEX SYSTEM OF INFLUENCE FACTORS**

The development of recreation tourism industry is usually influenced by many factors. In this paper, on the basis of studying the research results, considering the influencing factors of recreation tourism industry in actual development, eight index element variables are selected, including recreation policy tendency, recreation social economy, recreation tourism economy, recreation tourism resources, recreation cultural environment, recreation ecological environment, recreation infrastructure and recreation service foundation. The index system of influencing factors of the competitiveness of recreation tourism industry is constructed, and its influential role on the development of recreation tourism industry is studied. The index system of influencing factors of competitiveness of recreation tourism industry is shown in Table 1.

**Table 1. Competitiveness Impact Factor Indicators**

Overall layer	Element Layer	Indicator layer
Thrust Factors	Construction of projects related to recreation and tourism	Policy Tendencies
	Per capita living consumption expenditure of residents	Social Economy
	Tourism income to GDP ratio	Tourism Economy
Gravitational Factors	Number of A-class scenic spots	Tourism Resources
	Number of Museums	Cultural Environment
	Comprehensive Air Quality Index	Ecological Environment
Supporting Factors	Road density	Infrastructure
	Number of health institutions	Health Service Foundation

## 2.2. INTERACTION OF INFLUENCING FACTORS

Recreation tourism resources, recreation cultural environment and recreation ecological environment as the gravitational factors of recreation tourism industry have significant influence on the competitiveness level of recreation tourism industry in Shandong Province, and all three can be used as attractors to promote the development of the competitiveness level of recreation tourism industry. Recreation policy tendency and recreation tourism economy as the thrust factor of recreation tourism industry also have more significant influence on the competitiveness level of recreation tourism industry, both of them can guide the consumption together with local social economy and stimulate the gravitational factor to make counter force to it, so as to promote the production of recreation tourism. Wellness service foundation as one of the supporting factors of the wellness tourism industry, the level of competitiveness of the wellness tourism industry also has a more significant impact, and its role as a basic condition to support the attraction, but also indirectly promote the development of the wellness tourism industry. In short, the three major factors interact and influence each other, and work together for the development of the competitiveness level of the recreation tourism industry.

## 3. EMPIRICAL ANALYSIS OF THE DEVELOPMENT OF RECREATION TOURISM INDUSTRY IN HAINAN PROVINCE

### 3.1. ANALYSIS METHOD AND SELECTION OF INDICATORS

Gray correlation analysis is a method used to analyze the interrelationships between factors within a sample and a system with insufficient information, and it calculates the correlation coefficient and the degree of correlation between factors. The change trend of factors and the data of correlation degree are proportional to each other, the higher the correlation degree, the higher the degree of synchronous change, and vice versa, the lower. In this paper, we believe that there are many complex factors affecting the degree of integration in the recreation tourism industry, so the method of gray correlation analysis is applicable.

After data collection, it was found that tourism, as the leading industry in Hainan Province, has been recorded at the provincial and municipal levels for tourism-related data over the years. Therefore, the added value of the sports industry in Hainan Province in the recent three years from 2018-2020 was selected as an indicator of the recreation and health industry in Hainan Province ( $Y$ ). In terms of health industry, the total investment in health and health in Hainan Province from 2018-2020 was selected as the indicator of health industry ( $X_1$ ). In terms of tourism industry, the total tourism revenue of Hainan Province in the last three years from 2017-2020 is selected as an indicator ( $X_2$ ), aiming to analyze the correlation between the total

revenue of tourism industry in Hainan Province and the added value of sports industry in Hainan Province in recent years. This paper develops gray correlation analysis by combining the above-mentioned influencing factors indicators of the competitiveness of recreation tourism industry in order to better propose a high-quality development path.

### 3.2. ANALYSIS OF GREY CORRELATION RESULTS

Firstly, this paper takes the added value of recreation industry as the reference series  $Y(t)$ , and the total expenditure of health and the total income of tourism industry in Hainan as the comparative series  $X_i(t)$ . Secondly, this paper adopts the initialization to dimensionless the data to improve comparability. The normalization formula is:

$$X'_i(t) = X_i(t) / \bar{X}, i = 1, 2, t = 1, 2, 3 \quad (1)$$

where  $X'_i(t)$  is the result of dimensionless processing.  $\bar{X}$  is the normalized initial value, which is taken as the corresponding value in 2018 in this paper.

Finally, the extreme difference absolute value calculation is performed to derive the maximum and minimum values of the comparison series and the reference series, and the correlation degree is derived by substituting into the gray correlation degree calculation formula. The gray correlation degree calculation formula is:

$$\zeta_i(t) = \frac{\min_i \min_t |\bar{X} - X'_i(t)| + \rho \cdot \max_i \max_t |\bar{X} - X'_i(t)|}{|\bar{X} - X'_i(t)| + \rho \cdot \max_i \max_t |\bar{X} - X'_i(t)|} \quad (2)$$

where  $\rho$  is an adjustable factor in the range of  $(0,1)$ , and in this paper it is  $\rho=0.5$ .

The results of data dimensionless processing and correlation degree analysis are shown in Figure 1. To a certain extent, the degree of integration between industries reflects the degree of interaction between industrial integration subjects, the degree of circulation between industrial resources and the degree of contribution of industrial integration value. When using gray correlation analysis, the correlation value is between 0 and 1, and the closer the value is to 1, the higher the degree of integration. The degree of integration between recreation industry and tourism industry in Hainan is only 0.6295, which is lower than the national average. This reflects the lack of interaction between resources, the lack of integration depth and the lack of comprehensive integration development between the recreation industry and tourism industry in Hainan. The integration degree of health industry and tourism industry in Hainan is 0.5902, which also indicates that the integration development of recreation industry and tourism industry in Hainan may have reached the bottleneck.

**Figure 1.** Data dimensionless processing and correlation analysis results

### 3.3. OPTIMIZATION PATH OF HIGH-QUALITY DEVELOPMENT OF RECREATION TOURISM INDUSTRY

The purpose of wellness tourism is to allow tourists to adjust their mood and release stress. Therefore, it is necessary to adhere to the perspective of tourists and understand the reasons why tourists choose recreation tourism destinations thus enhancing the tourism experience. Recreation tourism needs to invest a lot of money in the initial development, relying on the financial power of the government alone is far from enough, and the participation of social funds is not high due to the lag and uncertainty of the economic benefits of the tourism industry. Therefore, in the development of recreation tourism to accelerate the innovation of the project's investment mechanism, as far as possible to attract the participation of recreation tourism main body. The government can encourage the districts and counties to give full play to their green ecological advantages, increase the mutual cooperation between each district and county, and introduce a regional synergistic cooperation mechanism. Combining the characteristics of local resources and tourism market demand, based on the existing attractions, fully integrate regional resources to create a new model project of recreation tourism.

### 4. CONCLUSION

In this paper, through the industry analysis of recreation tourism industry, the influencing factors of the competitiveness of recreation tourism industry are studied, and the index system of influencing factors for the development of competitiveness is constructed. The gray correlation method is used to analyze the correlation degree between recreation industry and tourism industry in Hainan Province by combining the competitiveness indexes. Hainan Province is rich in recreation tourism resources, laying a solid foundation for the development of recreation tourism industry. Hainan Province promotes industrial integration through the development of big health industry, breaks the industry barrier and extends the tourism industry chain, but the development of its recreation tourism industry is still in the primary stage. The development path of recreation tourism industry in Hainan Province can be started from consolidating infrastructure, overall scientific planning, strengthening talent training, innovating recreation products and promoting industrial integration.

## ABSTRACT

The purpose of the Civic Education in colleges and universities is to promote the cultivation of high-quality talents, and it is also necessary to enhance the cultural self-awareness and cultural self-confidence of talents in the cultivation process. This paper starts from analyzing the necessity of enhancing the cultural self-awareness of college students in Civic Education in the information era, and explains the main characteristics and importance of cultural self-awareness in Civic Education. By analyzing the data of cultural consciousness of college students based on cluster analysis, the problems faced in the cultivation of cultural consciousness in civic education are derived. The cultivation and development of cultural consciousness of college students can be realized by enhancing the cultural consciousness ability of educators, expanding cultural consciousness channels, enriching educational and cultural resources, and promoting cultural innovation of college students.

## KEYWORDS

Information era; Civic education; Cultural consciousness; Cultural resources; Cluster analysis; Cultural innovation

## 1. INTRODUCTION

Civic education has both cultural and political overtones, and schools must build a high-quality education system with a firm and correct political orientation and draw on cultural resources that meet the needs of students' growth. With the power of leading and inspiration of excellent culture to implement the fundamental task of establishing moral education and spreading mainstream values, the profound meaning of excellent culture and the contemporary connotation of thinking education together constitute the foundation of moral education in schools [1-2]. Civic education in the new era assumes the responsibility of inheriting and spreading excellent culture, and culture is not only an important component of the content system of school civic education, but also an important carrier of spreading mainstream ideology, which influences the direction of civic education work [3-4]. If we want to effectively enhance the effectiveness of the cultural consciousness of Civic Education, schools need to accelerate the construction of culture and deeply plant the spiritual connotation of excellent national culture in students' blood. To enhance young students' identification with excellent national culture and cultivate their national cultural self-awareness, so that they can grow up to be well-rounded talents with both virtues and talents [5-6].

Educating people with culture is a fine tradition of Civic Education and an important way to cultivate students' cultural self-awareness. At present, the wave of cultural globalization is

becoming increasingly severe, and the cultural value concepts, traditional customs and behavioral habits of different ideologies are intertwined, forming a greater impact on the mainstream Chinese values and easily misleading people's value choices [7-8]. In the information era, as the main path of ideological communication, the ideological education should take the initiative to play the cultural function, strengthen the dominant role of cultural values, cultivate the cultural consciousness of young students with the help of the effectiveness of educating people, and strengthen the educational infectivity and penetration in order to effectively enhance the effectiveness of educating people.

In the new era of informationization, it is the urgent need to adapt to the new era, the objective need for the cultivation of talents in colleges and universities, and the practical need for the overall improvement of the literacy of contemporary college students to give full play to the advantages of the university's civic education and focus on cultivating the cultural self-awareness of college students. This paper analyzes the necessity of enhancing the cultural self-awareness of college students in the era of information technology, so as to give the role of thinking education in enhancing the cultural self-awareness of college students and the problems faced by it. In response to the problems, the path of enhancing cultural self-awareness in Civic Education is given, which can promote the enhancement of cultural self-awareness in Civic Education through various aspects such as teachers' self-awareness ability, enriching educational and cultural resources, strengthening college students' self-reflection and broadening educational channels.

## 2. THE NECESSITY OF ENHANCING THE CULTURAL CONSCIOUSNESS OF COLLEGE STUDENTS' CIVIC EDUCATION IN THE INFORMATION ERA

### 2.1. MAIN FEATURES OF COLLEGE STUDENTS' CIVIC EDUCATION IN CULTIVATING CULTURAL CONSCIOUSNESS

Under the strong impact and erosion of Western culture, the development of socialist culture with Chinese characteristics has been affected to a certain extent, and the wrong cultural view of self-centeredness and total westernization has spread. General Secretary Xi Jinping pointed out that "China has firm road, theoretical and institutional self-confidence, the essence of which is cultural self-confidence based on the inheritance of a civilization of more than 5,000 years." Remembering history is the foundation of cultural confidence, and the excellent Chinese traditional culture is the historical source of the four self-confidences. Cultural confidence is the affirmation, recognition and pride in the value of socialist culture with Chinese characteristics. Only by affirming the reasonable value and scientific spirit of socialist culture with Chinese characteristics can we have confidence in socialist culture with Chinese characteristics, and then we can sincerely feel proud and confident in the comparison of the value of various different cultures at home and abroad, so as to realize the inheritance, innovation and promotion of socialist culture with Chinese characteristics. Combining the existing researches, the main characteristics of the ideological and political education of college students to cultivate cultural self-awareness are summarized as shown in Figure 1.

**Figure 1.** Key features of cultivating cultural self-awareness

## 2.2. THE IMPORTANCE OF CULTIVATING CULTURAL CONSCIOUSNESS IN COLLEGE STUDENTS' CIVIC EDUCATION

Cultural self-confidence is the people's ability to grasp the reality of China and the needs of the times, and to scientifically identify and grasp the characteristics and essence of various different cultures even in the face of the complex and diversified cultural trends in the world today. Scientifically screening and rationally discarding socialist culture with Chinese characteristics and foreign cultures is the core force to realize the rational choice of culture by college students. Therefore, teachers should make good use of the platform of ideological and political education to cultivate college students' self-confidence in socialist culture with Chinese characteristics and promote the formation of college students' cultural self-awareness, so as to help them establish correct cultural views and values. The main contents of the importance of cultivating college students' cultural self-awareness are shown in Figure 2.

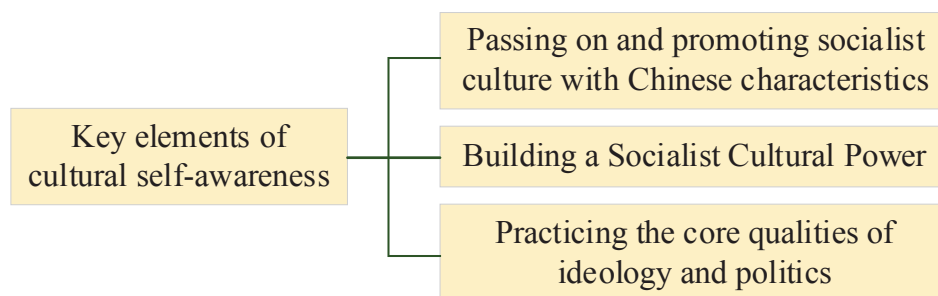

Figure 2. Key elements of cultural self-awareness

## 3. ANALYSIS OF THE PROBLEMS OF CIVIC EDUCATION ON ENHANCING THE CULTURAL CONSCIOUSNESS OF COLLEGE STUDENTS

### 3.1. DATA MODELING OF COLLEGE STUDENTS' CULTURAL SELF-AWARENESS BASED ON CLUSTER ANALYSIS

Assume that there is  $n$  sample data  $D = \{x_1, x_2, \dots, x_n\}$ , where  $x_i$  represents the  $i$ th sample. Sample  $x_i$  can be carved by  $m$  attribute indicators, i.e.  $y = \{y_1, y_2, \dots, y_n\}$ . Then the sample values under the attribute set are noted as  $x_i = \{x_{i1}, x_{i2}, \dots, x_{im}\}$ , where  $x_{ij}$  is the value of the  $i$ th sample under the  $j$ th attribute indicator, and the data matrix can be obtained as

$$D = (x_{ij})_{n \times m} \quad (1)$$

The dataset  $D$  is represented as  $n$  sample row vectors  $x_1, x_2, \dots, x_n$  or as  $m$  attribute column vectors. The mean of the sample vector  $X_i = \{x_{i1}, x_{i2}, \dots, x_{im}\}$  and the attribute vector  $Y_j = \{y_{1j}, y_{2j}, \dots, y_{mj}\}$  in this dataset can be calculated. To measure the deviation of a random variable from its mathematical expectation, then the variance of the sample vectors  $X_i$  and  $Y_j$  can be calculated. Also, the data can be normalized using equation (2). That is:

$$x_{ij}^* = \frac{x_{ij} - \bar{x}_i}{S_1}, y_{ij}^* = \frac{y_{ij} - \bar{y}_j}{S_2} \quad (2)$$

where  $S_1, S_2$  is the standard deviation of sample vectors  $X_i$  and  $Y_j$ .

To determine whether the trend between two variables is consistent, the covariance

$cov(u, v)$  of two variables  $u, v$  can be calculated and the covariance of different variables can be filled into a matrix to form a covariance matrix, i.e:

$$C = (C_{ij})_{n \times m} \quad (3)$$

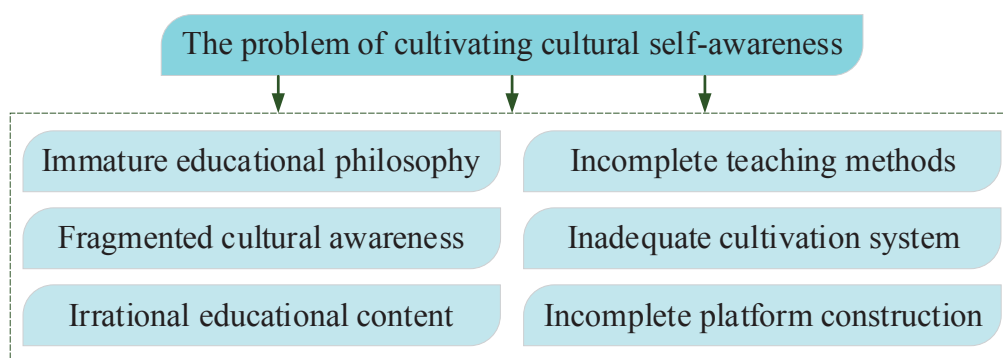

Among them,

$$C_{ij} = \frac{1}{n-1} \sum_{k=1}^n (u_{ki} - u_i)(u_{kj} - u_j) \quad (4)$$

In the age of information technology, the problems faced by college students in the process of cultivating cultural consciousness in civic education are clustered through the method of cluster analysis to find out similar categories and compare them. In this way, it can better help universities to implement the reform of Civic Education and further clarify the problems that may exist in the process of cultural consciousness cultivation of college students, so as to improve the effectiveness of cultural consciousness cultivation.

### 3.2. PROBLEMS FACED IN THE CULTIVATION OF CULTURAL SELF-AWARENESS IN CIVIC EDUCATION

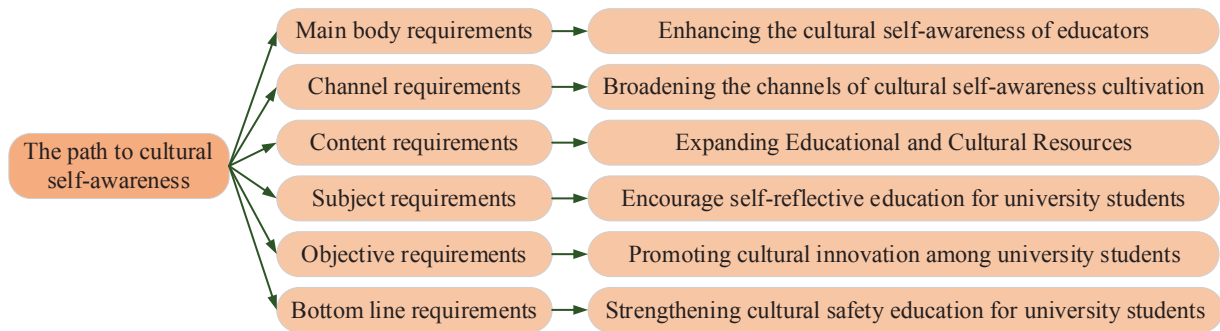

Based on the previous modeling of the data of cultural consciousness of college students and the clustering analysis of the data of cultural consciousness of college students in Civic Education, the current problems faced by the cultivation of cultural consciousness are derived. The specific classification is shown in Figure 3.

**Figure 3.** Problems faced in the cultivation of cultural self-awareness

## 4. EXPLORING THE PATH TO ENHANCE THE CULTURAL CONSCIOUSNESS OF COLLEGE STUDENTS IN THE ERA OF INFORMATION TECHNOLOGY EDUCATION

As a product of spiritual civilization, cultural self-awareness cannot be produced without social progress and development of the times. With the in-depth development of the information era, contemporary college students must have cultural self-awareness, so that they can draw nutrients from the rich soil of Chinese traditional culture and realize cultural innovation based on the improvement of their own ideological understanding. The main construction of the path of cultural self-awareness enhancement of the thinking and political education of college students in the information era is shown in Figure 4.

**Figure 4.** The path to cultural self-awareness

(1) Enhance the cultural self-awareness ability of educators. The first and foremost thing to cultivate cultural self-awareness in universities is the cultural self-awareness of educators, and the teachers of college Civics courses, as the main body to cultivate the cultural self-awareness of college students, should take the initiative to assume the historical mission of cultural inheritance and innovation and strengthen the sense of mission in the cultivation of cultural self-awareness.

(2) Broaden the channels of cultivating cultural self-consciousness, to give full play to the explicit education of the main positions of Civics and other classroom teaching, to strengthen the construction of curriculum Civics, and to need the invisible education of campus culture and family education.

(3) Expand the educational and cultural resources, and guide the college students to establish “theoretical confidence, road confidence, system confidence and cultural confidence” by teaching them the relevant theories of the Party and the country.

(4) Encourage self-reflection education of college students, encourage college students to improve their self-reflection ability through reading and self-study is a necessary requirement, cultural self-awareness and self-confidence is a process of ideological identity, which must be internalized in the heart and externalized in action.

(5) To promote cultural innovation among college students, cultural self-awareness is necessary for cultural self-improvement, and cultural self-improvement requires cultural innovation. Cultural innovation is the practice of cultural self-awareness cultivation, and promoting cultural innovation of college students is an inevitable requirement to lead the new development concept in the new era.

(6) Strengthening the cultural safety education of college students is a necessary process of cultivating cultural self-awareness among college students.

## 5. CONCLUSION

Cultivating cultural self-awareness among college students in the information age is the right thing to do to realize a strong cultural nation and the Chinese dream. This paper takes the analysis of the necessity of enhancing the cultural self-awareness of college students’ civic education as the starting point, uses the cluster analysis in the information era to model the data on the cultivation of college students’ cultural self-awareness, and analyzes the current problems faced in the cultivation of cultural self-awareness. It also gives the path to enhance the cultural self-awareness of college students in the era of information technology, but the cultivation of cultural self-awareness is a complex and long process, which requires the college and university civic education workers to actively promote the cultivation and practice of the cultural self-awareness of college students by combining the channels of curriculum, campus, family and society.

## ABSTRACT

This paper discusses the framework of the development model of educational informatization and the development history of informatization teaching of college English. On the basis of theories based on informatization teaching, the three stages of the development of informatization teaching of college English are further detailed. Next, the development of English education informatization policy is described, including specific content system analysis and value system analysis. The study shows that artificial intelligence technology should be used in current university English informatization education to develop technologies such as adaptive learning, personalized teaching, natural language processing, and speech recognition. It also strengthens the development and management of education informatization policies in order to achieve sustainable development and innovation of university English informatization education.

## KEYWORDS

Information-based teaching; University English; Policy development; Content system; Value system; Artificial intelligence

## 1. INTRODUCTION

With the rapid development of artificial intelligence technology, various industries are also actively exploring and applying artificial intelligence technology, including the field of education [1-2]. Nowadays, information-based teaching has become one of the main means of university English teaching, because it can break the time and space constraints, improve teaching effectiveness, and personalize and differentiate courses [3]. However, traditional information-based teaching still has limitations that make it difficult to meet the diverse learning needs of contemporary students and the changes in teaching mode [3-4]. In fact, many scholars and researchers have carried out research on informational teaching of college English based on artificial intelligence technology [5]. The literature [6] proposed a model of English listening teaching system based on machine learning technology, and achieved good teaching results. In addition, the literature [7] studied the teaching model of English writing based on artificial intelligence technology in MOOC environment and achieved higher learning effectiveness than traditional teaching. In this paper, we discuss the development mode of informative teaching of college English in the context of artificial intelligence, and analyze and discuss it systematically. The theoretical basis of informatization teaching is introduced to lay the foundation for the subsequent contents. The content and value system of English education informatization policy development are also explored, demonstrating the importance and impact of the policy.

## 2. FRAMEWORK OF EDUCATION INFORMATIZATION DEVELOPMENT MODEL

### 2.1. INFORMATIONAL TEACHING THEORY

Information-based teaching theory refers to the theory of combining information technology with teaching and learning and exploring how to better use information technology to promote teaching reform and teaching quality improvement. Its core idea is to realize the organic combination of education modernization and informatization by taking students as the center, teachers as the leading, information technology as the support, and improving teaching effect as the goal. The theory of informatization teaching mainly includes the following aspects:

(1) Educational technology theory mainly studies how to use various educational technology tools, such as multimedia and network, to promote teaching reform and teaching quality improvement.

(2) Cognitive psychology theory mainly studies the cognitive process and psychological mechanism of learners, and how to use information technology to promote students' learning and cognitive ability.

(3) Educational evaluation theory should study how to use information technology to realize the scientific and personalized educational evaluation, and improve the accuracy and effectiveness of evaluation.

(4) Educational management theory is to study how to use information technology to modernize and scientify educational management and improve the efficiency and effectiveness of management.

### 2.2. THE DEVELOPMENT HISTORY OF UNIVERSITY ENGLISH INFORMATIZATION TEACHING

#### 2.2.1. THE INITIAL STAGE OF UNIVERSITY ENGLISH INFORMATIZATION TEACHING

In the 1990s, information-based teaching of English in college began to take off. Teachers began to use e-mail, multimedia courseware and other technical means to improve teaching effectiveness. During this period, information-based teaching was mainly applied to the management of teaching resources and courseware production, and teachers' knowledge and application of information-based teaching were still relatively low.

Let the size of the local range of time from the beginning of the evolution of the start-up phase of university English informatics teaching to the moment  $T$  be  $2\Delta t$ , and the proportion of node  $i$  in each  $2\Delta t$  time, be  $m_{T-\Delta t}, m_{T-\Delta t+1}, m_{T+\Delta t}$ . Then the average value  $\bar{m}$  of the proportion of its messages in the moment  $T$ , is

$$\bar{m} = \frac{\sum_{t=T-\Delta t}^{T+\Delta t} m_t}{2\Delta T} \quad (1)$$

Then, at moment  $T$ , the fluctuation coefficient  $\kappa_i$  of node  $i$ , is

$$\kappa_i(T) = \frac{\sum_{t=T-\Delta t}^{T+\Delta t} (m_i(t) - \bar{m})^2}{2\Delta T} \quad (2)$$

According to the temporal evolution of  $\kappa_i(T)$ , the temporal fluctuation characteristics of various English informatics developments can be derived, and the health of the English

informatics teaching development model can be analyzed based on this characteristic.

### **2.2.2. THE DEVELOPMENT STAGE OF UNIVERSITY ENGLISH INFORMATIZATION TEACHING**

At the beginning of the 21st century, with the rapid development of computer technology and network technology, university English informatization teaching has entered a stage of one-by-one development. Teachers began to use online teaching platform, electronic whiteboard, online interaction and other technical means in order to achieve teaching goals well. The information-based teaching in this period was mainly applied to the sharing of teaching resources and online learning, and teachers' awareness and application of information-based teaching gradually improved.

### **2.2.3. THE INNOVATION STAGE OF UNIVERSITY ENGLISH INFORMATIZATION TEACHING**

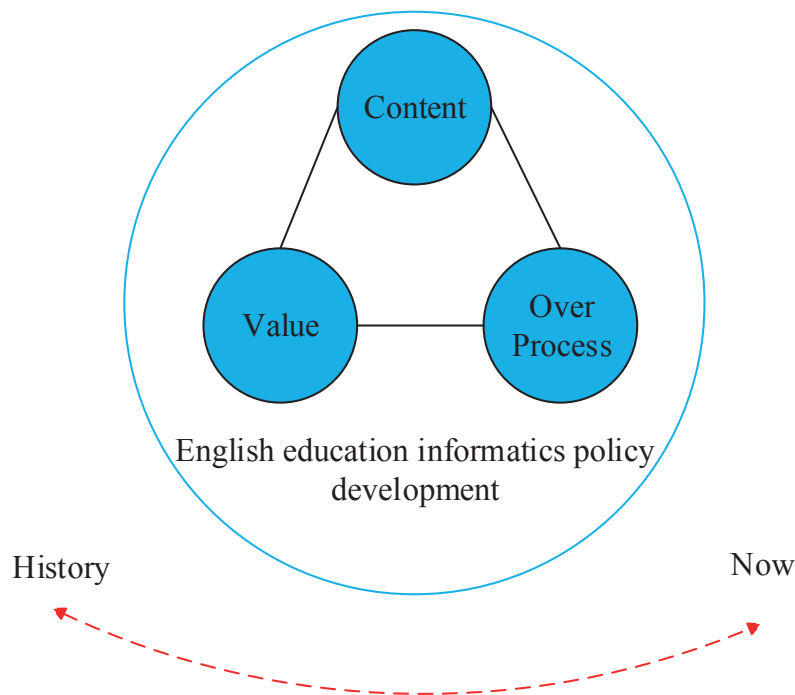

Currently, university English informatics teaching has entered an innovative phase. Teachers have begun to use cutting-edge technological tools such as artificial intelligence and virtual reality to better meet the learning needs of students. The information-based teaching in this period is mainly applied to personalized learning and intelligent assessment, and teachers have reached a high level of awareness and application of information-based teaching.

## **3. ENGLISH EDUCATION INFORMATIZATION POLICY DEVELOPMENT**

### **3.1. CONTENT SYSTEM ANALYSIS OF ENGLISH EDUCATION INFORMATIZATION POLICY DEVELOPMENT**

The content system of foreign language education informatization policy development is a specific factor of foreign language education informatization policy, which is an important link between policy theory and practice, and it includes both vertical and horizontal aspects. Vertically, the content analysis of foreign language education informatization policy refers to various ecological factors within the foreign language education informatization policy ecosystem, such as: hardware of foreign language education informatization such as infrastructure construction, software such as resource construction and application of foreign language education department informatization, teachers in the context of informatization, foreign language pedagogy, foreign language teaching materials, testing and evaluation, curriculum standards, etc. Horizontally, the policy ecosystem of foreign language education informatization interacts with and constrains other ecosystems in society, such as economic system and political system. Figure 1 shows the theoretical analysis framework of foreign language education informatization policy development in colleges and universities, and it can be seen that the issue of value orientation of foreign language education informatization policy plays an extremely important role in the planning activities of foreign language education informatization.

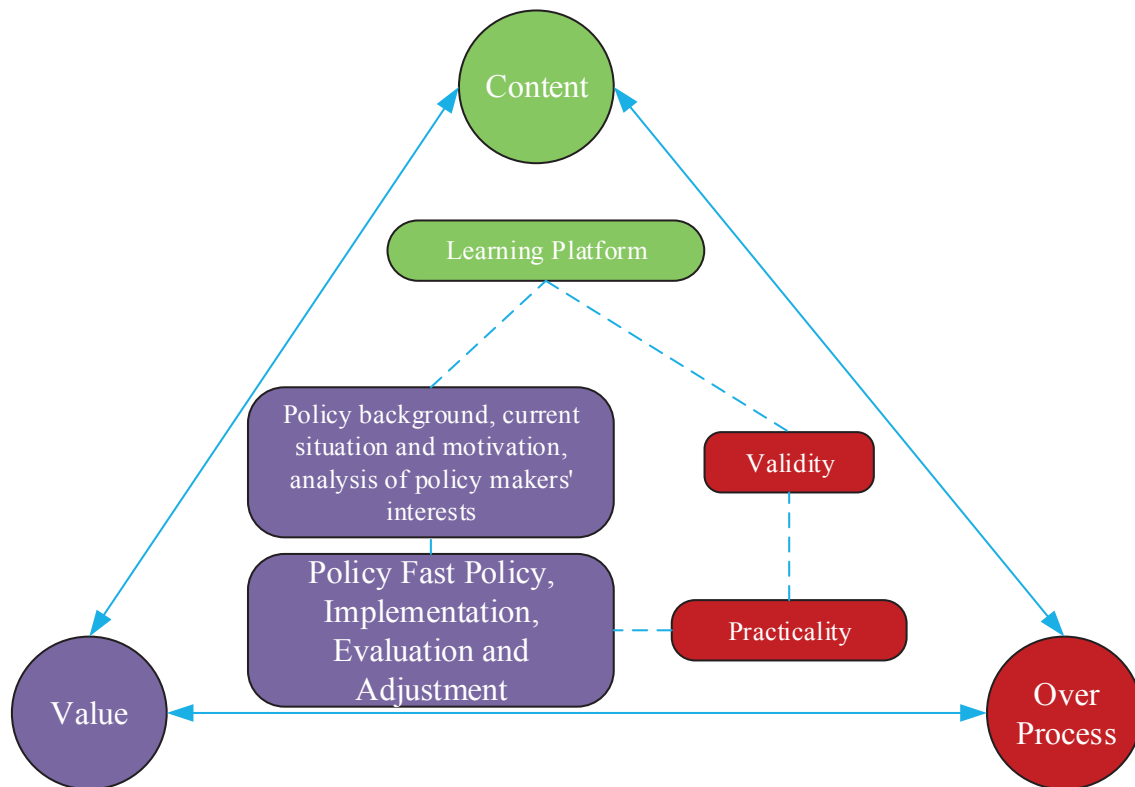

It is closely related to the motives and goals of language policy and education informatics policy planning, and governs the entire planning process of foreign language education informatics.

**Figure 1.** Policy development framework of English education informatization in higher education

### **3.2. VALUE SYSTEM ANALYSIS OF FOREIGN LANGUAGE EDUCATION INFORMATIZATION POLICY DEVELOPMENT**

Among the three factors of foreign language education informatization policy analysis, the process factor and the content factor of foreign language education informatization policy are governed by the value factor. The development of foreign language education informatization is a process of using modern information technologies in all areas of the foreign language education system in a comprehensive and in-depth way, accelerating the modernization of foreign language education and developing the full potential of foreign language learners using information technologies. Figure 2 shows the framework of the policy development model of foreign language education informatization in colleges and universities proposed in this paper.

**Figure 2.** Framework of English education informatization policy development model

With the continuous development and application of artificial intelligence technology, the development of university English informatization teaching will also develop in the direction of more intelligence, personalization and efficiency. Artificial intelligence technology will be widely used in the teaching process, such as intelligent voice recognition and intelligent assisted question answering, which will greatly improve the teaching effect and learning efficiency. The teaching content will be more personalized and diversified, and teachers can tailor the teaching content and teaching methods for students according to their learning situations and needs. The teaching platform will be more intelligent and efficient, and teachers and students can communicate and interact more conveniently and efficiently through the platform.

#### 4. CONCLUSION

This paper examines the development model of informatization teaching of college English in the context of artificial intelligence technology. By analyzing the framework of education informatization development model and the history of university English informatization teaching. This study concludes that university English informatization education has gone through three stages: start-up, development and innovation, in which artificial intelligence technology has been gradually incorporated. On this basis, this paper further analyzes the development content and value system of English education informatization policy, and puts forward suggestions for the current development of university English informatization education that requires the use of artificial intelligence technology and the strengthening of education informatization policy formulation and management.

College of Mechanical and Electrical Engineering, Hubei Three Gorges Polytechnic, Yichang, Hubei, 443000, China

[13507243824@163.com](mailto:13507243824@163.com)

---

## ABSTRACT

In this article, we investigate the distribution system's reliability and continuity predictions using the correlation of large-scale power supply and distribution data. According to the research, the factors with average variation above 0.0025 are the cableization rate of the 110kV power grid, the average maximum load rate of the 110kV power grid lines, the average maximum load rate of the 35kV power grid lines, the average power supply radius of the 10kV power grid, the number of high loss distribution substations of the 10kV power grid, and the average percentage of line strip that is satisfied by the 10kV power grid. Big data-based supply and distribution systems have a certain level of dependability and continuity, which can satisfy customers' needs for a dependable power supply and high-quality electricity.

## KEYWORDS

Power supply and distribution system; Power supply reliability; Management system analysis; Component reliability; Index analysis

## 1. INTRODUCTION

China's electricity system has grown bigger and more complex with the growth of the country's economy thanks to ongoing expansion and grid integration [1]. Although large systems are beneficial to the economic operation of the entire power grid, they make the possibility and hazards of major disasters and accidents greatly increased [2-3]. The power system is made up of three components: the power generation system, the transmission system, and the distribution system. Its primary function is to transmit qualified electrical energy to power users in a safe, cost-effective, and dependable manner [4-5]. The distribution system, which is the last component of the power system, is made up of substations that distribute power at various voltage levels, distribution lines and distribution feeders that constitute the distribution network and its equipment, whose role is to connect the power source or transmission and substation system to the users and to distribute and supply electrical energy to the users [6]. It is clear that the distribution system is the component of the power system that is most directly related to consumers and has a direct impact on the amount of power supplied to and used by end users [7-8]. The capacity of the power system to provide electricity and power to customers continuously in accordance with acceptable quality standards and necessary quantities is measured by the reliability and continuity of the power supply and distribution system. The reliability assessment of the power system is typically a measurement of the system's suitability. [9]. In this study, the power supply and distribution system's reliability and continuity evaluation analysis is built using big data technology, and the power supply and distribution system's reliability indices are examined. As compared to the component's stable

operation phase, system failures occur more frequently and last longer on average during the first fault phase and depletion fault phase. This has an impact on the power supply and distribution system's dependability and continuity.

## 2. RELIABILITY STUDY OF POWER SUPPLY AND DISTRIBUTION SYSTEM

### 2.1. BASIS OF RELIABILITY INDEX ANALYSIS OF SUPPLY AND DISTRIBUTION SYSTEM

The foundation for evaluating dependability is reliability indices. Different reliability indices are often directly generated in the reliability evaluation of the power supply and distribution system to quantitatively respond to the dependability level of the distribution network from many aspects. The distribution system reliability evaluation indexes are mainly divided into three kinds of indicators, such as outage time type index, outage frequency type index and power supply quantity, covering load point index and system index, average load point failure rate, average load point outage duration per failure, average load point annual outage time, average system outage frequency, average system outage duration, average power supply availability, average power supply shortage, average power supply quantity index, etc.

#### 2.1.1. COMPONENT RELIABILITY PARAMETERS

Component reliability parameters are the basic index data for reliability assessment, and the component reliability parameters involved in reliability assessment are failure rate and failure repair time.

Components in the unit of statistical time due to failure and can not continue to perform the specified function of the number of times called the failure rate, the statistical time is generally one year, its calculation formula is:

$$\mu = \frac{s}{h} \quad (1)$$

where  $y$  is the number of failures during the statistical time and  $t$  is the statistical time.

Component failure resulting in power failure to the faulty components through the repair or replacement of new equipment and the restoration of power supply experienced time is called fault repair time, generally reflected by the derivative of the repair time, its calculation formula is:

$$U = \lambda\mu \quad (2)$$

where  $s$  is the number of component repairs during the statistical period and  $h$  is the total time that the component was repaired.

#### 2.1.2. LOAD POINT RELIABILITY INDEX

The load point reliability index, which is a probability index that represents the predicted value under a certain probability distribution, measures the degree of dependability of continuous power delivery at each load point.

##### (1) Average Failure Rate

The total number of outages brought on by component failures over the course of a year is the average failure rate of a load point. The amount of the failure rate is a good indicator of how dependable the power supply is at the load point.

##### (2) Average Restoration Time

The ratio of the outage time to the total number of outages at a load point per year is known

as the average restoration time. The average restoration time, in a sense, reflects how soon the load point receives power following an outage; the higher the value, the slower the load point receives power.

### (3) Average Outage Duration

The total number of outages at a load point over the course of a year is the average annual outage length for that load point, and this indication directly represents the dependability of the power supply at each load point. The distribution network frequently uses each load point's outage time to determine how reliable the overall power supply is. The definition states that the calculating formula is:

$$U = \lambda\mu \quad (3)$$

where  $\lambda$  is the mean time to failure and  $\mu$  is the mean time to repair.

## 2.2. SYSTEM CONTINUITY ANALYSIS

### 2.2.1. SYSTEM STATIC STABILITY AND RESERVE FACTOR

The stability reserve factor of power system is not only used to indicate whether the given power system is stable under normal operation mode, but also can be used to understand the size of the stability limit of this normal operation mode and indicate the ability of power system to withstand the deterioration of operation mode or parameters. The reasonable stability reserve factor should be based on the summary analysis of power system design and operation experience and technical and economic arguments, and at the same time should use statistical methods to estimate the possibility of stability damage in individual parts of the power system and its consequences. If the reserve factor is too large, the equipment in the power system will not be used very effectively. On the contrary, if the reserve factor is too small, it will not ensure the safe operation of the system when certain changes in system parameters or operation methods occur.

### 2.2.2. TRANSIENT CONTINUITY ANALYSIS

The question of whether the generators can retain synchronous operation after the power system has been subject to significant disruptions is referred to as the transient stability of the power system problem. The following are the primary reasons for significant power system disruptions:

- (1) An abrupt shift in load, such as the addition or removal of heavy users, etc.
- (2) The removal or addition of significant system components, such as generators, transformers, and lines, etc.
- (3) Short-circuit problems happening.

The most severe disruption is a short-circuit fault, which is frequently used to determine if a system meets the requirement for transient stability. Various electromagnetic characteristics that describe the operational status of the system are vulnerable to fast changes when the power system is subject to a significant disruption. But before the power of the prime mover can be modified, a certain period of time must pass due to the governor's high degree of inertia. As a result, the generator's electromagnetic power and the prime mover's mechanical power are no longer in balance, and an imbalanced torque is produced. Under the action of the unbalance torque, the generator starts to change its speed, so that the relative position between each generator rotor changes (mechanical movement). The change in the relative position of the generator rotors, i.e. the relative angle, in turn affects the change in current, voltage and generator electromagnetic power in the power system. Because of this, the

complicated process of the power system transient produced by huge disturbances, when there is a tangle of mechanical motion between the generator rotors and electromagnetic transient processes.

### 3. RELIABILITY ANALYSIS OF POWER SUPPLY AND DISTRIBUTION SYSTEM BASED ON BIG DATA TECHNOLOGY

#### 3.1. RELIABILITY ANALYSIS

The model trained using big data technology is able to be used to conduct sensitivity analysis of pertinent influencing factors and examine the level of influence of each pertinent factor on the predicted value of supply and delivery reliability. The prediction results are then displayed in Figure 1. The cableization rate for 110kV grid, the average maximum load rate for 110kV grid lines, the ratio of main substations satisfied by 35kV grid, the average maximum load rate for 35kV grid lines, the average supply radius for 10kV grid, the number of high loss distribution substations for 10kV grid, and the ratio of lines satisfied by 10kV grid are the factors with an average variation above 0.0025.

According to the prediction results, the aforementioned seven factors have a disproportionately large impact on the reliability of the power supply and distribution system, and this information has a specific reference value for the measures to increase the system's level of dependability, i.e., improvements can be made in these seven areas to increase the system's level of dependability.

Figure 1. Comparison of the magnitude of change in each factor

#### 3.2. ANALYSIS OF BUILDING A BIG DATA FUSION MANAGEMENT SYSTEM

A large data analysis experiment based on the fusion management system is constructed in order to examine the reliability and continuity research of the power supply and distribution system, the computation is completed in the following four schemes after the addition of the time-varying failure rate model and time-varying load., and the system reliability indexes calculated under different schemes are shown in Table 1:

Scheme 1: The load model employs the average load, and the component failure rate is constant.

Scenario 2: The load model employs time-varying load, and the component failure rate is

constant.

Option 3: The component failure rate is modeled as a time-varying failure rate that considers the impact of equipment life cycle, and the load is modeled as variable in time load.

Option 4: The load is a variable in time load model, and the component failure rate is a variable in time failure rate model that considers both equipment life cycle and environmental conditions.

According to the experimental results, the average frequency and duration of system outages are higher during the initial fault stage and wear-out fault stage than during the stable operation stage, and the corresponding system power shortage EENS increases and the system power availability ASAI decreases.

**Table 1.** Calculation results of system reliability indicators under different scenarios

Different programme indicators	SAIFI	SAIDI	CAIDI	EENS	ASAI
Option 1	1.7804	7.1103	5.2573	53.8306	98.4595
Option 2	1.6734	7.8034	6.0451	57.3075	96.5791
Option 3	2.2008	8.9551	6.3208	59.3922	99.4910
Option 4	2.1067	9.4538	6.3361	61.5270	98.1287

#### 4. CONCLUSION

People's expectations for a dependable power supply and high-quality power are increasing as China's economy and society expand. Meanwhile, the distribution system, which has a direct impact on the consistency and dependability of the power supply, is getting larger and larger in scale, and the grid structure is becoming more and more complex, so it is more difficult to analyze its reliability by traditional methods.

The advent of the information age has brought about a massive amount of data from multiple heterogeneous sources, innovations in related technical means, and changes in people's way of thinking. This paper intends to give voice to the data and conduct research on the reliability and continuity prediction assessment method of distribution system from the relevance of big data of electricity distribution. For an open and complex distribution system, there are intertwined correlations among its components, and the correlations among various types of data generated by the system are the concretization of such correlations. Based on the relationship between big data and the dependability and continuity of the power supply and distribution system, the elements pertaining to the reliability of the distribution network are mined from the vast amounts of data in this study. By employing big data analytic technology to train and learn from past data on distribution system continuity and reliability, the prediction model is created to forecast and evaluate the degree of distribution system dependability throughout the course of the future. The distribution system's system dependability may be predicted and calculated using big data analytic technology.

# A STUDY OF PSYCHOLOGICAL STRESS ASSESSMENT ALGORITHMS FOR SECURITY PERSONNEL IN HIGHER EDUCATION INSTITUTIONS IN DIFFERENT PERIODS

---

Silan Chen\*

Yueyang Institute of Vocational Technology, Yue Yang, Hunan, 414000, China

[yyzy0405@sohu.com](mailto:yyzy0405@sohu.com)

---

## ABSTRACT

This paper analyzes the causes and physiological mechanisms of psychological stress changes in university security personnel. The accuracy of the psychological stress assessment method with multimodal physiological signals is explored. The characteristics of three physiological parameters, EEG, ECG and EMG, which contain rich information of psychological changes were fully utilized. The average correct classification rate of EEG signal was 84.7%, that of ECG signal was 83.16%, and that of EMG signal was 81.12%. Therefore, the psychological stress assessment method based on the fusion of multiple physiological parameters can more objectively determine the psychological stress state of the test subjects.

## KEYWORDS

Security personnel in higher education institutions; Psychological stress assessment; Integration of multiple physiological parameters; Information on psychological changes; Physiological mechanisms

## 1. INTRODUCTION

Appropriate psychological stress can improve people's work efficiency, but excessive or long-term psychological stress will have adverse effects on people's lives and even affect their physical health [1]. How to accurately assess the state of psychological stress has become a key direction of modern psychological research [2-3]. In the field of psychology, psychological stress is assessed mainly by means of questionnaires, which only subjectively assesses the test taker's psychological state and thus lacks accuracy and objectivity [4-5]. In contrast, the method of psychological stress assessment based on physiological parameters can more objectively determine the state of psychological stress of the tester [6]. Security guards, in the new era, play an irreplaceable role in maintaining social security and stability [7]. Security work, due to the nature of its work, is bound to face more dangers, which puts it in a bad psychological condition for a long time. When people are under psychological stress, the human physiological system will produce corresponding stress changes and maintain a balanced state within its tolerance range. However, if people are subjected to a greater degree of psychological stress for a long time, the physiological equilibrium state of the human body will be broken, and then, a series of adverse effects on the human body, such as depression and cardiovascular diseases [8]. In order to ensure the psychological health of security personnel in higher education institutions, it is very urgent to quickly and accurately assess the psychological state and help regulate the psychological stress in a reasonable way.

## **2. CAUSES AND PHYSIOLOGICAL MECHANISMS OF PSYCHOLOGICAL STRESS CHANGES IN UNIVERSITY SECURITY PERSONNEL**

### **2.1. ANALYSIS OF PSYCHOLOGICAL STRESS OF SECURITY PERSONNEL IN COLLEGES AND UNIVERSITIES**

#### **2.1.1. PSYCHOLOGICAL STRESS BASED ON THE NATURE OF SECURITY WORK**

Security work due to its nature of work, is bound to face more dangers, including the capture of suspects, will be the other side of strong resistance, or even force confrontation. For security personnel's physical fitness, skills level is not high, in the face of emergencies, can not be timely and correct disposal, and make itself in an isolated situation. From the experience of others or themselves, security personnel will have fear and nervousness about this danger.

#### **2.1.2. PSYCHOLOGICAL STRESS BASED ON THE EMPLOYMENT RELATIONSHIP OF SECURITY WORK**

Most of the security professions in China are irregular and temporary jobs, and the relationship between security personnel and universities is mostly employment. The rights and obligations of security personnel are mostly stipulated by the hiring party, which cannot fully protect the legitimate rights and interests of security personnel. There is no industry organization to protect the rights and interests of security personnel. In addition, the temporary nature of the work makes security personnel to get by. The psychology of not concentrating on security work leads to low efficiency and fails to achieve the goal of keeping the peace.

#### **2.1.3. PSYCHOLOGICAL QUALITY OF SECURITY PERSONNEL CONTENT**

(1) Conscientious and responsible working attitude. Be honest and easy-going, smart and strong, good at learning and thinking, active, serious and responsible, down-to-earth, extremely enterprising, confident in the future, trying to make themselves a valuable person.

(2) Rich in understanding and compassion. First, it is shown in the interaction with students can be equal to others, modest and calm, honest and trustworthy, good at communicating with others, self-aware and compassionate.

(3) Have the spirit of unity and cooperation. Solidarity and cooperation are the abilities that modern college security guards have.

(4) Have a more perfect psychological quality ability. An important task of security work in colleges and universities is to distinguish individuals who are mixed in the crowd and may carry out sabotage activities. In this identification process, the social experience of security personnel is a severe test. Security personnel should master the psychological quality of basic skills: keen observation, accurate memory, good thinking skills, strong communication skills, the necessary grappling skills.

### **2.2. PHYSIOLOGICAL MECHANISMS OF CHANGES IN PSYCHOLOGICAL STRESS**

#### **2.2.1. PHYSIOLOGICAL EFFECTS OF CHANGES IN PSYCHOLOGICAL STRESS ON THE HUMAN BODY**

When a person experiences a physical or psychological stressful stimulus, the brain initiates a stress response, followed by a series of reactions within the body. The stress response is a healthy defense mechanism that involves the release of many biochemical and physiological indicators related to hormones. However, the continued release of these hormones during chronic psychological stress conditions can be detrimental to physical health, increasing the risk of many diseases, including heart disease, stroke, and angina. Stress hormones can weaken the immune system and cause the body to be susceptible to infections.

The human autonomic nervous system is specifically associated with negative psychological states such as stress, anxiety, and depression. The ANS performs and regulates automatic bodily functions related to respiration, heart rate, digestion, and the endocrine system, and the ANS contains sympathetic and parasympathetic nervous systems that initiate the stress relaxation response, respectively. Normally, a balance is maintained between the sympathetic and parasympathetic nervous systems, and chronic stress can disrupt this balance, leading to the development of stress-related health problems.

### **2.2.2. ANALYSIS OF ELECTROCARDIOGRAPHIC SIGNALS IN PSYCHOLOGICAL STRESS STATES**

The ECG signal is closely related to human psychological stress, and the relevant physiological indicators extracted from the ECG signal can visually reflect the state of human psychological stress, among which heart rate and heart rate variability are extremely important indicators for analyzing ECG characteristics.

In a normal person, the number of heart beats per minute in a quiet state is 60 to 100 beats per minute. When the human body is subjected to certain external stimuli, the phenomenon of psychological tension or nervous excitement will arise, which will make the human heart diastolic and contraction speed up, and the heart rate will increase as a result.

## **3. PSYCHOLOGICAL STRESS ASSESSMENT BASED ON THE INTEGRATION OF MULTIPLE PHYSIOLOGICAL PARAMETERS**

### **3.1. STUDY ON THE APPLICATION OF PHYSIOLOGICAL SIGNAL ACQUISITION SYSTEM IN PSYCHOLOGICAL STRESS ASSESSMENT**

Psychological stress, also known as psychological stress, is a state of physical and mental tension that the human body exhibits physiologically and psychologically when it is stimulated by the internal and external environment. Considering that the characteristics of physiological signals cannot be disguised, the physiological signals of the human body can be used to objectively and effectively assess the psychological stress state of the human body.

This system is based on a multimodal physiological signal-based psychological stress assessment method, including physiological data acquisition, preprocessing, feature extraction, data set partitioning, training process, assessment process and three psychological stress assessment outputs of calm, mild stress and high pressure. The training process starts with the classification of the features extracted from a single modality by SVM and calculates the posterior probability and confusion matrix based on the classification results of the single modality. This is used to construct the basic probabilities of DS decision layer fusion, and finally the classification judgment of decision layer is performed using DS evidence theory to calculate the comprehensive classification results of psychological stress under multimodal information.

### **3.2. GA-BASED OPTIMIZATION SEEKING SVM CLASSIFICATION RESULTS**

In this paper, three physiological parameters, EEG, ECG, and EMG, were collected simultaneously in the data acquisition, where two electrodes, FP1 and FP2, were collected for the comparison of the mental stress information embedded in the EEG signals of the left and right hemispheres of the brain. The electrode leads of the ECG signal were the right upper limb and the left and right lower limbs, while the EMG signal was collected from the expression muscles on both sides of the cheeks, i.e., the surface EMG signal. A total of 50 samples were collected in the paper, and the ratio of the number of samples in the training set to the number of samples in the test set was set to 30:20. GA-seeking SVM classification was performed for the three physiological parameters, and the maximum and average correct rates of the training and test sets are shown in Table 1. The EEG signals were collected simultaneously from two

electrodes, FP1 and FP2. In the training and test sets, the maximum correct rate and the average correct rate of EEG signal classification were greater for the FP1 electrode than the FP2 electrode, based on the fact that the FP1 electrode was located in the left forehead of the brain and the FP2 electrode was located in the right forehead of the brain, indicating that the EEG signal of the left forehead of the brain contained richer information of psychological stress than that of the right forehead of the brain.

Comparing the classification accuracy of three physiological parameters, EEG, ECG and EMG, the maximum correct rate and the average correct rate of classification of EEG signals in the FP1 region of the brain were the largest in either the training set or the test set, with the maximum correct rate of 90.21% and the average correct rate of 82.34% in the test set. In summary, SVM combined with DS can effectively classify three different stress states, and their classification accuracies are all relatively high.

**Table 1.** GA Optimization Search SVM Classification (%)

Physiological parameters	Training set correct rate		Test set correct rate	
	Maximum value	Average value	Maximum value	Average value
EEG-FP1	93.24	85.23	90.21	82.34
EEG-FP2	89.45	80.48	82.36	83.27
ECG	92.26	84.32	85.42	78.32
EMG	90.34	82.19	87.14	79.48

### 3.3. COMPARISON OF SVM FEATURE LAYER CLASSIFICATION AND DS EVIDENCE THEORY DECISION LAYER CLASSIFICATION RESULTS

The maximum values of correct classification rates for EEG and ECG signals during SVM feature layer fusion classification are shown in Table 2. 92% and 86%, respectively. Only one of the two sample ordinal numbers for the misclassified EEG signal and the sample ordinal numbers for the misclassified ECG are the same, and the rest are different, i.e., for different physiological parameters, they do not contain exactly the same amount of information about psychological stress, and the classification results indicate that the EEG signal contains more information about psychological stress than the ECG signal. The average correct classification rate of the EEG signal was 84.7%, the average correct classification rate of the ECG signal was 83.16%, and the average correct classification rate of the EMG signal was 81.12%. This indicates that the classification of EEG signals is the best, followed by ECG signals, and the classification of EMG signals is lower than that of EEG and ECG signals when performing GA-seeking SVM feature layer fusion classification.

In summary, all three physiological signals, EEG, ECG, and EMG, are capable of effective quantitative analysis of psychological stress levels. Among them, DS evidence theory decision layer classification is more effective than feature layer fusion on a theoretical basis, and this is also proved by experimental data. When performing psychological stress classification, the higher the correct rate, the better it can help people to regulate psychological stress.

**Table 2.** Comparison of SVM and DS evidence theory classification results (%)

Classification		Test set correct rate	
		Maximum value	Average value
SVM feature layer fusion classification	EEG	92	84.7
	ECG	86	83.16
	EMG	84	81.12
DS Theory Decision Level Fusion Classification	EEG+ECG	98	89.42
	EEG+EMG	94	84.27
	ECG+EMG	94	85.61
	EEG+ECG+EMG	96	87.45

#### 4. CONCLUSION

In this paper, three typical physiological parameters, EEG, ECG and EMG, are used to achieve effective assessment of psychological stress based on a decision layer fusion algorithm combining DS evidence theory and SVM. In order to verify the feasibility of the multimodal physiological signal acquisition system, relevant calibration experiments were designed to further validate the stability and reliability of the system for resting physiological parameter acquisition by conducting comparison tests on EEG, ECG, EMG, and parameters, respectively. Psychological stress assessment experiments were designed to extract the time domain, frequency domain and nonlinear feature parameters related to psychological stress in the signal to form a psychological stress dataset, and the dataset was divided into training and test sets according to the computational model. Finally, the subjects' psychological stress states were classified by multi-classification SVM and DS evidence theory algorithms. The experiments demonstrate the feasibility of assessing psychological stress based on the fusion of multiple physiological parameters for psychological stress.

## **ABSTRACT**

With the rapid development of digital media technology, a new development opportunity has been brought to traditional art education. In this paper, in order to study the reform of the teaching mode of aesthetic education for college students based on digital media technology, students' views on the use of digital media technology for aesthetic education teaching are analyzed. In order to explore the feasibility of digital media technology for aesthetic education teaching mode reform, the research data show that 62.9% of students think it is very necessary for teachers to apply digital media courseware, and 10.2% of students think it is somewhat necessary. It shows that the reform of the teaching mode of college students' aesthetic education based on digital media technology solves the long-standing teaching problems in traditional teaching.

## **KEY WORDS**

Traditional art education; College students' aesthetic education teaching; Teaching mode reform; Art curriculum; Art curriculum design

## **1. INTRODUCTION**

With the reform of education, the contradiction between the richness of art classroom content and the scarcity of teaching hours is in front of educators [1] How to stimulate students' interest in the university art classroom and how to fit the development of the era of digital media art, so that the art classroom can really achieve short time and high efficiency and richness, and truly realize the goal of the university art curriculum standards and promote the reform of university students' aesthetic education teaching mode [2-3]. In the general environment of digital media, we should uphold the scientific and diversified path to create the best use channel applicable to university art course education, and explore and improve it continuously in practice [4-5]. The introduction of digital media art into university art courses aims to enable students to understand and master cutting-edge artistic expressions and approaches, change their learning styles, expand their thinking, cultivate their creativity and practical skills, and enrich their aesthetic and expressive approaches [6-7]. The promotion of digital media technology has led to a significant increase in teaching efficiency and a marked improvement in the effectiveness of the university art classroom. The key has been significantly effective in inspiring students' creativity, broadening their horizons, and enhancing their motivation to learn art [8].

This study seeks to explore the practical value of digital media in reforming the teaching mode of college students' aesthetic education, to do practical analysis on the introduction of digital media into the college art classroom, and to explore new methods of research to better

cut digital media technology into the reform of college aesthetic education teaching mode.

## **2. THE NECESSITY AND FEASIBILITY OF DIGITAL MEDIA TECHNOLOGY TO REFORM THE TEACHING MODE OF AESTHETIC EDUCATION**

### **2.1. THE NECESSITY OF USING DIGITAL MEDIA TECHNOLOGY IN AESTHETIC EDUCATION**

#### **2.1.1. THE NEED TO CULTIVATE STUDENTS' INTEREST IN ART LEARNING**

Mobilizing students' interest in learning is the key to achieving the desired teaching effect. In a boring learning life, if digital media technology can be used to make art classes interesting and fun, it will certainly attract students' attention and make them interested in art teaching, so that they can participate more seriously in art teaching classes and continuously improve their art level and artistic cultivation. Art is one of the art disciplines with strong intuition. In the traditional art teaching, teachers often cannot get rid of the teacher's general talk, a lot of jargon explanation, lack of limited picture materials, monotonous and uncreative imitation exercises, which, over time, make students' original active and divergent thinking become rigid and formatted, completely losing the original purpose of art teaching as the teaching goal of inspiring students' creativity and imagination. In fact, art classes can be colorful. In fact, art classes can be colorful, and the key is to make clever use of teaching aids like digital media technology. Digital media technology provides an extraordinary wealth of materials and tools for the art classroom, whether it is a variety of vivid and interesting videos, a variety of pictures, or computer painting and creation itself, all of which can be effectively linked to the art classroom and become tools to assist in the development of classroom teaching.

#### **2.1.2. THE LACK OF TRADITIONAL ART TEACHING**

The main reason for using digital media technology in art teaching is that traditional art teaching has deficiencies and shortcomings, and does not fully motivate students' interest in learning art. In traditional art teaching, teachers usually only explain the theory, and use blackboard painting and display some objects to enhance students' art appreciation and ability. Such teaching methods are relatively backward, boring and tedious. Traditional art teaching still adopts the indoctrination teaching method, students' interest in participation is not high, and the classroom effect is also very ordinary. If digital media technology can be used, the teaching effect will be very different. By using digital media technology in art teaching, not only the teaching effect is obviously very effective, but also the teaching objectives can be successfully accomplished.

#### **2.1.3. THE NEED TO DEVELOP STUDENTS' MEDIA LITERACY**

In the information-based society, the expression and dissemination of art are expanding. In the past, people could only learn about art information through books and art museums, but now they can access art information at any time whether they are walking on the street or at home. With the continuous development of digital media art, the ways of artistic expression have diversified, and how to train students to express themselves with media information in the art classroom has become an important part of the art curriculum, so that students can understand the beauty of art and enhance their creative and practical skills. Today, artistic expression has been diversified by the influence of digital media technology, and modern media are well integrated with classical art.

### **2.2. FEASIBILITY OF DIGITAL MEDIA TECHNOLOGY FOR AESTHETIC EDUCATION TEACHING MODE REFORM**

In modern society, the Internet has become an important way for people to understand the world, present themselves and communicate with each other. At the same time the internet is

an important resource to support the teaching of modern media art. The network also makes the world connected and the art open more and more. At the same time, the advantages of fast transmission speed and short update time of network resources are beyond the reach of traditional publications. As a contemporary teacher, it is important to learn to use Internet resources wisely and to collect the latest artworks at all times. The teacher first teaches students how to use Internet resources, selects resources with a positive attitude towards life, and teaches them to improve their artistic taste from Internet resources, thus enhancing the quality of their own creations.

### **2.3. REQUIREMENTS OF TEACHERS FOR THE INTRODUCTION OF DIGITAL MEDIA INTO ART COURSES**

In this new attempt to introduce digital media art creation into the university art classroom, the teacher must be psychologically prepared for a change in role. On the one hand, the teacher must be a good facilitator of the active construction of meaningful knowledge for the learners, and on the other hand, he or she must pay attention to the cultivation of his or her own comprehensive qualities and prepare the students for the active construction of knowledge structures as necessary:

#### **(1) Teachers should have media awareness**

The introduction of digital media into the college art classroom is both an opportunity and a challenge for art teachers. On the one hand, digital media provide us with multifaceted classroom resources, such as graphics, video, audio, etc. to enrich our classroom content and improve classroom efficiency, on the other hand, the use process often brings trouble to education and teaching due to improper understanding or use. In order to solve the difficulties, first of all, we should have the right media awareness.

#### **(2) Teachers should have the ability to explore new teaching methods**

The introduction of modern media art creation into the college art classroom is a new attempt in art education, and there are countless teaching methods waiting for teachers to try and explore. In the era of information-based education, the role of teachers has changed from being the organizer and transmitter of knowledge to being the facilitator of students' knowledge construction. While the role of teachers changes, classroom teaching methods must also change and new, scientific modern educational ideas and concepts must be established.

## **3. RESEARCH ON REFORMING THE TEACHING MODE OF AESTHETIC EDUCATION BASED ON DIGITAL MEDIA TECHNOLOGY**

### **3.1. CONSTRUCTION OF DIGITAL MEDIA ART CREATION CURRICULUM DESIGN STUDY**

Students are the subjects of the classroom and the active constructors of knowledge. In order to study the necessity of digital media technology for aesthetic education teaching. The analysis of students' views on the use of digital media technology for aesthetic education teaching is shown in Figure 1. The research data show that 62.9% of students think it is very necessary for teachers to use digital media courseware, 10.2% of students think it is necessary, 8.5% of students think it is indifferent, and 18.4% of students think it is not necessary. This shows that the majority of students still want teachers to use multimedia courseware containing a lot of picture information in the art classroom.

**Figure 1.** Students' research on teaching aesthetic education in digital media

### 3.2. ADVANTAGES OF REFORMING THE TEACHING MODE OF AESTHETIC EDUCATION IN DIGITAL MEDIA TECHNOLOGY

In response to the role of digital media technology used in the classroom, a study was set up to analyze the impact of digital media technology on the teaching mode of art education, and the analysis data are shown in Table 1 below. Students mostly affirmed the value of digital media art, and believed that the role played by the introduction of digital media art in the art classroom was also multifaceted, enriching art teaching materials and making classroom teaching more interesting, as well as making art knowledge more understandable and increasing interaction with the teacher in the classroom. This shows that students highly approve of the use of digital media technology in the art classroom.

**Table 1.** Advantages of using digital media technology

The role of digital media technology use	Number of people	Proportion
Richer teaching materials	164	83.2%
Richer materials for teaching art	118	78.6%
More understandable knowledge	94	64.7%
Increased classroom interaction	109	74.3%
Other	87	48.7%

### 4. CONCLUSION

With the advent of the digital age, the integration and unification of technological development and art creation is becoming the development direction of art education in universities around the world, and the reform of the teaching mode of aesthetic education for college students based on digital media technology deserves further exploration and research in the dual dimensions of education and teaching experience and doctrine. Nowadays, the tentacles of science have penetrated into all aspects of social life, and the era of media and technology has quietly come. Education, as a fundamental backbone of social development, also needs to draw on the energy of science and technology. Along with the rise and rapid

development of digital media, the teaching process has begun to integrate more digital media elements and assist in the creation of art disciplines and the cultivation of aesthetic education, which is a worldwide trend. Only by stimulating the degree of students' interest can art teaching be implemented effectively and the depth and breadth of teaching be improved. The use of digital media in art teaching not only provides teachers with rich and diverse teaching contents and means but also greatly broadens students' knowledge and vision, solving many long-standing teaching problems in traditional teaching.

---

## ABSTRACT

At present, the main problem of foreign language teachers' team construction in colleges and universities is the lack of a reasonable performance evaluation system and a sound incentive mechanism. This paper explores the team building model of foreign language teachers in colleges and proposes to build a performance system of foreign language teachers in colleges and universities based on fuzzy algorithm. The evaluation factors of teachers in the performance evaluation assessment system are set. The information of teachers is collected and the evaluation factors of teachers are designed in layers, and the weights of factors in each layer are ensured to be accurate. Thus the fuzzy algorithm-based performance system for foreign language teachers in colleges and universities has some guiding significance in achieving the promotion of professional development of teachers' teams.

## KEYWORDS

Stratification of evaluation factors; Team building model; Scientific performance evaluation; Teacher performance system; Performance evaluation factors

## 1. INTRODUCTION

As a form of promoting teachers' professional development, team building for foreign language teachers in higher education is a way for teachers to combine into an organization in some form in a culture of cooperation and sharing [1-2]. And in the organizational life around the common aspirations and development goals, in the process of continuous learning and practice, through cooperation, communication, sharing and reflection, they cooperate and support each other and share their practical experiences with each other, so as to achieve the teachers' own professional development [3-4].

At present, computer technology has penetrated into all levels of social life, and the efficiency of people's life and work has been significantly improved [5]. In various schools, the traditional teacher performance evaluation qualification assessment system, which is based on human subjective criteria, faces many human factors in order to improve the objectivity of the evaluation and reduce the interference of human factors [6-7]. Therefore, from the study of the drawbacks of teacher performance evaluation, the evaluation of teachers in the face of which cannot be quantified, the traditional evaluation methods are currently unable to reflect the teacher's teaching level, moral quality level, and scientific research level in a comprehensive manner [8]. It is also no longer suitable for the requirements of society that the evaluation of talent quality is becoming more and more scientific and standardized, so the development of a new teacher performance evaluation and assessment system becomes

inevitable, as well as the use of the teacher performance system to conduct the teacher performance evaluation and assessment system.

## **2. ANALYSIS OF THE CURRENT SITUATION OF FOREIGN LANGUAGE TEACHERS' TEAM BUILDING IN COLLEGES AND UNIVERSITIES**

### **2.1. THE DEVELOPMENT OF FOREIGN LANGUAGE TEACHER TEAM BUILDING IN HIGHER EDUCATION**

#### **2.1.1. LONG-TERM FIXATION OF FOREIGN LANGUAGE TEACHER TEAMS IN COLLEGES AND UNIVERSITIES**

Due to the problem of imperfect regional teacher exchange mechanism, teacher resources do not flow up, which leads to the fault of teacher structure. The construction of foreign language teachers' team in colleges and universities is affected by the teacher establishment, the team has few new teachers joining and no new teachers supplementing the team, and the team's vitality appears to be increasingly insufficient. The existing team of English teachers has a single education, a single knowledge structure, weak scientific research power, low level of writing papers, unable to raise their teaching practice to the theoretical level, resulting in no hard scientific research achievements in the title evaluation. Therefore, the development of foreign language teachers' team in colleges and universities needs to be supplemented by the mobility of teachers and new teachers.

#### **2.1.2. LACK OF CULTURE OF COOPERATION AND SHARING WITHIN THE TEAM OF FOREIGN LANGUAGE TEACHERS IN HIGHER EDUCATION**

A team of foreign language teachers in higher education is a cooperative organization with common ideals, goals and beliefs, a relatively stable, united and cordial group formed based on cooperation guided by professional or industry norms. Cooperation and sharing are the prerequisites for the community to carry out community activities and the basic principles for maintaining the partnership among community members. Cooperation and sharing transcends the traditional, simple mentoring and being mentored relationship among members. This relationship not only strengthens collaboration and communication among teachers, but also is beneficial to increasing the unity and friendship among teachers, forming a democratic, open and lively interpersonal atmosphere, triggering the positive psychology of teachers' love for education and commitment to practice, and promoting the professional development of individuals and groups in the community.

However, from the current situation of the development of foreign language teachers' team building in colleges and universities, it can be seen that the culture of cooperation and sharing is generally lacking. There is more competition than cooperation among teachers, a lack of sharing consciousness among teachers, and a lack of mutual trust and support atmosphere. The individualistic teaching culture of teachers is deeply rooted in the teachers' group and permeates all aspects of teachers' work and study, and it is becoming a major obstacle to the development of the community day by day.

### **2.2. RESEARCH ON FOREIGN LANGUAGE TEACHERS' PERFORMANCE IN UNIVERSITIES BASED ON FUZZY ALGORITHM**

#### **2.2.1. ESTABLISH SCIENTIFIC PERFORMANCE EVALUATION INDEX SYSTEM BASED ON FUZZY ALGORITHM**

Teacher development is a major issue in educational research and practice because quality education is only possible with high quality teachers. The role of teachers in education depends on the quality of teachers themselves on the one hand, and on a reasonable and effective teacher management system on the other. Therefore, it is more important than ever

to establish an effective teacher performance evaluation system based on fuzzy algorithm to evaluate teachers' performance in an open, fair, scientific and efficient way.

## **2.2.2. SYSTEM INDEX CONTENT OF PERFORMANCE APPRAISAL OF TEACHERS IN COLLEGES AND UNIVERSITIES**

According to the different weights of performance appraisal indexes of university teachers, the types of appraisal systems can be divided into three types, research-oriented, teaching-oriented and comprehensive-oriented. If the research-oriented performance appraisal system is used, the weight of research should be increased to guide teachers to pay attention to research in order to meet the development strategy of research-oriented universities. If a teaching-oriented performance appraisal system is used, the weight of teaching should be increased, and teaching should be the main focus, and research should be the secondary focus, in order to adapt to the development strategy of teaching-oriented universities. The comprehensive-oriented performance appraisal system should give equal weight to teaching and research to support the balanced development strategy of the university.

## **3. FUZZY ALGORITHM-BASED PERFORMANCE SYSTEM FOR FOREIGN LANGUAGE TEACHERS IN UNIVERSITIES**

### **3.1. ANALYSIS OF FOREIGN LANGUAGE TEACHERS' PERFORMANCE EVALUATION SYSTEM IN HIGHER EDUCATION**

How to make a fair and objective evaluation of teachers' teaching is also an important issue for foreign language teachers' team building. In the past, the sum method was often used in teaching evaluation, i.e., students, experts, and peers used the evaluation form, and students, experts, and peers gave the teachers scores and then summed them up to find the total. This method has some drawbacks. In some cases we set different weights depending on the assessment index but there are still problems. In many cases, certain index factors are ambiguous, such as teaching objectives, teaching methods, etc., which are difficult to evaluate with a single score. "In many cases, it is difficult to use one score to evaluate the teaching objectives and teaching methods. Therefore, it is very important to establish a fair and objective performance system for foreign language teachers in universities.

### **3.2. LOGIC MODEL OF FUZZY ALGORITHM-BASED PERFORMANCE EVALUATION SYSTEM**

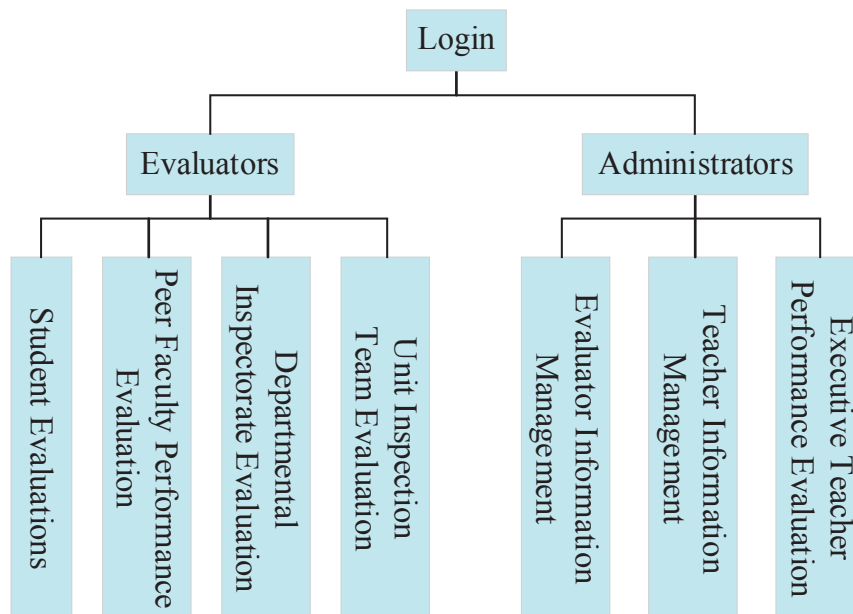

The logic model of the performance evaluation system based on fuzzy algorithm is shown in Figure 1.

(1) Rich expressiveness, i.e., the ability to express various needs of users and fully reflect the real world.

(2) Easy to communicate and understand. The conceptual model has strong verbal expression ability, which is a language for users to communicate with database designers and can directly express different semantic knowledge in the application.

(3) Easy to modify and expand. In order to reflect the needs of users and changes in the environment at any time, the conceptual model must be able to change flexibly.

(4) It can be converted to different data models. Since the conceptual model is independent of the DBMS, it can be easily converted to various data models such as mesh model, relational model or hierarchical model.

**Figure 1** System logic function model

### 3.3. DATA ANALYSIS OF EVALUATION FACTORS OF TEACHER PERFORMANCE EVALUATION ASSESSMENT SYSTEM

In order to improve the teacher performance evaluation assessment system and collect the basic information of teachers in an objective and detailed way, the evaluation factors of teachers in the performance evaluation assessment system are shown in Table 1. The weights in each of their evaluation factors are set accurately. The information of teachers is collected and the evaluation factors of teachers are designed in layers, and the accuracy of the weights of the factors in each layer is ensured. Design a large number of tables and a large number of recorded factor data in the evaluation factor data so that the evaluation results are more correct and objective. Accurate definition and operation are carried out in the process of implementation, and the operation efficiency of the system is gradually improved.

**Table 1.** Table of evaluation factors of teacher performance evaluation system

Level 1 evaluation factors	Weights	Level 2 evaluation factors	Weights
Business level	0.45	Study the business diligently	0.1
		student management	0.25
		Job target tasks	0.3
		Job task quality	0.3
Work discipline	0.3	Commute to work on time	0.25
		Concentrate on work during working hours	0.25
		School Rules and Regulations	0.25
		Compliance with professional ethics	0.25
Work Style and Collaboration	0.25	Spirit of Giving	0.2
		Serious work	0.25
		Cooperation and Communication	0.30
		willingness to help	0.2

## 4. CONCLUSION

The team building of foreign language teachers in colleges and universities not only promotes the professional development of foreign language teachers, but also promotes the change of teacher management in educational management communities and schools as well as the construction of teachers' teams in the region. In this paper, the research of foreign language teacher team building model in colleges and universities based on fuzzy algorithm is fully used in the teacher performance evaluation system through the gradual and in-depth

study of fuzzy algorithm. The existing fuzzy evaluation algorithm is also improved. A multi-level fuzzy comprehensive weighted evaluation algorithm is designed, thus breaking the limitations of the single-level fuzzy comprehensive evaluation algorithm and improving the objectivity of teacher performance evaluation assessment as well as the evaluation efficiency of the evaluation system. Through the continuous improvement of the teacher performance evaluation factors and the accurate setting of the weights of each evaluation factor, the evaluation system not only overcomes the influence of many human subjective factors. It effectively solves the difficulties of human evaluation which requires a lot of data statistics and calculations. The system will be continuously improved in the future to enhance the objectivity of performance evaluation, so as to promote the cultivation of internal development consciousness of foreign language teachers' team and solve the problem of teachers' burnout. It can bring the teacher performance evaluation system to a new level and promote the construction of foreign language teachers' teams in colleges and universities.

[42204571@qq.com](mailto:42204571@qq.com)

---

## ABSTRACT

As China's higher education gradually steps from the stage of elite education to that of mass education, the absolute quantity of higher education resources has increased greatly, which can no longer meet the needs of the fast-developing social economy for intellectual resources. By thoroughly analyzing PPP financing mode experience both domestically and internationally and making reference to the effective PPP financing mode model in general companies, we actively investigate the need for and viability of its implementation in building colleges' and universities' infrastructure. The country's education funding in 1994 was almost nine times that of 1980, with an astonishing growth rate. This paper combines the advantages of the government and private enterprises through the PPP financing model for universities, allocates risks to all parties, achieves risk sharing and effective management, and thus minimises the overall risk of PPP financing projects, while also improving the construction of university infrastructure.

## KEYWORDS

educational resources; PPP financing model; infrastructure development; combination of advantages; effective management

## 1. INTRODUCTION

China's higher education sector has taken on a global role, evolving from elite to mainstream education gradually, with a growing tendency toward marketization [1-2]. In China, the great majority of colleges and universities are public benefit organizations with a limited number of channels and a single funding system [3]. Almost all of China's top institutions are currently suffering from a severe lack of funding for infrastructural development [4-5]. Additionally, in order to ease the burden of a funding shortfall, this pushes big institutions to exclusively seek money from society through a variety of

channels and methods [6]. But since universities are institutions whose primary function is to develop talent, they cannot simply chase economic advantages and take significant risks [7]. There are now a number of issues that need to be resolved about the type of finance strategy that universities should use to address the issue of the lack of funding for campus infrastructure building while also ensuring that it can be carried out in a largely secure and stable environment [8].

## **2. INFRASTRUCTURE DEVELOPMENT IN HIGHER EDUCATION**

### **2.1 CURRENT STATUS AND PROBLEMS OF INFRASTRUCTURE DEVELOPMENT IN HIGHER EDUCATION INSTITUTIONS**

Infrastructure for teaching and research and infrastructure for living services make up higher education institutions. Teaching and research infrastructure covers teaching buildings, administrative office buildings, student experimental and practical training centres, laboratory construction, libraries, gymnasiums and sports grounds, while living infrastructure mainly includes student dormitories, restaurants and supermarkets. At present, the infrastructure construction of higher education institutions mainly includes the overall planning and construction of new campuses, the expansion of teaching, research and living service facilities, etc.

### **2.2 FUNDING SHORTFALLS HINDER RAPID DEVELOPMENT OF HIGHER EDUCATION**

The state has been giving education work an increasing amount of attention ever since the reform and opening up. Due to the nation's economy's rapid growth, the gross domestic product has expanded year after year, and the state has raised the amount it invests in education financing. From 1978 to 1985, this investment climbed by an average of 1.694 billion yuan annually, and from 1985 to 1994, the ten-year period was as high as 6.310 billion yuan per year, and in 1994 the education funding was almost nine times that of 1980, an impressive rate of growth. Despite the quick growth in the scope of higher education, public spending on education across all levels of government has not expanded proportionally and promptly, thus the average student education expense is still declining. Due to the relative scarcity of state support, the fast growth in the number of universities, the spike in student enrollment, and the unique factors driving price increases, university funding is still extremely limited for the majority of institutions, particularly non-key universities.

### **2.3 SHORTAGE OF STUDENT ACCOMMODATION AND CLASSROOMS, OUTDATED TEACHING EQUIPMENT**

The state of school buildings has gotten worse as a result of the sharp increase in the number of registered students. Many colleges lack enough classrooms, or the

equipment in those classrooms is antiquated and unable to accommodate current teaching. The overall value of teaching equipment in many institutions is below the appropriate national requirements owing to budgetary issues, and a lot of old and out-of-date laboratory equipment cannot be upgraded and disposed of in a timely manner. Each of them has made a substantial contribution to the growth of higher education and the enhancement of educational quality.

## **2.4 INEFFICIENT USE OF EDUCATION FUNDS**

China's higher education finance has had a highly humiliating predicament for the entire time. On the one hand, higher education financing is invested in comparatively insufficiently, and on the other hand, the effectiveness of using education funds is quite inefficient. For instance, the use of classroom space, athletic equipment, and lab equipment in schools is underutilized. Due to institutional crossover and relocation, a sizable portion of the university's funding goes toward paying for management staff. Additionally, staff redundancy causes an increase in daily management friction, which decreases efficiency.

## **3. DEFINING THE PPP FINANCING MODEL**

The PPP financing model refers to the cooperative financing mechanism formed by the government and private enterprises or private capital to jointly build infrastructure projects and provide public goods and services, in which the government and private capital are partners who share the benefits and risks, and both parties sign contracts to clarify their responsibilities and obligations, utilize governmental and societal resources to enhance the standard of public services and create mutually beneficial collaboration. PPP funding has been widely employed in a number of projects, as it has improved the efficiency of construction and the effectiveness of the use of funds.

### **3.1 APPLICATION OF PPP FINANCING MODELS IN HIGHER EDUCATION**

As higher education expands quickly, more money is being invested in it, but this financial assistance is not sufficient to address the issue of colleges and universities' financial troubles. The implementation of the PPP model in higher education can, among other things, improve investment efficiency, broaden the funding sources available to colleges and universities, and leverage social capital. It can also create a diversified financing system under the direction of the government and involving social capital. The introduction of social capital, on the other hand, can effectively alleviate the situation, resolve the debts of colleges and universities, and promote the beneficial operation of colleges and universities in the conflict between the lack of local financial strength and the improvement of college operating conditions. In this process, the government plays an important role in policy formulation, supervision and management, provides corresponding supporting services for private capital, and realizes the

conversion of government functions in the framework of government-enterprise cooperation.

### **3.2 PPP FINANCING MODELS HELP DIVERSIFY PROJECT RISKS**

The construction of infrastructure in universities requires a large amount of investment and the recovery of funds is slow, and the project's construction and management unavoidably include a number of hazards. Project risks are spread out thanks to the PPP finance model's use in higher education.

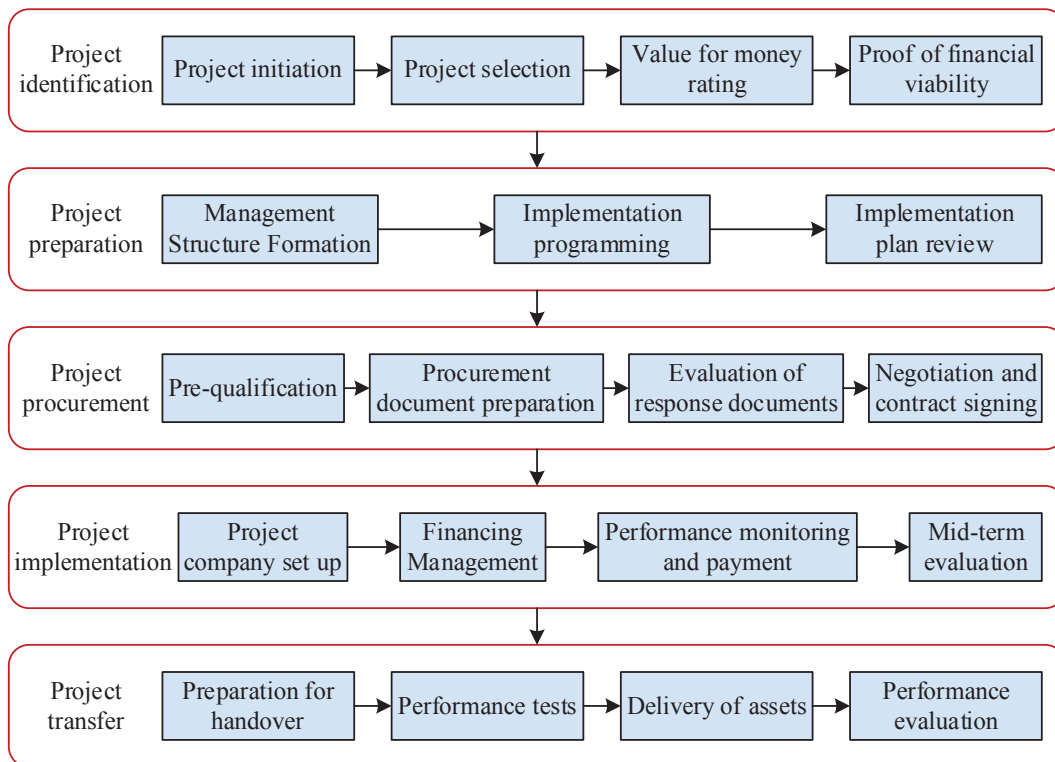

Firstly, under the competitive bidding mechanism of PPP projects, the winning enterprises have strong financial strength and strong risk management ability, which can improve the comprehensive ability to prevent and control PPP projects.

Secondly, the PPP financing mode of universities introduces a special subject of private capital, which can make use of its cash management experience and high technical means, and the project is handled by a professional team from risk identification to risk allocation and risk control stages, which improves the feasibility of the project.

Thirdly, the university PPP financing model can combine the advantages of the government and private enterprises, allocate risks to all parties, achieve risk sharing and effective management, thus minimising the overall risk of PPP financing projects and improving project stability.

### **3.3. PPP PROJECT OPERATION PROCESS**

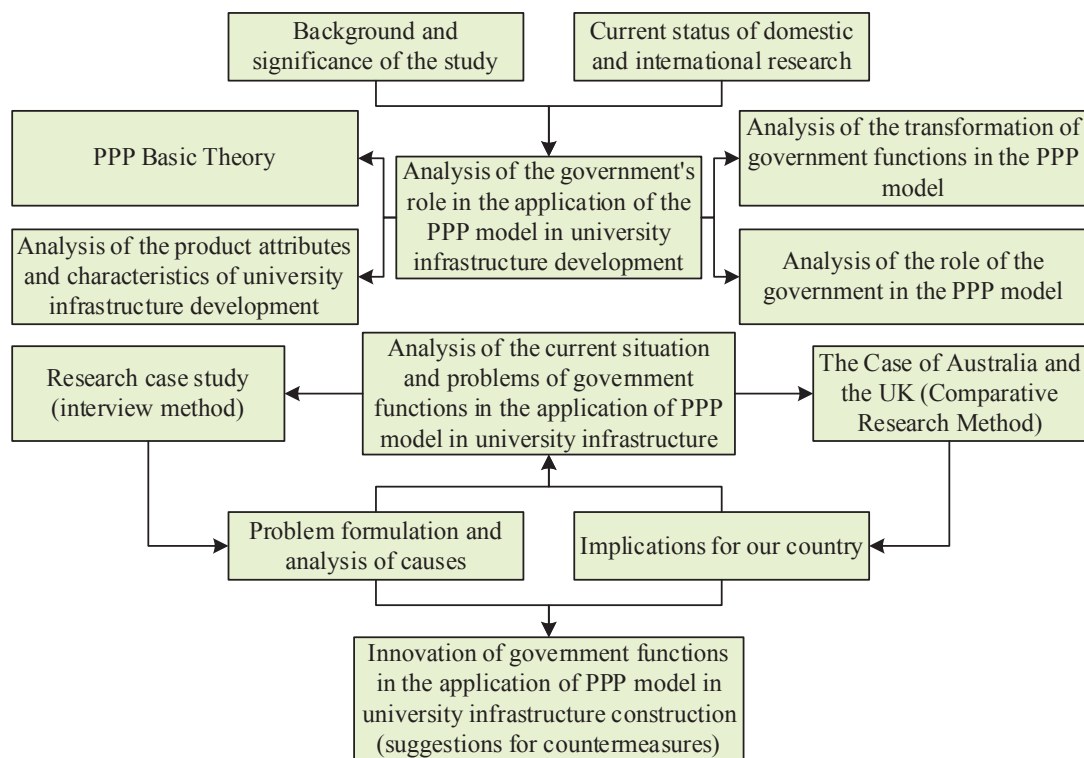

As PPP construction projects have many approval links, long cycles and complex operations, they place high demands on the government's management capabilities. In order to standardise the use of PPP in practice and strengthen policy guidance, the Ministry of Finance issued the Operational Guidelines for Government and Social Capital Cooperation Model in November 2014, which systematically introduces the whole life cycle operational process of PPP construction projects, as seen in Figure 1, project identification, planning, procurement, implementation, and transfer are the primary project-related activities.

**Figure 1** Government and social cooperation project flow diagram

### 3.4 FEASIBILITY OF PPP FINANCING MODEL APPLIED IN UNIVERSITY INFRASTRUCTURE DEVELOPMENT

After domestic and international research shows that the PPP model has been applied in public infrastructure fields such as transportation, municipalities, waste treatment, energy, education, culture and medical care. The foreign PPP model has been applied more successfully in the construction of school infrastructure in Australia and the UK. Figure 2 illustrates how some domestic scholars have discussed the viability of implementing the PPP finance strategy for building university infrastructure using the quality of quasi-public higher education offerings. They did this while taking into account the pressure of public finance expenditures on universities and the challenge of raising funds for the construction of university infrastructure.

**Figure 2** PPP financing model framework diagram

#### 4. CONCLUSION

The education sector is a fundamental sector with significant implications for the nation's future development. It is a budding sector with a large market and promising growth potential. However, the demand for building money for the quick expansion of universities cannot be satisfied by the conventional financial allocation-based support for education. A significant amount of local and foreign cash has poured into China's higher education industry as a result of China's WTO membership and the country's continued educational advancement. This essay examines the need for and viability of financing college infrastructure through public-private partnerships. We can see that not only can we construct college infrastructure using the PPP finance model with our own features, but also keenly sense the vigor and enormous push it provides for the logistical reform and leapfrog development of China's colleges and universities. The university infrastructure PPP investment and finance model not only addresses the issue of challenging university infrastructure investment and financing, but also stimulates the whole university logistics industry.

## **ABSTRACT**

With the development and progress of the times, the education reform of higher education institutions is also deepening, and the theory of education management in higher education institutions has been greatly enriched compared with that before. The traditional institutionalized management mode has gradually ceased to adapt to today's student management in higher education institutions, and the management concept in the context of human-centredness is gradually accepted by major universities. As many as 90.77% of the respondents chose student management staff as very important, and no survey respondents thought that student management work was not important. In this paper, by using the advantages of big data and the Internet under student management in higher education institutions in a human-centred context, the professional quality of student management teams and managers has been enhanced, and the level of student management in higher education institutions has also been improved.

## **KEYWORDS**

institutionalised management model; people-centred; management philosophy; professional quality; big data

## **1. INTRODUCTION**

The new situation brings new challenges. The rapid development of the level of science and technology and the diversification of social value orientation bring great challenges to the education of higher vocational colleges and universities[1-2]. The comprehensive quality of graduates from higher education institutions is constrained by the level of student management in higher education institutions[3]. The knowledge and skills of graduates from higher education institutions cultivated by backward management fail to meet the requirements of society, resulting in the career path of graduates from higher education institutions being repeatedly troubled, their personal development prospects being hindered, and their employment treatment and social evaluation being significantly lower than those of non-vocational education schools, resulting in high employment rates and low satisfaction rates [4-5]. In addition, the rapid popularity of the Internet and smart phones, various types of information on the Internet are mixed, and students in higher education institutions do not have strong discriminatory ability and are easily influenced by negative information [6]. Thus, the concept emerges that in order to improve and enhance the quality and level of education in vocational universities nationwide, it is necessary to fully combine the teaching system, student characteristics and management characteristics of vocational universities at the current stage, to analyse the current problems of student management in vocational universities as an entry point, and to deeply integrate the concept of people-oriented management ideas [7]. Through the innovation of management system mechanism and method, we can build a scientific and effective student management system and perfect measures for student management, improve the scientific and rational nature of the student management system of vocational universities, so that students can learn and grow in a healthy way[8].

## **2. THE CURRENT SITUATION OF STUDENT MANAGEMENT IN HIGHER EDUCATION INSTITUTIONS**

### **2.1 CUMBERSOME AND INEFFICIENT STUDENT ADMINISTRATION**

The current management of students in higher education institutions is very complicated and involves many levels, both in the process and in the specific implementation, which is not a simple matter, and is a source of difficulty and pressure for school managers. With the expansion of universities and the increase in the number of students, the traditional management model is no longer able to cope with such a huge workload, and it is difficult for managers to grasp the overall situation of students, nor can they dynamically follow up the progress of their studies and pay attention to their psychological and emotional changes. The management of students without a grasp of the students' learning situation can easily reflect the strong subjectivity of the

management and the school, and the management measures formulated are very unsuited to the students' needs, making it difficult to attract students' approval and make them cooperate and implement them, which affects the efficiency and quality of the management.

## **2.2 STUDENTS ARE MORE DEPENDENT NOT INDEPENDENT ENOUGH**

Although China's new curriculum reform and quality education have been implemented for more than 10 years, the general environment of examination-based education has not really changed, and many students in primary, junior and senior secondary schools are still receiving education aimed at improving their examination results. After entering university, students' learning environment and living environment, learning mode and life mode will be greatly changed, many students think that university is no longer as heavy as in the past will face the heavy burden of coursework, gradually relax their own study requirements, coupled with the colorful university life, and the Internet is flooded with students' lives, facing the massive amount of online information, students are easily attracted to it. Most of the university students lack sufficient social experience and experience, and cannot distinguish the information on the Internet correctly, and lack good self-control and self-management ability. The management capacity and energy of tutors and class teachers are limited, and the management of students depends largely on their self-discipline and self-awareness.

## **2.3 DATA MANAGEMENT HAS HIDDEN RISKS**

The organic integration of big data and current student management in higher education institutions requires schools to strengthen the introduction, development and use of big data. But while the integration of big data and the internet has brought many positive effects on the efficiency and quality of management work, it has also brought negative effects. It has also brought negative effects. Information on the internet is complex and complicated, and students are not aware of the pitfalls when searching for and collecting information or communicating and sharing it. Lack of awareness of online pitfalls and prevention can easily lead to data omissions or fraud. The problem of lost student data and information can make it more difficult for higher education institutions to manage their students, and the existence of network security risks can also have a negative impact on the implementation of other aspects of the school's work.

## **2.4 THE CONCEPT OF INTELLIGENT STUDENT MANAGEMENT IN HIGHER EDUCATION INSTITUTIONS IN A HUMAN-CENTRED CONTEXT**

The traditional management system of higher education institutions is inflexible and based on negative incentives, and long-term institutional constraints have led to a lack of self-management awareness among students. In the new era, higher vocational schools can practise humane management in four ways: optimising the management

system, innovating the management model, establishing a "people-oriented" education concept and establishing a multi-dimensional management evaluation system.

#### 2.4.1 MANAGEMENT PHILOSOPHY

All those involved in student management consider student management to be "very important" or "important" in the running of the school, with 90.77% of respondents choosing very important and no respondents considering student management to be unimportant. No respondents thought that student management was not important. It is undeniable that student management is a fundamental part of the school's role in teaching and educating people, and an important reflection of the effectiveness of the school's work as shown in Figure 1.

**Figure 1** Survey on the perceived importance of student management

### 3 CHANGE MANAGEMENT PHILOSOPHY

To do a good job on the current scientific management of higher vocational college school students, it is necessary for college leaders and managers to update their own management concepts, break through the traditional management mode of thinking,

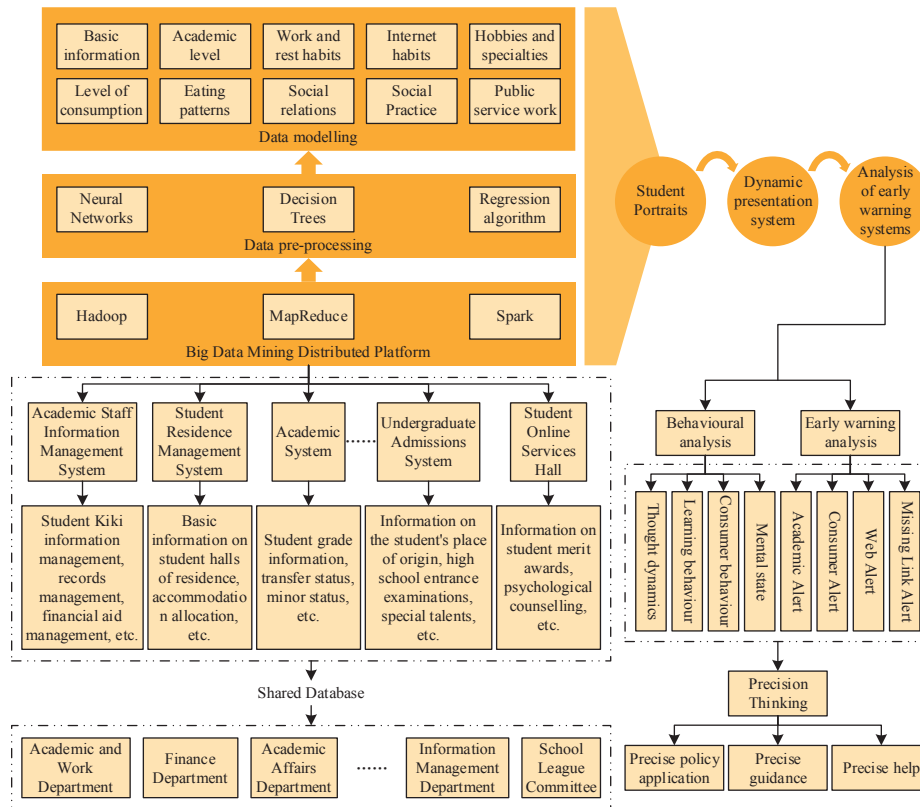

committed to cultivating excellent talents for society in the context of people with big data technology and the Internet as a bridge, the management of students and changes in social life closely combined, adhere to keep pace with the times always pay attention to changes in social employment needs, pay attention to Talent training objectives, while establishing talent training objectives, optimize management content, innovative management tools, to implement the educational management of students to provide effective decision-making and basis. The integration of big data technology and the Internet in the context of human beings not only promotes the transformation of the thinking of higher vocational college school managers, but also promotes their professional growth. In order to give full play to the advantages of big data, higher education school administrators must strengthen lifelong learning and constantly improve their information literacy to ensure that student management is put into practice and achieves the desired results.

### **3.1 GUIDING INTELLIGENT STUDENT MANAGEMENT IN A HUMAN-CENTRED CONTEXT**

Under the background of people-oriented, the first impact on student management in universities is the management concept. In order to effectively cope with the challenges faced by the management concept, higher education institutions should actively cultivate managers' Internet thinking, lead them to practice Internet thinking, and actively respond to the impact of the rapid development of the Internet on student management at the level of ideology.

### **3.2 INTELLIGENT MANAGEMENT OF STUDENTS IN HIGHER EDUCATION INSTITUTIONS IN A HUMAN-CENTRED CONTEXT**

Student management in higher vocational college schools should actively respond to the current changes with big data thinking in the context of people-oriented, quantify student education and management services in higher vocational college schools, cultivate big data awareness, enhance sensitivity to data information; improve data positioning and collection ability, data analysis and interpretation ability, data reflection and decision-making ability, through active collection, collation of data information and scientific modelling, comprehensive analysis, in-depth By taking the initiative to collect and collate data and information, as well as scientific modelling and comprehensive analysis, we can dig into the relevance of data and information of management and service objects, so as to enhance the foresight and foresight of education work and open the door of intelligent management with big data thinking. The practical innovation of using big data thinking to carry out ideological and political education and management services in the management of students in higher vocational colleges and universities, and the construction of a wisdom system is shown in Figure 2.

**Figure 2** The path diagram of accurate thinking and government research based on students' big data

#### 4. CONCLUSION

Under the background of the new era, in the process of continuous reform and deepening of education, student management in higher education institutions is facing many challenges and the transformation is imminent. Based on the advantages of big data and the Internet, the leaders and managers of higher education institutions must take a positive and open attitude towards the application of big data technology in the management of students in higher education institutions, based on the actual situation of schools and the training requirements of students, always adhere to the concept of people-oriented, adhere to the service of students By giving full play to the advantages of big data technology, we can improve the shortcomings of traditional student management in higher education institutions. In an era of globalised economic, political and cultural development, the wisdom of student management in higher education institutions in the context of human-centredness has unparalleled advantages, expanding the student management team and improving the professional quality of management staff, as well as raising the level of university management.

# CAREER PLANNING AND EMPLOYABILITY ENHANCEMENT OF UNIVERSITY STUDENTS IN THE CONTEXT OF BIG DATA TECHNOLOGY

---

Lin Wang\*

Recruitment and Employment Guidance Center, Xi'an Peihua University, Xi'an,  
Shaanxi, 710125, China

[linda\\_2324@126.com](mailto:linda_2324@126.com)

---

## ABSTRACT

The course on career planning and employability for university students is a new course that has been developed in line with the practical needs of social development. The information-based teaching in the context of big data technology can realize the efficiency of classroom teaching content, and also emphasizes the use of real and reliable information as the basis for teaching. Fourteen per cent of university students believe that it does not matter whether they plan or not. This paper enables students to form correct career goals and life ideals through online learning under big data technology, gives full play to the initiative of teachers and students, promotes changes in the career guidance mode of schools, enables students to complete career planning more efficiently and with higher quality, and lays the foundation for the improvement of career planning and employability of university students.

## KEYWORDS

career planning; employability; big data technology; information-based teaching

## 1. INTRODUCTION

In recent years, the group of college graduates has been facing an increasingly severe employment situation and employment environment [1-2]. However, from the present point of view, many universities have not devoted enough attention to career planning guidance for university students, and seldom popularize relevant knowledge or skills to students in the course of teaching, which has led to many university students lacking employment preparation when they enter employment and finding it difficult to adapt to the workplace environment [3]. At present, how university students can establish an advantage in the fierce competition in the job market has become a problem that cannot be ignored [4]. With the continuous deepening of the reform of the

economic system, it has brought a brand new challenge to the career planning and employment guidance work of college students, and also provided many good employment opportunities for students [5-6]. Therefore, in view of the current problems in society, universities, families and individual students, it is necessary to effectively improve the methods and ideas of career guidance and career planning, and guide students to establish correct employment concepts and put themselves into social work with a healthy and upward attitude[7-8].

## **2. CAREER PLANNING AND EMPLOYMENT STATUS OF UNIVERSITY STUDENTS**

Career planning for university students is to plan and think about their future career direction and development goals during their study and life, and to work out an action plan to achieve their career goals. Employment of university students With the increase in the popularity of higher education, the number of university students is increasing year by year, and the competition in the employment market is becoming increasingly fierce, leading to increased difficulties in employment. The structural imbalance in employment is manifested by the serious phenomenon of high level jobs and low level jobs, and many highly educated talents can only work in low income jobs, making it difficult to realise their career aspirations. Some university students have an incorrect concept of employment, believing that high education can be exchanged for high salary, ignoring the importance of work experience and practical ability, leading to the situation that university students are not able to achieve high but not low. There are also many college students in the job search process, due to the lack of job search skills, such as resume making, interview skills, etc., resulting in poor job search results, it is difficult to find a satisfactory job.

### **2.1 CURRENT STATUS OF CAREER PLANNING EDUCATION FOR UNIVERSITY STUDENTS**

According to the market research on the currently existing career planning-related APPs, learning websites and WeChat applets, it can be found that there are more career planning-related platforms in China, as shown in Table 1. It can be seen that there are fewer career planning platforms of public interest, and most of them are profit-oriented. Secondly, the career planning resources on these platforms lack systematicity. The recommended resources do not have the advantage of personalised learning, so a public interest learning resource recommendation platform designed for the purpose of promoting career planning knowledge is in demand for the university student market.

**Table 1:** Comparison of features and functions of career planning-related platforms

Platform Name	Features	Is there a resource recommendation function
Thousand Job Crane	You can pay for personality tests and interest tests, etc. There are related courses that require payment	No
Bantam career	There are modules for students, all courses, career tests, career tips, etc.	Yes, but not based on personal characteristics, but on the overall content
Mileage ask deer	After logging in, you can choose a number of test preparation goals (selecting subjects for senior high school, volunteering, college planning, etc.), and each goal you choose has a corresponding paid course	Yes, we recommend courses based on the preparation goal you selected when you logged in.
Gleaning Planning	There are modules for education, career, skills and interests, and you can take career interest and personality tests	Yes, the recommended content mainly includes today's weather, hot movies, holidays, etc.
The point	There are modules for career matching, resume scoring, assessment area, route map, etc.	No

## 2.2 INADEQUATE PREPARATION FOR CAREER PLANNING

Career preparation is considered to be the foundation for one's entry into the workplace, but the actual situation shows that university students generally lack ideological preparation for career planning. Many university students still maintain their original study habits after entering university, i.e. studying for the sake of studying, lacking clear study goals. Some students also think that they can rest easy after entering the university of their choice, imagining that they will get a satisfactory job after graduation, which eventually leads to slackness in thinking and laziness in behaviour.

### 2.2.1 CAREER GUIDANCE IGNORES INDIVIDUAL STUDENT DIFFERENCES

Career guidance is about the effect of students' career planning, but from the current situation of teachers' career guidance, it is not uncommon to ignore students' individualized differences. Currently, university teachers in career guidance will place students in the direction of choosing a career in an industry related to their major. For example, teachers of planning majors will introduce information about well-known advertising companies in the region in their career guidance. This is followed by the introduction of supporting industries or industries that require less professional skills. In the above career guidance, students' individual aspirations are easily overlooked, such

as students' personality interests and hobbies can be an important factor in employment.

### 2.3 ANALYSIS OF THE RESULTS OF A SURVEY ON CAREER PLANNING FOR UNIVERSITY STUDENTS

As shown in Figure 1, 44% of university students did career planning because they did not have professional guidance, 27% did not know what career planning was, 15% did it because there was no software specifically to guide them in doing it, and 14% thought it did not matter whether they planned or not, as long as they could graduate. As you can see, the main purpose of career planning for most of those who have done it is to make their university career more planned, and there are very few people who are forced to do it. In the survey on the reasons for not doing career planning, most students did it because they did not know what career planning was or they did not think it was important, which shows that university students' awareness of career planning is weak and they need to be provided with a place where they can study at any time.

**Figure 1** College students' perception of career planning

### 3 ONLINE LEARNING IN THE CONTEXT OF BIG DATA TECHNOLOGY

Online learning in the context of big data technology is equivalent to networked learning, a way of learning in which learning communities share multimedia teaching content designed by course developers and experts on online learning platforms, and can engage in online discussions and exchanges with the technical support of big data. Online learning is summarised as changing the teacher-student relationship in

traditional teaching and the role of teachers in classroom teaching through the Internet, through big data technology It enables different learning and teaching activities, using the communication mechanism of modern information technology and a diverse learning environment to change the traditional teaching structure and the nature of education. Online learning is highly efficient, low-cost, popular and personalised, trackable and manageable, learner-centred, and allows students to take control of their own learning progress, providing a good learning path for learners throughout their learning and lifelong learning.

### **3.1 BIG DATA TECHNOLOGY AND UNIVERSITY STUDENTS' CAREER PLANNING AND EMPLOYABILITY**

Career planning for university students is a process that takes place throughout their university career, and big data technology can provide continuous learning resources so that learners can study independently at any time. The Big Data technology recommendation platform is based on WeChat applets, which provide an efficient solution to the development of university career planning courses on the online platform based on the advantages of applets that do not require downloading and updating, avoiding the resistance of learners to downloading apps that take up mobile phone memory, and designed with the principle of practical convenience for university teachers and learners. The content of career planning for university students is aimed at university students who, compared to other age groups, have the ability to study independently and have more time to spare, so the platform is recommended through learning big data technology to provide learners with resources they are interested in for study in their spare time. At the same time, in the face of more learning resources and many complex employment information, achieving accurate employment information pushing can save teachers from screening resources to send to learners, and also enable learners to receive learning resources that are more in line with their own interests and characteristics. For career planning education for university students, students are the main body and teachers play a guiding and directing role, encouraging students to fully understand themselves in the learning process, building awareness of the importance of career planning education for university students and making them aware of the importance of career planning.

## **4. CONCLUSION**

In this context, in order to better meet the employment needs of the society, teachers can innovate the working mode around career planning and employment guidance, guide students to form correct career goals and life ideals through methods such as career guidance under big data technology, give full play to teachers' and students' subjective This will give full play to the initiative of teachers and students and

promote the change of the career guidance model in schools, so that students can complete their career planning more efficiently and with higher quality, and lay the foundation for the smooth employment of university students. The application of career planning and employability of university students under the big data technology platform can well meet the personalised learning needs of learners and their demand for career planning learning, as well as the enhancement of employability.

**ABSTRACT**

In the information technology era environment, education and teaching are also affected by the information technology. In this paper, we construct a framework for informational teaching in pharmacology and build a high-quality teaching resource library suitable for informational teaching. By analyzing the expertise mastery of students who have participated in the informatized pharmacology course. Pharmacology experiments were 97%, drug preparation knowledge learning was 98.5%, drug quality control was 96%, and pharmacodynamics was 97%. It can be seen that the pharmacology course through information technology allows students to better grasp professional knowledge and has some practical significance for improving the quality of teaching pharmacology courses in universities.

**KEYWORDS**

Teaching quality; Pharmacology teaching; Online course construction; Basic medicine; Teaching change

**1. INTRODUCTION**

In the whole life science, pharmacology, as an important bridge between basic medicine and clinical medicine, is not only rich and practical in medicine, but also closely related to other basic and clinical disciplines [1]. Nowadays, pharmacology teaching has been equipped with diversified teaching modes, and the integration of information technology and education has formed the development direction of education informatization, and informatization teaching is the concrete presentation of this development direction [2-3]. Informational teaching design, as the most important part of informational teaching, has also encountered new challenges [4]. The learning style is no longer limited to the teacher's lecture, the activity context needs to be connected with real life, the use of technology needs to be adapted to the development of the times, etc. [5-6]. Teachers are able to effectively build and manage the curriculum, strengthen the interaction between teachers and students, and students are able to acquire the knowledge they need in a purposeful and targeted way, actively constructing or reorganizing their own knowledge system [7]. Students' learning interest, learning ability, creativity, and application ability will be continuously stimulated and improved, and students' independent learning and teamwork ability will be enhanced [8].

This paper discusses the construction and practice of pharmacology network courses in colleges and universities based on information technology for the comprehensive education mode of post-course competition certificate, to broaden and improve the construction level of

network courses, and aims to provide reference significance for the exploration of the comprehensive education mode of post-course competition certificate of pharmacology.

## **2. ANALYSIS OF THE CURRENT SITUATION OF COMPREHENSIVE EDUCATION OF PHARMACOLOGY COURSE TEACHING AND POST-COURSE COMPETITION CERTIFICATE IN COLLEGES AND UNIVERSITIES**

### **2.1. COMPREHENSIVE EDUCATION MECHANISM OF “POST-COURSE COMPETITION CERTIFICATE**

#### **2.1.1. THE CONNOTATION OF THE COMPREHENSIVE EDUCATION MECHANISM OF “POST-COURSE COMPETITION CERTIFICATE**

In the concept of “post, class, race and certificate”, “post” means the enterprise job group and its core tasks corresponding to the university majors, which is the professional core quality that the employees must have to complete the corresponding job tasks. “The “course” refers to the development of professional training program of higher vocational colleges and universities, which is manifested in the setting of professional curriculum system, especially core courses, including professional curriculum structure and curriculum mode, from the specific professional core qualities corresponding to the aforementioned enterprise job groups. The “competition” is the vocational skills competition, and the “certificate” is the vocational skills level certificate, which is the “X” certificate piloted in China at present. Among them, the curriculum system is the core and carrier of integration, which is the setting of the core curriculum of the profession.

#### **2.1.2. CHARACTERISTICS AND PROBLEMS OF PHARMACOLOGY COURSES**

Pharmacology is a discipline that takes the basic theory of medicine as its guide, applies modern technology and pharmacological methods, and takes the effects of medicine on various functions of the body and the principles and mechanisms of action as the focus of teaching.

Based on the characteristics of the pharmacology curriculum, there are more pharmacology experimental projects, but students often do not pay attention to the experimental process, are not active and involved enough, and lack a rigorous research attitude. Contemporary college students grow up in an environment full of information technology and are able to manipulate various multimedia and network information resources quickly and skillfully. Therefore, the traditional teaching mode is usually difficult to make students interested, and only by using network resources and constructing a reasonable curriculum system can we re-invigorate students' interest in learning and participation in class, thus improving the quality of teaching.

### **2.2. THE NEED FOR ONLINE COURSE CONSTRUCTION AND COURSE DEVELOPMENT**

#### **2.2.1. CULTIVATING STUDENTS' INTERNET THINKING WITH “INTERNET+” EDUCATION AS A MODEL**

Compared with traditional teaching methods, contemporary college students are more interested in modern education methods and online teaching methods. Therefore, teachers can make full use of “Internet+” education mode in the teaching process, which can make students deeply experience the changes of “Internet+” on traditional teaching methods, extend teaching time and space, expand teaching contents, enrich teaching resources, adopt online and offline The hybrid teaching mode activates the traditional classroom through discussion, voting and testing, strengthens process learning, enhances students' enthusiasm and participation in class, and helps teachers to analyze students' learning in multiple dimensions, adjust teaching methods and solve difficult problems in time.

## 2.2.2. THE NEED FOR ONLINE COURSE CONSTRUCTION

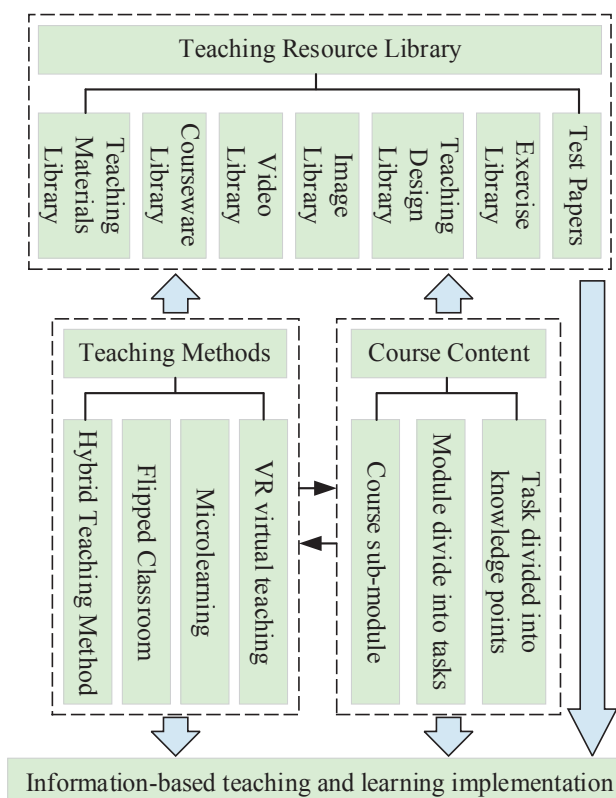

Pharmacology covers a wide range of knowledge, rich in content and information, and requires more knowledge points to be learned and mastered, thus affecting students' learning initiative and enthusiasm. The traditional teaching mode is relatively single compared to modern teaching needs, and students are less interested in learning and less efficient in the learning process. The online course platform belongs to the important interaction platform of learners and learning resources, which has significantly improved the effect and efficiency of students' knowledge acquisition, so it is significant to build online courses.

## 3. RESEARCH ON THE INTEGRATION OF INFORMATION TECHNOLOGY INTO THE TEACHING OF PHARMACOLOGY COURSES IN COLLEGES AND UNIVERSITIES

### 3.1. A STUDY OF THE FRAMEWORK FOR TEACHING INFORMATICS PHARMACOLOGY

Combined with the current situation of information-based teaching in pharmacology to analyze the integration of information technology into the whole process of teaching pharmacology courses, optimize course content and structure, improve teaching strategies, enhance teaching effectiveness, and improve the quality of professional training.

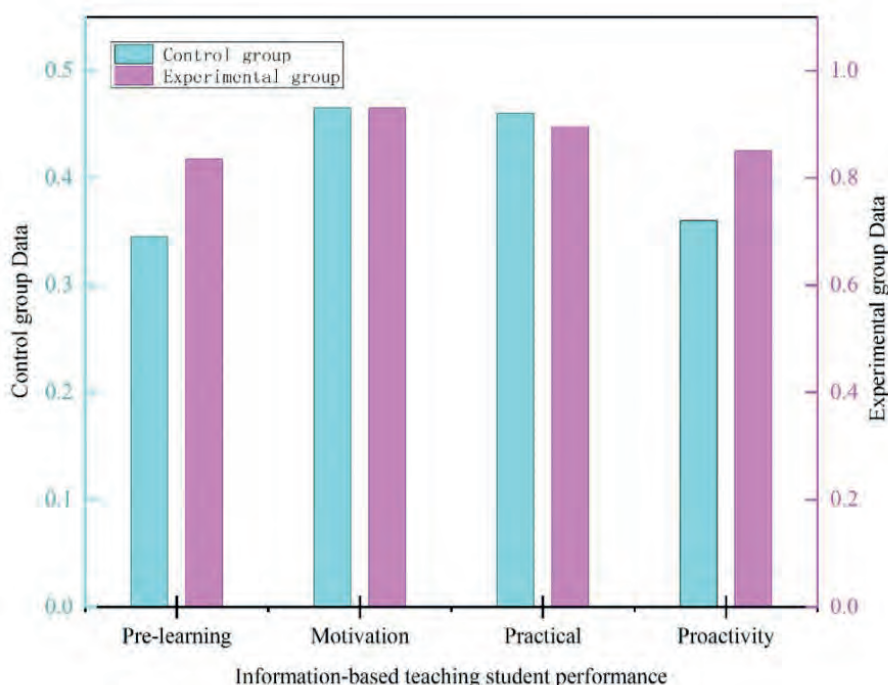

Specifically, the informatization teaching framework of pharmacology profession is shown in Figure 1, and its core problem is to solve "the problem of how to implement informatization teaching", and its focus is to solve "what to teach" and "how to teach", and the reform of teaching methods and course contents. The core issue is to solve the problem of "how to implement information-based teaching", which focuses on "what to teach" and "how to teach", and the reform of teaching methods and course contents. The framework model is summarized as follows: according to the needs of teaching content integration and teaching methods, build a high-quality teaching resource library suitable for informatization teaching, ensure the effective implementation of teaching methods, and finally evaluate the teaching effect through the new evaluation mode.

**Figure 1.** Framework for informational teaching of pharmacology

### **3.2. RESEARCH ON TEACHING PHARMACOLOGY COURSES IN UNIVERSITIES BASED ON INFORMATION TECHNOLOGY**

In order to investigate the effect of teaching pharmacology courses in colleges and universities based on information technology on improving students' classroom participation. In this study, the students' classroom participation was analyzed through the information technology on the learning situation and learning effect of the students in the experimental group and the comparison group, and the effect of information technology on classroom participation is shown in Figure 2. The classroom participation of the experimental group was significantly higher than that of the general class. It shows that the information technology teaching reform is conducive to enhancing students' learning enthusiasm and initiative. Students were more interested in information technology teaching, and since the pre-study and post-study review rates and interaction rates of students in the experimental group were higher, it showed that the information technology teaching reform helped students develop good learning habits.

**Figure 2.** Study of student engagement in the classroom

### **3.3. FEASIBILITY STUDY OF TEACHING INFORMATION TECHNOLOGY COURSES ON TEACHING PROFESSIONAL KNOWLEDGE**

In order to investigate the help of information technology for teaching expertise in pharmacology courses, students who participated in the information-based pharmacology course were tested for their expertise, and the feasibility of information-based pharmacology teaching for teaching expertise is shown in Table 1. Students who participated in the informatics pharmacology course had a high level of expertise. 97% for pharmacology experiments, 98.5% for drug preparation knowledge learning, 96% for drug quality control, and 97% for pharmacodynamics. It can be seen that it is feasible for students to better master their professional knowledge through pharmacology courses with information technology.

**Table 1.** Degree of students' expertise in pharmacology

Expertise	Mastery level
Pharmacological experiments	97%
Knowledge of drug preparation	98.5%
Drug quality control	96%
Pharmacodynamics	97%

#### 4. CONCLUSION

Under the environment of "Internet+", the efficient and fast characteristics of information technology have made the application of information technology penetrate into all aspects of national economy and social development. Informatization reform of education is an inevitable trend. Therefore, the teaching reform strategy of information technology in vocational education is an inevitable choice. Due to the epidemic, the importance of informatization of its education is once again reinforced for education all over the world. More teachers and students deeply appreciate the importance of informatization in education.

It can promote the reform and innovation of pharmacology teaching by exploring new ideas of pharmacology curriculum construction through information technology, so that students can have a broader space and resource support in the process of self-learning, and finally achieve to improve the learning effect of clinical medicine students, cultivate students' innovation ability and practical ability, so that they can have a solid theoretical foundation in future clinical practical work and become excellent medical professionals delivered by the school to the society.

## ABSTRACT

To investigate the effect of exercise and care on the improvement of osteoporosis problems in order to propose a comprehensive clinical physical therapy program. In this paper, we explored the role of big data in the study of diabetic complications by using data mining methods, combined with correlation analysis and regression analysis to uncover the factors influencing osteoporosis in elderly diabetic patients. And based on this, the effect of exercise and care on the alleviation of osteoporosis problem was explored. For the dependent variables of osteoporosis, the regression coefficients of ALB, LYM, and NLR were -0.51, 0.25, and 0.22, respectively, and the increase of these indicators could increase the occurrence of osteoporosis.

## KEYWORDS

data mining; correlation analysis; regression analysis; osteoporosis; diabetic patients; comprehensive physical therapy

## 1. INTRODUCTION

Osteoporosis is a bone disease characterized by a decrease in the amount of bone tissue per unit volume [1]. The high prevalence of osteoporosis is in the elderly. Patients with osteoporosis may present with bone pain and shortening of the bone body [2-3].

Older patients with type 2 diabetes have skeletal muscle atrophy due to insulin resistance, abnormal release of inflammatory factors triggering abnormal skeletal muscle signaling and increased protein catabolism [4-5]. Motor unit loss is associated with loss of innervation or inadequate compensatory reinnervation of muscle fibers. If the denervated muscle fibers do not acquire new innervation, skeletal muscle cells atrophy, die, and are subsequently fatty deposited or replaced by other non-contractile tissues [6-7]. Myosatellite cells are involved in repair after skeletal muscle injury, and studies have found a decrease in the number of regenerating fibers and myosatellite cells in skeletal muscle in patients with type 2 diabetes mellitus A. There is also a conversion of myosatellite cells into adipocytes, which eventually causes skeletal muscle atrophy [8]. It has been suggested that comfort care for elderly patients with osteoporosis can improve their quality of life [9]. This study focused on the clinical effects of exercise and care on elderly patients with osteoporosis by studying the factors influencing osteoporosis.

## **2. BIG DATA-BASED INFORMATION MINING FOR DIABETIC PATIENTS**

### **2.1 THE USE OF DATA MINING IN DIABETES COMPLICATIONS**

#### **2.1.1 DATA MINING FOR BIG DATA ON MEDICAL VISITS**

Data mining (DM) is an all-round research inside a huge amount of data material to discover unknown patterns and valuable knowledge. Data mining mainly includes association rules, clustering analysis, data summarization and regression analysis. Data summarization is to summarize the basic characteristics of data in multiple dimensions and levels to discover the unknown laws. Association rules mainly analyze the interdependence and interrelatedness of things, as well as predict the occurrence and development of unknown things.

In recent years association rules have been gradually introduced into the research of Chinese medicine, which is now mostly focused on the prescription dispensing rules, the discovery of medication characteristics, the association between symptoms and signs, and the experience inheritance of famous and old Chinese medicine practitioners. Cluster analysis, also known as cluster analysis, is a multivariate statistical analysis method for classifying samples with similar or similar characteristics, which is to classify a large number of samples or data according to reasonable characteristics, without any pattern or a priori knowledge for reference. At present, cluster analysis is mainly used in TCM clinical research on TCM evidence, basic TCM research, and prescription and medicine analysis research. The general trend of TCM research is objectification, standardization and quantification, of which quantification is a very important aspect. The Bayesian network structure model is a directed acyclic graph, in which the nodes represent the indicators or variables to be examined, the directed edges represent the probabilistic correlations among the variables, and the probability set gives the conditional probability of each variable when conditioned on its parent node, which can reveal the complex relationships among numerous symptoms and between symptoms and symptoms, and quantitatively determine their diagnostic value.

Association rule analysis is a common method in data mining, mainly from the number is a common method in data mining, mainly from the data set to discover frequent data sets, so as to find some interesting combination of laws.

### **2.1.2 The evolution of data mining applications**

In recent years, in the context of big data and evidence-based medical research gradually, more and more researchers have combined big data research mining with Chinese medicine evidence and evidence element research. By using literature collation or data mining of clinical data information, we can visualize the distribution pattern of disease symptoms and evidence elements, and study the combination of disease and evidence at different levels and dimensions of research subjects, which can reveal the pattern of disease development more clearly and standardized, and provide support for clinical decision-making. Diabetes mellitus has a complex pathogenesis, diverse clinical manifestations, complications throughout the body, and numerous concomitant diseases because it mostly occurs in elderly patients. It can be said that diabetes and other systemic diseases are a closely linked network system, but there is a lack of research on the multi-level pathology-evidence combination of diabetes and its complications based on the massive clinical treatment data.

## **2.2 GERIATRIC DIABETES AND OSTEOPOROSIS**

### **2.2.1 OSTEOPOROSIS**

Osteoporosis is a disease of bone metabolism characterized by decreased bone mass and density, damage to bone microarchitecture, decreased bone calcium, and massive bone loss, leading to increased bone fragility and fractures, and includes both primary and secondary categories. Primary osteoporosis is a physiological degenerative lesion that occurs with ageing. Secondary osteoporosis is mostly caused by various diseases. With the deepening of aging in China, the incidence of osteoporosis is increasing, especially in postmenopausal women and elderly men. Patients with osteoporosis are at significantly increased risk of falls and fractures and have increased mortality.

### **2.2.2 DIABETIC OSTEOPOROSIS**

There is a strong relationship between type 2 diabetes and osteoporosis, with 2/3 of diabetic patients experiencing a reduction in bone density and the incidence of diabetic osteoporosis has reached 60%. Approximately 40-66% of diabetic patients develop osteoporosis during the course of the disease. Patients have atypical clinical symptoms, mostly with fractures as the first symptom, and are at increased risk of falls, fractures and death, which significantly shorten the life expectancy of diabetic patients. the risk of fracture is significantly higher in patients with T2DM, considering that it may be because they have lower cortical bone density and lower bone strength although they have higher bone trabecular density. T2DM increases the risk of fracture 13-fold, but the underlying mechanisms are not fully understood.

### 3. THE EFFECT OF EXERCISE AND CARE ON THE RELIEF OF OSTEOPOROSIS PROBLEMS

#### 3.1 ANALYSIS OF FACTORS INFLUENCING OSTEOPOROSIS IN ELDERLY DIABETIC PATIENTS

After data mining the diagnostic information of elderly diabetic patients, this paper investigates the influencing factors of their osteoporosis problem based on correlation analysis. The results of correlation analysis of factors influencing osteoporosis in elderly diabetic patients are shown in Table 1. The correlations of height, weight, BMI, HDL-C, LYM, NLR, and ALB with the occurrence of osteoporosis in elderly patients with type 2 diabetes were statistically significant, with P values less than 0.05. Among them, height, weight, BMI, and ALB were negatively correlated with the occurrence of osteoporosis, and the increase of their indexes could inhibit the occurrence of osteoporosis. HDL-C, LYM, and NLR were correlated with the occurrence of The correlation coefficients were 0.16, 0.18 and 0.205, respectively, and the increase of their indexes could promote the occurrence of osteoporosis.

**Table 1** Correlation analysis of influencing factors of osteoporosis

Factor	Ht(cm)	Wt(kg)	BMI(kg/m <sup>2</sup> )	ALB(g/L)
r	<0.001	<0.001	0.03	0.045
P	-0.42	-0.28	-0.25	-0.31
Factor	HDL-C	LYM	NLR	Ca
r	0.16	0.18	0.205	-0.23
P	0.035	0.028	0.034	0.16

According to the results of the correlation analysis, regression analysis was performed on height, weight, BMI, HDL-C, LYM, NLR, ALB and the occurrence of osteoporosis in elderly patients with type 2 diabetes. The results of the regression analysis are shown in Table 2. The intensity of the effects of osteoporosis in elderly type 2 diabetic patients were ALB, LYM, NLR, HDL-C, height, weight, and BMI from highest to lowest, respectively. the regression coefficients of ALB, LYM, and NLR were -0.51, 0.25, and 0.22, respectively. it can be seen that weight, height, BMI, and ALB were negatively correlated with osteoporosis, and their increase could reduce the occurrence of osteoporosis , NLR, LYM, HDL-C were positively correlated with osteoporosis, and their increase could increase the occurrence of osteoporosis.

**Table 2** Results of regression analysis of osteoporosis occurrence

Dependent variable	Argument	$\beta$	Wals	P
Bone mass condition	BMI	-0.05	0.01	0.01
	Ht(cm)	-0.14	3.17	0.03
	Wt(kg)	-0.1	0.52	0.01
	LYM	0.25	0.23	0.01
	HDL-C	0.16	1.53	0.001
	ALB(g/L)	-0.51	1.87	0.03
	NLR	0.22	0.31	0.03

### **3.2 EXPLORATION OF EXERCISE AND CARE FOR THE RELIEF OF OSTEOPOROSIS PROBLEMS**

Exercise can reverse osteoporosis and also alleviate the process of losing, bone mass due to aging, thus maintaining the normal shape of bone. The mechanism is that exercise increases blood flow to the bone cortex, resulting in increased blood calcium transport to the bone and increased transformation of osteoclasts to osteoblasts, which promotes bone formation. Exercise also produces stress on bone through muscle activity, and increased skeletal stress causes bone to generate negative pressure potential, making it easy to bind cationic calcium ions and promoting osteoblast proliferation and differentiation. Exercise promotes the secretion of sex hormones and increases bone calcium content. Exercise can also increase bone mass while increasing the use of blood calcium by bone tissue. In addition, frequent exercise outdoors can receive sufficient sunlight, which increases the concentration of vitamin D in the body, improves gastrointestinal function and calcium and phosphorus metabolism, and also promotes calcium absorption in the body.

### **4. CONCLUSION**

In this paper, we mined the diagnostic pathology information of elderly diabetic patients based on the data mining method under big data, and mined the factors influencing osteoporosis in elderly diabetic patients using correlation analysis and regression analysis. HDL-C, LYM, and NLR were positively correlated with the occurrence of osteoporosis, and the correlation coefficients were 0.16, 0.18, and 0.205, respectively, and the occurrence of osteoporosis was positively correlated with the above indicators were positively correlated. Nurses providing targeted exercise instruction according to the symptoms of primary osteoporosis patients is an effective means to improve the symptoms of osteoporosis such as bone mass and low back pain in elderly diabetic patients, which can achieve a complementary effect with medication. Comfort care for elderly patients with osteoporosis can provide them with a comfortable treatment environment, improve the effectiveness of their treatment and care, improve their health status, and enhance their quality of life.

# ANALYSIS OF THE DILEMMA OF OPTIMIZATION AND DEVELOPMENT OF UNIVERSITY ENGLISH TEACHING MODE IN THE INTERNET ERA

---

Yuan Tang\*

School of Foreign Languages, Hunan University of Science and Engineering, Yongzhou,  
Hunan, 425199, China

yuanyuantang07@163.com

---

## ABSTRACT

In the Internet era, the online and offline deeply integrated teaching mode has become an important development direction in the new round of reform of university English education mode. In this paper, an experiment is constructed to test whether the Internet-based scaffolding teaching mode can alleviate students' reading anxiety, and the experimental data are analyzed. The average reading anxiety score of the experimental group before the experiment was 79.82, and that of the control group was 78.51. The mean reading anxiety score of the experimental group after the experiment was 61.07, while that of the control group was 73.27. It shows that the application of Internet-based scaffolding teaching mode has certain feasibility and practicality in the optimization of college English teaching mode.

## KEYWORDS

Internet era; Scaffolding teaching model; Reading anxiety; Teaching model optimization; Education model reform

## 1. INTRODUCTION

In the Internet era, the difference between language teaching and traditional foreign language classroom teaching is that the application of Internet technology in foreign language teaching is not limited to basic educational teaching tools, but covers a wider range of areas [1-2]. Modern Internet technology is used as an organic carrier of teaching contents, and the deep integration of Internet technology and teaching is carried out [3]. On the other hand, teachers make efforts to create a quality teaching curriculum for college English, so that students have more access in the classroom [4-5].

According to the students' emotional needs in the learning process, teachers should teach them in layers according to their different cognitive levels and emotional characteristics. For those students with weaker foundation, less interest in learning and lower self-identity, teachers have to provide targeted training and guidance. [6-7]. For students' English anxiety, teachers should design questions to help students understand and master the reading content according to their cognitive level and reading level. For those students who have a weak foundation, teachers can reduce the reading difficulty and set simple questions for them to help them comprehend and master English. [8].

In the current social and historical context, this paper aims to re-examine college English teaching, explore the changes brought about by the introduction of Internet technology into college English teaching, and how to achieve an organic combination of teaching and learning in the new environment, how to deal with the teacher-student relationship, how to build a

teaching model that combines Internet technology with the classroom, and how to solve the dilemmas faced in the development of the college English teaching model.

## **2. INNOVATIVE CHANGES IN THE ENGLISH TEACHING MODEL**

### **2.1. EXPLORATION AND STATUS OF UNIVERSITY ENGLISH TEACHING MODEL**

#### **2.1.1. TEACHING MODE INTERNET OPTIMIZATION**

The introduction of computer network technology into university English teaching has led to radical changes, which represents a further deepening of English teaching reform in universities..

Evaluating college English courses in three aspects: language knowledge, language skills and language application, not only detects the actual level of students, but also identifies the problems of students in the process of language learning, and provides feedback and guidance for college English teaching in order to improve teaching and improve the quality of teaching, college English education has traditionally received attention from all parties, including the state, society and the education sector, especially since the reform and opening up, China's college English has undergone a series of reforms and made progress.

With the increasing importance of Level 4 and 6 exams in the society, English teaching at university has gradually deviated from its teaching focus, and the one-sided pursuit of test scores and passing rates has led to criticisms such as "education for the test" and "English as a subject". At the same time, due to the massive expansion of higher education, the number of students receiving higher education has increased dramatically, while there is a relative shortage of teachers, weak faculty, and the supporting facilities cannot keep up, and it is difficult to find a matching model and method for teaching in a short period of time. According to the characteristics and rules of college English, the teaching mode of college English has been optimized and deepened to improve the quality of teaching to actively and orderly promote the development of college students' English ability, and these adapt to the requirements of cultivating talents in the new century.

#### **2.1.2. THE CURRENT SITUATION OF EXPLORING UNIVERSITY ENGLISH TEACHING MODE**

The "Internet" has been one of the hot topics of attention in recent years, and people hope to use the convenience of Internet technology to optimize the industry. In the face of the opportunities and challenges brought by the Internet information era, the education industry has seized the opportunity to reform and explore and actively make full use of Internet technology to realize personalized teaching.

The lack of proper knowledge and understanding of the teacher-oriented situation is the main reason for the delay in promoting the new teaching mode of college English. Some teachers use multimedia tools such as PPT too much in the classroom, lacking effective communication with students, and some teachers unilaterally pursue the "student-centered" form, ignoring the teaching of language knowledge. Teachers have not managed to deal with the organic combination of teaching and exploring both with the Internet as the core of college English, which is the current problem of college English.

## **2.2. THE DILEMMA OF DEVELOPING ENGLISH TEACHING MODEL BASED ON THE INTERNET**

### **2.2.1. DISSONANCE BETWEEN REGULATIONS, PLANS AND ACTUAL OPERATIONS**

Although the curriculum of college English in most colleges and universities has changed significantly from the previous one, setting up different types of classes to promote the

strengthening and development of students' English skills in various forms, the organization and teaching practice of each class type are not satisfactory.

There is also a certain dissonance between different class types in terms of teaching methods and formats. In the reading and writing class or reading and writing translation course, although the teacher uses a variety of teaching methods and forms with the help of modern Internet technology such as computer network, such as three-dimensional, interactive and collaborative teaching methods. The specific organization form also adopts such as discussion, debate, dialogue, etc., and the teaching process also presents the characteristics of video, audio and other vivid images. On the surface, it seems that university English classes have got rid of the original dull teaching atmosphere, increased the opportunities for students to participate, and provided conditions for improving students' application ability, but the courses are still mainly focused on knowledge transfer, with a preference for the explanation and practice of words and sentence patterns. It is worthwhile to rethink the root of the problem and make practical solutions.

### 2.2.2. DISSONANCE BETWEEN TEACHING CONTENTS AND TEACHING OBJECTIVES AND REQUIREMENTS

The inclusion of English level test content in English language teaching is a current trend in English language development. According to the data analysis of the existing situation, the analysis of the proportion related to the inclusion of English level test content in the classroom is shown in Table 1. Only 3% of teachers never teach content related to the Level 4 exam, while 38% of teachers always teach content related to the Level 4 exam. With such factors, the teaching contents chosen by teachers and the learning contents chosen by students largely reflect the tendency of exam-oriented learning, which to a certain extent restricts the overall development of students' language ability and thus makes it impossible to achieve the teaching goal of cultivating students' comprehensive English application ability, especially listening and speaking ability, and thus creates a serious dysfunctional phenomenon.

**Table 1.** Proportion of four levels of content taught in university classrooms

	<b>Always</b>	<b>Frequently</b>	<b>Sometimes</b>	<b>Occasionally</b>	<b>Never</b>
Number of people	76	48	34	36	6
Proportion	38%	24%	17%	18%	3%

## 3. RESEARCH ON THE APPLICATION OF UNIVERSITY ENGLISH TEACHING MODEL

### 3.1. INTERNET-BASED SCAFFOLDED TEACHING MODEL IN ENGLISH TEACHING APPLICATION

Scaffolding is a conceptual framework provided by the teacher based on the students' current learning level is used to help students complete the progressive understanding and construction of knowledge. With the help of the teacher's guidance, students finally complete the meaningful construction of knowledge.

To test how effective the Internet-based scaffolding model is in practice on students' reading anxiety and reading achievement, i.e., whether it can alleviate students' reading anxiety and verify that it can improve students' reading achievement. The collected data were analyzed and discussed as shown in Table 2. A control experiment was constructed by grouping 40 students to analyze the feasibility and practicality of the Internet-based scaffolded teaching model applied to college English reading instruction by comparing and analyzing the reading anxiety scale data of the two groups.

From the test data, it can be seen that the mean reading anxiety score of the experimental group before the experiment was 79.82, while the control group was 78.51. The mean reading anxiety score of the experimental group after the experiment was 61.07, while that of the control group was 73.27. This indicates that the Internet-based scaffolding model is effective in alleviating students' English reading anxiety.

**Table 2.** Descriptive statistics of reading anxiety post-test

		Number of cases	Average value	Maximum value	Minimum value
Experimental group	Previous Tests	20	79.82	84	63
	After the test	20	61.07	87	58
Control group	Previous Tests	20	78.51	82	54
	After the test	20	73.27	90	68

### 3.2. OPTIMIZATION OF TEACHING AND LEARNING MODE WITH INTERNET TECHNOLOGY SUPPORT

The following points are to be achieved under the requirement of Internet system optimization based on university English teaching principles of sustainable development, wholeness, openness and dynamic balance, starting from each Internet factor and the relationship between them, and adopting various measures and strategies, which is a complex process that needs to be promoted in all aspects.

In this process, the first thing to do is to take the concept as the breakthrough, because human behavior is guided by ideas and concepts, the same thing under the influence of Internet subjects holding different concepts will produce different results, sometimes even diametrically opposite, so the optimization the prerequisite and strategy for the establishment of university English teaching system is the change of concept. Teachers should have students in mind in the preparation, organization and reflection of classes, and the selection of teaching contents, organization of teaching activities and teaching methods should be based on students' needs and actual situation. Internet technology should serve students' learning and development and prevent the phenomenon that Internet technology occupies the center of teaching and learning or becomes a mere decoration for teaching. Take advantage of Internet technology and computer networks to create the necessary and good personalized and independent learning environment for students.

## 4. CONCLUSION

Trade, information transfer and cultural exchange between countries highlight the importance of English in the development of the new era. The common problem faced by education systems all over the world is how the teaching model should be transformed in the light of the demands of the times. The English teaching model has new requirements in today's constantly and rapidly developing information and the new English talents require profound changes in the teaching mode, which also brings serious challenges to the traditional teaching mode. In order to promote the development and improve the quality of college English teaching, it is necessary to study and examine the changes and problems that appear in college English teaching in the context of the Internet era, and to study the measures and steps to solve the problems by finding the root causes of the problems.

# EXPLORING THE INTEGRATION OF RURAL CULTURAL REVIVAL AND DIGITAL MEDIA IN THE CONTEXT OF DEEP LEARNING

---

Zhiming Liu

Guangdong Polytechnic of Science and Technology, Zhuhai, Guangdong, 519090, China

[13570643770@163.com](mailto:13570643770@163.com)

---

## ABSTRACT

This paper studies the degree of people's love for rural culture, and the study analyzes users' attention to local history, art, human feelings, and scenery. The data of users' favorite degree of country culture shows that the local history is 79.5%, the country art decoration is 87.3%, the country customs is 73.9%, and the country scenery is 92.4%, among which the attention of country scenery and the favorite degree of country art decoration are relatively high. We will increase the promotion of rural scenery and rural art decorations to attract users' attention and promote cultural exchange and rural culture dissemination. Digital media technology plays an active role in effectively promoting the development of rural agriculture and helping rural modernization.

## KEYWORDS

Rural culture, Rural art arrangement; Agricultural development; Rural modernization; Cultural exchange

## 1. INTRODUCTION

In today's digital age, the dissemination of art and aesthetics is constantly advancing the construction of public space [1]. Since the countryside is not the main carrier of China's economic, cultural, and artistic development compared to the city, the digital construction of rural public space lags behind that of the city, and how to use digital media to enhance the digital construction of rural public space is an important issue to be studied and explored [2].

With the promotion of urban-rural integration construction, the trend of urban residents returning to the countryside has increased, and rural public space and urban public space together constitute the main space for residents' daily life [3-4]. As an extension of public space, rural space has become a new platform for public art creation, expanding the creation area for public art [5-6]. Compared to urban public spaces that carry out a clear division of labor into functional areas, using rural spaces as a carrier of public art can make the presentation area and manner of art richer [7-8]. Farming has always been an important direction for rural development, and using farming landscape as the landing point for public art can combine rural farming culture with modern art [9]. Rural culture, rural values, and people's ideology and lifestyle can be reflected in rural public spaces through digital public art, enabling people to participate in rural cultural construction and public art works to the maximum extent [10].

In this paper, we analyze the integration of digital public space art into rural landscapes, and study the benign interaction between digital art and the environment and humanities as a basis for upgrading and improving the presentation of farming landscapes. The paper studies

the practical operation of digital public space art intervention in rural landscape, seeks the changes brought by digital technology and public art intervention in rural landscape under the influence of digital art, explores the future development trend and creative means of rural landscape design, and provides practical reference cases for the development of rural public space.

## **2. THE CURRENT SITUATION OF REVIVING RURAL CULTURE WITH THE INTEGRATION OF DIGITAL MEDIA TECHNOLOGY IN THE CONTEXT OF DEEP LEARNING**

### **2.1. DIGITAL MEDIA TECHNOLOGY RURAL CULTURAL REVIVAL**

#### **2.1.1. STATUS OF RURAL CULTURE CONSTRUCTION UNDER THE DIGITAL VILLAGE POLICY**

The construction of digital countryside provides the technology and platform for the transformation of rural cultural industry to digitalization. Various parts of China have responded positively to the digital countryside policy launched by the state, coordinating and coordinating the efforts of all parties to promote digital countryside construction as a whole. After years of digital village construction, the digital village policy system has become more perfect, and the construction of rural information infrastructure has been improved. With the popularity of Internet access among the public, cultural exchange through the Internet has become a mainstream trend, and the construction of interconnection infrastructure has provided a broad platform for the dissemination of rural culture in digital form. The digital construction of rural cultural resources plays an important role in protecting outstanding rural cultural resources, reshaping a benign rural cultural ecology, and promoting excellent farming culture.

#### **2.1.2. PUBLIC ART INTERVENTION IN RURAL CONSTRUCTION**

The intervention of public art will become one of the important ways to build rural public space and give feedback to rural construction with rural culture as the entrance. Public art has the characteristics of conveying artistic concepts, intervening in public space, and reflecting cultural status quo, and is a kind of transformation of the surrounding environment by human beings with consciousness, while human history and culture act on public art, public art will also subconsciously react to human cultural concepts.

## **2.2. DIGITAL MEDIA-BASED RURAL CULTURE**

### **2.2.1. RURAL CULTURE VISUAL RECONSTRUCTION MODEL**

The implementation of digital countryside construction, rural culture construction and rural tourism infrastructure construction breaks the previous geographical limitation of urban-rural information interchange and provides technical platform and cultural resources for the digitization of rural cultural resources. The digital transformation of rural cultural resources cannot be separated from the development of digital cultural industry.

The digital culture industry is a comprehensive industry that manufactures, produces, disseminates, and utilizes cultural contents based on digital communication and network technologies and the integration of various media forms. The development of the rural digital culture industry has transformed the input method of “culture going to the countryside” in the city into the external output method of mainly rural digital culture content products, from input to output, so that rural cultural resources break through the limitations and realize the interoperability of urban and rural cultural resources. With the development of rural digital culture industry, the designers’ ability to explore the excellent rural cultural resources and control digital technology has been improved, and a rural cultural visual reconstruction mode

mainly based on “rural culture + digital media technology + design” has been gradually formed, which is to revitalize and display rural culture and disseminate digital products with the help of network platform. The model is to revitalize rural culture and disseminate digital products through online platforms to promote rural culture.

### **2.2.2. COMBINATION OF DIGITAL MEDIA ART AND FARMING ENVIRONMENT**

The current rural space renovation project is seriously homogenized and lacks space renovation based on the local rural environment and culture. The government strongly supports the modernization of rural space, but its spatial style is trended by internet popularity and lacks the cultural characteristics of local villages. The combination of digital media art and farming environment uses the regional language of farming environment to enrich rural public space and cultural forms, while exploring the value tendency of using art for the public, enhancing the experience of villagers and tourists in rural space through the newer public art forms, combining policy directions, integrating digital public space art into rural public space construction, and promoting cultural dissemination. The project also aims to integrate digital public space art into rural public space construction and promote cultural dissemination and economic development.

## **3. DIGITAL MEDIA-BASED RURAL CULTURAL REVIVAL DESIGN**

### **3.1. RURAL CULTURE CONTENT APPLICATION DESIGN EXPERIMENT**

In terms of visual reconstruction of rural cultural content products, the reconstruction content mainly takes the form of rural culture combined with rural policy information services, rural tourism services, special agricultural products promotion services, and rural social services. The cell phone software records local history, geography, people and scenery, so as to inherit and pass on culture and promote hometown culture and literature. The public uses the tourism service interface provided by the rural cultural content product cell phone software to conduct cultural exchanges and sales of agricultural products.

In order to understand which aspects of rural culture users pay high attention to, by constructing a study on users' attention to local history, art, human feelings and scenery, the degree of people's love of rural culture is shown in Figure 1. The user's favorite degree of country culture local history is 79.5%, country art ornament is 87.3%, country customs is 73.9%, and country scenery is 92.4%, among which the attention of country scenery and country art ornament favorite degree are relatively high. Therefore, we can increase the promotion of rural scenery and rural art ornaments to attract users' attention, so as to promote cultural exchange and rural culture dissemination.

**Figure 1.** Degree and type of rural cultural favorites

### 3.2. STABILITY ANALYSIS OF RURAL CULTURAL CONTENT PRODUCT INNOVATION

The boost of communication media is the external power of cultural communication, and the visual quality of digital products is the core of cultural communication, which directly affects the communication effect. With the development of information technology, digital media technology is also constantly updated. Applying some new technologies such as VR, AR, 3D modeling technology and digital image processing technology to rural culture communication system can realize the digital transformation of rural culture.

To test the stability of the digital media rural culture communication system based on deep learning. The data processing speed of the rural culture dissemination system is shown in Table 1. Set the user access line to 100 and operate the system at the same time. The system still maintains normal operation and the system performance are in good condition, so the digital media rural culture dissemination system based on deep learning is very stable.

**Table 1.** Stability studies of cultural communication systems

Test content	Test Results	Test pass status
User Permissions	Preventing over-authorization	Test Pass
System Licensing	Agree to authorize	Test Pass
Exporting data	Realization of requirements	Test Pass
Importing Data	Realization of requirements	Test Pass

## 4. CONCLUSION

The future countryside is taken as an important grip of the city's rural revitalization strategy. Starting from ecology, with conservation as the main principle, and insisting that villagers in the countryside take the position of owners to jointly promote a strategic plan to adapt to the development of the countryside, digital artistic empowerment of the farming environment is carried out while ensuring the inheritance of excellent farming culture. Through digital intervention in the farming landscape, highlighting the use of digital technology, advocating digital mindset, understanding the role of digital cognition in the future countryside, and comprehensively enhancing the industry of the countryside, this is an essential step in the development of China's rural revitalization.

Digital media means can be used to apply design aesthetics principles to the visual reconstruction of rural culture, making rural digital cultural content products more innovative, interactive, interesting and artistic, in order to realize the modern reconstruction of rural cultural symbols. Digital products with quality cultural content are more recognized by the public in the process of dissemination and can better stimulate the public's attention to the development of rural culture.

## FUNDING

This research was supported by Leading Party building in rural revitalization and cultural rejuvenation design—Take digital media art design professional group as an example.

# STUDY ON THE STRATEGY OF INTEGRATING THE DEVELOPMENT OF CIVICS AND EDUCATION WITH INDUSTRY IN THE INFORMATION AGE

---

Jia Liu\*

Guangdong Baiyun University, Guangzhou, Guangdong, 510450, China

[sucessyear@126.com](mailto:sucessyear@126.com)

---

## ABSTRACT

The information technology era has posed new challenges to the development of the integration of the Civics curriculum and industry-education. In this paper, in order to study the strategy of integrating the development of Civics and Education with Industry in the information age, we analyze the current situation of teaching Civics and Education courses in the information age and discuss the influence of information technology platform on enhancing the articulation of Civics and Education courses. It also studies the teaching effect of the Civics course before and after using information technology. 73.95% of the students are interested in the course, compared with 48.85% before the study, and 87.45% of the students think that the focus of the course is easy to understand, compared with 63.57% before the study. Informatization is the direction of further development of the teaching of the Civics course and the development of the integration of industry and education.

## KEYWORDS

Civics course; Integration of industry and education; Information technology platform; Teaching efficiency; Teaching status

## 1. INTRODUCTION

In the current process of college education and teaching, teachers who can really eat the connotation of thinking and political education and gradually learn to integrate it in the college curriculum [1]. Then they can better help students to form good ideological and moral qualities and pay attention to their own behavior in the process of progressing in ideological and moral cultivation, and gain more progress and development about the ideological and political education [2-3]. Through such a model, students not only implicitly receive the ideological and moral qualities [4]. While actively learning scientific and cultural knowledge for the better development of their own abilities, they can also expand the conditions for the development of their educational abilities and the progress of their educational strengths in the new era by expanding the ideological and political literacy, which in turn promotes the development of students' learning and better lays the foundation for their progress [5].

The teaching mode of industry-education integration is a necessary and important method for colleges and universities to cultivate moral and technical, all-round and high-quality technical talents [6]. Civics course teaching is to strengthen its nurturing function while the course learning, and the two complement each other and promote each other [7-8]. With the demand of society for high-quality talents, it is of great practical significance to improve students' comprehensive literacy [9]. However, there are still many problems faced in the reform of college curriculum Civics under the background of integration of industry and

education, which need further improvement and enhancement. The reform of college curriculum thinking and politics under the perspective of integration of industry and education is of great importance, but at the same time, the reform of college curriculum thinking and politics in higher education institutions faces some problems and needs to take corresponding improvement measures.

## **2. THE DEVELOPMENT OF THE INTEGRATION OF CIVIC SCIENCE CURRICULUM AND INDUSTRY-EDUCATION IN THE AGE OF INFORMATION TECHNOLOGY**

### **2.1. INTEGRATION OF INDUSTRY AND EDUCATION IN THE DEVELOPMENT OF CIVIC SCIENCE COURSES IN HIGHER VOCATIONAL INSTITUTIONS**

#### **2.1.1. IMPROVE THE QUALITY OF EDUCATION AND THE LEVEL OF SCHOOLING**

Colleges and universities should vigorously improve the quality and level of education, implement the concept of industry-education integration at all levels of education and teaching work, realize the adaptation of education to technological progress, changes in production methods and social public services, and promote the upgrading of economic quality and efficiency. The integration of industry-education and the Civic and Political Science curriculum both emphasize the leadership of values and the refinement of professionalism in terms of education objectives, and attach importance to the sustainable development ability of talents, which has become the new mission of the times for education and is constantly empowered and strengthened.

Under the perspective of industry-education integration, the reform of the Civic and Political Science curriculum in colleges and universities is of great significance. It is important to carry out Civic Education through the whole process and all links of talent cultivation, strengthen students' ideological and political education by linking Civic Theory with reality, plant patriotism sentiment, inject red gene and spirit of model workers and craftsmen, strengthen character cultivation and professional ethics education, shape the soul of future talents, and cultivate excellent talents to serve the country and sustainable development in the process of industry-education integration. Therefore, the reform of Civic and Political Science curriculum under the perspective of industry-education integration can significantly improve the quality of college students, realize the innovation of culture and technology, promote industrial restructuring and improve the quality of education.

#### **2.1.2. THE COMPLEXITY OF THE LEARNING ENVIRONMENT IN THE CONTEXT OF INDUSTRY-EDUCATION INTEGRATION**

Under the background of industry-education integration, students' learning environment and living environment are not only concentrated in the campus, but also oriented to the society. Entering a more complex social environment, students will be exposed to more new things, which will have a significant impact on students' cognition and ideas. At this time, students have not yet formed stable values, and are easily influenced by external negative factors, resulting in confusion and lost in the complex society. If the school does not find students' ideological problems in time and take appropriate educational measures, it is easy to produce adverse consequences.

## **2.2. TEACHING IDEOLOGICAL AND POLITICAL COURSES IN THE AGE OF INFORMATION TECHNOLOGY**

### **2.2.1. ANALYSIS OF TEACHERS' IMPORTANCE**

The importance of teachers in higher education is critical to the integration of Civic Studies content into classroom education. Because teachers' attitude determines everything, only when teachers can better integrate the content of Civic Education can they help students form

a good learning experience and gradually guide their development. However, in the process of education and teaching at the present stage, we will find that many teachers in the process of college education do not pay enough attention to the content of Civic Education, and cannot correctly view the important role and significance of Civic Education, which makes it difficult to truly form the strength of education and teaching, and to develop the meaning of connotation value in education and teaching.

In order to understand the teachers' incorporation of information technology in the classroom in the Civics course, the evaluation data of 60 students were collected for analysis, and the teachers' use of information technology in the Civics classroom is shown in Figure 1. Thirty-four students evaluated that teachers only use information technology occasionally, 17 students thought that teachers usually use information technology, and 9 students said that teachers basically do not use information technology for teaching Civics. This means that in the context of the information technology era, although teachers can also be clear about the importance of adding information technology to the Civics course, they still do not pay enough attention to it, which is also something that can affect the effectiveness of Civics education.

**Figure 1.** The importance teachers place on the integration of information technology

### 2.2.2. COMPARISON OF TEACHING EFFICIENCY OF CIVICS COURSES

In the current education and teaching process, we will find that many teachers still adopt boring education mode in the process of education, which cannot better arouse students' interest in learning, nor can they integrate corresponding ideological and political education activities, but simply carry out didactic teaching. The lack of design and attention to the corresponding activities directly leads to the low interest of students in learning.

In order to investigate the impact of information technology on the teaching efficiency of the Civics course in the teaching process, the teaching effect of Civics course before and after using information technology is shown in Table 1. 73.95% of students were interested in the course after the study of teaching the Civics course with information technology, compared with 48.85% before the study, 87.45% of students found the focus of the course easy to understand, compared with 63.57% before the study, and 85.95% of students thought that the learning efficiency was improved, compared with 57.54% before the study. This implies a

relatively strong relationship with teachers taking full advantage of information technology to enrich the content of the Civics course. These Civics education activities are no longer boring for students and are conducive to improving students' understanding of Civics courses, thus improving the efficiency of teaching Civics courses.

**Table 1.** Changes in the teaching effect of information-based Civics courses

	Pre-study	After the study
Courses of interest	48.85%	73.95%
Comprehension focus	63.57%	87.45%
Learning efficiency	57.54%	85.95%

### 3. INFORMATION TECHNOLOGY PLATFORM TO ENHANCE THE ARTICULATION OF CIVICS COURSES

#### 3.1. REFINE THE STUDENT DATABASE

Enhance the whole layout of ideological and political theory course articulation, the most important is to promote the integration of the top-level design of curriculum value objectives. Promote the articulation of teaching contents and form a coherent talent training model. To achieve this, it is necessary to effectively use information technology tools to explore the educational synergy between online platforms and educators to do a good job of curriculum articulation. The student database should be refined, and the existing course value objectives and content settings of ideological and political theory courses for students of different levels and student learning should be fully integrated into the student database, and updated in real time.

It provides a realistic basis for educators to effectively deal with the problems of similar or repetitive course contents in ideological and political theory courses of different levels, and the incompatibility between teaching knowledge content system and students' cognitive development system. Teachers of ideological and political theory courses in colleges and universities should make good use of database information in the teaching process to grasp the progress of students' ideological and political theory course learning and precisely arrange course teaching objectives and contents.

#### 3.2. USING IT PLATFORMS TO ENHANCE STUDENTS' SENSE OF ACCESS

Ideological and political theory courses are an important way to enhance students' ideology, theory and sense of access, and are the main channel to establish moral education and cultivate the soul of people. In the age of information technology, the alienation of teachers and students under the influence of multiple real-life factors is deepening, and it is especially important to enhance the affinity and relevance of ideological and political education work, especially online ideological and political education work, using information technology platforms to discover the social hotspots of students' concerns and confusion, timely responses and answers, to achieve two-way interaction, is an effective measure to enhance the influence of ideological and political theory classes.

With the rapid development of big data and blockchain technology, we can try to explore the big data service with blockchain as the underlying technology and visualize the data while collecting students' thought dynamics extensively. After scientific and reasonable analysis of the obtained data, we can explore the needs of students' thoughts and confusion from the demand side, and provide a reliable and realistic basis for timely and effective communication. In this process, educators must have more solid theoretical knowledge, be problem-oriented, take the initiative to discover the causative factors and logic behind the problems, and give clear and powerful positive answers and guidance in a timely manner.

### **3.3. HIGHLIGHTING THE TEACHING CHARACTERISTICS OF CIVICS COURSES**

Teachers themselves should have high moral cultivation, be able to correct their teaching attitudes and master good knowledge of Civics, so as to help students make continuous progress in their thinking while learning professional courses, become people with high moral character and good moral cultivation, maintain a positive and optimistic attitude towards work, study and life, and take an excellent professional outlook, outlook on life and values as a clear guide on the way to growth.

The premise of ideological and political education value is to adhere to the education of people, ideological and political theory class teaching activities is to contribute to the value of ideological and political education from the theoretical state into the real state of the important driving force, strengthen the ideological and political theory class teaching reform and innovation is an effective measure to enhance this driving force, is also the most direct means to improve the quality and ability of college students.

### **4. CONCLUSION**

Under the perspective of industry-education integration, university curriculum thinking education is still in the exploration period of development, and there are relatively few cases and experiences to learn from. Colleges and universities should be brave to break the traditional teaching mode, explore new paths of development and continuously accumulate reform experience. By improving the curriculum thinking and politics education system, clarifying the content and methods of curriculum thinking and politics, improving the level of thinking and politics of higher education teachers, and building model education of thinking and politics courses. The innovative measures such as highlighting the characteristics of curriculum Civics teaching, closely contacting with enterprises and cooperating with each other to create a new model of curriculum Civics teaching more in line with the actual situation of colleges and universities.

In the context of information technology, the various temptations that students face are increasing, and the Civic Science curriculum is integrated into the education and teaching process. It can help students to identify the correct information among various kinds of information, which is beneficial to their growth. And in the current college political work, only the counselors devote their efforts to help students to avoid the development of various undesirable factors, in order to better form a barrier for students to learn. For students to choose the right path of life, help students to establish a correct world view, outlook on life and values, and promote the formation of students' ideological and moral cultivation.

# DESIGN OF ENGLISH WEB TEACHING RESOURCE SHARING PLATFORM BASED ON MOBILE WEB TECHNOLOGY

---

Jianwei Zhang\*

Central South University of Forestry and Technology, Changsha, Hunan, 410004, China

[zjw15074996954@163.com](mailto:zjw15074996954@163.com)

---

## ABSTRACT

This paper constructs the design of English online teaching resource sharing platform, elaborates the principles of teaching resource sharing platform development, studies the learning mode of sharing platform, and tests the stability of teaching resource sharing platform. 100 users browse the teaching resource platform with a response time of 1-1.5 seconds, 500 users browse the teaching resource platform with a response time of 3-4.5 seconds, and several illegal users log in to the platform with a recognition time of 5-7 seconds. The response time is 5-7 seconds, the average automatic database backup time is 2 seconds, and the response time of 100-500 users browsing the teaching resource platform is less than 5 seconds, which meets the standard. Therefore, the English network teaching resource sharing platform based on mobile Web technology is helpful to improve the efficiency of teaching resource sharing.

## KEYWORDS

English online teaching; Teaching resources; Development principles; Database; Sharing platform

## 1. INTRODUCTION

With the development of the Internet and computer information technology, the generation, development, acquisition and application of knowledge are undergoing unprecedented and profound changes. And these changes are quietly changing the way of teaching and learning for human beings [1-2]. As one of the fastest innovating, most versatile, and most penetrating high technologies in the world today, information technology is not only profoundly changing the way people live, but also changing the way you and I learn [3-5]. In order to accelerate the construction of education informatization, schools have started to vigorously carry out the construction of network resource platforms, open network resources, and establish network and information resource sharing mechanisms, so as to achieve the great teaching goal of education informatization leading to education modernization [6-7]. The arrival of mobile Web has ushered in new opportunities for educational informatization [8]. Web advocates personalized services, focuses on interaction and uses collective wisdom, and applying this technology to the construction of teaching resource platforms in schools has become an inevitable trend in the current high-quality curriculum platform [9-10]. The English Web teaching resource sharing platform expands the depth and breadth of networked college English learning so as to achieve the most optimal teaching effect.

## **2. RESOURCE SHARING PLATFORM PRINCIPLES AND LEARNING MODEL**

### **2.1. PRINCIPLE OF TEACHING RESOURCE SHARING PLATFORM DEVELOPMENT**

#### **2.1.1. EASE OF USE PRINCIPLE**

As far as the teaching resource sharing platform is concerned, its ease of use is a direct indicator to evaluate the system. We should not let it become a replica of the textbook content, but should fully consider the learning environment and learning preferences of students, summarize the rules of students' online learning through systematic demand research, and develop a system that is easy for students to accept and use in a targeted manner.

#### **2.1.2. USABILITY PRINCIPLES**

The teaching resource sharing platform is not only to pile up teaching resources, but also to be able to make the platform welcomed by everyone, improve the click rate of the platform, and thus enhance the usage rate of the resources. Therefore, usability is a necessary quite a few requirements for the system. Thus, we need to study the majority of teachers and students, what kind of resources they need, what kind of resource presentation forms they need, and implement them in the system with corresponding technologies for their needs.

#### **2.1.3. STABILITY PRINCIPLE**

The teaching resource sharing platform, with basic Web technology development, is a relatively complex resource sharing platform, which not only needs to complete the sharing of common documents, but also needs to solve the problems of automatic document format conversion, multimedia processing technology, and easy browsing of documents. At the same time, the platform needs to face all teachers and students of the university, and also includes visitors from outside the university. When the number of accesses is high, it is easy to cause the access speed of the system to drop and make the service stop or become unstable. Therefore, the system needs to be designed with stability in mind, optimizing the data reading efficiency and improving the stability of the system as much as possible.

### **2.2. STUDY OF SHARED PLATFORM LEARNING MODEL**

#### **2.2.1. SELF-DIRECTED LEARNING MODEL**

The self-directed learning mode is a learning mode in which learners set and accomplish specific learning goals according to their own conditions and needs under the regulation of the overall teaching objectives and the guidance of teachers. This theory is also in line with the individual participation characteristics of the Web platform, which provides students with learning resources and allows them to obtain useful information according to their own needs, while actively seeking answers to their questions on their own. Autonomy.

#### **2.2.2. COLLABORATIVE LEARNING MODEL**

The collaborative learning model is a way of organizing students' learning in small groups, in order to achieve common learning goals. The main modes of collaborative learning are competition, debate, group work, and role-playing. The Web platform allows students to work in small groups on the same topics to develop critical and creative thinking.

#### **2.2.3. DISCUSSION-BASED LEARNING MODEL**

Discussion-based learning mode is a learning mode in which multiple learners acquire knowledge through discussion with certain help. There are four main forms of discussion learning mode in specific teaching practice: problem-based discussion method, experimental discussion method, exercise based discussion method, and random discussion method. On the Internet, a teaching platform, there are two main types of discussion learning modes:

synchronous discussion and asynchronous discussion.

### 3. ENGLISH ONLINE TEACHING RESOURCES SHARING PLATFORM DESIGN AND TESTING

#### 3.1. DATABASE DESIGN

Almost all database systems can be combined with NET platform to provide database support for NET system, including ORACLE, SQL SERVER, ACCESS, MYSQL, etc. The architecture of shared teaching resources system is shown in Figure 1. SQL SERVER is chosen as the database for system development. SQL SERVER can provide powerful data access and data management tasks, and can efficiently pass the data business dynamically through the logical processing layer to the surface layer and present it to users in the form of page data.

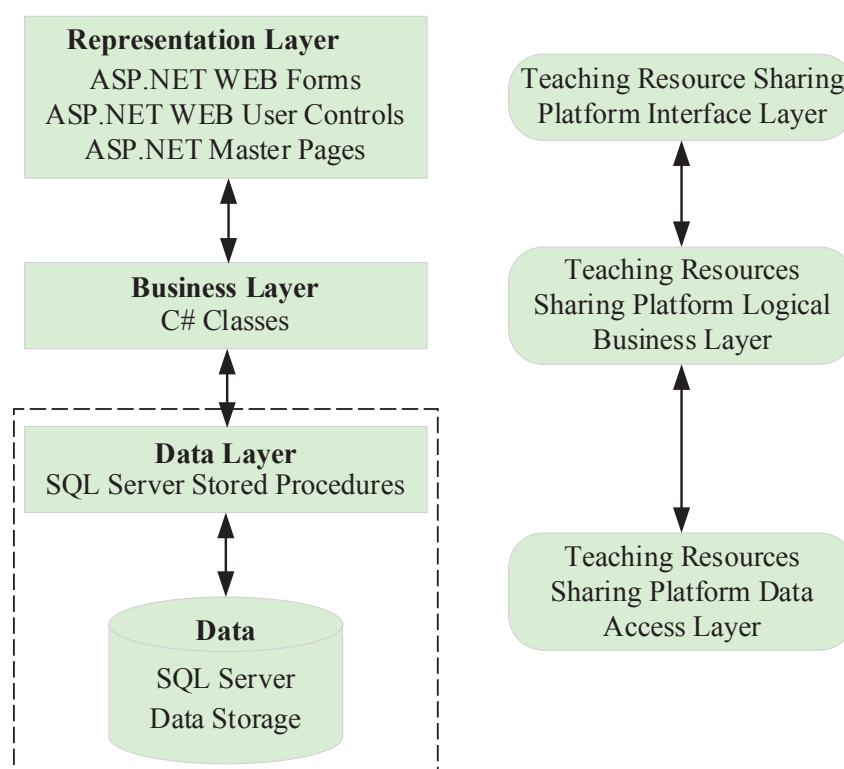

Figure 1. Database system architecture

#### 3.2. PLATFORM STABILITY TESTING

In order to test the stability of the English teaching resource sharing platform, the performance of the teaching resource sharing platform was tested by simulating various functions of the platform as shown in Table 1. 100 users browsed the teaching resource platform with a response time of 1-1.5 seconds, 500 users browsed the teaching resource platform with a response time of 3-4.5 seconds, several illegal users logged on to the platform with a recognition time of 5-7 seconds, and the average automatic database backup time was 2 seconds. The response time of 100-500 users browsing the teaching resource platform is less than 5 seconds, so the platform stability test is passed. It shows that the English network teaching resource sharing platform based on mobile Web technology can meet the requirements of information security and stability.

**Table 1.** Performance test data of teaching resource sharing platform

Test number	Test	Test content	Test results
1	Platform configuration testing	Ability to successfully configure the system in Windows 10	Success
2	Multi-user platform response time testing	Response time for 100 users to view teaching resources	1-1.5 seconds
3	Multi-user platform response time testing	Response time for 500 users to view teaching resources	3-4.5 seconds
4	Platform Security Testing	Multiple illegal users logged into the platform to identify the time spent	5-7 seconds
5	Platform data backup test	Set the average time for automatic database backup	2 seconds

#### 4. CONCLUSION

Based on mobile Web technology, the English online teaching resource sharing platform takes the Internet as the base to integrate polymorphic course resources, diverse forms of teaching communication, diverse interpersonal interaction and communication activities, diverse teaching media technologies and diverse evaluation methods with the university English course to create an ideal English teaching environment that supports “independent exploration, multiple interactions, contextualization, cooperative learning and resource sharing” and construct a new teaching structure model. The new model of teaching structure is constructed by creating an English teaching environment that supports “independent exploration, multiple interactions, context creation, cooperative learning, and resource sharing”. The construction of this model makes up for the shortcomings of single online teaching and traditional classroom teaching, expands the classroom teaching space, broadens students’ access to education and information, and gives students more autonomy in learning.

# THE CULTURAL SYNDROME BEHIND THE METAVERSE ELEMENTS IN FILM AND TELEVISION WORKS

---

Mingzhe Cao\*

Guangling College of Yangzhou University, Yangzhou, Jiangsu, 225002, China

[15050710371@163.com](mailto:15050710371@163.com)

---

## ABSTRACT

This paper explores the cultural syndrome behind metaverse from the metaverse elements in film and television works. The metaverse elements are widely used in film and television works, including the creation and exploration of metaverse and many other aspects. In the metaverse, the cultural symptoms are mainly expressed in the use of cultural symbols, the presentation of cultural conflicts, and the construction of cultural identity. The results show that the health culture meta-universe has about 10%~35% improvement in stage evolution compared with the traditional meta-universe with the support of 5 major technologies. This study is of great theoretical and practical significance to deeply understand the influence of metaverse elements on cultural syndromes and to promote the construction and development of healthy cultural metaverse, and provides new ideas and perspectives for research in the field of culture.

## KEYWORDS

film and television works; metaverse elements; cultural syndrome; cultural symbols; cultural conflict; stage evolution

## 1. INTRODUCTION

As a new concept that has emerged in recent years, metaverse has attracted a lot of attention and research in various industries [1-2]. As a virtual, digital "second world", metaverse can be regarded as a community with its own special rules and culture, which contains many cultural factors and social phenomena [3-4]. As a popular cultural vehicle with wide distribution and influence, film and television works are constantly exploring and exploring the cultural symptoms and connotations behind the metaverse [5]. Literature [6] proposed the concept of "metaverse thinking" and pointed out that metaverse, as a digital, user-centered and diverse virtual community, plays an important role in cultural innovation and dissemination. The paper [7] analyzed the

connotation and components of metaverse culture and proposed the multiple characteristics of metaverse culture in the process of intermingling traditional and digital cultures.

This paper will first introduce the application of metaverse elements in film and television works, including two aspects of metaverse creation and exploration more. Secondly, it will analyze the expressions of metaverse elements in film and television works, which include cultural symbols, cultural conflicts and cultural identity in the metaverse. On this basis, the connotation characteristics and evolutionary stages of the health culture metaverse will be proposed, and the important position of the health culture metaverse in promoting global cultural innovation and development will be discussed.

## **2. META-UNIVERSE ELEMENTS IN FILM AND TELEVISION WORKS**

### **2.1 THE APPLICATION OF METAVERSE ELEMENTS IN FILM AND TELEVISION WORKS**

#### **2.1.1 CREATION AND EXPLORATION OF METAVERSE**

In film and television, the metaverse is often seen as a fictional world, and the creation and exploration of this world has become an important element in film and television. For example, in the movie "Top Gun", the protagonist Wade is searching for the hidden level in the game "Resurrection Beetle", and needs to solve the puzzle by understanding the author Harry Mason and thinking about him. This process not only shows Wade's wisdom and courage, but also gives the audience an in-depth understanding of the creator of the meta-universe and the cultural elements behind it. In the movie Avatar, the protagonist Jack enters the metaverse of Pandora and has a series of adventures and battles with the local Nami people. This process not only gives the audience a glimpse of a new world, but also makes them think deeply about issues such as human beings and nature, technology and culture.

Therefore, the creation and exploration of metaverse is not only an important element in film and television works, but also an important topic that can provoke the audience to think and explore.

#### **2.1.2 THE CULTURAL SYNDROME OF THE METAVERSE**

However, the creation and exploration of metaverse in film and television can also lead to some cultural symptoms. For example, the meta-universe "Oasis" in the movie "Top Gun" is full of various cultural elements, but it is a world controlled by the rich, and the poor are often unable to enjoy it. This cultural symptom suggests the problem of the gap between the rich and the poor and class solidification in the real society. For example, in the movie "Guardians of the Galaxy", the protagonist Peter Quill enters the

meta-universe of "Novak" and has a series of adventures and battles with Rocket Raccoon and other alien races. However, in this meta-universe, alien people are often regarded as "alien" and "inferior creatures", and this racial discrimination also suggests the racial problems in the real society.

Therefore, the creation and exploration of metaverse not only can show the cultural elements in film and television works, but also may trigger the audience to think and reflect on the problems in the real society.

## **2.2 REPRESENTATION OF METAVERSE ELEMENTS IN FILM AND TELEVISION WORKS**

Virtual reality technology is one of the important expressions of metaverse elements in film and television works. Through the virtual reality technology, the audience can feel the virtual world in the film and television works immersively. For example, the virtual reality game world "Oasis" in the movie "Top Gun" is presented through virtual reality technology. The audience can put on the VR headset and enter the virtual world in the film to experience the amazing scenes and plots depicted in the movie. In addition to movies, virtual reality technology is also widely used in TV series, animation and other film and television works. For example, the game scenes in the TV series "All in One" are presented through virtual reality technology, allowing the audience to feel the realism of the game world. The use of virtual reality technology not only enhances the visual effect of film and television works, but also expands the narrative space of film and television works, allowing the audience to better understand and experience the plot and characters in the film.

## **2.3 THE CULTURAL SYNDROME OF METAVERSE ELEMENTS IN FILM AND TELEVISION WORKS**

### **2.3.1 CULTURAL SYMBOLS IN THE METAVERSE**

Cultural symbols in the metaverse are a common element in film and television productions. These symbols can be cultural heritage from real life or fictional cultural elements. For example, in the movie Star Wars, the Jedi's costumes and lightsabers are a cultural symbol, and they symbolize the glory and power of the Jedi. And in the movie Avatar, the exotic plants and animals are a fictional cultural element, which represent the ecosystem and culture on the planet Pandora.

### **2.3.2 CULTURE CLASHES IN THE METAVERSE**

Since the cultural symbols in the metaverse come from different cultural backgrounds, conflicts between them are inevitable. For example, in the movie Star Trek, the cultural differences between humans and alien races lead to a series of conflicts and misunderstandings. These conflicts not only drive the development of the

story in the plot, but also reflect the real-life cultural conflicts and challenges of multiculturalism.

### 2.3.3 CULTURAL IDENTITY IN THE METAVERSE

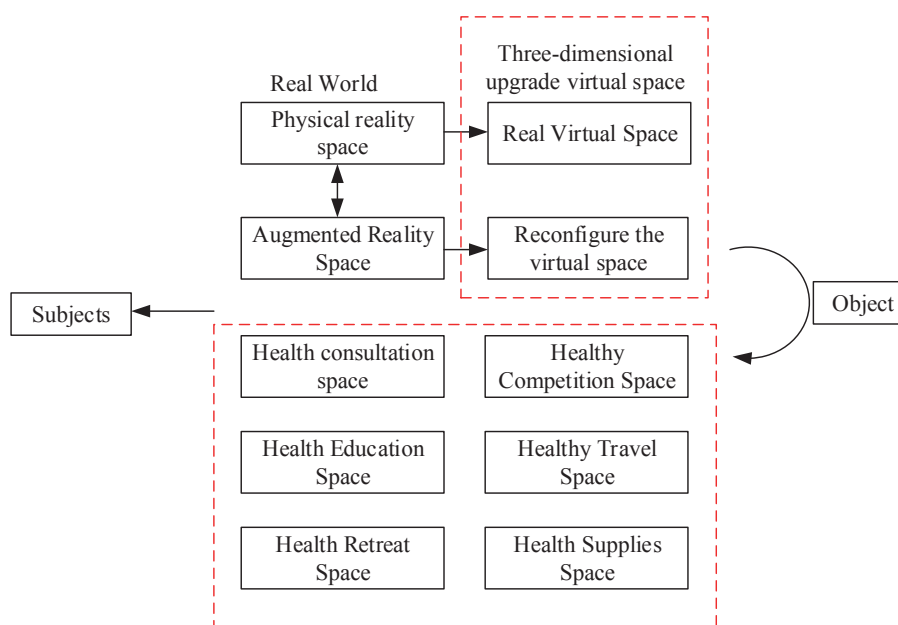

At the same time, cultural symbols in the metaverse can be a way for people to identify with their own cultural identity. For example, in the movie "Black Panther", the cultural symbols of Wakanda symbolize the cultural heritage of Africa and black pride. These symbols not only make the audience feel the unique charm of black culture, but also make the black audience feel their own identity and pride.

## 3. THE CONNOTATION CHARACTERISTICS AND EVOLUTION OF HEALTH CULTURE METAVERSE

### 3.1 THE INNER CHARACTERISTICS OF THE HEALTH METAVERSE

(1) A healthy interactive space with a fusion of real and imaginary links

Health Culture Meta-Verse is a new type of health space that integrates real health space and virtual space. Its spatial form of linking and fusing virtual and real expands the interaction space of users' health activities, and gradually develops various health forms under the impetus of new technologies, thus realizing the interaction, integration and symbiosis between the real world and virtual space. In the health metaverse, labor and capital are combined with data of the main production factors, triggering significant changes in the space of health supply and demand activities and ways, thus expanding the perspective of displaying health practice forms and basic forms. The core features of the health culture metaverse are shown in Figure 1.

**Figure 1** Core features of the health culture meta-universe

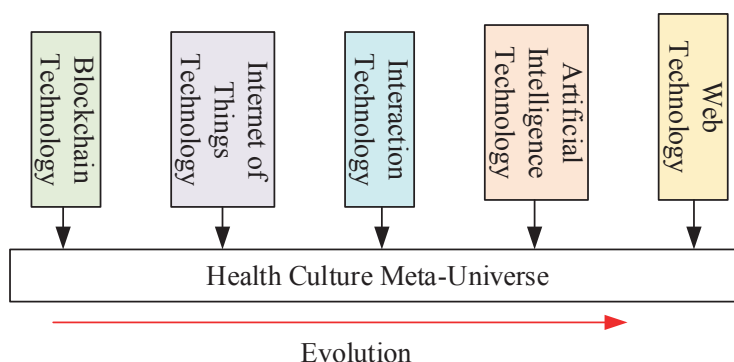

(2) Immersive experience space with somatic activity as the core

The basic means of health promotion is somatic activities, and the realization of health is accomplished through relatively independent somatic activities. The health metaverse builds a field with characteristics such as deep immersion and high realism, and realizes a new experience for users by establishing a health virtual space.

The immersive experience space extends the sensory experience of users. Relying on intelligent interaction technology, Health Metaverse creates a 3D upgraded space that is more immersive and interactive compared to the real world, providing people with a more free and expansive space.

### 3.2 STAGES OF EVOLUTION OF THE HEALTH CULTURE METAVERSE

With the continuous evolution and promotion of digital technology, the virtual reality of health meta-universe, the integration will also be continuously promoted according to different development stages such as digital twin, virtual native and virtual symbiosis. The technological reliance and stage evolution of the health culture meta-universe construction are shown in Figure 2.

**Figure 2** Technical support and stage evolution of health culture metaverse construction

(1) Digital twin stage, the real world, health activities, objects, people, scenes and other elements can be completely mirrored in the virtual world health space through virtual simulation technology, to achieve the digital simulation and dynamic presentation of all elements in the real health space.

(2) In the virtual native stage, the virtual health space of the health metaverse is a new virtual health space that is different from the real health and exists independently. The virtual imaginary world in this space is stimulated to expand the spatio-temporal system, and a large number of virtual entities beyond reality are derived.

(3) The stage of virtual-real symbiosis, in which the real health space and the virtual health space achieve deep integration and symbiosis and interactive linkage.

#### 4. CONCLUSION

This study systematically explores the cultural symptoms behind the metaverse elements in film and television works, analyzing the expressions and the cultural meanings represented by the cultural symbols, cultural mid-emergence, cultural identity and cultural innovation in the metaverse. Through the study, it is found that the reference and representation of metaverse elements in film and television works is not only to enhance the audience's entertainment and aesthetic experience, but also a way of cultural integration and transmission, which is an important form of modern cultural communication.

# ANALYSIS OF THE PRACTICAL EXPERIENCE OF INDUSTRIALIZATION OF INTERNATIONAL EDUCATION IN AUSTRALIA BASED ON KNOWLEDGE MAPPING IN THE CONTEXT OF THE NEW CROWN EPIDEMIC

---

Hongbo Du\*

Chengdu Jincheng College, Chengdu, Sichuan, 611731, China

[christinadhb@163.com](mailto:christinadhb@163.com)

---

## ABSTRACT

This paper firstly introduces the semantic network and the way of constructing knowledge graphs, as well as the application in the field of education. Then it focuses on analyzing the application of knowledge graph in the practice of international education industrialization in Australia, including the construction of knowledge graph in Australian education field and the application of knowledge graph in international education market. Finally, the advantages and application experiences of knowledge mapping in the practice of international education industrialization in Australia during the pandemic period of COVID-19 are summarized. The results show that knowledge mapping is effective in improving the efficiency of utilizing education resources and promoting the collaborative development of education industry in Australia. This paper provides valuable practical experience for practitioners in the international education field.

## KEYWORDS

knowledge graph; semantic web; international education; Australia; industrialization of education; application experience

## 1. INTRODUCTION

The outbreak and global spread of the new crown epidemic has brought unprecedented challenges to the international education industry [1-2]. In this context, how to improve the efficiency and competitiveness of the international education industry by means of information technology has become an urgent problem [3]. Knowledge graph, as a new type of data structure and information processing, is widely used in various fields [4]. In recent years, the application of knowledge graphs has received increasing attention. In the field of education, the application of knowledge graphs can help build educational knowledge systems and improve the efficiency of information sharing and utilization [5-6]. And in the international education industry, the application of knowledge graphs has become more and more common [7]. For example, educational institutions and technology companies in the United States have joined forces to create a knowledge graph called the Learning Opportunity Graph, which

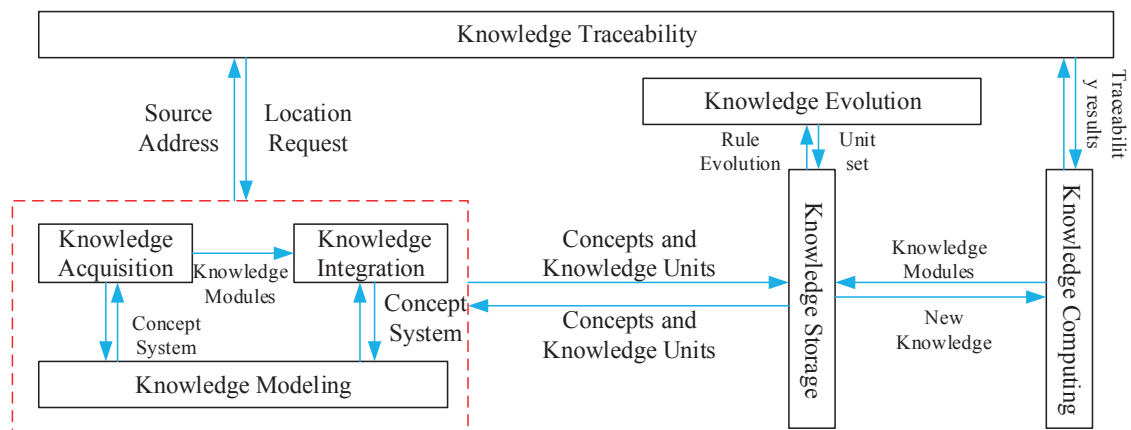

aims to provide better learning resources and a more comprehensive learning experience [8]. This paper first introduces the construction of knowledge graph and its application in the field of education. Then, it specifically analyzes the application of knowledge graph in the practice of international education industrialization in Australia, including the construction of knowledge graph in Australian education field and the application of knowledge graph in Australian international education market , which was affected seriously especially during the period of COVID-19. Finally, the experiences and advantages of knowledge mapping in the practice of international education industrialization in Australia are summarized, and useful inspirations and references to the international education industry in other countries and regions are proposed.

## 2. KNOWLEDGE GRAPH

A knowledge graph is a semantic network for representing entities, concepts, and relationships among them, which helps machines understand and reason out the meaning of human linguistic expressions. The essence of a knowledge graph is a structured, semantic, computable knowledge base that encodes and stores various types of entities and concepts and the relationships between them.

### 2.1 CONSTRUCTION OF KNOWLEDGE GRAPHS

The construction of the knowledge graph requires acquiring and integrating data from multiple data sources, including structured data, semi-structured data and unstructured data. The process of building the knowledge graph is shown in Figure 1. By semantic analysis and association mining of these data, they can be transformed into nodes and edges of the knowledge graph to form a complete knowledge network.

**Figure 1** Structure of knowledge graph construction process

The knowledge graph is composed of three main components: entities, attributes and relationships.

Entities are the nodes in the knowledge graph, which can be things, concepts, people, etc. Each entity has a unique identifier to distinguish different entities.

An attribute is a characteristic or property of an entity, for example, a person entity can have attributes such as name, date of birth, nationality, and so on. Attributes can be used to describe and classify entities.

Relationships are the connections between entities, for example, person entities can have kinship relationships, work relationships, and so on. Relationships can be used to establish connections and reasoning between entities.

These three components interact with each other to form the base structure of the knowledge graph. In the knowledge graph, entities, attributes and relationships are presented graphically for easy visualization and analysis.

## **2.2 KNOWLEDGE GRAPH APPLICATIONS IN EDUCATION**

In the field of education, the application of knowledge mapping is mainly reflected in the following aspects:

### **(1) Student knowledge modeling**

Students' learning experiences and knowledge points are modeled to form a knowledge map of students, so that teachers and students can understand students' learning and knowledge level for better teaching and learning.

### **(2) Course recommendation**

Through the analysis of students' knowledge map, courses and teaching materials suitable for their knowledge level and learning needs will be recommended to improve students' learning effectiveness.

### **(3) Teaching resource management**

The teaching resources are associated with knowledge points to form a knowledge map of teaching resources so that teachers can better manage and utilize teaching resources.

### **(4) Educational Assessment**

Through the analysis of students' knowledge map, students' learning effects can be assessed effectively, providing teachers with more targeted teaching suggestions to improve teaching quality.

## **3. ANALYSIS OF THE PRACTICAL EXPERIENCE OF INDUSTRIALIZATION OF INTERNATIONAL EDUCATION IN AUSTRALIA DURING THE PEIROD OF COVID-19**

### **3.1 THE APPLICATION OF KNOWLEDGE GRAPH IN THE PRACTICE OF INDUSTRIALIZATION OF INTERNATIONAL EDUCATION IN AUSTRALIA**

#### **3.1.1 CONSTRUCTION OF A KNOWLEDGE MAP IN AUSTRALIAN EDUCATION**

The construction of knowledge graph in the field of education in Australia mainly includes three aspects: data acquisition, data processing and knowledge graph construction. In the data collection stage, data need to be acquired from various educational institutions, government departments and other related organizations,

including student information, educational resources, educational policies, etc. In the data processing stage, the collected data are cleaned, integrated and processed to ensure the accuracy and usability of the data. In the knowledge graph construction stage, the processed data need to be mapped to build a knowledge graph in the field of Australian education.

### **3.1.2 APPLICATION OF KNOWLEDGE GRAPH IN AUSTRALIAN INTERNATIONAL EDUCATION MARKET**

In the Australian international education market, knowledge graph is mainly applied in the following three areas: education resource integration, intelligent recommendation for students and education policy development. In the area of education resource integration, knowledge graph can integrate the education resources of various educational institutions to improve the efficiency and accessibility of resources. In terms of intelligent recommendation for students, Knowledge Graph can recommend the most suitable schools and courses for students based on their interests, learning abilities and other information. In terms of education policy making, the knowledge graph can provide in-depth analysis of the Australian education market and provide strong support for policy making.

## **3.2 PRACTICAL EXPERIENCE OF KNOWLEDGE MAPPING IN THE INDUSTRIALIZATION OF INTERNATIONAL EDUCATION IN AUSTRALIA**

### **3.2.1 APPLICATION OF KNOWLEDGE GRAPH IN AUSTRALIAN INTERNATIONAL EDUCATION INDUSTRY**

Knowledge graph is a semantic web-based knowledge representation method that can graphically present various entities, attributes and relationships, and automate the reasoning and application of knowledge through techniques such as machine learning and natural language processing. In the Australian international education industry, knowledge graphs are widely used in the following areas:

#### **(1) Student recruitment**

By building a knowledge graph of students, it can match students' needs and backgrounds more accurately, provide more personalized recruitment services for students, and improve recruitment efficiency and quality.

#### **(2) Course recommendation**

By establishing the knowledge graph of courses, the relationship and similarity between different courses can be reasoned automatically to provide students with more accurate course recommendation service and improve their learning experience and effect.

#### **(3) Career Planning**

By building the knowledge graph of careers, we can automate the relationship and development path between different careers, provide students with more personalized career planning services, and help students better plan their future.

### **3.2.2 ADVANTAGES OF KNOWLEDGE GRAPH IN AUSTRALIAN INTERNATIONAL EDUCATION INDUSTRY DURING THE PEIROD OF COVID-19**

As Australia's fourth largest export, the international education industry has been one of the pillars of the Australian higher education economy. In the wake of the COVID-19 pandemic in 2019, the international education industry at Australian universities has been hit hard for several reasons. The number of international students enrolled in Australian universities fell from 46 million in 2019 to 700,000 by 2020, according to statistics from Australia's Department of National Education. Under the pandemic, Australian universities are facing severe enrolment situation and huge economic losses, which will directly affect the development of Australia's national economy, the development of universities and the whole form of employment in Australia.

The application of Knowledge Graph in the Australian international education industry has the following advantages so as to reduce the negative influence from COVID-19:

#### **(1) Accurate Matching**

Knowledge Graph can display various entities, attributes and relationships graphically, thus enabling accurate matching and recommendation of various entities such as students, courses and careers.

#### **(2) Automated Reasoning**

Knowledge graphs can automate the reasoning and application of knowledge through technologies such as machine learning and natural language processing, thus improving the efficiency and quality of educational services.

#### **(3) Personalized services**

The knowledge graph can provide more personalized educational services for students according to their needs and backgrounds, and improve their learning experience and effectiveness.

In summary, knowledge graphs have a wide range of application prospects and advantages in the Australian international education industry, and can provide more accurate, efficient and personalized education services for all parties, including students, educational institutions and enterprises so that it can provide a way to optimize the international education services and reduce the negative influence brought by the pandemic.

## **4. CONCLUSION**

This paper aims to explore the practical experience of Australian international education industrialization based on knowledge mapping in the context of the new crown epidemic. By analyzing the Australian experience, it is found that the application of knowledge mapping in international education during the pandemic period has many advantages, such as improving the efficiency of using education resources, promoting the synergistic development of education industry and improving the quality of

education services. Knowledge mapping can also help forecast trends and changes in education markets and institutions, and provide better strategic decision support for companies and governments. Therefore, this paper suggests applying knowledge mapping to education industries in other countries to improve industrialization and promote the development of the international education sector. Meanwhile, further research should be conducted in the future on how to optimize the construction and application of knowledge graphs to achieve better results.

## ABSTRACT

In this paper, we analyze the user behavior in the smart library, process the data through user behavior data conversion, etc., and analyze the overall user behavior in the library, so as to optimize the library user behavior services. 2.04 million people entered the library in the academic year 2021-2022, and 340,000 people entered the library. Of the total number of users, 19,000 checked out paper books and 14,000 reserved seats in the reading room using the seat reservation system, and June and December were the months with the highest number of visits and the longest time spent by students. Based on the characteristics and differences of users' behavior in university libraries, it can provide reference for university libraries to optimize management and upgrade services.

## KEYWORDS

Intelligent library; User behavior; In-library behavior; Behavioral characteristics; Library management

## 1. INTRODUCTION

With the rapid development of cloud computing technology, big data technology and various sensor technologies, the infrastructure architecture of library data centers and user service models have undergone fundamental changes, and data resources have become an important component of library information systems and an important guarantee factor for library service capabilities [1-3]. How to efficiently use big data resources to accurately sense and identify user needs, user information behaviors, user social relationships, library service methods and library business models is a prerequisite for libraries to improve insight into user needs and improve user reading experience, as well as a strong guarantee for libraries to carry out accurate and personalized services for users and improve their own service competitiveness [4-6]. Library users often need to borrow books and journals from the library in the course of their professional courses or research activities, and interdisciplinary or professional cross-learning research has become the norm [7-8]. These borrowing behaviors of users tend to have certain behavioral characteristics, commonalities among user groups, and correlations among borrowed titles [9]. The borrowing data generated by the library information system can be mined deeply through data mining techniques to discover such "hidden correlations" and to promote the service of university libraries in the direction of intelligence [10].

## **2. SMART LIBRARY USER BEHAVIOR PREDICTION DATA**

### **2.1. LIBRARY USER BEHAVIOR DATA PROCESSING**

#### **2.1.1. USER BEHAVIOR DATA CLEANING**

User behavior data cleaning refers to the processing of collected user behavior data, verifying the completeness of the data, filtering out junk data that are not related to user behavior analysis, in order to reduce the adverse effects of data redundancy and noise on user behavior analysis. The data cleaning process is carried out through a combination of technical and manual operations, mainly the correction of spelling errors, the addition of missing data values, the processing of duplicate data in different systems, and the removal of noisy data.

#### **2.1.2. USER BEHAVIOR DATA CONVERSION INTEGRATION**

As the data acquisition for user behavior analysis comes from different databases and data tables, these data may have different data storage formats and types, so the data field types stored in certain data tables need to be modified to achieve the unification of data field formats and types for the smooth implementation of the data mining process. The purpose of data conversion is to convert the data with different structures collected and extracted into integrated and uniform standard data, forming an integrated and uniform standard data collection. In addition, after the first loading of data, it is necessary to monitor the changes of data sources in real time and load the updated required data into the data warehouse.

### **2.2. LIBRARY USER BEHAVIOR SERVICE APPLICATIONS**

#### **2.2.1. USER BEHAVIOR DATA PROVISION SERVICE MODEL**

User personalized service refers to user-centered, data mining technology to mine and analyze user behavior data, obtain library users' information behavior, habits, preferences, characteristics and specific needs of users, and provide targeted and proactive services to meet their individual needs.

(1) To provide targeted information services including information consultation and information result delivery for different users' different information needs.

(2) User preferences found through analysis of user information or user's information demand behavior, so as to achieve proactive, useful information services for users that meet their requirements. Therefore, the behavior, habits, preferences and characteristics of library users are the basis of personalized library services, advanced data mining technology is an important means of personalized library services, and targeting and proactivity are the characteristics of personalized library services.

#### **2.2.2. USER DATA ANALYSIS TO OPTIMIZE RESOURCE CONSTRUCTION**

By using data mining technology to analyze and mine the circulation records and retrieval data of library users, we can count the denial and frequent borrowing sets of resources through classification patterns, and then make targeted additions to information resources. In addition, the utilization rate of resources can be analyzed and the outdated and aging resources can be eliminated in time. In addition, the information retrieval data can be used to obtain library resources as an alternative to purchasing titles. Through the actual needs of users for the purchase of library resources construction to improve the quality of book purchases, enhance the relevance and practicality, reduce the blindness, greatly improve the borrowing rate of books, is to improve the utilization rate of library resources literature, improve the quality of user services is an important link.

### 3. INTELLIGENT LIBRARY USER BEHAVIOR ANALYSIS

#### 3.1. OVERALL USER BEHAVIOR IN THE LIBRARY

In order to study the overall user behavior in the 2021-2022 academic year, based on the statistical analysis of big data technology, the user behavior in each month is shown in Table 1. 2021-2022 academic year, the university library was visited by 2.04 million people, and 340,000 people entered the library. Among all the users, 19,000 of them checked out paper books and 14,000 of them reserved seats in the reading room using the seat reservation system. The average length of stay in the library was 3.06 hours per visit. The month with the highest number of paper books and periodicals checked out was October, with 11,000 loans in one month. The months with the lowest number of loans were February and August, with the number of loans not exceeding 1,000 in each month.

**Table 1.** User access and borrowing behaviour by month of the academic year

Month	Attendance	Length of stay	Average length of stay	Number of books borrowed
1	78498	269169	3.36	6958
2	150	78	0.36	234
3	73195	202995	2.97	5763
4	14859	267211	3.887	7383
5	160893	438620	4.93	6836
6	221605	645281	4.85	4726
7	67381	218621	3.89	2208
8	64268	247226	4.72	628
9	131892	356672	2.98	8517
10	16464	519298	3.16	12723
11	180172	610882	3.69	7632
12	217004	802678	3.06	7184

#### 3.2. CORRELATION BETWEEN USER BORROWING AND SEAT USE BEHAVIOR

The correlation analysis between user borrowing and seat use behaviors is shown in Table 2. In terms of seat use, the correlation coefficients between the library access behavior and seat reservation behavior of college users are both around 0.3, which are very close to each other, but there are differences between the borrowing behavior and seat use behavior. The correlation coefficients between the borrowing behavior and seat-use behavior of science and engineering college users were both significant. Among them, the correlation coefficient between borrowing and seat use was higher in the self-study category. In the humanities and social science faculty, only the social science books were significantly correlated with seat use, while in the medicine faculty, only the self-subject books were significantly correlated with seat use. In general, although the values are different, they are all less than 0.1, and the difference is actually negligible, which is also due to the overall low borrowing volume.

**Table 2.** Correlation between access and borrowing behaviour

Type of discipline	People Behaviour	Self-Subject Borrowing	Social Science Loan
Science and Engineering	Number of visits	0.058	0.059
	Length of time in the library	0.012	0.020
Humanities and Social Sciences	Number of visits	0.018	0.085
	Length of time in the library	0.011	0.021
Medicine	Number of visits	0.089	0.048
	Length of stay	0.062	0.032

#### 4. CONCLUSION

This paper proposes a library mobile user behavior analysis method with big data mining technology, which uses big data mining technology to mine the behavioral preference features of library users, find out the implicit association between feature data, and analyze the behavior pattern according to the degree of association to realize the analysis of user behavior. This method effectively solves the problems of traditional analysis methods, improves the accuracy of behavior analysis results, and provides reasonable technical support for the development of libraries. By analyzing the reading patterns of users, it can provide reference for libraries to reasonably enrich their collections, book acquisition and editing, shelf placement, and business system process optimization, and actively provide more personalized services to users.

# ANALYSIS OF THE DESIGN OF INTERACTIVE COMPOSITION TEACHING PLATFORM OF POPULAR MUSIC IN UNIVERSITIES UNDER THE BACKGROUND OF INTERNET

---

Hui Lu\*

Minjiang University, MJU, Fuzhou, Fujian, 350108, China

[13600818775@163.com](mailto:13600818775@163.com)

---

## ABSTRACT

This paper discusses the performance of the teaching platform for interactive creation of popular music in colleges and universities based on iOS design, proposes key technologies for platform development, and tests the platform performance by LoadRunner10.0. Under the condition of 3000 concurrent users, the response time of the platform does not exceed 3 seconds, and this response time can meet the time requirement of the teaching platform. For the service of querying some more complicated data, the platform response time cannot exceed 10 seconds. It shows that the interactive composition teaching platform is a teaching platform in line with music majors and can make full use of learners' scattered time to complete learning and practice, which ensures the learning effect and helps improve the teaching effect of music courses.

## KEYWORDS

College popular music; Teaching platform; Music majors; Response time; Music course teaching

## 1. INTRODUCTION

Today, with the rapid development of information dissemination, the traditional classroom teaching model can no longer meet the needs of students, so the emergence of the Internet platform as a medium makes the "classroom" flexible [1-2]. Throughout the present, excellent music needs to be known, and with the help of the Internet platform, we can make our teaching activities richer and education more progressive [3-4].

The iOS-based music teaching platform is a comprehensive teaching platform that integrates basic information management, student music assignment management, music practice management, online classroom management, and information notification management by making full use of existing mobile Internet technology and network technology and combining the characteristics of the music major itself on the iOS platform [5-6]. The teaching platform provides professional support for teaching and learning of music majors and offers great convenience to distance learners through cell phone networks [7-8]. This is mainly reflected in the fact that teaching and learning can provide recipients including learning content, learning process, and learning methods, and this diverse learning mode not only satisfies normal classroom learning, but also provides learners with a better learning effect by completing practice or examination operations through the platform [9].

## **2. THE CURRENT SITUATION OF TEACHING POP MUSIC COMPOSITION IN COLLEGES AND UNIVERSITIES**

### **2.1. ONLINE MUSIC COURSES**

#### **2.1.1. OPERATION OF THE BUSINESS MODEL**

The unsoundness of the access mechanism for online courses has led to the participation of all types of online courses with varying quality and predictable effects. In the face of profit, many platforms that provide music teaching resources have lost their philosophy and trampled on their principles. Learning content that is not of any quality is put on the platform with a great deal of publicity and sound bites, wasting students' precious learning time as well as money.

Such behavior will cause students to gradually lose trust in online courses, which will be detrimental to the development of online courses, and the benefits brought by online courses mentioned earlier will disappear. It is not conducive to the development of education.

#### **2.1.2. LACK OF CORRECT CONCEPT**

The current network platform has not built out a core value system, and the chaotic phenomenon of network platform construction has affected the development and reform of China's Internet education. Due to the lack of correct concept, the network teaching platform has gradually evolved into a social platform, teaching resources are not fully utilized, and there is a lack of innovation in the construction of the platform. The management of resources is lax and lacks the advantage of overall cooperation. A large number of famous teachers as well as experts' high-quality educational wisdom and ideas are instead drowned by the network. What is valuable but cannot be fully utilized is a waste of resources. In online music teaching, because many teachers do not understand modern distance education theories, they let online teaching resources turn into simple knowledge transfer. In the process of construction of online teaching, educational institutions are obsessed with its quantity and ignore the problem of its quality. There is no prescribed answer to the accurate answer of music knowledge, and a unified standard cannot be achieved.

## **2.2. ANALYSIS OF INTERACTIVE COMPOSITION TEACHING PLATFORM FOR COLLEGE POP MUSIC**

### **2.2.1. BASIC INFORMATION MANAGEMENT FUNCTION MODEL**

Generally speaking, when students start to study music courses, students need to complete registration on the platform through mobile terminals, fill in student-related information, and after filling in the information, the teacher will authenticate and audit the submitted student information in the background, and the student's registration information will be valid only after the audit is passed, and they can log in through the client.

The users of music teaching platform include teachers, students and teaching platform administrators. User information management is the basis of teaching platform management, and user information management includes user information maintenance, user information query and statistics of user information and other operations.

### **2.2.2. FUNCTIONAL MODEL OF STUDENT MUSIC ASSIGNMENT MANAGEMENT**

For a teaching platform, first of all, students need to acquire knowledge through music assignments, which are the basis for students to learn and teachers to teach. Therefore the platform needs to complete the maintenance of music assignments of the system for music assignment management. We know that online learning systems generally use video, audio and other related materials, and this creation teaching platform also belongs to a kind of online learning system. Therefore, music assignments are represented in the form of text descriptions

and file attachments. Teachers can maintain music assignments and upload or delete music assignments, and after teachers upload music assignments, students can browse and query and download assignments in the system. Students find their target course by course category and can also do a direct resource search to achieve this. Management tools can be used to personalize their own course design, and learning tools can also be used to complete learning tasks.

### 3. KEY TECHNOLOGIES AND DESIGN ON IOS PLATFORM

#### 3.1. M-V-C DEVELOPMENT MODEL

The MVC paradigm for iOS is divided into the following categories:

(1) Model is the core data of the program, the class that holds the application data. Model methods provide data through a protocol between data sources and data meanings, and need to implement callback methods triggered by the controller.

(2) Views are components of windows, controls, and other elements that the user can see and interact with. The view component is provided by a subclass of the UIView class and is assisted by its associated UIViewController class

(3) The role of the controller is to bind the view and model and determine how to handle the application logic of user input. The behavior of the controller is implemented through three key techniques: delegation, target operations, and notifications.

#### 3.2. M-V-C DESIGN PATTERN

The goal of MVC is to implement 3 classes of code that are as distinct as possible. Make the 3 modules independent of each other and have good loose coupling of the components. MVC is a design pattern that makes the elements of MVC work independently of each other. The separation of the elements of MVC makes it possible to build maintainable, independently updatable program components.

### 4. TESTING OF INTERACTIVE COMPOSITION TEACHING PLATFORM FOR POPULAR MUSIC IN HIGH SCHOOLS

#### 4.1. PLATFORM FUNCTIONAL TESTING

Through the teaching platform for interactive composition of popular music in colleges and universities, the music assignment management module was tested as shown in Table 1. It shows that the operations such as music assignment maintenance and music assignment query can be completed through both roles of students and teachers. The data addition operation is completely normal, and the data deletion operation gives corresponding prompts to ensure data security.

**Table 1.** Music job management module function test table

Serial number	Test Items	Test Method	Test Method
1	Music assignment information entry	Enter the entry screen, enter some illegal data, test to see if it can be saved, and test to see if it can be saved by entering fewer required items.	Passing the test
2	Music assignment information revision	Select a music assignment information, modify a piece of information, and test whether it can be saved after modification	Passing the test
3	Music assignment information deletion	Can the music job information be deleted correctly, and test whether there is a prompt message before its deletion	Passing the test
4	Music assignment information upload	Complete the attachment upload by selecting the music assignment.	Passing the test

## 4.2. PLATFORM PERFORMANCE TESTING

In order to understand the performance of the teaching platform for interactive composition of popular music in universities, the teaching platform stress test is shown in Table 2. The test tool is chosen to be completed by LoadRunner10.0. Specifically, we can select certain typical services, write test scripts, run them under LoadRunner, and view the performance response of the teaching platform by observing the running results.

By selecting certain typical application system functions and simulating the number of virtual concurrent users, the number of virtual users set is 1500, 2000 and 3000. Under these different test conditions, the service access is concurrently executed and the platform stress test results are viewed under LoadRunner. After testing, the response time of the platform does not exceed 3 seconds under the condition of 3000 concurrent users, and this response time can meet the time requirement of the teaching platform. For the service of querying some more complicated data, the platform response time cannot exceed 10 seconds. Through the performance test of the music interactive creation teaching platform, it shows that the platform provides the maximum number of withstand users can meet the actual requirements.

**Table 2.** Teaching platform system stress test

Serial number	Number of virtual users created	Expected Value	Actual value	Regression test
1	200	200	200	1
2	800	800	800	2
3	1000	1000	1000	3
4	1500	1500	1500	4
5	2000	2000	2000	5
6	3000	3000	3000	6

## 5. CONCLUSION

The current music teaching in colleges and universities must make full use of Internet technology to assist teaching, which can provide a multimedia music world with sound and emotion for college students to learn music. The new age internet platform has had a very profound impact on the teaching activities of music, combining with the traditional teaching model to achieve the best teaching effect. While adhering to the traditional music teaching mode, we actively accept and inject fresh blood to make our teaching activities more dynamic and promote the development of music education in the new era.

Today, with the rapid development of the Internet, the new situation of music teaching activities is full of variety, and the new mode of "online teaching" has emerged. It has broken the traditional single "face-to-face" teaching, and the learners are no longer limited to school students, and the scope of teaching is also more extensive, which also provides sufficient conditions to meet the growing cultural needs of the people. It breaks the limitations of traditional teaching in terms of fixed location and time, making learning more convenient and more conducive to reasonable time arrangement.

## ABSTRACT

This paper explores the current problems of the information management mode of college education in the Internet era, puts forward suggestions for innovative information management construction of college education, and conducts research on student learning aspects. There are 78.45% students think that there is no breakthrough of traditional teaching mode, 85.15% students think that the quality of online courses is not high, 63.85% students think that the course content is not attractive enough, 78.20% students think that the course is not focused, and 85.95% students think that the course content is fragmented. The professional level of the current college education management team needs to be improved, therefore, the innovative college education information management mode is an inevitable choice to adapt to the development of contemporary colleges and universities and student management.

## KEYWORDS

University education; Information management mode; Traditional teaching mode; Education management team; Student learning research

## 1. INTRODUCTION

Today, with the continuous development of technology, society has entered the era of information technology, and continues to rapidly develop the education business based on such an era, and the ideology, lifestyle and production methods have undergone profound changes [1-2]. Social development gradually moves toward the direction of realizing personalization, diversity and self-value of human beings, and the competition of enterprises gradually develops into the competition of talents and knowledge [3-4]. The optimization and reconstruction of the education model must be in line with the characteristics of the information technology development period, making full use of the current high-tech information technology to optimize the educational management of the campus, etc. [5]. In order to better meet the requirements of the times, we should focus on students, focus on cultivating their innovation, practical skills and IT literacy, and give them more attention and care, and give them thoughtful care. [6-7]. Higher education student management relies on Internet information technology to build information platforms and other new information technology methods to help teaching and learning, promote educational change, and facilitate the development of education. [8-9].

Universities can achieve digitalization, modernization and intelligence in education management by integrating Internet technology with education, which is one of the key areas for the development of the Internet industry. [10]. To improve the effectiveness of education management, it is necessary to establish an effective management model and adopt a high-

tech innovative management model to get rid of the shortcomings of current university management.

## **2. INNOVATIVE INFORMATION MANAGEMENT CONCEPT FOR HIGHER EDUCATION**

### **2.1. MANAGEMENT OF STUDENT EDUCATION IN HIGHER EDUCATION**

#### **2.1.1. STUDENT EDUCATION MANAGEMENT TIMES REQUIREMENTS**

Taking college students as the main body, using more maintaining scientific and healthy educational management means to promote the overall development of all moral characters such as moral, intellectual, physical, aesthetic and aesthetic, and improve the ability to organize activities, this is the inherent meaning of college student education management and its significance. Student education and management in higher education is not only the management of students' ideological and political education and daily student affairs, but also the assessment and evaluation of students' work, the mastery of skills and methods of student work, and the provision of guidance and services for the overall development of students. Student information management is a comprehensive test of education management in colleges and universities based on the requirements of the era of information technology and talent training, and is the foundation of the era for the training of future national builders.

#### **2.1.2. STUDENT MANAGEMENT MODEL**

The school uses continuous research on educational objectives to clarify the goals of education, fully uses information technology as a tool to implement education, and builds a more scientific management model and mechanism to achieve a new type of educational management reform in the current education sector. In order to realize the innovative development of college students' education management, it is necessary to test the educational achievements by practical activities, to carry out meaningful research on the model after continuous optimization of changes, to examine the problems in practical application, and to make improvements to promote its relative maturity.

The manager makes a personal "answer" to the development of student management by conducting a comprehensive test of educational goals based on ideological and political education ideas, in order to explore the innovation of educational mechanisms and achieve the continuous development of educational models

## **2.2. MANAGEMENT MODEL INNOVATION ISSUES**

### **2.2.1. TEACHING MODE IN HIGHER EDUCATION**

Study the current status of the current model of university education, the main factors of the current problems of university curriculum education are shown in Figure 1. University students' information-based education management in the context of the continuous development of the Internet, 78.45% students think that there is no breakthrough in the traditional teaching mode, 85.15% students think that the quality of online courses is not high, 63.85% students think that the course content is not attractive enough, 78.20% students think that the course is not focused, and 85.95% students think that the course content is fragmented. Through research and analysis, we found that the main reason for the low level of student motivation is the old education model and the lack of attractiveness of classroom teaching to students, resulting in low subjective motivation. It also reflects that the professional level of the current education management team needs to be improved.

**Figure 1.** Study of the main issues of higher education programs

### 2.2.2. THE DEVELOPMENT OF INNOVATIVE INFORMATION MANAGEMENT MODEL FOR HIGHER EDUCATION

Exploring the information management model of university education information based on the foundation of the Internet era for information innovation the changes of students' learning ability under the innovative management mode of education information are shown in Figure 2. Students' independent learning ability is 85% after management, 54.8% before management, learning enthusiasm is 87.2%, 63.7% before management, and knowledge focus mastering ability is 79.4%, 57.3% before management. The students' learning ability has been improved under the innovative information management of college education, these are the advantages of the innovative management mode of information technology in colleges and universities, such as meeting the current needs of students' actual learning, improving the management of university education, and accomplishing the task of talent training.

**Figure 2.** Changes in student learning under the information-based management model

### **3. RESEARCH ANALYSIS OF EDUCATIONAL MANAGEMENT INNOVATION IN HIGHER EDUCATION**

#### **3.1. INFRASTRUCTURE DEVELOPMENT**

The scientific and reasonable top-level design of education information management construction by university administrators is a necessary process of education innovation. It gives full play to the own advantages of each relevant department and each university, and gives full play to the overall benefits to prevent the situation of not sharing information, effective management of basic data and duplicate construction. The work is carried out on the basis of the principles of easy maintenance, scalability, stability and practicality. In order to guarantee the information management of colleges and universities to carry out, in order to achieve the current college platform information sharing and promote the sharing of campus resources, it is necessary to develop a scientific and perfect program as the basis, which requires the information construction as a whole to develop requirements.

Full use of big data technology based on the background of the Internet era to improve the visualization, intelligence and refinement of management. The relevant data is deeply and dynamically mined, the correlation between data is analyzed, and finally presented in the form of reports, which provides solid data support for school leaders' decision-making and finally improves the teaching level and quality of the school in all aspects. Making full use of big data technology in management work is conducive to timely grasp of important information and eventually realize intelligent management.

#### **3.2. INNOVATIVE EDUCATION INFORMATION MANAGEMENT SYSTEM**

In the information technology environment, schools are faced with a more complex environment, which places a higher standard on the way they are managed. For example, the traditional stereotypical management style has been made flexible and varied so that it can be adapted to different external environments. Gradually create a new teaching management style that can be universally adapted and accepted by both students and teachers, so that students can also actively recognize the need for management in the process of receiving it.

In the new technological environment, it seems imperative to reform the educational management system to get rid of the rigid layout of the original educational results and to simplify the information appropriately in order to convey it in the most concise way. Information technology will provide strong technical support when exploring improvements, thus accelerating the pace of educational management system reform. Information technology is widely used in school management organizations, and the users and owners of network information technology in a school are staff and employees. In this context, teachers and trainers need to be equipped with more professional knowledge and skills.

#### **3.3. CLARIFY THE ORGANIZATION OF EDUCATION MANAGEMENT**

The organizational structure can be evaluated in four ways:

(1) It is accountability, which refers to the need for all members of the organization to have a strong belief in serving the organization.

(2) It is adaptability, which means that the organization has to innovate and characterize its own structure in a timely manner according to the changes in the external environment.

(3) It is reactive, which means that the organization has to improve and refine accordingly to the changes or needs from the external environment.

(4) Efficient, which simply means that the importance of efficiency should be taken into account when carrying out relevant work. Not only the quality of the work done, but also the

time taken to complete it, in addition to other factors, such as resource consumption, should be taken into account.

#### 4. CONCLUSION

Educational management in higher education is student-centered and dedicated to enhancing the learning experience of students, and this concept is widely applied from the perspective of teaching and learning process management. Contributing to the discovery of students' potential is the biggest difference between it and the traditional educational management model, based on the way the Internet innovation is at the level of the teaching model that allows universities to change from traditional teaching to a comprehensive teaching model. It allows students to change from passively receiving knowledge to actively participating in it. Among the systems of university management based on the Internet technology, the attendance system and the credit hour system, which are based on two different subjects of teachers and students, have fully improved the quality of teaching and learning management. Moreover, Internet technology brings a more open environment for higher education and helps teachers form a benign competition atmosphere among themselves, which can appropriately enhance the sense of urgency of teaching innovation work and set a good example for learners to recognize the importance of learning, thus building a good foundation for a lifelong learning society.

## ABSTRACT

The dull classroom teaching style in the current context not only fails to meet the development requirements of the times but also wears out the students' desire for knowledge. This paper analyzes the characteristics of current effective teaching and explores innovative ways of teaching English in colleges and universities under the blended teaching model, and examines the differences in the average scores of each question item in the final test of the experimental class through a control study. The overall English scores of the experimental class improved by 11.132 points after the experiment, including the average scores of 2.520, 0.826 and 0.781 in completion and filling, writing and reading. In order to achieve the purpose of improving the effectiveness of college English teaching, we innovate college English teaching and build hybrid teaching based on Internet technology.

## KEYWORDS

Hybrid teaching; Teaching technology innovation; Effective teaching; Classroom teaching mode; College English

## 1. INTRODUCTION

College English education presents a series of challenges and opportunities because of the accelerating pace of development in today's society [1]. With the aim of improving the quality of English teaching and learning, students and teachers work together to discover resources and new ways of teaching English, which is the ideal educational and organic association of the teaching and learning process [2-3]. The quality of teaching is vulnerable to a variety of factors to, the lack of educational resources in English teaching, etc. are the main reasons for the difficulties in the development of teaching innovation [4-5]. In order to make the quality of teaching develop toward a better situation, then it is necessary to create a response to meet the current teaching dilemma by continuously innovating teaching mode and enriching teaching resources in the teaching process as the standard [6-7].

The main feature of blended learning is flexible learning and personalized instruction, which requires that teachers and students work together to create a new learning environment in which online learning and classroom lessons are integrated [8-9]. Blended learning integrates both online learning and face-to-face classroom instruction, and teachers need to conduct a comprehensive review and design of course structure, course content, and resource distribution and configuration.

## **2. OPPORTUNITIES FOR THE DEVELOPMENT OF ENGLISH LANGUAGE TEACHING IN COLLEGES AND UNIVERSITIES**

### **2.1. ENGLISH TEACHING MODE IN HIGHER EDUCATION**

#### **2.1.1. ENGLISH TEACHING CONTENT**

Exploring new ways of English teaching development is due to the continuous development of the Internet in the current information age has brought a considerable impact on the traditional way of teaching English, which is also a good time for universities to change their teaching forms. Since teaching nowadays is all about making students master job skills, English teaching in colleges and universities is mainly based on the demand for English expertise from companies in the talent market.

The English teaching mode in colleges and universities is gradually developing into a diversified trend through the scientific use of technology based on Internet technology. Changes in teaching modes such as online one-to-one teaching mode and distance learning mode are closely related to the development of related technologies.

#### **2.1.2. IT IS CONDUCIVE TO TRANSFORMING THE FORM OF ENGLISH TEACHING**

The active construction of new English teaching resource paths in colleges and universities based on traditional teaching methods with the concept of scientific development is a serious challenge in the context of the development dilemma of English teaching in colleges and universities. In the process of building English teaching resources centered on the enterprise market, college administrators use Internet technology to improve the English teaching resource setting and perfection process so as to meet the teaching needs and future development direction, which is an education resource innovation centered on the premise of meeting the enterprise market and development.

### **2.2. WAYS OF TEACHING TECHNOLOGY INNOVATION IN ENGLISH BLENDED TEACHING MODE**

#### **2.2.1. HYBRID TEACHING**

Blended teaching is a new model with flexible forms and full mobilization of all effective teaching resources, aiming to increase students' interest and initiative in learning. Blended teaching has its characteristics:

(1) Flexible teaching forms, rich teaching resources, high applicability and high efficiency. Fully combine classroom and extracurricular, virtual network environment and traditional classroom, textbook knowledge and various online teaching resources.

(2) Personalized teaching innovation. As a public course, English is a basic course for all college students. The diversification of learning forms allows students to have more independent choices. Teachers can provide students with personalized learning suggestions and objective all-round evaluation of their learning performance according to their English foundation, motivation, and the majors they study, in order to improve their English learning effectiveness. In this way, the evaluation of students' performance in English classes is no longer a single score, but a more scientific and feasible evaluation.

#### **2.2.2. CHARACTERISTICS OF EFFECTIVE TEACHING IN THE CONTEXT OF INFORMATIZATION**

The use of blended learning is becoming more widespread. The way to achieve effective teaching in higher education is based on the current information technology background fully integrated with the characteristics of blended teaching. To achieve effective teaching and

learning one has to aim at fundamental changes in teaching objectives and methods, rather than simply using IT in teaching, which is only a superficial feature. The digital and mobile learning methods are only the superficial characteristics of learning in the informationization era. Achieving effective teaching in the context of information technology requires fundamental changes in teaching goals and methods. Instructional objectives emphasize the development of higher order thinking skills, the teaching methods emphasize student-centeredness, the creation of a learning environment conducive to the construction of meaning, and the advocacy of independent, cooperative, and inquiry learning styles.

### 3. EXPERIMENTS IN BLENDED TEACHING OF ENGLISH IN HIGHER EDUCATION

#### 3.1. ANALYSIS OF VARIABILITY

To test the quantitative study of the effect of blended instruction, Comparative experimental variability analysis in Table 1. The data on the change of the experimental subjects' performance before and after the test were analyzed based on the sample A test. From the data, it can be seen that the variability of test scores between the pre-test and post-test of the experimental class was shown in the four areas of total score as well as completion, Chinese to English translation and writing, and the mean score increased steadily in the pre-test on the basis of the post-test.

The differential performance of "Chinese to English" translation in the experiment is  $\mu \leq 0.01$  the difference level of "Completion and filling" is  $\mu \leq 0.01$ , The highest levels of variability in the experimental class were in "total score" and "writing"  $\mu \leq 0.01$  for "Writing" and "Total score".

The results of the analysis of the difference in scores of the students in the experimental class show that there is an improvement in their performance under the hybrid teaching, and the results of the analysis of the difference in scores of the students in the control class show that there is no difference in their performance under the traditional teaching. This study demonstrates the effectiveness of the blended teaching model in ELT.

**Table 1.** Experimental analysis of pre-post performance variability

Type	Dimensionality	Compare to pre-test results		Comparison of post-test scores	
		Average	Standard deviation	Average	Standard deviation
Experimental Classes	Total Score	76.595	7.510	87.727	5.898
	Gestalt fill in the blank	8.95	3.530	11.47	3.587
	Chinese to English	8.458	0.938	9.174	0.198
	Writing	22.612	2.454	23.438	1.006
Control class	Total Score	76.367	7.606	79.499	7.744
	Gestalt fill in the blank	8.100	4.232	8.200	4.228
	Chinese to English	8.502	1.080	9.016	0.896
	Writing	22.450	2.254	22.710	1.501

#### 3.2. ANALYSIS OF TEACHING EFFECTIVENESS

By analyzing the mean scores of each item in the pre-test and post-test of the experimental class as shown in Table 2, the effect of blended teaching was tested. The overall English scores of the experimental class improved by 11.132 points after the experiment, and the scores of other items improved in descending order: completion, writing, reading comprehension, and Chinese to English translation, with the average scores of completion, writing, and reading improving by 2.520, 0.826, and 0.781 points. This indicates that the blended English teaching has significantly further improved students' vocabulary matching and usage, their mastery of wordiness, and their understanding of phrases.

**Table 2.** Comparison of the mean scores of each question item in the experimental class

	<b>Total Score</b>	<b>Gestalt fill in the blank</b>	<b>Reading Comprehension</b>	<b>English to Chinese</b>	<b>Chinese to English</b>	<b>Writing</b>
Before experiment	76.595	8.95	14.308	9.113	8.458	22.612
After the experiment	87.727	11.47	15.089	9.651	9.174	23.438
Average score difference	11.132	2.520	0.781	0.538	0.716	0.826

#### 4. CONCLUSION

Blended learning is currently receiving a lot of attention from the community, mainly because it is very significant for improving school education, improve students' comprehensive literacy, develop personalized education and cultivate students' core competitiveness. School education is not only about imparting knowledge to students, but also about imparting skills and ideas. Therefore, as an educator, we not only innovate teaching techniques, but more importantly, we convey to students the idea that the development of society requires innovation, and that only by being innovative can we develop and grow.

Blended teaching college English is a new teaching mode that combines network, multimedia technology, database technology and traditional classroom teaching, making full use of the advantages of network and multimedia, so that the learning process can take place both in and out of class, allowing students to fully feel the fun of learning and improve their independent learning ability.

## ABSTRACT

This paper introduces a study on the practical exploration of the corporate exhibitor case teaching method in the big data environment. Firstly, the application and challenges of big data analysis in corporate exhibiting case teaching are described, and then the practical cases, effect evaluation and application scope of the pedagogy are discussed. Finally, the practical teaching design of the enterprise exhibiting case teaching method is given, including teaching objectives, case selection and teaching methods. The results show that the teaching method can effectively improve students' practical and quality abilities, and has promising applications in the big data environment. The findings of this study can provide reference and guidance for the educational practice of enterprise exhibiting case teaching method in the big data environment.

## KEYWORDS

big data; enterprise exhibitors; case teaching method; instructional design; case selection; hands-on skills

## 1. INTRODUCTION

With the continuous development of big data technology, enterprise exhibiting has become one of the important means for enterprises to promote their products, expand their markets and enhance their brand awareness [1-2]. However, the traditional way of enterprise exhibiting can no longer meet the needs of modern enterprises, therefore, how to use the advanced exhibiting case teaching method to improve the effect of enterprise exhibiting in the big data environment has become an important research topic [3-4]. In this context, this study aims to explore the practical application of enterprise exhibitor case teaching method in the big data environment, with a view to providing a more effective promotion method for enterprise exhibitors [5]. The literature

[6] explored the application of big data analysis in corporate exhibiting case teaching, using big data technology to analyze exhibition data to improve students' learning effectiveness and develop their practical skills. The literature [7] explored the evaluation of the teaching effectiveness of the corporate exhibiting case teaching method, including assessing the learning effect of students and evaluating the effectiveness of the teaching method. This paper describes the application and challenges of big data analysis in corporate exhibiting case teaching, and proposes the adoption of a practical exploration approach to address these challenges. Through practical exploration of specific cases, the practical effects of the corporate exhibiting case teaching method are analyzed and its scope of application is discussed. Finally, the practical teaching design of the corporate exhibiting case teaching method is proposed, including the key points of teaching objectives, case selection and teaching methods.

## **2. TEACHING CASE STUDIES OF ENTERPRISE EXHIBITORS IN BIG DATA ENVIRONMENT**

### **2.1 APPLICATION OF BIG DATA ANALYTICS IN TEACHING CASE STUDIES OF CORPORATE EXHIBITORS**

In the big data environment, the teaching of enterprise exhibitors' cases can be improved by big data analysis. First, by collecting data of exhibition exhibitors, such as booth location, exhibit types, display effects, etc., data analysis can be conducted. Find out which companies have more superior booth locations, which exhibits are more popular, etc., so as to provide students with more realistic and accurate exhibiting cases.

Secondly, by analyzing the data of students' behaviors during the exhibition, such as the time of viewing exhibits, the order of visiting booths, etc., we can understand students' learning interests and learning habits, so as to provide teachers with more accurate teaching guidance.

Finally, by analyzing the data of students' learning outcomes of exhibiting cases, such as students' evaluation of exhibits and students' evaluation of the effectiveness of enterprise displays, we can understand students' learning effects and learning outcomes, so as to provide reference for teachers to adjust teaching strategies and improve teaching effectiveness.

### **2.2 CHALLENGES OF BIG DATA ANALYTICS IN TEACHING ENTERPRISE EXHIBITOR CASES**

Although big data analysis has great potential in teaching business exhibitors' cases, it also faces some challenges. First, data collection and processing is costly and requires significant human, material and financial resources. Second, data analysis

requires specialized skills and knowledge, which teachers and students may lack. Finally, data analysis needs to protect students' privacy and personal information, and requires strict compliance with relevant laws and regulations and ethical norms. Therefore, these challenges should be fully considered in the teaching of enterprise exhibit cases, and a reasonable data collection and processing plan should be developed. Take a large education exhibition as an example, which invited several well-known education companies to exhibit. Based on big data analysis, we selected two of them for case study.

The first company was an online education platform that showcased its latest online courses, teaching platform and teaching resources at the exhibition.

The second company is an education technology company that showcased its latest smart teaching devices and teaching software. We conducted a case study by analyzing the exhibits of these two companies at the show, visitors' feedback and related data.

## **2.3 EXPLORATION OF PEDAGOGICAL PRACTICES**

Enterprise exhibitor case teaching method is a method of learning and teaching through enterprise exhibitor cases. In the big data environment, the enterprise exhibitor case teaching method can help students better understand and master the development and application of enterprises in the era of big data and improve their practical and application skills [8].

### **2.3.1 PRACTICAL EXAMPLES OF CASE STUDY TEACHING METHOD FOR CORPORATE EXHIBITORS**

In practice, some representative cases of enterprise exhibitors can be selected, such as a large Internet enterprise's big data application case displayed at a large exhibition. By analyzing the case, students can learn about the strengths and weaknesses of the enterprise in big data application and how the enterprise uses big data to promote business development. At the same time, students can also be guided to think about the challenges and solutions that the enterprise may face in terms of big data application.

### **2.3.2 EVALUATION OF THE PRACTICAL EFFECT OF THE CASE STUDY TEACHING METHOD FOR ENTERPRISE EXHIBITORS**

The effectiveness of the "Case Study Teaching Method for Enterprise Exhibitors" can be evaluated through questionnaires and examinations of students. The results of the survey show that students have a high opinion of the teaching method and believe that it can effectively improve their practical and application skills. The examination

results also show that students' learning effect under this teaching method is significantly better than that of traditional teaching method.

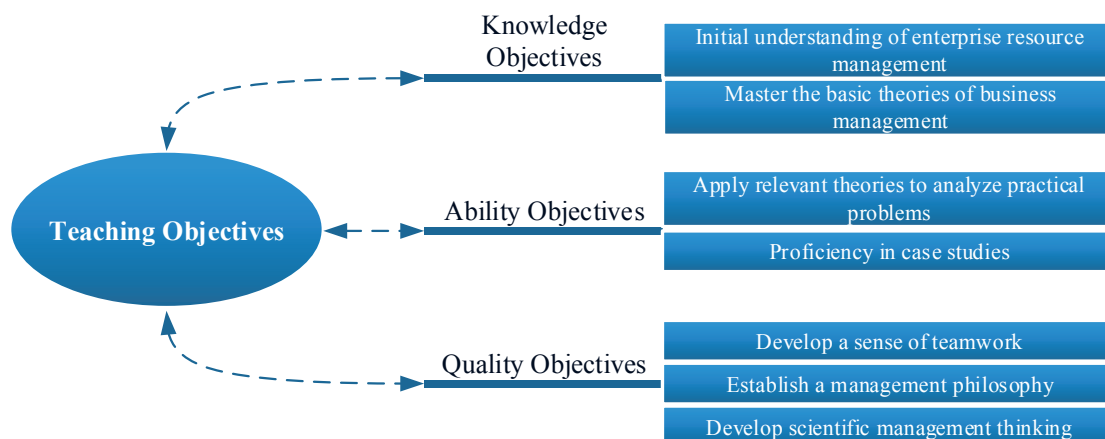

### 2.3.3 SCOPE OF APPLICATION OF CASE STUDY METHOD FOR CORPORATE EXHIBITORS

The "Enterprise Exhibitor Case Teaching Method" is applicable to all kinds of educational institutions and majors, especially those related to big data. It is also applicable to all educational stages, and can be adjusted and improved according to different students' characteristics and course contents.

## 3. PRACTICAL TEACHING DESIGN OF CASE STUDY TEACHING METHOD FOR ENTERPRISE EXHIBITORS

### 3.1 TEACHING OBJECTIVES

According to the basic guiding ideology of vocational education in China, the course focuses on the actual situation of the students, and on the premise of accomplishing the knowledge objectives, the course focuses on cultivating the practical learning ability and quality ability of the students. The main teaching goal is to make students master the basic knowledge of modern enterprise management through the study of modern enterprise management course, so that students can make a solid theoretical foundation for their future practical work in enterprises. The practical teaching objectives of the case study method for enterprise exhibitors designed in this paper are shown in Figure 1. In terms of specific knowledge, ability and quality objectives, this paper believes that they all need to be developed around the fundamental purpose of "practical". The goal of knowledge is to have a solid theoretical foundation when facing the actual modern enterprise management problems. The goal of competence is to have good professional practical ability when solving the actual modern enterprise management problems. The goal of quality is to have a good team consciousness and scientific management thinking when facing any practical problems. Accordingly, the knowledge goal, ability goal and quality goal are designed.

**Figure 1** Practical teaching objectives of the case study method for enterprise exhibitors

### **3.2 CASE SELECTION**

In the practical exploration of the case teaching method for enterprise exhibitors in the big data environment, it is necessary to select suitable cases for teaching first. When selecting cases, the following aspects need to be considered:

(1) High relevance to the current industry: choosing cases with high relevance to the current industry can help students better understand and apply what they have learned.

(2) Large and reliable data volume: Choosing cases with large and reliable data volume will enable students to have a deeper understanding of the actual situation of enterprise exhibitors.

(3) Representative: Choosing representative cases can help students better understand the general rules of corporate exhibiting.

### **3.3 TEACHING METHOD**

After selecting a good case, a suitable teaching method needs to be used for teaching. In the big data environment, the following teaching methods can be used:

(1) Data visualization: Through the way of data visualization, complex data can be made intuitive and easy to understand, which can help students better understand the story behind the data.

(2) Interactive teaching: Interactive teaching can stimulate students' interest in learning and promote students' active learning.

(3) Seminar teaching: Through seminar teaching, students can better understand the problems in the case and improve their analysis and problem-solving ability.

Through the application of the above teaching methods, it can make the enterprise exhibitor case teaching method play a better effect in the big data environment.

## **4. CONCLUSION**

Through the practical exploration of the case study teaching method for enterprise exhibitors in the big data environment, this study finds that the teaching method can effectively improve students' practical skills and problem-solving abilities. Specifically, this study finds that:

(1) The enterprise exhibiting case teaching method can effectively stimulate students' learning interest and enthusiasm and improve the learning effect.

(2) The teaching method can help students better understand the meaning and purpose of corporate exhibiting and enhance their practical skills.

(3) Through the analysis of enterprise exhibition cases, students can gain a deeper understanding of information about the business model, market environment and competitors of enterprises and improve their problem-solving skills.

Based on the above findings, this study suggests that the enterprise exhibiting case teaching method should be widely used in teaching practice and combined with big data technology for teaching innovation in order to improve students' practical skills and problem-solving abilities. At the same time, teachers should guide students to analyze enterprise exhibiting cases in depth and focus on the cultivation of students' practical operation and thinking skills in order to cultivate more competitive talents.

# INNOVATIVE CHANGES OF ENGLISH TEACHING MODEL IN UNIVERSITIES BASED ON CLOUD COMPUTING MANAGEMENT IN THE PERSPECTIVE OF EDUCATIONAL ECOLOGY

---

**Anyi Zhou\***

School of Foreign Languages for Business, Guangxi University of Finance and Economics,  
Nanning, Guangxi, 530008, China

[19728900@qq.com](mailto:19728900@qq.com)

---

## ABSTRACT

This paper investigates the ecological English teaching model under cloud computing management, analyzes the ecological English teaching model under cloud computing management, and contrasts the changes in students' learning capacity before and after the innovation of the college English teaching mode. The English communication ability was 78.8% after the innovation and 63.6% before the innovation, the language foundation was 86.2% after the innovation and 51.8% before the innovation, and the English writing ability was 76.3% after the innovation and 63.8% before the innovation. The improvement of students' English-learning skills is aided by the innovation of university English teaching models based on cloud computing management, and the balance of university English teaching ecosystems is aided by innovative shifts in educational ecology perspectives.

## KEYWORDS

Educational ecology; Teaching model innovation; English language learning ability; Innovative change; Teaching ecosystem

## 1. INTRODUCTION

The networked age is significantly affecting many parts of people's life as a result of the slow but steady progress of globalization and the rapid growth of computer network technology [1]. While accepting the computer network environment is a new setting and opportunity, traditional foreign language instruction is confronting innumerable repercussions and obstacles [2–3]. How to ensure that the two resources are integrated effectively, allowing the information age's benefits to fully manifest, the ability of the computer network to adapt to the demands of modern educational development and truly integrate as an organic part of the curriculum has emerged as a key issue to support the modernization of college English teaching and also serves as the subject of research on the present change of the teaching of foreign languages. [4].

In the ecological perspective, traditional college English teaching is an ecologically balanced system, and all ecological factors have been in a relatively compatible and stable state after long-term development and friction [5-6]. However, the integration of information technology with a computer network at its core into college English instruction is obligated to alter the traditional teaching objectives, modes, materials, curriculum, and other elements, and these modifications will inevitably upset the initial ecological balance and result in a number of disorders [7-8]. Teachers must adapt to the new online learning environment in a timely manner, adhere to the "student-centered" teaching philosophy, analyze students' learning needs, direct students' learning, supervise overall activities, and work with students to help them understand

how the focus of classroom teaching activities has changed, as well as how their online independent learning skills have improved [9]. It is encouraged for the instructor and the pupils to grow together. To restore equilibrium to the environment of university English teaching, we support the joint growth of instructors and students.

## **2. INNOVATION OF ENGLISH TEACHING MODE IN COLLEGES AND UNIVERSITIES**

### **2.1. FOREIGN LANGUAGE ONLINE TEACHING BASED ON CLOUD COMPUTING TECHNOLOGY**

#### **2.1.1. ENGLISH TEACHING BASED ON CLOUD COMPUTING TECHNOLOGY**

A uniform format is used to convert several kinds of multimedia teaching resources (such as electronic lesson plans, instructional films for the classroom, and videos of experimental demonstrations, etc.) into streaming media files. They can also be captured in real time on site through audio and video capture devices. To dynamically distribute instructional resources to students in accordance with actual instructional demands, store them in a certain organization to the cloud service end. In order to select the best cloud computing service platform, instructors must be aware of the learning characteristics of students in the "cloud era" in addition to having access to more cloud service resources for teaching. The "cloud era" has changed the way that students learn, and teachers must be aware of these changes in order to select the best cloud computing service platform for their classes. Students will receive individualized on-demand instruction that is more appropriate for them. Using the corresponding "cloud," students may buy services and educational resources from vendors based on their own requirements.

#### **2.1.2. FEATURES OF ENGLISH ONLINE TEACHING WITH CLOUD COMPUTING TECHNOLOGY**

University foreign language instruction aims to improve students' language proficiency, which includes their reading, speaking, listening, and writing skills as well as their comprehension of Western culture. The benefits of sharing resources and having infinite storage space are two advantages of the cloud services made possible by cloud computing.

(1) Resource sharing. Access to streaming audio and video saved on cloud servers is possible at any time and from any location can be accessed from anywhere on the network and at any time from streaming media servers without having to save and carry these media files, as long as the URL and directory storage structure of the cloud server are known.

(2) Students can learn quality teaching resources easily and intuitively. Teaching managers can easily and quickly generate courseware so that teaching and learning can communicate in time, which largely improves the effect of distance learning.

### **2.2. ENGLISH TEACHING MODEL IN UNIVERSITIES UNDER EDUCATIONAL ECOLOGY**

#### **2.2.1. ECOLOGICAL TEACHING MODEL**

The direction of a teaching method's healthy growth is toward an ecological perspective. It is gradually investigated and produced in the teaching practice of the ecological classroom, and at the same time, its growth can help the teaching of the environment. This paradigm applies the idea of "student-centered" education and is inspired by the philosophy of educational ecology. It encourages students' natural, harmonious, and unfettered growth and development under good artificial settings by balancing the ecological positions of various educational components and ecological forces. The model's development seeks to account for objective elements including internal and external constraints on students' learning, individuals'

inherent characteristics, and societal standards. In order for students to realize a classroom ecological environment with independent, free and open, cooperative, and inquiry learning, teachers and students must activate teaching cognition and other organism activities by utilizing the ecological subject's growth of happy emotions and subjective consciousness.

### 2.2.2. ECOLOGICAL FOREIGN LANGUAGE TEACHING MODE UNDER CLOUD COMPUTING MANAGEMENT

The educational model under cloud computing administration involves the integration of technology for cloud computing into the learning and instruction model, adding technology as a new incentive to support teaching and learning activities. The realization of the teaching model assisted by technology is also a result of the application creation of the teaching model in the conditions of modern information technology. By depending on and utilizing cloud computing technology, it relies on and uses a relatively stable structure of instructional activities and a collection of methods for instruction developed under the direction of specific teaching ideas and theories to accomplish the set goals of teaching foreign languages.

The ecological approach to teaching foreign languages is based on educational ecology as a common underpinning principle and is controlled via cloud computing. It is a theoretical teaching method that makes use of a variety of teaching techniques to optimize the presentation of the subject matter being taught in order to meet the predetermined learning objectives. It is the path of logical evolution and optimization of the contemporary foreign language education paradigm.

## 3. DESIGN OF ENGLISH TEACHING MODE IN CLOUD COMPUTING COLLEGES AND UNIVERSITIES UNDER THE PERSPECTIVE OF EDUCATIONAL ECOLOGY

### 3.1. INNOVATION OF ENGLISH TEACHING MODE IN COLLEGES AND UNIVERSITIES

Students are expected to have a high level of learning autonomy and self-discipline in online instruction and independent learning. Table 1 displays the differences in student learning capacity before and after the introduction of a new teaching strategy. Students' learning autonomy was 72.4% after innovation and 55.6% before innovation, students' self-discipline was 55.9% after innovation and 42.9% before innovation, while English communication ability was 78.8% after innovation and 63.6% before innovation, language foundation was 86.2% after innovation and 51.8% before innovation, and English writing ability was 76.3% after innovation and 63.8% before innovation. Among them, the students' language foundation and English communication skills changed significantly. This demonstrates the development of a new English teaching method based on cloud computing management in colleges and universities, which is helpful in enhancing students' English learning skills and recognizes the dynamic role of teachers and students in ecological subjects. Reasonable innovation and optimal allocation were made in the mode's development.

**Table 1.** Changes in students' learning ability before and after the innovation of teaching mode

Type	Pre-innovation in teaching	After teaching innovation
Learning autonomy	55.6%	72.4%
Self-discipline	42.9%	55.9%
English communication skills	63.6%	78.8%
Language Basics	51.8%	86.2%
English writing skills	63.8%	76.3%

### 3.2. TEACHING CONCEPTS AND TEACHER ROLE ORIENTATION

The evaluation of teachers' role orientation is shown in Table 2. 59.7% and 63.1% of instructors were rated as being able to function as direction guides in the classroom and for students' autonomous online learning, respectively, by teachers and students, indicating that more than half of the teachers fully performed their assigned leading duties, designed classroom teaching activities rationally, and mobilized students' main enthusiasm for learning effectively.

**Table 2.** Evaluation of teacher role orientation in educational ecology

Positioning Type	Teacher Evaluation	Student Evaluation
Knowledge transferor	62.7%	72.8%
Requirements analyst	59.5%	69.2%
Student Collaborators	55.3%	64.4%
Orientation guide	59.7%	63.1%
Knowledge trainer	55.3%	54.8%
Motivator	48.4%	49.5%

### 4. CONCLUSION

College English course is an important part of college English teaching, which aims at cultivating students' college English application ability and improving their comprehensive college English skills as its teaching objectives. With its distinctive teaching benefits, educational ecology has been increasingly embraced alongside the modernization and reform of higher education. The term "educational ecology" mostly refers to the teaching process that takes place in classrooms, where students perform interactive learning outside of class and between teachers and students using multimedia and videos, among other things, including question and answer, cooperative learning, extracurricular inquiry, and self-study after class. In this way, the teaching effect of college English classroom can be effectively improved. Because college English is traditionally taught in a teacher-centered, rather outdated manner, most students have a major lack of interest in learning, and there are few teaching strategies used in the classroom, which contributes to the poor quality of college English instruction.

The confines of conventional college English instruction are broken by incorporating the notion of educational ecology into the classroom. Students can continue their education independently before and after class thanks to a platform that was specifically designed for uploading footage of in-class instruction. The variety of teaching strategies used in college English classes also enhances the course material and boosts the effectiveness of instruction.

### FUNDING

This research was supported by 2020 Annual Planning Foundation Project for Humanities and Social Science Research of the Ministry of Education of the People's Republic of China (20YJA740021).

## ABSTRACT

This paper discusses the evaluation of the utility of the development of college curriculum Civic Education in the context of big data, analyzes the current situation of college curriculum Civic Education based on big data, and explores the effect of the development of college curriculum Civic Education in the context of big data. The highest average score of students' comprehensive Civic and Political Education assessment is 77.59 in psychological aspect, 73.76 in political aspect, and 82.75 in civic aspect, 68.27 in scientific aspect and 69.45 in humanities aspect. therefore, the development of Civic and Political Education in college courses under the background of big data has a certain promotion effect on students' comprehensive Civic and Political Education, which is beneficial to stimulate students' learning of professional courses The interest of students in professional courses.

## KEYWORDS

Curriculum Civic Education; Utility Evaluation; Civic Education; Comprehensive Civic Literacy; Professional Curriculum

## 1. INTRODUCTION

The current rapid development of global high-tech power, the high degree of integration of new technologies and methods with the construction of college course Civics to promote the innovative development of college education ability has become an important development trend of college education and teaching reform [1-2]. The construction of professional course ideology is an innovative teaching concept of the mutual integration of professional course teaching and ideology education. Because of the rigorous and standardized knowledge of professional courses and the abstract learning content, students are easy to feel boring in the learning process and gradually lose interest in course learning in the long run [3-4]. Adding ideological and political education to the teaching of traditional professional courses, deeply excavating the philosophical thinking, spiritual connotation and value pursuit and other thinking and political elements contained in the professional courses, makes the traditional classroom new vitality, stimulates students' interest in learning professional courses, broadens students' learning ideas, and then improves learning effectiveness [5-6].

Using the advantages of big data technology makes the Civic Science data resources more abundantly accessible, data analysis faster, and information more effective, thus enhancing the accuracy of Civic Science elements into teaching [7]. Civic content is gradually internalized into students' learning drive, enhancing students' spiritual leadership, allowing students to

clarify the direction of learning forward, and shaping students into a new era of talent pursuing comprehensive development of ideas, skills and character [8].

## **2. CIVIC EDUCATION OF COLLEGE CURRICULUM IN THE CONTEXT OF BIG DATA**

### **2.1. CURRICULUM CIVICS CONSTRUCTION IN HIGHER EDUCATION**

#### **2.1.1. IDEOLOGICAL AND POLITICAL EDUCATION IS EXTENDED IN PROFESSIONAL COURSES**

The extension of ideological and political education in professional courses provides a clear direction for curriculum education. Curriculum ideology and politics aims to construct and improve the task of educating people, so that the implementation of the fundamental task of establishing moral education becomes the core of all work in universities. It is worth noting that the extension of ideological and political education in professional courses is not forcibly inculcated, grafted and transplanted, but through the excavation and refinement of humanistic and value elements contained in the courses themselves, to realize the interpenetration and integration of nurturing people and nurturing talents in course education, and the courses and Civic Science and Politics go in the same direction.

The extension of ideological and political education in professional courses is a necessary step for the effectiveness of ideological and political education. The “Curriculum Civic Government” faces the problem of separating knowledge education and value education in the traditional education system and realizes the extension of ideological and political education in professional courses. This extension is the interpenetration of professional education and ideological and political education, the excavation and refinement of the elements of course education, and the formation of consciousness of course education. This extension realizes the growth of the spiritual life of the curriculum, enriches and deepens the connotation of the curriculum education, and makes the curriculum education consciously abandon the adherence to “value neutrality”.

#### **2.1.2. CONSTRUCTING THE CULTIVATION PATTERN OF “THREE COMPREHENSIVE EDUCATION”**

The construction of “Curriculum Thinking and Politics” integrates the whole process of education and teaching, and makes the nurturing links have a cross-cutting nature. The ideological and political education for college students should be implemented in all aspects of talent training and accompany the whole process of students’ growth and success. According to the law of growth, learning characteristics and professional characteristics of students of each major combined with the law of thinking and government work, the students’ talent cultivation plan should be implemented. To strengthen the continuity of the whole process of education, enrich the profound connotation of “three comprehensive education”, establish a hundred flowers of thinking and political education mode and the mechanism of thinking and political education throughout, so that the ideological and political education work in colleges and universities can be progressed and developed. The construction of “Curriculum Civic Politics” needs to improve the ability of global planning and make the education model complete. The construction of “Curriculum Thinking and Politics” needs to be carried out jointly by multiple departments and systems, optimize the top-level design, build up a cross-dimensional and cross-disciplinary collaborative education model, and establish a “Curriculum Thinking and Politics” cultivation pattern.

## **2.2. ANALYSIS OF THE CURRENT SITUATION OF CIVIC EDUCATION IN THE CURRICULUM BASED ON BIG DATA**

### **2.2.1. DIVERGENT VALUES OF PROFESSIONAL EDUCATION AND IDEOLOGICAL AND POLITICAL EDUCATION**

Professional education aims to equip the educated person with the knowledge and skills to perform a specialized job through the transfer of professional knowledge and skills. Ideological and political education consists of two main aspects: on the one hand, it makes the educated person a human being through educational guidance, and on the other hand, it guides the educated person to become a citizen by reconciling personal values with community values.

First of all, professional education is concerned with “training a certain kind of person”. Through the transfer of knowledge and skills, a person acquires the ability to earn a living. Therefore, professional education emphasizes the objective presentation and teaching of professional knowledge and the presentation of facts. As a result of the one-sided pursuit of knowledge transfer in the process of education, it has gradually departed from the dual educational mission of pursuing intellectual truth and forging personality.

Secondly, ideological and political education focuses on the cultivation of people themselves. To make people human and to make them citizens is the dual mission of ideological and political education. In terms of the meaning of life, through education and guidance, the educated person becomes a person with ambitious ideals and firm beliefs, so that human life as an individual tends to be true, good and beautiful.

### **2.2.2. MISPERCEPTION OF CURRICULUM THINKING**

The so-called curriculum thinking politics, that is, the expansion of the influence and impact of thinking politics education. No matter it is a professional basic course, core course or application practice course, the teaching concept of originated from life and above life is emphasized in actual teaching, which coincides with the connotation of thinking politics. In the specific teaching, some institutions fail to truly realize the value of integrating the content of Civic Education with the teaching of professional courses. Even if the serving teachers elaborate the content of Civic Education in the course teaching, it always lacks affinity and relevance, which makes students feel boring and tedious, just like chewing wax, and it is difficult to combine the learning needs and growth characteristics of students to form a synergistic effect, not to mention improving the quality of Civic Education.

## **3. DESIGN OF CIVIC EDUCATION IN COLLEGE CURRICULUM UNDER THE BACKGROUND OF BIG DATA**

### **3.1. RESEARCH ON CURRICULUM CIVIC EDUCATION IN HIGHER EDUCATION**

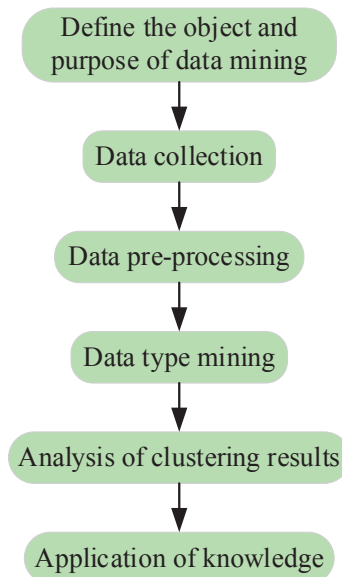

This paper explores the effect of the development of Civic Education in college courses under the background of big data, and the comprehensive Civic Literacy assessment of students is shown in Table 1. Reflecting the measured students' literacy status in psychology, politics, civics, humanities and science, and get their comprehensive quality status of Civics and Politics on average. The highest average score of psychological aspect is 77.59, the highest average score of political aspect is 73.76, while the highest average score of civic aspect is 82.75, the highest average score of science aspect is 68.27, and the highest average score of humanities aspect is 69.45. Therefore, the development of Civic and Political Education in college curriculum under the background of big data has a certain promotion effect on students' Civic and Political comprehensive literacy.

**Table 1.** Average scores of students' comprehensive quality assessment of Civics and Politics

Grade Level	Psychology	Political	Civics	Science	Humanities
2017 Class	73.48	71.74	81.45	67.89	60.45
2018 Class	78.46	68.34	80.63	63.89	68.34
2019 Class	77.59	73.76	82.75	68.27	69.45

### 3.2. EXAMINATION OF CIVIC AND POLITICAL WORK BASED ON BIG DATA

Data mining is a process by which programs are affirmed and is a means to analyze and study data at a deeper level. It is particularly meaningful to apply the technique to the examination system of counselor work appraisal. Data mining analysis of counselor work appraisal is shown in Figure 1. The data mining method of cluster analysis is adopted to process the data information of counselor work effectiveness, which can transform a large amount of data into clustering results, and then make better use of that type of data. These are features that commonly used traditional evaluation systems do not have. Data mining of this data can lead to important conclusions that can have a huge impact on both management and teaching, yielding incalculable benefits and results.

**Figure 1.** Data mining analysis of counselors' work assessment

### 3.3. ENHANCE THE MULTIDIMENSIONAL INTEGRATION OF TEACHING MEDIA

With the continuous development of the new era, the new media has become an important carrier and means of practical teaching of "Course Civics". The construction of "Curriculum Civics" should realize the effective combination and complementary advantages inside and outside the classroom, inside and outside the school, online and offline, and expand and improve the all-round, multi-level and three-dimensional practical teaching media.

Colleges and universities should pay attention to the creation of professional model ideological and theoretical education resources website, learning and education network mutual interaction community, the school 'course thinking politics' construction education microblogging, timely update and push well-known experts and scholars in the field of innovative articles, the relevant system campus WeChat public number and other network new media construction. Guiding students to naturally change from "I want to learn" to "I want to learn", to establish a correct view of the Internet, and to grow up to be the defender of Marxism and the current practitioner of the Internet.

#### 4. CONCLUSION

Ideological and political education is an activity that establishes the Archimedean point of the human spirit and reunites man with his own rational essence. Through educational guidance the values with truth are associated with and carried out in the will and behavior of man, and the essence of man is returned to man to realize the full possession of his essence.

We promote the process of building the knowledge system and ideology system of ideological and political education disciplines, promote the overall level of discipline construction, and accumulate theoretical and practical strength for the full play of the function of ideological and political education. From the doctrinal level, it stimulates the self-reflection of disciplinary theories, explores new disciplinary growth points, improves the construction of disciplinary knowledge and ideological system, clarifies the positioning of the study of “curriculum thinking and politics” in the disciplinary system, and provides a macroscopic knowledge picture for the in-depth development of relevant research. From the practical level, it provides theoretical support and practical reference for the in-depth promotion of “Curriculum Civics”.

# THE CONSTRUCTION AND PRACTICE OF MUSIC PEDAGOGY SYSTEM FOR PRESCHOOL EDUCATION MAJORS BASED ON OBE CONCEPT

---

Gangyu Tian\*

Lanzhou City University East Campus, Lanzhou, Gansu, 730020, China

[18719793379@163.com](mailto:18719793379@163.com)

---

## ABSTRACT

This paper constructs a music pedagogy system based on OBE concept for preschool education majors, designs a reconstructed OBE concept music curriculum content, and analyzes the changes of students' learning initiative before and after the system construction. Among them, 61.87% of students reviewed music theory knowledge, 46.37% before the construction, 73.65% of students previewed the course in advance, 37.62% before the construction, 73.24% of students completed the after-class homework in time, 53.87% before the construction, and 72.24% of students mastered the key points of the course, 46.36% before the construction. The music pedagogy system of preschool education based on OBE concept plays its proper role in preschool education and is important for the cultivation of preschool education professionals.

## KEYWORDS

OBE concept; Preschool education major; Music pedagogy system; Curriculum content reconstruction; Talent training; Learning initiative

## 1. INTRODUCTION

The output-oriented OBE concept is an international advanced educational philosophy that leads the current reform of talent training programs and curriculum teaching in higher education [1-2]. While the traditional educational philosophy focuses on how well teachers teach, the output-oriented OBE concept is more concerned with how well students learn [3]. It emphasizes that teaching should first clarify the competencies and qualities that students should eventually possess after learning, and then proceed to teaching design and implementation [4-5].

The learning center emphasizes following the law of teacher-training students' growth and success, allocating educational resources, organizing curriculum and implementing teaching with teacher-training students as the center [6-7]. Output orientation emphasizes taking teacher-training students' learning effects as the guide and evaluating the quality of talent

training against the core competencies and quality requirements for teacher-training students' graduation [8-9]. Continuous improvement emphasizes the all-round and whole process evaluation of teaching and the application of evaluation results to teaching improvement to promote the continuous improvement of talent cultivation quality [10]. Curriculum teaching reform in higher teacher training institutions should be output-oriented in practice, with the basic concept of continuous improvement, and a series of reflections and reforms on curriculum design and implementation, so as to improve the quality and efficiency of professional talent training.

## **2. MUSIC TEACHING IN PRESCHOOL EDUCATION BASED ON OBE CONCEPT**

### **2.1. ANALYSIS OF OBE CONCEPT PRESCHOOL EDUCATION PROFESSIONAL TEACHING**

#### **2.1.1. LOGICAL STARTING POINT OF OBE CONCEPT**

The logical starting point of the OBE philosophy is constructivism. Constructivism believes that learners construct knowledge modules through active learning in order to complete the analysis, synthesis and evaluation of knowledge. The learner is the subject of knowledge construction and the teacher is the guide of the learning process. The active learning model of learners, on the other hand, focuses on the learning process and learning outcomes, and learners must solve problems by engaging in reading, writing, and discussing, which becomes the basis of the core concept of OBE.

#### **2.1.2. CONNOTATION OF OBE CONCEPT**

The connotation of OBE concept is to improve learners' core competencies, achieve learning outcomes and learning goals through reverse design and positive implementation of the curriculum with the learner as the center and outcome output as the orientation. Simply put, it means setting educational standards based on the learning outcomes to be achieved in the end, setting learning goals after students understand the relevant educational standards, achieving learning goals in stages continuously during the teaching process, and using the achievement of learning goals and learning outcomes to form a way to evaluate learning outputs, and then based on learning outcomes, reversing the curriculum based on learning outcomes and organizing the implementation of outcome output-based Curriculum teaching.

### **2.2. EXISTING PROBLEMS OF MUSIC TEACHING IN PRESCHOOL EDUCATION BASED ON OBE CONCEPT**

#### **2.2.1. THE DILEMMA THAT TENDS TO CREATE UNSYSTEMATIC TEACHING**

In daily music teaching, if we want to grasp both practice and theory, we will inevitably face the problem of unsystematic teaching. The integrated teaching mode of theory and practice tends to fragment knowledge. Music is a relatively abstract subject, and the integration of theory and practice is more difficult than in other majors. After all, in the process of using the integrated teaching mode, some teachers may only focus on the teaching of music skills,

resulting in the lack of knowledge about music. Over time, students may also focus on musical skills and ignore the connotations of music itself. Music theory has a complete system chain, and if there is a slight lack of it, students will not be able to connect their knowledge smoothly, resulting in a more confusing knowledge system, which directly affects students' deeper mastery of music subjects later.

### **2.2.2. TEND TO CAUSE STUDENTS TO FAVOR PRACTICAL DILEMMAS**

Some students have a great interest in improving their musical skills in a short period of time, and in the skill improvement sessions they are interested in, these students are eager to get started as soon as the teacher finishes the demonstration without prompting or prodding, and thus are able to complete the skill training well. However, for theoretical lessons that are time-costly and ineffective, students are more impatient, which in turn leads to a lack of theoretical support behind the skills. For example, many students are very motivated in instrument playing classes, but are listless in basic music theory classes.

### **2.2.3. ONE-SIDED COURSE EVALUATION**

The traditional forms of evaluation are mainly divided into three kinds of examinations, examinations and certifications. In terms of the evaluation method of the course, it mainly follows the traditional way of forming a comprehensive grade in the form of attendance, classroom performance, post-class assignments and examinations to examine the students' learning outcomes of this course. This form of evaluation is mainly based on students' behavioral performance and on-site practical performance, but there is no assessment of the changes of students' ability and quality in the learning process. The final comprehensive grade is not able to objectively evaluate the learning results, and also cannot reflect the students' ability gaps in the practical teaching process, forming a one-sided evaluation result, which is not conducive to subsequent teaching improvement.

## **3. CONSTRUCTION OF MUSIC PEDAGOGY SYSTEM FOR PRESCHOOL EDUCATION MAJORS BASED ON OBE CONCEPT**

### **3.1. STUDENT LEARNING INITIATIVE**

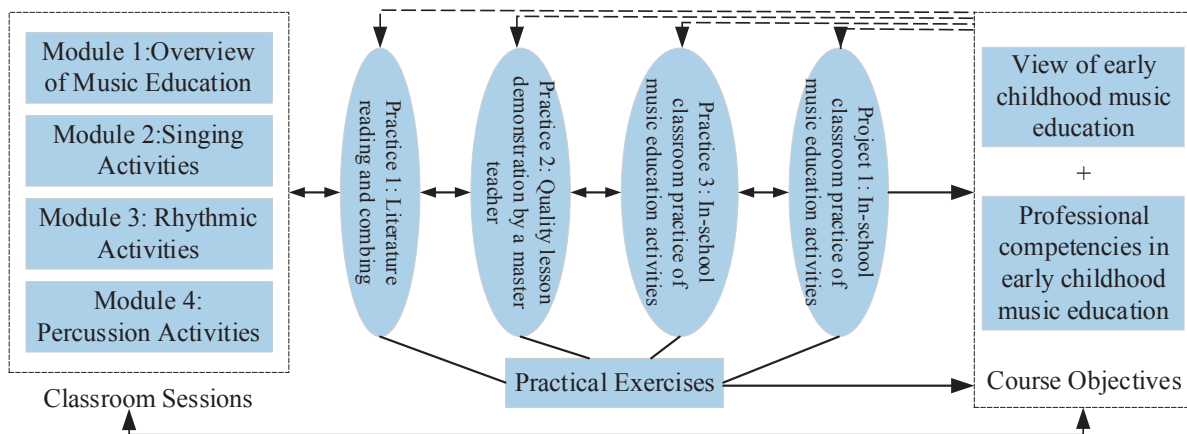

Based on the OBE concept of music pedagogy system construction for preschool education majors, the changes of students' learning initiative before and after the system construction are shown in Figure 1. Among them, 61.87% of students reviewed music theory knowledge, 46.37% before the construction, 73.65% of students previewed the course in advance, 37.62% before the construction, 73.24% of students completed the after-class homework in time, 53.87% before the construction, and 72.24% of students mastered the key points of the course, 46.36% before the construction. It can be seen that in the construction of music pedagogy system based on OBE concept helps to enhance students' learning initiative, thus guaranteeing the teaching quality of music courses in preschool education and realizing the consistency of learning outcome output and learning goal achievement.

**Figure 1.** Changes in students' learning initiative before and after the construction

### 3.2. COURSE CONTENT RECONSTRUCTION BASED ON OBE EDUCATION CONCEPT

The OBE education concept course content construction is shown in Figure 2, which completely breaks the traditional sense of subject content as the logical main line of course content construction method, and takes the final learning outcomes of students as the core structure of course content. The course content design with a high degree of integration between theory and practice focuses the course objectives on the acquisition of students' correct concepts and professional abilities in music education, which fully reflects the output-oriented OBE education concept.

**Figure 2.** OBE education concept course content construction

## 4. CONCLUSION

The long-standing problems of traditional preschool vocal music courses are mainly manifested in the lack of accurate positioning of course objectives, the disconnection between course content selection and kindergarten teaching practice, the emphasis of vocal music

teaching on skill training but not on ability cultivation, and the single way of vocal music course evaluation. With the guidance of OBE output orientation, we should accurately position the course objectives, reorganize the course contents, reform the teaching methods and adjust the course evaluation. At the same time, the study and practice of vocal music enriches students' knowledge of art appreciation and expression, enhances their musical literacy and aesthetic ability, meets vocational needs, and reserves solid musical literacy for students to engage in kindergarten music education activities in the future. In the current context of professional accreditation, it is of great significance and value to reflect on and reform the teaching design and implementation of the vocal music course for preschool education majors by applying the educational concept of OBE.

The objectives of the course can be made clearer and more humane by setting the whole objectives based on the students' core. It is easier for students to understand their learning goals intuitively and clearly, and to implement the teaching process step by step under the guidance of the whole system, because the introduction of teaching evaluation makes the teaching results can be gradually improved in the process of implementation, forming a continuous upgrading process. The establishment of such a system will eventually play a certain improvement role for the progress of music education in preschool education, and for There is a certain significance on the way of transporting talents to higher education.

## ABSTRACT

Mental health monitoring system is the basic link in the whole psychological crisis intervention system, which can play an early warning role. In this paper, in order to study whether the psychological crisis intervention platform based on big data technology for higher education students helps to understand the psychological state of students, therefore, the classification accuracy of the psychological crisis intervention platform is analyzed. The highest accuracy rates of five algorithms were 78.40%, 88.30%, 80.40%, 90.80%, and 89.30%, respectively, with logistic regression algorithm and support vector machine performing the best. Combining big data technology with the monitoring system of higher vocational students' mental health status is of great practical value and relevance to promote the stable development of mental health education in higher vocational institutions.

## KEYWORDS

Mental health education; Mental health status; Monitoring system; Psychological crisis intervention platform; Psychological development in higher education institutions

## 1. INTRODUCTION

Mental health education is pivotal, and higher vocational colleges and universities cultivate a large number of high quality technical skill talents every year to support economic and social development [1-2]. Vocational education has entered a critical moment, and psychological crisis intervention in the post-epidemic era is the top priority of mental health education in higher education institutions [3-4]. Using big data thinking and Internet technology means, we can dynamically track and understand the psychological state and thought behavior of higher vocational students and improve psychological intervention measures [5-6]. Saving teachers' working time, enhancing the efficiency of handling students' psychological crisis events, innovating and improving the psychological crisis platform for higher vocational students, and achieving four levels of psychological crisis prevention and intervention with precise education, management and service are inevitable, far-reaching and significant for psychological work in higher vocational institutions [7-9].

In this paper, we mainly establish the classification models of psychologically abnormal students and normal students. Firstly, the imbalanced data are mixed equalization processed, and the classification results of different classifiers are compared again, and it is found that the

logistic regression algorithm has better performance in classification accuracy and recall rate. The combined equalization process.

## **2. ANALYSIS OF STUDENTS' MENTAL HEALTH IN HIGHER EDUCATION INSTITUTIONS**

### **2.1. THE CURRENT SITUATION OF MENTAL HEALTH EDUCATION FOR HIGHER VOCATIONAL STUDENTS IN THE ERA OF BIG DATA**

#### **2.1.1. LOW STUDENT SELF-EFFICACY**

Currently, higher education students may have a sense of loss and low self-efficacy in the learning process. Students with a sense of loss will look for balance and recognition on the Internet. It can be said that currently every college student belongs to an independent self-media, but compared with adults, higher vocational college students are more likely to be influenced by the external environment. At the same time, there are different opinions on the Internet about the same thing and social hotspots, which are very likely to cause students' cognitive bias. Among them, negative comments are not conducive to the formation of positive mental health of students. In addition, students in higher education have just become adults, and their perceptions are easily influenced by public opinion, and their self-control still needs to be improved compared with adults in other age groups.

#### **2.1.2. SINGLE CHANNEL OF ACCESS TO MENTAL HEALTH**

At present, the mental health condition of college students in higher education is in dynamic change, and it will show different mental states with different grades. However, at present, the channels to obtain students' mental health in higher education are mainly paper-based psychological questionnaires. The survey method is mainly for the first year of university students. There are differences in the entrance time of higher vocational students, and they are under different academic and life pressures, but it is difficult to effectively collect the mental health status of all students by paper questionnaires. There are differences in the mental health status between freshman and senior students who face different pressures. If a single channel is used to obtain mental health status, it is difficult to effectively discover the heterogeneity of mental health status of the two students.

At the same time, in the Internet era, higher education also does not use big data technology to regularly and dynamically summarize and rank college students' health problems, and only uses paper questionnaires to obtain students' mental health status, which is an obstacle to the effective development of mental health education in higher education.

#### **2.1.3. LACK OF PROFESSIONAL FACULTY**

For a long time, it has been difficult to solve the shortage of mental health education professionals in higher education due to the low number of psychological professionals and the fact that most teachers are mainly engaged in research work. A large number of higher education institutions lower the recruitment threshold of mental health teachers. Many colleges and universities even directly take mental health courses as elective courses. It makes it possible to only teach mental health courses instead of school psychological work, and it is impossible to discover the mental health problems of students in a timely and effective way.

### **2.2. INNOVATIVE PATHS OF MENTAL HEALTH EDUCATION FOR HIGHER VOCATIONAL STUDENTS WITH BIG DATA**

#### **2.2.1. ESTABLISHING AWARENESS OF BIG DATA IN MENTAL HEALTH EDUCATION**

Under the background of big data, higher education should actively apply big data technology in mental health education courses according to the development needs of the

times, and actively use big data thinking mode to think about and understand students' mental health problems, with the intention of improving and enhancing the quality of students' mental health education service work. Higher education should establish the awareness of big data for mental health and improve the concept of data. Pay attention to the application of big data in mental health education in the field of ideology and use big data as an indispensable resource in order to promote the innovation and development of mental health education mode in higher education. At the same time, higher education should apply cloud computing and big data thinking in student mental health management work.

Secondly, higher education needs to develop diversified guarantee measures according to students' mental health, so as to create a working environment and atmosphere for mental health education using big data technology. Finally, in the process of daily teaching, higher vocational mental health teachers should form the habit of thinking about big data, organize and analyze relevant questions, and grasp the mental health condition of students in time.

### **2.2.2. PSYCHOLOGICAL CRISIS INTERVENTION PLATFORM FOR HIGHER VOCATIONAL STUDENTS**

The psychological behavioral characteristics of higher vocational students are positive and negative, which need timely adjustment and improvement, and intervention and promotion by educators. Integrating big data technology into the construction of a psychological crisis intervention platform for higher vocational students can comprehensively collect and process data information on students' academic performance, interpersonal relationships, living status, and network activity, deeply excavate and analyze students' psychological status, optimize the formation of unified information, enhance the accuracy of psychological intervention, and strengthen foresight. The flexible use of big data technology can not only make accurate prediction of individual behavioral tendencies, but also anticipate the development pattern of psychological behavior and major events of higher vocational students, thus laying a good foundation for educators to implement scientific treatment programs.

### **2.3. ANALYSIS OF MENTAL HEALTH DATA SOURCES FOR HIGHER EDUCATION STUDENTS**

There are various factors that contribute to psychological problems, and mental health data need to be analyzed from multiple perspectives. Mental health data obtained from different perspectives reflect different psychological states respectively. The main sources of data for mental health factor indicators are mental health centers, schools, dormitories, families, and friends with whom we have a lot of contact. From the perspective of the surveyed personnel, the main sources are mental health counselors, school teachers, classmates and friends they usually communicate with, and the way to obtain these data is through conversation, survey and counseling. The main source of mental health data for students in higher education is the school, because the school is the place where students live the longest, so the school mental health data is more important.

## **3. CONSTRUCTION OF A PSYCHOLOGICAL CRISIS INTERVENTION PLATFORM FOR HIGHER VOCATIONAL STUDENTS BASED ON BIG DATA TECHNOLOGY**

### **3.1. QUANTIFICATION AND ANALYSIS OF STUDENTS' BEHAVIORAL CHARACTERISTICS**

In the mining of higher vocational education data, based on the original large amount of data, the features are extracted and quantified, aiming at the feature indicators after extraction can more intuitively reflect the students' school behavior performance. In addition, by referring to the basic psychology and pedagogy, we establish indicators to extract students'

characteristic traits and build more complete and complete behavioral characteristics to measure students' school performance, compare and analyze the difference in performance between psychological abnormalities and normal students, paint an accurate portrait of students based on the above data, assess the estimated level of mental health, and establish corresponding coping mechanisms. It realizes the early warning of students' mental health status, psychological problems and other accurate predictions, and continuously improves the system of prevention and intervention of mental health crisis in higher education.

### 3.2. PSYCHOLOGICAL CRISIS INTERVENTION PLATFORM MODEL TRAINING AND OPTIMIZATION

In order to study whether the psychological crisis intervention platform based on big data technology for higher education students helps to understand the psychological state of students, the classification accuracy of the psychological crisis intervention platform is shown in Table 1. In this paper, we use the above filtered four features to train the model and select five algorithms: logistic regression algorithm, Bayesian algorithm, support vector machine algorithm, K-nearest neighbor algorithm and decision tree to classify them.

The highest accuracy rates of the five algorithms were 78.40%, 88.30%, 80.40%, 90.80%, and 89.30% when using data from three years of university to classify psychologically normal and abnormal students, respectively, with logistic regression algorithm and support vector machine performing the best, and the classification results of plain Bayes being relatively poor. This shows that the model of higher vocational psychological crisis intervention platform based on big data technology has a high accuracy rate in analyzing students' psychological status.

**Table 1.** Comparison of classification accuracy of different classifiers

	Bayesian algorithm	Decision Trees	K Nearby	Logistic regression algorithm	Support vector machines
Freshman year	74.80%	82.60%	75.70%	88.60%	84.70%
Sophomore	78.40%	88.30%	80.40%	87.20%	89.30%
Junior	69.60%	76.80%	67.90%	90.80%	87.60%

### 3.3. COMPARISON OF CLASSIFICATION MODELS

The data are first oversampled by SMOTE and undersampled by K-means, after which the data are fed into a binary classification model for training to obtain classification results. However, due to the unbalanced nature of the data, excessive data sampling may lead to distortion of the data or produce overfitting of the classification model, so the classification algorithm One-Class SVM algorithm for outlier detection is used here to compare with it.

The One-Class SVM algorithm is suitable for situations where the sample data is extremely imbalanced and only the data patterns of the majority class samples are concerned. By learning the data from the majority class samples, a hyperplane is found to circle the majority class samples, and this hyperplane is used to make decisions thereafter. The test samples are input and the positive and negative samples are distinguished by the trained hyperplane. Since the One-Class SVM training model has only one class, the output can only discriminate whether it belongs to this class, and returns a "yes" result if it belongs to this class, or a "no" result if it does not. In this experiment, psychologically abnormal students are defined as positive cases and normal students are defined as negative cases. The positive and negative samples are divided into test sets according to 1:1, i.e., 50 normal students are randomly divided into 50 abnormal students as the test set, and the rest of the normal students are used as the training set to train the One-Class SVM model to find the classification boundary and classify.

The One-Class SVM classification results are shown in Figure 1. Its accuracy was 90.80%, and the recall and G-mean were 80.40% and 80.40%, respectively. Both are lower than the classification results of the optimized logistic regression model, but can also identify psychologically abnormal students by differential features.

**Figure 1.** Optimized logistic regression with one classification results

#### 4. CONCLUSION

With the popularization of information technology, the emotional communication barrier between people will become more and more obvious, and higher vocational students are a group with great mental health problems, so the active introduction of big data technology to analyze data in various aspects can help students grow up healthily by constructing a feedback system based on the results obtained from big data analysis.

This paper identifies psychologically abnormal students through big data analysis of different behavioral characteristics of higher education students. Based on multiple channels to optimize the integration of data, big data analysis allows to grasp students' behavioral performance and to study their thought dynamics. Student behavior patterns and psychological states are predicted through life, learning, and activities.

It helps mental health educators in higher education institutions to timely identify psychological crisis subjects, reduce the occurrence of psychological crisis events among college students, and promote the stable development of mental health education in higher education institutions, thus promoting the harmonious development of society.

## ABSTRACT

This paper introduces the role of environmental art design in rural revitalization, including enhancing the cultural connotation of the countryside and improving the aesthetic value of the rural environment. At the same time, the challenges faced by rural environmental art design innovation are analyzed, including the lack of professional talents, insufficient financial investment and the traditional concept of bondage. Then strategies and methods to cope with rural environmental art design innovation are proposed, including several specific practical measures to strengthen rural environmental art design talent training and promote rural environmental art design concept innovation. The results show that by guiding designers to focus on rural cultural characteristics and establishing the industrialization of rural environmental art design, the visibility of rural cultural tourism is effectively increased by 10-50%. This paper conducts an in-depth study on the challenges faced by rural environmental art design innovation and response strategies, which have important practical significance for promoting rural revitalization.

## KEYWORDS

environmental art; rural revitalization; cultural connotation; aesthetic value; design innovation; talent training

## 1. INTRODUCTION

Rural revitalization is one of the important development strategies of China at present, and environmental art design, as an innovative design form, also plays an important role in this process [1-2]. With the implementation of rural revitalization strategy, environmental art design has received more and more attention as an important means to promote sustainable rural development and create a beautiful countryside [3-4]. Some scholars have researched and elaborated on the role of

environmental art design in rural revitalization, such as enhancing the cultural connotation of the countryside and improving the aesthetic value of the rural environment [5]. At the same time, some researchers have also discussed the challenges faced by environmental art design innovation, such as the lack of professional talents and insufficient financial investment [6]. Some scholars believe that environmental art design can enhance the cultural connotation of the countryside, improve the quality of the rural environment, and explore the "ecology + culture" rural revitalization model, etc. [7]. This paper firstly introduces the role of environmental art design in rural revitalization, including enhancing the cultural connotation of the countryside and improving the aesthetic value of the rural environment. Secondly, it analyzes the challenges faced by rural environmental art design innovation, including the lack of professional talents, insufficient financial investment and the traditional concept of bondage. Finally, corresponding response strategies are proposed, including strengthening rural environmental art design talent training and promoting rural environmental art design concept innovation.

## **2. THE ROLE AND CHALLENGES OF ENVIRONMENTAL ART DESIGN IN RURAL REVITALIZATION**

### **2.1 THE ROLE OF ENVIRONMENTAL ART DESIGN IN RURAL REVITALIZATION**

#### **2.1.1 ENHANCE THE CULTURAL CONNOTATION OF THE COUNTRYSIDE**

In rural revitalization, environmental art design can enhance the cultural connotation of the countryside and improve the cultural taste of the countryside through the excavation and inheritance of the countryside culture. For example, in a certain countryside, designers can integrate these cultural elements into environmental art design by understanding and studying local traditional culture, such as setting up sculptures and murals with traditional cultural elements in public spaces, so that tourists and residents can feel the local traditional culture while enjoying the beautiful scenery.

Another role of environmental art design in rural revitalization is to enhance the cultural connotation of the countryside. The countryside is an important bearer of traditional culture, and environmental art design can promote rural traditional culture and enhance the cultural connotation of the countryside by creating cultural atmosphere and symbols with local characteristics. For example, setting cultural elements with local characteristics in rural public spaces, such as traditional architecture and folk art, can allow visitors and residents to better understand and feel the local cultural landscape, thus promoting cultural exchange and inheritance. At the same time, these cultural elements can also become brand symbols of the countryside, attracting more tourists and investors to develop and promote rural revitalization.

## **2.1.2 ENHANCE THE AESTHETIC VALUE OF THE RURAL ENVIRONMENT**

An important role of environmental art design in rural revitalization is to enhance the aesthetic value of rural environment. Through art design means, the rural environment can be aesthetically modified and shaped to make it more in line with people's aesthetic needs and cultural heritage.

For example, setting up landscape sculptures with local characteristics and painted walls on both sides of rural roads can make the rural environment more vivid and beautiful, attracting more tourists and investors to develop. At the same time, the enhancement of the aesthetic value of the rural environment can also stimulate the pride and sense of belonging of local residents and promote their love and identification with their hometowns, thus enhancing the endogenous power of rural revitalization.

## **2.2 THE CHALLENGES OF RURAL ENVIRONMENTAL ART DESIGN INNOVATION**

### **2.2.1 LACK OF PROFESSIONAL TALENTS**

In rural areas, there is a relative lack of professional talents in the field of environmental art design, which leads to the limitation of the ability to innovate rural environmental art design. As the rural environment is relatively homogeneous, the lack of professional talents makes it difficult to carry out diversified design innovation, which also limits the development of rural environmental art design. Therefore, it is necessary to strengthen the cultivation and introduction of professional talents for rural environmental art design in order to improve the ability of rural environmental art design innovation.

### **2.2.2 INSUFFICIENT FINANCIAL INVESTMENT**

The economy of rural areas is relatively weak, and insufficient capital investment is also one of the challenges facing rural environmental art design innovation. Rural environmental art design requires a large amount of capital investment, including design costs, material costs, construction costs, etc., and the relative lack of funds in rural areas cannot meet the needs of rural environmental art design innovation. Therefore, it is necessary to strengthen the financial support for rural environmental art design, including government funds and social funds, in order to promote the development of rural environmental art design innovation.

### **2.2.3 THE BONDAGE OF TRADITIONAL CONCEPTS**

The traditional concept in rural areas is more conservative, which also brings certain challenges to rural environmental art design innovation. In some areas, people's knowledge and understanding of environmental art design is still stuck in traditional concepts, and it is difficult to accept new design concepts and methods. This has also

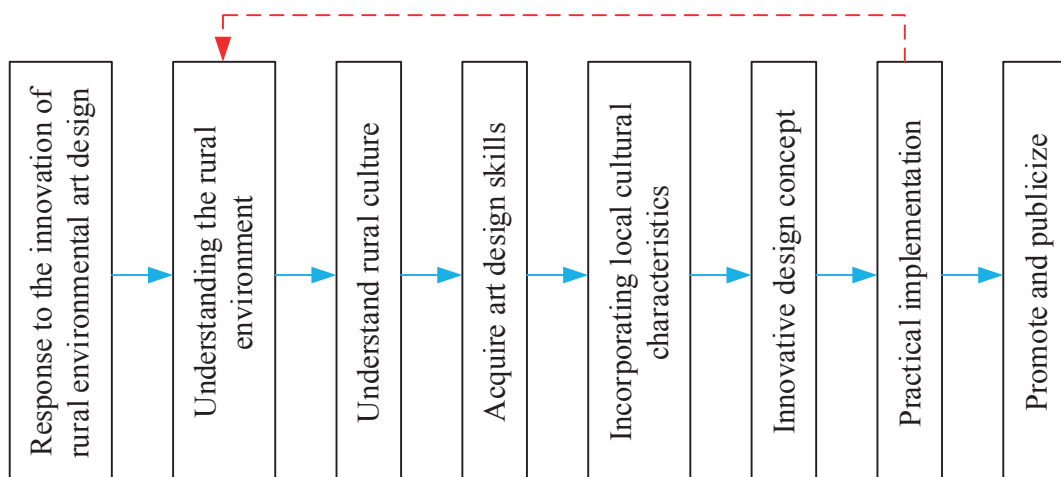

led to the hindrance of rural environmental art design innovation. Therefore, it is necessary to strengthen the propaganda and education in rural areas, improve people's knowledge and understanding of environmental art design, break the shackles of traditional concepts, and promote the development of rural environmental art design innovation.

### 3. RESPONSE TO THE INNOVATION OF RURAL ENVIRONMENTAL ART DESIGN

#### 3.1 STRENGTHEN THE TRAINING OF RURAL ENVIRONMENTAL ART DESIGN TALENTS

##### 3.1.1 STRENGTHEN THE CONSTRUCTION OF RURAL ENVIRONMENTAL ART AND DESIGN EDUCATION SYSTEM

The construction of rural environmental art design education system is an important initiative to strengthen the training of rural environmental art design talents. This education system should include basic courses, professional courses, and practical courses, etc., with the main goal of cultivating students' basic literacy and practical ability. In terms of basic courses, it should focus on the cultivation of students' art literacy, design thinking and cultural quality. In terms of professional courses, attention should be paid to the establishment of a diversified talent training system. The innovation path of rural environmental art design is shown in Figure 1.

**Figure 1** Rural environmental art design innovation path

In order to strengthen the training of rural environmental art design talents, a diversified talent training system needs to be established. The system should include multiple aspects such as school education, social practice and industry training. In terms of school education, the professional curriculum of rural environmental art design should be strengthened and students should be encouraged to participate in the practice of rural environmental art design. In terms of social practice, students can be

organized to participate in volunteer activities of rural environmental art design to improve their practical ability and sense of social responsibility. In terms of industry training, experts in the field of rural environmental art design can be invited to give lectures and training to help students better understand the latest developments and techniques in rural environmental art design.

### **3.1.2 ESTABLISHMENT OF INDUSTRY-ACADEMIA-RESEARCH COOPERATION MECHANISM**

Rural environmental art design is an interdisciplinary and comprehensive subject involving many fields, which requires the cooperation of industry, university and research. Therefore, an industry-university-research cooperation mechanism needs to be established to closely link schools, enterprises and research institutions to promote the innovation and development of rural environmental art design. This can be done by establishing internship bases and joint research projects, so that students can learn more knowledge and skills in practice, and also provide more talents and technical support for the development of the rural environmental art and design field.

### **3.2 PROMOTE THE INNOVATION OF RURAL ENVIRONMENTAL ART DESIGN CONCEPT**

#### **3.2.1 GUIDING DESIGNERS TO FOCUS ON RURAL CULTURAL FEATURES**

In rural environmental art design innovation, designers need to pay attention to the cultural characteristics of the countryside and integrate them into the design, so as to create works with regional characteristics and cultural connotations. The design elements of rural cultural characteristics are shown in Table 1.

For example, when designing a rural park, local traditional cultural elements can be incorporated into the landscape design, such as adopting the style of local traditional architecture and using local characteristic plants, so that the park has both a modern sense and a strong local flavor to attract more tourists to visit.

**Table 1** Design elements of rural cultural features

Design elements Elements	Design Practice
Geographical features Color	Integrate local traditional cultural elements into the landscape design, such as adopting the style of local traditional architecture, using local characteristic plants, etc.
Culture Connotation	Pay attention to the expression of cultural connotation in the design, such as setting up places to display local traditional culture and sculptures in the park

### **3.2.2 ESTABLISHING A SYSTEM FOR THE INDUSTRIAL DEVELOPMENT OF RURAL ENVIRONMENTAL ART DESIGN**

In order to strengthen the industrial development of rural environmental art design, a perfect system needs to be established. First of all, it is necessary to establish a market system for rural environmental art design, and attract more investment and capital into the field through market-oriented means. Secondly, it is necessary to establish a talent cultivation system for rural environmental art and design to cultivate more professional talents for this field. At the same time, it is also necessary to establish a technical innovation system for rural environmental art design to promote technical innovation and development in this field. Finally, a policy system for rural environmental art design needs to be established to provide policy support and guarantee for this field.

### **4. CONCLUSION**

This paper analyzes the role of environmental art design in rural revitalization, which includes enhancing the cultural connotation of the countryside and improving the aesthetic value of the rural environment. However, it also points out the challenges faced by rural environmental art design innovation, which mainly include the lack of professional talents, insufficient financial investment and the traditional concept of bondage. In order to cope with these challenges, the article puts forward a series of specific response strategies, including strengthening rural environmental art design talent training and promoting rural environmental art design concept innovation. Through the research work of this paper, we can conclude that only by innovating rural environmental art design, strengthening talent cultivation and promoting concept innovation can we better promote the process of rural revitalization, enhance the cultural connotation of the countryside and the aesthetic value of the rural environment, and realize the sustainable development of rural revitalization.

## ABSTRACT

This paper discusses the application of big data technology to English teaching by analyzing the current problems in the cultivation of intercultural communication skills based on the main points of English intercultural communication skills of college students. The mean value of difference identity in each dimension of intercultural sensitivity is 4.27, communicative skill mean value is 3.27, communicative involvement mean value is 3.97, interactive confidence mean value is 3.51, communicative concentration mean value is 3.82, communicative interaction mean value is 4.18, and interactive respect mean value is 3.41. It shows that the development of English intercultural communication skills of college students based on the background of big data promotes the improvement of students' English literacy to provide a strong guarantee.

## KEYWORDS

English for college students; Intercultural communication; English teaching; Communicative competence development; English literacy

## 1. INTRODUCTION

With the continuous development of big data technologies, it makes people in the world communicate with each other more and more frequently [1-2]. As a result, students are facing increasing challenges in terms of skill acquisition in English, the world's lingua franca [3]. Cultivating college students' core literacy and cross-cultural communication skills has become an inevitable trend in the reform of college English teaching [4]. Language is an important vehicle for transmitting culture, and learning a new language is inseparably linked to its culture [5-6]. However, in terms of the current situation of university English teaching courses, most of them pay more attention to the teaching of students' English language knowledge and skills in the implementation process, while ignoring the education of cultivating students' language application literacy and culture, which makes the quality of course teaching generally low and makes it difficult to give full play to the effect of language and culture education [7-8]. Therefore, in response to this phenomenon, university English teachers need to change their teaching methods in time, optimize the university classroom curriculum system in a scientific and reasonable way based on intercultural communication skills, and provide a strong guarantee to improve the efficiency of university classroom teaching and promote the improvement of students' English literacy [9].

## **2. CULTIVATION OF ENGLISH INTERCULTURAL COMMUNICATION SKILLS AMONG COLLEGE STUDENTS**

### **2.1. INTERCULTURAL COMMUNICATION SKILLS DEVELOPMENT**

#### **2.1.1. STIMULATING INTEREST IN LEARNING**

The cultivation of English intercultural communication ability of college students based on the background of big data can not only innovate and optimize teaching methods, teaching activities and teaching modes, but also create a new educational environment for students and promote the improvement of their English literacy. On the one hand, to cultivate students' intercultural communication skills in university English teaching, teachers need to take into account the current needs of talent cultivation in society, constantly optimize teaching forms, take the principle of improving students' professional ability and literacy, and fully mobilize students' enthusiasm to participate in English teaching activities. On the other hand, college English has a certain degree of humanistic literacy, so in the process of cultural education in the discipline, English teachers can target English skills and knowledge transfer, dig deeper into English cultural content when preparing lessons, transfer cultural knowledge and English grammar, sentence patterns and words to students, so that they can have a deeper understanding of knowledge and cultural content, stimulate students' enthusiasm for learning English, and promote the quality of college English classroom. The quality of teaching is improved.

#### **2.1.2. DEVELOPING INTERCULTURAL COMMUNICATION SKILLS**

In the college English classroom teaching process, English subject as a language course, only through a specific scene to guide college students into the English scene, drive students' English emotion, so that they can be in a good environment, through the English language knowledge and skills to express their own thoughts and feelings, to achieve the purpose of perfecting students' English literacy.

Similarly, by integrating English culture and creating a good learning atmosphere for students in English classroom teaching based on intercultural communication ability, it can help students feel the charm and interest of English subject in English culture, effectively expand the level of students' English knowledge, and promote the improvement of students' intercultural communication ability. In addition, by cultivating the intercultural communication ability of college students, it can not only make the college English classroom give full play to the form of subject education and improve the quality of teaching, but also use English culture as a teaching carrier to achieve the goal of improving the cultural confidence and cultural literacy of college students.

### **2.2. COLLEGE ENGLISH TEACHING FOR INTERCULTURAL COMMUNICATION SKILLS DEVELOPMENT**

#### **2.2.1. BACKWARD TEACHING METHODS**

The teaching methods in the university English classroom based on the cultivation of intercultural communication skills are generally outdated. The goal of university English classroom teaching is to strengthen the students' language application level, and not only the students' theoretical learning achievement, but also the students' practical application level is highly valued. However, in the current English classroom teaching situation, teachers adopt a single form of teaching, which makes students gradually lack interest in learning under the influence of a single teaching method and eventually causes a decline in the quality of classroom teaching. When teaching, some teachers only focus on how to explain English sentence structure, English word pronunciation and other content, ignoring students' English

application ability, so that students' learning needs cannot be met, which has a negative impact on improving their English literacy.

### 2.2.2. SINGLE TEACHING CONTENT

In college English classroom teaching based on the cultivation of intercultural communication skills, there is a common phenomenon of single teaching content and lack of intercultural communication content in teaching materials. In the current situation of college English teaching materials, although some cultural knowledge is integrated, the content lacks comprehensiveness, and the culture of English teaching materials is mostly integrated with British and American culture, and the content of local culture is less, which is not conducive to students' in-depth understanding of local culture. In response to this phenomenon, only timely reform of teaching content can effectively improve students' English comprehension ability and promote the smooth development of college English teaching.

## 3. EXPLORING THE CULTIVATION OF ENGLISH INTERCULTURAL COMMUNICATION SKILLS AMONG COLLEGE STUDENTS BASED ON BIG DATA

### 3.1. SENSITIVITY AND EFFICACY DIMENSIONS

The overall situation of the dimensions of intercultural communication sensitivity and efficacy of college students is shown in Table 1. Among the dimensions of intercultural sensitivity, difference identity has the highest score with a mean value of 4.27, the lowest score is communicative skill with a mean value of 3.27, communicative involvement with a mean value of 3.97, interactive confidence with a mean value of 3.51, communicative concentration with a mean value of 3.82, communicative interaction with a mean value of 4.18, and interactive respect with a mean value of 3.41. Thus, it can be seen that although college students have a strong willingness to participate in However, due to their limited foreign language proficiency, insufficient knowledge of Chinese and foreign cultures and insufficient intercultural experience, they cannot have enough confidence to face intercultural communication activities.

**Table 1.** Sensitivity and efficacy dimensions as a whole

Dimension Type	Minimum value	Maximum value	Average value	Standard deviation
Communicative engagement	2.85	4.37	3.97	0.41
Differential identity	3.17	4.87	4.27	0.36
Interaction Confidence	2.30	5.00	3.51	0.61
Interaction Focus	1.92	4.97	3.82	0.53
Interaction skill	2.39	4.69	3.27	0.42
Interaction Interaction	2.81	5.00	4.18	0.45
Interaction Respect	2.37	5.00	3.41	0.67

### 3.2. ENGLISH PROFICIENCY FACTOR VARIABILITY

To study the influence of English proficiency factors on college students' English intercultural communicative competence, data analysis was conducted by one-way ANOVA test with big data, and the influence of English proficiency factors on intercultural sensitivity and efficacy is shown in Table 2. The significance of each dimension is greater than 0.5, and there is a significant difference of English proficiency factor in each dimension of intercultural communication ability, which shows that the difference of English proficiency is the reason of affecting students' intercultural communication ability.

**Table 2.** Effect of English proficiency factors on cross-cultural sensitivity and efficacy

Dimensionality	Average value	Average value	<i>F</i>	Significance
Communicative engagement	3.973	0.437	1.518	0.573
Differential identity	4.286	0.518	0.596	0.511
Interaction Confidence	3.626	0.461	1.151	0.569
Interaction Focus	3.704	0.437	0.979	0.718
Interaction skill	3.172	0.531	1.083	0.729
Interaction Interaction	3.619	0.528	1.429	0.617
Interaction Respect	4.085	0.362	0.828	0.527

#### 4. CONCLUSION

The cultivation of intercultural communication skills can be developed from language learning, listening and speaking skills and intercultural communication. Teachers can use both in-class and out-of-class to cultivate students' intercultural communication, improve their interest in learning and encourage them to improve their intercultural communication skills spontaneously, which is also conducive to optimizing teachers' college English teaching process and students' English learning process. Cultivating students' intercultural communication skills in college English classroom teaching can not only improve students' English literacy, but also help to promote classroom teaching reform. Therefore, university English teachers should clarify the importance of intercultural communication in the teaching process, improve their own intercultural teaching level and intercultural communication literacy in a timely manner, innovate teaching methods in a reasonable way, optimize the content of English teaching materials, and promote students' overall development in the future.

## ABSTRACT

This paper firstly continues to analyze the development trend of packaging design sex, including the development of new materials, new morphological shape development and the development trend of new process technology. Secondly, the basic steps of packaging design form recognition are analyzed based on two-dimensional space, and the steps of the two-dimensional space analysis algorithm are optimized using local feature extraction. Finally, the comparative analysis of recognition rate using product packaging design shows that the average accuracy of the algorithm in this paper is 86.72%, which is 3.47%, 4.55% and 20.24% higher than 2DPCA, 2DLDA and 2DLPP respectively. This shows that the packaging design form with spatial analysis and local feature extraction has good recognition rate, which in turn promotes the innovation and optimization of packaging design form.

## KEYWORDS

spatial analysis; local feature extraction; packaging design; morphology optimization; recognition rate; 2DPCA

## 1. INTRODUCTION

New products are constantly appearing, and some of them involve new areas that have not been accessible to humans before. For example, microelectronics, superconductors, biogenic products, nano products, etc. These new products pose new challenges to packaging design itself, how to protect and preserve them, how to get them safely into circulation, and how they can be successful in commercial sales [1-2]. These new topics have contributed to the constant updating and progress in packaging structures, new materials, and visual communication to adapt to the needs of new product packaging [3-4].

Design expression is the deepening and development of the design concept, not the end. The success or failure of a design depends on both artistic conception and formal expression, and a unique and clever artistic conception needs a certain artistic form to be fully reflected. The design performance cannot be limited to the image of the product itself, nor can it only start from the function [5-6]. The packaging design is shaped by the image of goods with strong artistic influence, which must have aesthetic value, meet the psychological feelings of consumers about the goods, and adapt to the aesthetic needs of consumers [7].

This paper analyzes the development trend of packaging design forms, including the development trend of new materials, the development trend of new form and shape, and the development trend of new process technology. Two-dimensional spatial analysis is used to identify the packaging design forms, and the algorithm is optimized by local feature extraction. In order to verify the effectiveness of the algorithm of this paper, a comparative analysis of experiments is conducted, and the results show that the packaging design form recognition based on spatial analysis and local feature extraction has a high recognition rate and can help designers optimize the packaging design form.

## **2. DEVELOPMENT TREND OF PACKAGING DESIGN FORM**

### **2.1 NEW MATERIAL DEVELOPMENT TREND**

With the deepening of economic globalization and the accelerated change of science and technology, many new materials are emerging in contemporary product packaging design. Product packaging materials and systems tend to reduce costs, invest in green technologies and materials, and commit to more applicable services and functional designs. The world of corrugated box manufacturing is now highly competitive, and the corrugated packaging industry in European countries is choosing the best cost solutions by analyzing orders and raw material inventories. As China's corrugated carton industry continues to advance in lightweighting and quantification technologies, it will be of value to the entire packaging industry and to the product industry as a whole.

Figure 1 shows the product packaging material output value possession analysis chart. According to the basic positioning and trends of the packaging industry in the last 5-10 years shown in the analysis of the basic status of the product packaging industry, the output value of the paper packaging category accounts for 37.13% of the entire packaging industry in the first place, plastic packaging second 25%, glass packaging 4.87%, packaging decoration accounted for 17%, packaging machinery 6%, 3% of other packaging industries. Paper packaging industry due to express logistics, physical marketing, brand promotion, increasingly become consumers and various industries

rely on the industry, and at a rapid pace, to absorb a variety of demand for technical components.

**Figure 1** Packaging Materials Production Value Share Analysis Chart

## 2.2 NEW FORM MODELING TRENDS

Zero packaging, simplified packaging, green packaging is becoming the new outer packaging development trend, green goods, green packaging combination has become more attractive to the public highlights. Modeling design changes from the traditional neat and tidy flat geometric outer packaging design, to shaped design, bionic shape design, curved shape design, breakthrough conventional visual aesthetics, in the realization of a unique new shape at the same time, the transformation of functional upgrades.

Shaped design is a design method to achieve special use, special product demand and special public taste with complex and unconventional shape; it has a new trendy sense of shape in display, show and sale. From the packaging design point of view, if there is a reasonable combination of design planning, shaped outer packaging design not only needs to be perfect in terms of storage and transportation, but also in terms of the fit of the product itself to be able to fit perfectly. Bionic design is a symbiotic design science that combines traditional and contemporary, natural and human, art and technology, micro and macro, unique and universal, and other popular multicultural fusion.

## 2.3 NEW PROCESS TECHNOLOGY TRENDS

In today's global economic boom and the rise of real and virtual industries, the packaging revolution is based on the concept of "zero-degree packaging", "green packaging" and "simplified packaging" and is being implemented. The implementation of environmentally friendly green goods and biodegradable green packaging has become a new social hotspot. Due to the growing demand for paper packaging market, the original plastic process is gradually used in paper packaging. Extrusion, stamping, integrated molding, these processes solve the traditional paper packaging form process problems, to assist the development of paper packaging form. Emerging wet processing

technology, ultraviolet drying technology, high-temperature bonding technology, vacuum technology, digital laser cutting technology are aiding the high-tech contemporary development of the paper packaging industry.

### 3. PACKAGING DESIGN MORPHOLOGY ANALYSIS BASED ON SPATIAL ANALYSIS AND LOCAL FEATURE EXTRACTION

Based on the previous analysis of the development trend of packaging design form, in order to be able to understand more intuitively and help designers to carry out innovative design of product packaging. This chapter introduces spatial analysis and local feature extraction to provide a new research method for packaging design morphology analysis.

#### 3.1 PACKAGING DESIGN FORM RECOGNITION BASED ON TWO-DIMENSIONAL SPACE ANALYSIS

One-dimensional principal component analysis first converts the packed two-dimensional image into a one-dimensional vector. The image is already high in dimensionality, and the transformed dimensionality is even higher, which greatly increases the complexity of calculating the sample covariance. Stretching the image data into a one-dimensional vector will destroy the original data structure of the image. Two-dimensional spatial principal component analysis can maintain the original structure of the packaging design data to a certain extent.

The 2DPCA algorithm process is as follows:

(1) Construct the matrix  $X = [x_1, x_2, \dots, x_N]$  and the covariance matrix.

(2) Construct the projection subspace, use the eigenvectors of the covariance matrix as the projection axes, and solve for the coordinates.

(3) Compress the data, and perform the corresponding transformations on the training and test samples to obtain the corresponding low-dimensional matrices, respectively.

(4) Classify and identify, and categorize the samples to be tested.

#### 3.2 OPTIMIZATION OF TWO-DIMENSIONAL SPATIAL ANALYSIS ALGORITHM INCORPORATING LOCAL FEATURE EXTRACTION

Suppose we obtain the data  $X = [x_1, x_2, \dots, x_n]$ ,  $X \in M$  and  $M$  is a manifold hidden in the space of  $R^D$ . The main purpose of 2DPCA is to find the projection matrix  $A$ ,  $R^D$  that maps the data  $X$  in space to the low-dimensional  $R^d (D \geq d)$  space,

and the projected sample is denoted as  $Y = [y_1, y_2, \dots, y_n]$ , where  $y_i = Ax_i$ . The idea of the algorithm can be briefly described as follows:

(1) Detect the acquired sample data  $X = [x_1, x_2, \dots, x_n]$ .

(2) Construct the adjacency matrix  $W$ , i.e., the weight matrix of the neighborhood connectivity graph, for the neighborhood of the sample  $x_i$ . The  $\varepsilon$ -neighborhood and  $k$ -nearest neighbor methods are usually used.

(3) Determine the weights, so that  $w_{ij} = 1$  or  $w_{ij} = \exp(-\|x_i - x_j\|^2 / t)$ ,  $t$  are parameters, which need to be set by us manually.

(4) Solve for the eigenroots, converting the optimization problem for the objective function  $\sum_{ij} (y_i - y_j)(y_i - y_j)^T w_{ij}$  and the orthogonal constraint  $y^T U y = 1$  into a problem of solving for the minimum eigenvalue and eigenvector of  $XLX^T a = \lambda XUX^T a$ , where  $L = U - W$  is called the Laplacian matrix.

(5) Let  $\{a_0, a_1, \dots, a_{k-1}\}$  be the solution of the above equation with corresponding eigenvalues  $\lambda_0 < \lambda_1 < \dots < \lambda_{k-1}$ , and be able to calculate the corresponding eigenvector  $A = [a_0, a_1, \dots, a_d] \in R^{d \times k}$ , i.e.,  $y_i = A^T x_i$ .

The 2DPCA algorithm incorporating local feature extraction, which can keep the local information of the data well and is linear mapping with good clustering and classification effect, well promotes the application of local feature extraction in packaging design form optimization.

#### 4. EXPERIMENTAL RESULTS AND ANALYSIS

In order to verify the effectiveness of the method in this paper and its advantage in recognition rate, the experimental environment MATLAB is programmed to form a dataset by collecting the images of packaging products involved on the Internet. It is also compared with other existing algorithms to prove the effectiveness of the algorithm given in this paper on the recognition of packaging design forms.

This experiment pre-processes a total of 500 product packaging images in advance to facilitate subsequent operations without changing the gray scale. The first 80 images

are randomly selected as training samples to form a training set of 50\*80, and the rest are used as the test sample set, and the average value is taken as its final recognition rate using the ten-fold cross-validation method. The algorithms compared in this paper include 2DPCA, 2DLDA, and 2DLPP algorithms, and the classification method uses the nearest neighbor classifier with Euclidean distance. The comparison of recognition rates of each algorithm is shown in Figure 2.

From the algorithm comparison, the average accuracy of ten-fold cross-validation of the 2D spatial analysis algorithm incorporating local feature extraction in this paper is 86.72%, which is 3.47%, 4.55% and 20.24% higher than 2DPCA, 2DLDA and 2DLPP, respectively. This indicates that spatial analysis and local feature extraction can better identify packaging design forms, provide designers with more possible packaging design forms, and then promote the optimization and development of product packaging forms.

**Figure 2** Comparison of recognition rates by algorithm

## 5. CONCLUSION

Starting from the development trend of packaging design forms, this paper analyzes the trends of new materials, new form shapes and new process technology development. The two-dimensional spatial analysis algorithm is optimized by using local feature extraction to realize the effective recognition of packaging design forms. The results show that the average accuracy of this algorithm is 86.72%, which is 3.47%, 4.55% and 20.24% higher than that of 2DPCA, 2DLDA and 2DLPP respectively. This shows that the spatial analysis and local feature extraction can effectively carry out the recognition of packaging design forms, and then provide new possibilities for designers to innovate product packaging design forms.

## ABSTRACT

In this paper, we applied language interaction under the second language acquisition model to English learning, constructed a comparative study of language interaction groupings under the second language acquisition model, and analyzed the learning efficiency of multi-interactive classrooms. The average scores of the homogeneous, heterogeneous and self-selected groups were higher than those of the control group, with 57.5% for the control group, 71.5% for the homogeneous group, 68% for the heterogeneous group and 84% for the self-selected group. The active interaction between teachers and students, moderate decentralization of teachers, and motivation of students in the multi-interactive classroom are conducive to improving students' learning efficiency and promoting the development of interactive English teaching and the improvement of English teaching quality.

## KEYWORDS

English second language acquisition; Language interaction; Multiple interactions; Classroom learning efficiency; Interactive teaching of English

## 1. INTRODUCTION

Second language acquisition, as an important learning method in linguistics, plays an important role in improving the efficiency and learning skills of foreign languages [1]. The language teaching model of second language acquisition is based on the background of language knowledge, interactive learning based on the semantic correlation between the native language and the second language, improved means of language learning, improved effectiveness of language learning, and full dispatch of language learning [2-3]. The study of

the model of language interaction and innovation in the second language acquisition model is of great importance in language learning and foreign language teaching [4].

The process of linguistic interaction in second language acquisition is the process of characterization and information integration of language knowledge elements [5]. In the concretized application, the model of second language acquisition is constructed through the elements of language knowledge, and the concretized model of language application is used for holistic language teaching and full dispatch of the center of gravity of language learning [6-7]. The subject and object of second language acquisition are interchanged using the method of center of gravity shift to construct a pluralistic model of language interaction in the second language acquisition model [8-9]. Classroom interaction is a very important form of classroom teaching [10]. Teachers and students interact in the classroom to improve their understanding of each other, while increasing their knowledge and practicing their language expression and organizational skills. Through interaction, teachers can demonstrate expectations for their students, which can help them improve their academic performance. Teachers can also use interaction to regulate the classroom atmosphere and to better accomplish their teaching and tasks.

## **2. ANALYSIS OF LANGUAGE INTERACTION IN ENGLISH SECOND LANGUAGE ACQUISITION**

### **2.1. INTERACTIVE TEACHING OF ENGLISH AS A SECOND LANGUAGE ACQUISITION LANGUAGE**

#### **2.1.1. IMPROVING THE CLASSROOM LANGUAGE ENVIRONMENT AND SOCIAL ENVIRONMENT**

Interactive language education in the second language acquisition model is a multifaceted interactive teaching using the classroom environment and language environment, combined with multimedia technology to improve the direct perception of language knowledge and the ability to express information. We will build a good social and classroom environment for language learning, adopt a time-space integration approach to interactive language learning, and use advanced teaching and interactive tools to create a suitable teaching environment for language learning in second language acquisition. Teachers need to acquire rich knowledge of multimedia teaching, understand the local culture and geography of second-language countries, improve their information literacy, and play their technology-led and language-led roles. Deploy various resources to improve the classroom linguistic and social environment for second language acquisition, provide learners with a good learning environment, and realize the innovative teaching of language interaction in the second language acquisition mode.

#### **2.1.2. STIMULATING LEARNERS' COGNITION**

Through language interaction and knowledge transfer, learners' sensory perceptions are stimulated in many ways to improve the efficiency of learning. In the second language acquisition model, interactive language teaching is carried out through diverse learning and

teaching methods. A variety of activities such as lectures and conferences can be conducted to carry out interactive teaching of language learning, engage learners in the language environment, stimulate the senses of language learners, combine the second language acquisition mode of thinking, and carry out environmental language teaching to improve the efficiency of language learning. Campus radio is used to broadcast English programs at different levels to enhance the enjoyment of learning the language in a language environment that engages learners in language learning.

### **2.1.3. CONDUCT KNOWLEDGE EXPLORATION AND EXCHANGE**

The difference between teachers and students is mainly in the amount of knowledge acquisition and experience, and both parties are on an equal footing. Language interaction reflects the respect of both teachers and students for each other and is a progressive way of teaching. Students find the knowledge acquired through language interaction more interesting and memorable than traditional indoctrination. Through interaction, teachers can understand students' current learning situation and overall mental state, so that they can care for them in a targeted manner, help them reduce their learning stress, and allow them to acquire knowledge in a relaxed state.

## **2.2. INTERACTIVE IMPLEMENTATION OF ENGLISH SECOND LANGUAGE ACQUISITION LANGUAGE**

### **2.2.1. PARTICIPATION IN ENGLISH CLASSROOM INTERACTION**

English is a subject that must be voiced in order to be learned well, and speaking proficiency will get better as you speak more and more. The phenomenon of not participating in English classroom interaction only causes the gap between students' English proficiency to be widened further, thus creating a "monopoly on interaction". This is contrary to the goal of promoting the overall improvement of students' English proficiency through classroom interaction. At the same time, it also discourages students who are less proficient in English from interacting with each other, leading to their rejection of classroom language interaction, which is detrimental to their long-term development.

### **2.2.2. LOW LEVEL OF LANGUAGE INTERACTION**

In the process of English second language acquisition in colleges and universities, the way and level of language interaction is still at a preliminary stage, mainly consisting of teachers asking questions to students, which is not very different from the question-based interaction in traditional teaching. This superficial form of interaction lacks depth, and students do not have a strong sense of experience and therefore have little interest in language interaction. Interaction in the English classroom should be an exchange of English language knowledge between teachers and students, yet English teachers make a uniform choice of interactive content and do not design topics carefully, leading to students' fatigue and boredom. Teachers are less prepared for English classroom language interaction and have difficulty in accurately grasping the timing and amount of interaction, resulting in poor quality of interaction, failure to

stimulate students' interest in learning, difficulty in empathy between teachers and students, and loss of the meaning of interaction.

### 3. A STUDY OF MULTIPLE INTERACTIONS IN ENGLISH SECOND LANGUAGE ACQUISITION BASED ON DEEP LEARNING

#### 3.1. TEACHER-STUDENT INTERACTION

Teacher-student interaction is a basic form of organization for general teaching activities and also for multi-interactive classrooms. In order to investigate the changes in learning efficiency of teacher-student interaction in English second language acquisition, students were randomly selected and grouped according to the ranking of their English scores in the final exam, and the groups were tested at the end of the course as a way to analyze students' learning efficiency. The groups were divided into control group, homogeneous group, heterogeneous group, and self-selected group, and the self-selected group was formed by the students themselves. The learning efficiency of the multivariate interactive classroom is shown in Figure 1. The average scores of the homogeneous, heterogeneous, and self-selected groups were higher than those of the control group, with 57.5% for the control group, 71.5% for the homogeneous group, 68% for the heterogeneous group, and 84% for the self-selected group. This indicates that active teacher-student interaction, moderate teacher decentralization, and student motivation in the multi-interactive classroom are conducive to improving students' learning efficiency.

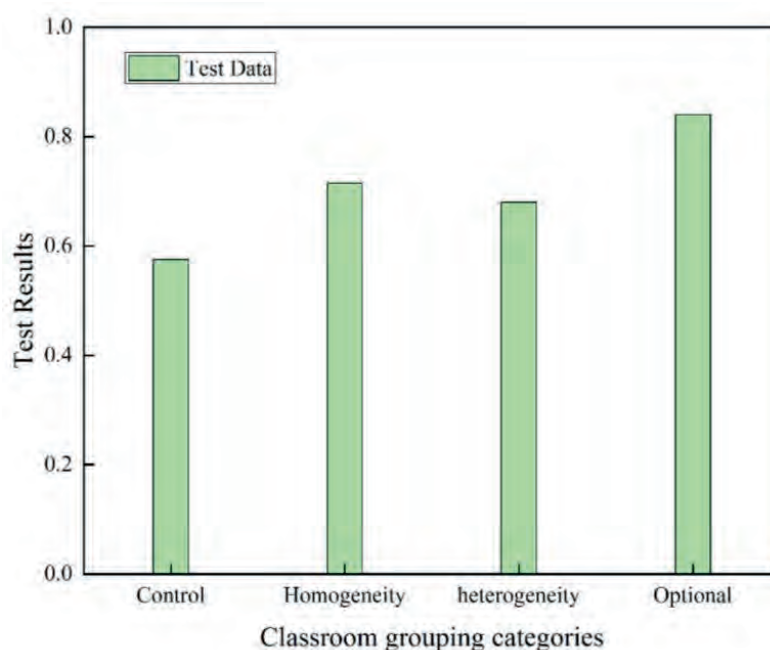

Figure 1. Learning efficiency of multi-interactive classroom

#### 3.2. MULTI-INTERACTIVE TEACHING MODE APPLICATION

In order to investigate the quality of English classroom questions in the multi-interactive teaching mode, classroom questions were divided into demonstrative and reference questions, and the quality of classroom questioning interaction is shown in Table 1. 108 reference

questions and 106 demonstrative questions were used by five teachers, and the use of demonstrative and reference questions in the English classroom was in a balanced state, with demonstrative questions occupying a dominant position in classroom questioning. It shows that English teachers are now fully integrating demonstrative and reference questions to examine students' knowledge learning and improve the quality of classroom questioning interaction.

**Table 1.** Quality of questioning interaction in the multi-interactive classroom

Teachers	Referential questions		Demonstrative questions		Total number of questions	Classroom interaction scores
	Quantity	Ratio (%)	Quantity	Ratio (%)		
<i>T1</i>	17	48%	19	52%	36	5.67
<i>T2</i>	21	50%	21	50%	42	5.65
<i>T3</i>	23	46%	27	54%	50	5.78
<i>T4</i>	27	58%	21	42%	48	5.93
<i>T5</i>	20	52%	18	48%	38	5.95
Total	108	52%	106	48%	214	

#### 4. CONCLUSION

With the development of the times, significant changes have taken place in all aspects of society. Education plays a huge role in the development of society. In the new era, the speed of updating and upgrading education is accelerating, and education can only avoid being eliminated by the times if it constantly updates its educational philosophy and methods. English education in colleges and universities has unique characteristics, and language interaction has a huge role in promoting English learning of college students. English teachers in secondary schools should introduce this new teaching method in their teaching activities in order to improve students' English and promote their overall development. The use of language interaction in the process of English second language acquisition has great advantages, but there are currently many problems with language interaction in English classes in Chinese universities. Among the more prominent problems, the number of participants in interaction is low, the level of teacher-student interaction is not high, and students are not motivated, etc.

## ABSTRACT

This paper symbolizes the traditional cultural elements under the guidance of intelligent era to make them modern, and studies the cultural attributes and characteristics of the era of jewelry design, combined with the analysis of jewelry consumer market and the design orientation to consumers. Among them, the acceptance rate of consumers aged 20-25 is 42.37%, that of consumers aged 25-30 is 53.64%, while that of consumers aged 30-35 is 67.93% and that of consumers aged 35-40 is 84.62%. As people's pursuit of spiritual life continues to develop, the acceptance of jewelry design implanted with traditional cultural elements has increased, increasing the historical and cultural heritage of jewelry design.

## KEYWORDS

Traditional cultural elements; Symbolization; Jewelry design; Cultural attributes; Cultural heritage

## 1. INTRODUCTION

With the rapid development of the economy and the improvement of people's material living standards, the pursuit of spiritual life of contemporary people also continues to develop, and jewelry can enhance the external temperament, which is one of the important ways to pursue elegant and noble temperament [1-2]. Due to the rotation of trends and the recognition of traditional Chinese culture, traditional Chinese ornamental elements have gradually become sought after in jewelry design, and jewelry that can embody traditional Chinese culture has gradually become an inevitable trend [3-4]. Adding elements of traditional Chinese ornaments in jewelry design can help the development of jewelry design industry and reflect the inheritance of culture, while designing jewelry that is more in line with modern aesthetics, which is also beneficial to the enhancement of commercial value [5-6]. Traditional culture is reflected everywhere in modern jewelry design, and the patterns of traditional Chinese ornaments are widely used in modern jewelry design [7]. Designers simplify and reorganize traditional ornaments, and subtly fuse them with modern aesthetics to introduce novel and unique jewelry with traditional cultural connotations [8]. In the development of national culture, the continuous evolution of history, Chinese traditional ornamentation and other art forms are the embodiment

of cultural heritage, modern jewelry design should be more in line with modern aesthetics, increase the historical and cultural heritage of the jewelry design market, and improve cultural literacy.

## **2. TRADITIONAL CULTURAL ELEMENTS AND JEWELRY DESIGN**

### **2.1. CURRENT STATUS OF JEWELRY DESIGN**

#### **2.1.1. CHINA JEWELRY DESIGN**

First of all, the materials in the jewelry market are relatively single. Jewelry materials should be colorful, and designers should use various jewelry materials with their own ideas combined with the market trends, instead of designing jewelry only with whatever material types are popular. Such a design will only always follow the fashion trend and will not become a trend-setting excellent work.

Molded jewelry dominates the market. The most important feature of molded jewelry is that it is all the same. The reason for this phenomenon is also that the market blindly follows the popular styles and only makes some changes in some small details, and then mass production. At present, jewelry enterprises are creating their own brands, but the jewelry styles on the market are more or less the same, which causes no own characteristics, it is difficult to distinguish from other brands, so we should strongly advocate designers to focus on originality.

#### **2.1.2. INTERNATIONAL JEWELRY DESIGN**

Western jewelry design has experienced a longer period of development, and now has a more complete set of design concepts and methods. First of all, the design strength is strong, active thinking, bold and advanced ideas. There are not only designers from international jewelry companies in the jewelry design field, but also designers who are active in other industries such as the construction industry. Most of these designers aim at innovation and establish their own brands, giving full play to their imagination and creative thinking, so their works have a unique style. Secondly, design exhibitions lead the fashion trend. In Europe and Japan, jewelry exhibitions are very frequent, and various jewelry associations have their own publications and magazines, hold knowledge lectures, and invite designers to communicate with the audience at the same time of the exhibition, all of which promote innovative design ideas, so new designs can become popular quickly.

## **2.2. HERITAGE CHINESE TRADITIONAL CULTURE IN JEWELRY DESIGN**

### **2.2.1. COMBINING CULTURE AND JEWELRY DESIGN**

The form of jewelry can be imitated, but the connotation of temperament cannot be copied. Therefore, we should advocate “cultural jewelry”, draw creative inspiration from the historical and cultural precipitation of jewelry, design jewelry with Chinese traditional cultural connotation, and strive to guide the culture of jewelry to become a consumer demand.

Jewelry market has developed to a certain stage, culture has become a demand. If Chinese jewelry brands want to go to the world, “cultural jewelry” is the way to go. If design is the soul, then the designer is the shaper of the soul. The president of the American Society of Designers once said, “If you don’t understand Western civilization, you don’t understand modern design; if you don’t understand Eastern civilization, you don’t understand design; Eastern civilization is the only path to save modern design.” China’s thousands of years of history and culture is our pride and the essence that distinguishes us from the Western culture. If jewelry is the inheritance of culture, then Chinese jewelry should inherit traditional Chinese culture.

## 2.2.2. IMPORTANT EMBODIMENT OF TRADITIONAL CULTURE INHERITANCE

Traditional Chinese ornaments, with their diverse forms and beautiful meanings, are the embodiment of ancient Chinese civilization, containing the desire for a better life, and their profound cultural heritage also has an important influence on jewelry design. Whether it is the patterns simply recorded on rocks and walls in primitive society, or the exquisite patterns stamped on pottery, porcelain and clothing, they are all products of the specific social culture at that time, and are an important reflection of traditional Chinese culture. In ancient times, traditional ornaments were symbols of people's aspirations and hopes, and ancestors put their good hopes in patterns of animals, plants, and words, such as carp leaping over the dragon gate. The combination of good wishes and traditional culture in jewelry design is an important embodiment of the Chinese idea of symbolizing things. Chinese traditional ornamentation is the traditional art of combining figures, animals and other patterns with legends and stories to send people's good needs, and is a comprehensive reflection of the social conditions of the time, political, economic, moral and so on. No matter how the pattern form changes in different periods, the national spirit contained in its essence remains the same, and the inheritance of traditional culture remains the same.

## 3. TRADITIONAL CULTURAL ELEMENTS IN JEWELRY DESIGN APPLICATIONS

### 3.1. ANALYSIS OF THE ACCEPTANCE OF TRADITIONAL CULTURAL JEWELRY DESIGN

Consumer acceptance of traditional cultural elements jewelry is shown in Figure 1. The acceptance rate of consumers aged 20-25 is 42.37%, that of consumers aged 25-30 is 53.64%, while that of consumers aged 30-35 is 67.93% and that of consumers aged 35-40 is 84.62%. The older the consumers, the more they prefer Chinese design. And among the younger consumers, those who like Chinese design, though less, also have a certain percentage. The older consumers are more profound in their knowledge of national culture, and they also identify more with traditional culture.

**Figure 1.** Acceptance of traditional cultural elements jewelry at different ages

### 3.2. TRADITIONAL DESIGN ELEMENTS JEWELRY CONSUMPTION MOTIVATION

To explore the implantation and application of traditional cultural elements in jewelry design, the analysis of consumers' choice of traditional design elements is shown in Figure 2. The high number of choices are the more symbolic ones, such as dragon, Buddha and Chinese zodiac. These are some elements representing China that we often see in various occasions, while relatively weaker design elements are blue flowers, long-life locks and auspicious clouds. When people buy jewelry, there is a considerable part of them, who pay great attention to the design style, and they have a stronger sense of national identity. When we design popular jewelry, we should first consider the more symbolic elements, so that our works are more easily accepted by the market.

**Figure 2.** Analysis of consumers' choice of traditional design elements

## 4. CONCLUSION

Different people have different definitions of beauty, and traditional Chinese ornamentation meets the aesthetics of contemporary people, which is an important embodiment of emotional attachment on the one hand, and the inheritance of the aesthetics of the ancients on the other. In modern times, the development of traditional ornamentation is organically combined with the development of jewelry design, which is the embodiment of modern people's aesthetics and permeates every aspect of daily life.

Traditional Chinese ornamentation is an extension of natural phenomena and is often used in modern jewelry design. Because the fashionable aesthetics meet the modern aesthetics and the modern people's identification with traditional culture and strong national pride, jewelry designs containing traditional ornamentation patterns are widely welcomed. Taking typical silver jewelry as an example, the combination of color contrast and traditional ornamentation in jewelry design is an effective fusion of modern aesthetics and classical culture, and produces a unique artistic effect.

Chinese traditional ornaments have a deep cultural heritage and are a source of inspiration for jewelry designers. Designers will use modern technology and techniques to apply traditional Chinese ornaments to jewelry design, which not only reflects the artistic connotation of jewelry design, but also is the process of fully displaying traditional Chinese cultural elements. And in

the long run, Chinese traditional ornaments are rich in subject matter, diversified patterns and large market potential, if we can design jewelry that contains 5,000 years of Chinese culture, it is also an effective way to show the world the charm of Oriental culture. At the same time, designers should improve the ability of independent innovation to promote the development of the domestic jewelry industry and enhance the international status.

## ABSTRACT

Innovation and entrepreneurship is an important force in the current economic development of China. In this paper, in order to study the characteristics of innovation and entrepreneurship of college students based on logistic regression model, the main problems of innovation and entrepreneurship of college students at present are analyzed, and the logistic regression of factors influencing students' innovation and entrepreneurship ability is analyzed. The VIF of each variable is much less than 10, which indicates that there is no covariance problem between each independent variable. The  $F$ -test observation of the model equation is 106.581, and the Sig value is 0.000, which is less than 0.05. Based on the logistic regression model, we analyze the degree of influence of entrepreneurial factors on the innovation and entrepreneurship efficacy of college students, which provides an empirical basis and practical insight to promote the cultivation of college students' innovation and entrepreneurship ability.

## KEYWORDS

Innovation and entrepreneurship; Test observations; Entrepreneurial factors; Innovation and entrepreneurial effectiveness; Competence development

## 1. INTRODUCTION

Innovation and entrepreneurship education is the third passport of education, which is called by the United Nations as having the same importance as academic education and vocational education [1-2]. Cultivating the new generation with innovative and entrepreneurial qualities is the concrete practice of the fundamental task of colleges and universities in the new era to adhere to the fundamental task of establishing moral education and the concept of student-centered schooling, and it is the urgent need to create the new generation who can be responsible for national rejuvenation [3-4]. To understand the real situation of innovation and entrepreneurship of higher vocational students in the new era, to study students' understanding and awareness of innovation and entrepreneurship, to analyze students' willingness to start a business, to show the new views and needs of higher vocational students on innovation and entrepreneurship, and to better open up new employment channels for higher vocational students [5-6].

Through optimizing the top-level design to improve the incentive guarantee mechanism, scientifically constructing the curriculum to reform the talent cultivation mode and building an

effective platform to provide personalized customization, the system of cultivating outstanding talents in colleges and universities is constructed [7-8]. To do this basic project well, universities must innovate talent cultivation mechanism, build an education system in line with their own characteristics, and devote themselves to the connotative development of higher education [9-10].

## **2. THE IMPACT AND ROLE MECHANISM OF INNOVATION AND ENTREPRENEURSHIP OF STUDENTS IN HIGHER EDUCATION**

### **2.1. THE MAIN PROBLEMS OF INNOVATION AND ENTREPRENEURSHIP FOR STUDENTS IN HIGHER EDUCATION**

#### **2.1.1. UNSTABLE INNOVATION AND ENTREPRENEURSHIP TEAM**

Whether it is an innovation project or an entrepreneurial practice, it is characterized by a strong collective nature and requires the full cooperation of team members to achieve. However, even with a common goal, innovation and entrepreneurship teams are still unstable, mainly in the following ways:

(1) Is weak in collaboration among members, poor sense of cooperation, team leaders often take on too much work and other members are in an optional position.

(2) The ability of self-control is slightly weak, and some students are extremely utilitarian, which makes it easier for friction and misunderstanding among members to occur when disagreements or problems arise.

(3) It is easy for college students' innovation and entrepreneurship team to be reorganized or disbanded because of different academic progress such as graduation of main members and inability to take care of professional study.

#### **2.1.2. TRANSFORMATION OF INNOVATION RESULTS**

Various competitions provide the best platform to show the value of college students' innovative achievements, whose innovative achievements and technologies can be applied for patent and technology protection, and transferred to enterprises through patent transfer and technology shareholding, thus transforming into actual productivity for economic development. Some college students' weak awareness of independent intellectual property protection has led to the phenomenon of scientific and technological works being stolen and produced by unscrupulous companies and others very commonly. The innovation activities stay at the competition level, lacking the overall concept, focusing only on the competition ranking and ignoring the subsequent transformation of innovation results, technology application and intellectual property protection. Lacking the scientific development concept, it has not established a technological innovation system with enterprise as the main body, market as the guide and the combination of industry, academia and research, not to mention the inability to combine the innovation activities of college students with the regional development under the new economic normal and promote the innovation of higher education as an important force to improve social productivity.

## **2.2. MECHANISM OF THE ROLE OF STUDENTS' INNOVATION ABILITY IN HIGHER EDUCATION**

### **2.2.1. IMPROVE THE CONSTRUCTION OF INNOVATION AND ENTREPRENEURSHIP TEAM**

When creating the innovation and entrepreneurship team, we should examine the ability and personality characteristics of the members to achieve complementary strengths and match the personality, ability and position. In the internal management of the team to clear the

positioning of the members. The team performance assessment should be adhered to the principle of fairness and openness to establish performance assessment indexes that take into account the team and individuals, and adopt differentiated rewards to ensure that team members are rewarded for their efforts. Reasonable use of the school's preferential policies such as flexible academic system, credit replacement and other balanced professional learning and innovation and entrepreneurial activities to ensure the stability of the team.

### **2.2.2. STRENGTHEN THE GUIDANCE AND MONITORING OF THE INNOVATION AND ENTREPRENEURSHIP PROCESS**

(1) Improve the incentive system for mentors of innovation and entrepreneurship projects, mainly including matching mentoring fees for mentors, including mentoring work into the calculation of teaching workload, linking it to teachers' personal development such as title promotion and personal assessment, providing opportunities for mentors to go out for exchanges and training, establishing a dual mentor system, with mentoring by teachers on campus and mentors from enterprises, and warning or disqualifying mentors who fail to fulfill their mentoring duties. The mentors who fail to fulfill their mentoring duties should be warned or disqualified.

(2) To establish a system for the phased disbursement of funding, to regularly check the progress of the project, and to order timely rectification or termination of the project if problems are found.

(3) Combine process assessment and result assessment in the project evaluation. The process assessment focuses on the implementation of the project, the records of the teacher's guidance process, and the details of the use of funds. The result assessment focuses on the form of project results, and strengthens the supervision of the originality and innovation of project results, such as the repetition rate detection, etc., while establishing a resource base of excellent projects.

### **2.2.3. ESTABLISHING A WIN-WIN MODEL OF "MUTUALLY BENEFICIAL COOPERATION BETWEEN SCHOOLS AND ENTERPRISES"**

Facing the changes of the new economic normal, universities should establish the awareness of market competition, actively dovetail with the needs of enterprises and industries, optimize the talent training structure, actively serve and lead the regional economic development, enhance the contribution of talents, and realize the deep integration with the economy and society. Close contact with enterprises, implement targeted research and development, and build a cooperation platform for the transformation of enterprises' scientific and technological innovation results. Through the enterprise's scientific and technological innovation proceeds to fund the innovation and entrepreneurial activities of universities, and jointly develop products that meet the market needs with universities.

## **3. LOGISTIC REGRESSION ANALYSIS OF FACTORS INFLUENCING COLLEGE STUDENTS' INNOVATION AND ENTREPRENEURIAL ABILITY**

### **3.1. DATA REGRESSION ANALYSIS**

To investigate the degree of influence of each entrepreneurial factor on college students' innovation efficacy, multiple regression analysis was conducted on each variable. Before conducting the regression analysis, considering the possible co-linearity among the six variables of college student group's knowledge of innovation and entrepreneurship competition, social capital, competition team, instructor's attitude, personal ability and personal innovation motivation, firstly, we should exclude the multiple co-linearity and prevent the existence of linear correlation among independent variables. The tolerance and variance inflation factor

(VIF) tests are used to determine whether there is multicollinearity among the above variables, with tolerance ranging from 0 to 1. The smaller the tolerance, the more serious the problem of multicollinearity exists. The variance inflation factor is the inverse of the tolerance, the larger the VIF, the more obvious the multicollinearity, and it is usually considered that when the VIF is less than 10, there is no multicollinearity. The results of the regression model are shown in Table 1, and the VIF of each variable is much less than 10, indicating that there is no co-linearity problem among the independent variables. The  $F$ -test observation of the model equation is 106.581, and the Sig value is 0.000, which is less than 0.05, so it can be judged that the model reaches the significant level and the equation to establish the model is feasible.

**Table 1.** Results of the innovation effectiveness regression model

Models	Non-standardized coefficient		Standard coefficient	$t$	Sig	Covariance statistics	
	$B$	Standard Error	Trial Version			tolerances	VIF
Level of understanding	0.268	0.031	0.371	12.390	0.000	0.678	1.596
Social Capital	0.077	0.020	0.072	3.763	0.000	0.898	1.182
Competition Team	0.060	0.019	0.057	3.061	0.003	0.858	1.094
Positive Attitude	0.057	0.028	0.064	2.057	0.030	0.610	1.350
Personal Capabilities	0.034	0.014	0.038	2.282	0.035	0.674	1.662
Personal motivation for innovation	0.155	0.032	0.170	7.347	0.000	0.459	1.352

### 3.2. ANALYSIS OF LOGISTIC REGRESSION RESULTS

In terms of the significance probability of the influence coefficients, the significance levels of the influence coefficients of college students' knowledge about innovation and entrepreneurship competition ( $X_1$ ), social capital ( $X_2$ ), competition team ( $X_3$ ), instructor's attitude ( $X_4$ ), personal ability ( $X_5$ ) and personal innovation motivation ( $X_6$ ) on college students' innovation efficacy ( $Y$ ) are all less than 0.05, indicating that all of them are significant.

The respective influence coefficients (i.e., non-standardized coefficient  $B$ ) of the six variables, i.e., knowledge of the university student group about the Internet+ competition, social capital, competition team, instructor's attitude, personal ability, and personal innovation motivation, on the dependent variable innovation effectiveness are 0.268, 0.077, 0.060, 0.057, 0.034, and 0.155, respectively, 0.034, and 0.155, i.e., when the higher the respondents rated the degree of knowledge about the innovation and entrepreneurship competition, social capital, competition team, mentor's attitude, personal ability, and personal motivation to innovate among the college student population, the higher they perceived the innovation efficacy. Among them, understanding the innovation and entrepreneurship competition has the greatest influence on innovation efficacy, and the rest are personal innovation motivation, social capital, competition team, instructors' attitude, and personal ability in order. From the above analysis, the six adjusted research hypotheses  $H1$ ,  $H2$ ,  $H3$ ,  $H4$ ,  $H5$ , and  $H6$  proposed in this study were all verified to be valid, and the results are shown in Table 2.

**Table 2.** Hypothesis testing results

Serial number	Research Hypothesis	Hypothesis validation results
<i>H1</i>	The degree of knowledge about the competition has a positive effect on the innovation and entrepreneurship efficacy of college students	Established
<i>H2</i>	Social capital has a positive impact on college students' innovation and entrepreneurship efficacy	Established
<i>H3</i>	Team member collaboration has a positive impact on college students' innovation and entrepreneurial effectiveness	Established
<i>H4</i>	Instructors' attitudes have a positive impact on the effectiveness of college students' innovation and entrepreneurship	Established
<i>H5</i>	Personal ability has a positive impact on college students' innovation and entrepreneurial effectiveness	Established
<i>H6</i>	Personal motivation to innovate has a positive effect on college students' innovation and entrepreneurship efficacy	Established

#### 4. CONCLUSION

Based on the understanding of the problems of innovation and entrepreneurship of higher vocational students and the main factors affecting students' entrepreneurship, the government, society and schools should continuously improve their work and take effective measures to stimulate college students' innovation and entrepreneurship. In talent training, colleges and universities should adhere to the guidance of social needs, adjust professional courses according to the market, and strengthen the cultivation of students' comprehensive ability, practical skills, pioneering and innovative ability, team cooperation and entrepreneurial consciousness, so as to improve the entrepreneurial self-confidence of higher vocational students.

After years of rapid development, China's economic growth has slowed down, the economy is operating with a better structure and higher efficiency, and the development model has shifted to innovation-driven development. The shift from factor-driven and investment-driven to innovation-driven is an important feature of the new economic normal. Higher education can guide scientific and technological innovation, export knowledgeable talents to the society, and provide great energy for economic growth. As the first productive force of science and technology and the first resource of talents, higher education is an important part of the national innovation system. Talent is the root of innovation, and it is necessary to make strong practices and reforms for innovation and entrepreneurship education under the new economic normal.

#### FUNDING

This research was supported by this paper is the conclusion result of the special project of Philosophy, Social, Ideological and Political Affairs of Jiangsu Province in 2020, "The Significance and Path Analysis of Reconstructing College Students' Collectivist Values in the Post-epidemic Period" (2020SJB0097).

## ABSTRACT

In order to be able to help the group of students with respiratory difficulties to build a spirit of tenacity and perseverance, physical education in colleges and universities, which is developed by Internet technology, has an unshirkable obligation. This paper gives the epidemiological principles, pathogenesis and definition criteria of the existence of diaphragmatic dysfunction in the respiratory difficulty group, starting from the basic definition analysis of the respiratory difficulty group. The role of physical education in improving physical fitness and toughness is explained, and strategies for developing toughness in the group of students with respiratory difficulties in physical education are given. The development of physical education in colleges and universities should provide students with effective quality cultivation assistance, which in turn will enable more disadvantaged student groups to face the future with a sunnier mentality and a more resilient spirit.

## KEYWORDS

College education; Internet; Respiratory distress group; Resilience; Diaphragm dysfunction; Teaching

## 1. INTRODUCTION

In the background of the Internet, with the popularization of higher education and the awareness of educational equity, more and more physically ill and weak students are entering universities. Physical education course is a compulsory course in universities, which carries the double responsibility of enhancing physical fitness and improving mental health, and special physical education courses for physically ill and weak students in colleges and universities are also an integral part of college physical education courses [1-2]. The physical fitness and health level of physically handicapped and weak students in colleges and universities are in the lower to middle level due to their long-term chronic diseases, and the long-term medication and treatment make them in a low and depressed psychological mood for a long time [3-4].

According to the World Health Organization, health is not only the absence of disease, but also the maintenance of good physical, psychological and social adaptability. This definition has changed the long-standing traditional view that “no disease is healthy” and started to pay attention to mental health and social adaptability [5-6]. Compared with other exercises that can achieve both physical and mental health, physical health exercises are slow and gentle with deep and long breathing, which can stretch the limbs and achieve balance, and normalize the secretion of various organs and glands in the body [7-8]. The breathing and meditation regulate

the nervous system, thus promoting the physical and mental health of people with respiratory difficulties.

This paper analyzes the criteria for defining the respiratory distress group in the context of the Internet and gives the epidemiology and pathogenesis of diaphragmatic dysfunction present in the respiratory distress group. The role of physical education in improving physical fitness and toughness qualities is discussed, and the rational use of game teaching can promote the positive impact of sports on mental health. Based on this, strategies are given for the development of toughness in the respiratory distressed group in physical education, focusing on the creation of mental health education activities as well as physical education activities. Thus, physical education is used to improve the mental health quality and resilience of the respiratory distressed group.

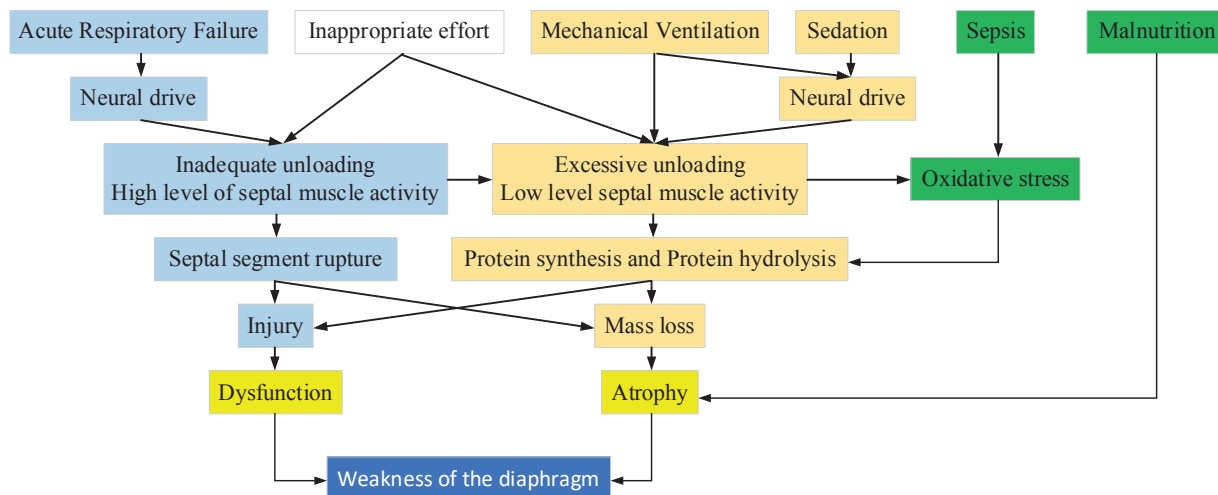

## **2. BASIC DEFINITION OF RESPIRATORY DISTRESS GROUP**

### **2.1. EPIDEMIOLOGY OF DIAPHRAGM DYSFUNCTION**

The probable factor that produces dyspnea in the dyspnea group is diaphragmatic dysfunction. Diaphragmatic dysfunction, however, refers to changes in lung capacity, active inspiratory capacity, and decreased contractile movements of the diaphragm triggered by a series of factors that diminish or lose the ability of the diaphragm to produce force. It can lead to respiratory distress, exercise intolerance, and sleep disturbances. Diaphragmatic dysfunction in mechanically ventilated patients is characterized by high incidence, rapid changes, and greater severity, and its functional status is often monitored clinically by inspiratory manometry, diaphragmatic ultrasonography, pulmonary function tests, and others. The definition of diaphragmatic dysfunction varies in different studies and includes bilateral phrenic nerve magnetic stimulation airway twitch pressure  $<7$  or  $11$  cmH<sub>2</sub>O, diaphragm mobility  $<10$  mm, diaphragm thickening fraction  $<20\%$ , etc.

### **2.2. PATHOGENESIS OF DIAPHRAGM DYSFUNCTION**

From a respiratory physiology perspective, damage to any link in the respiratory center to diaphragm contractile protein pathway can lead to diaphragm dysfunction. It is known that patients with acquired weakness in the ICU can develop neurological and or muscular impairment, which in turn affects the patient's functional status. However, the correlation with diaphragmatic dysfunction is low or absent, possibly due to different risk factors for its onset. Drugs often used in critically ill patients include propofol, glucocorticoids, and neuromuscular blocking agents that inhibit respiration and enhance protein hydrolysis with inhibition of protein synthesis. It can also be associated with sepsis and malnutrition triggering impaired mitochondrial oxidative stress or inflammatory responses that impair mitochondrial function and aerobic metabolism, leading to apoptosis. In the context of a multifactorial combination, a full understanding and exploration of the pathogenesis of diaphragmatic dysfunction is conducive to better diaphragm protection and strengthening, and the pathogenesis of diaphragmatic weakness in critically ill patients is shown in Figure 1.

**Figure 1.** Pathogenesis of diaphragmatic dysfunction

### 2.3. CRITERIA FOR DEFINING PATIENTS WITH RESPIRATORY DISTRESS

(1) Patients come to the hospital with dyspnea as the primary clinical manifestation, which meets the definition of dyspnea, referring to the expert consensus on the diagnosis, assessment and management of dyspnea, which can be a subjective feeling of respiratory discomfort or an objective sign of labored breathing.

(2) The criteria for determining severe dyspnea are the British Medical Research Society's modified dyspnea index, which classifies the severity of dyspnea as severe dyspnea at level 2 or higher, including level 3, when dyspnea occurs after walking about 100 meters or a few minutes on level ground and one must stop and breathe heavily. The level 4 is when the dyspnea makes it impossible to leave the house or when the dyspnea is evident when dressing or undressing. The specific grading is shown in Table 1.

**Table 1.** mMRC Assessment

mMRC grading	Respiratory distress symptoms
Level 0	Dyspnea during strenuous activity.
Level 1	Difficulty breathing when walking fast on level ground or climbing hills.
Level 2	Walking at a fast pace on level ground slower than peers or needing to stop and rest due to breathing difficulties.
Level 3	Needs to stop after walking about 100m or a few minutes on level ground to catch his or her breath.
Level 4	Difficulty in leaving the house due to breathlessness, or difficulty in breathing when dressing or undressing.

## 3. THE ROLE OF PHYSICAL EDUCATION IN IMPROVING PHYSICAL FITNESS AND TOUGHNESS

### 3.1. THE NEED FOR RATIONAL USE OF GAME TEACHING TOOLS

In traditional physical education, teachers are mainly responsible for imparting knowledge and skills with less interaction, which leads to students mastering some motor skills but not having better understanding of mastery and lower interest in sports. Analysis of the reasons for this is mainly due to the teachers' failure to start from the students' subjectivity, allowing them to feel the action and understand the role and effectiveness of the action. Therefore, in physical education to let students master skills is only part of the teaching goal, more need to let students know how to use skills, more help breathing difficulties students from the psychological acceptance of the game teaching, and then develop their good habits of life and exercise.

The reform of physical education curriculum also mentions that while students learn new knowledge and skills, they focus on the cultivation of students' active learning attitude and prompt them to develop good physical exercise habits. This requires a change in the teaching concept of physical education teachers, who need to abandon the traditional teaching concept and give full play to the subjectivity of students. At the same time, teachers should also give full play to their leading role, actively guide students to participate in sports, so that students are brave enough to explore the practice of movement, so as to effectively cultivate students' practical skills and lay a solid foundation for lifelong physical education.

### **3.2. POSITIVE EFFECTS OF TEACHING PHYSICAL GAMES ON PHYSICAL AND MENTAL DEVELOPMENT**

Physical education originates from games, a social and recreational activity that promotes the harmonious development of human beings through physical exercises. It can fully blend the physical and mental development of students and has both recreational and educational effects. Sports games can make students feel the fun of sports and competition in a happy atmosphere. Sports games have a wide range of subjects, and almost all sports can develop sports games. Therefore, sports games can provide rich teaching contents and means for physical education classroom.

The use of physical education games in physical education can bring out the intelligence of each student to a great extent and develop their collective consciousness and strong mentality. The use of physical education games before the teaching of physical education skills can generate a strong interest in students, and when used during the teaching of skills, students can transfer their interest in physical education games to the learning of motor skills, thus improving the teaching effect. When used after the skills are taught, they can consolidate the skills learned and have a relaxing effect on the body and mind. Sports games have a positive effect on developing students' good character, developing their intelligence, and developing their basic motor and tactical skills and social skills.

Based on the above, exploring the degree of influence of game teaching in physical education on the physical health and physical interest of the respiratory difficulty group will help physical education teachers to better develop teaching plans to promote the physical health level as well as the mental health level of students.

## **4. STRATEGIES FOR CULTIVATING THE QUALITY OF RESILIENCE IN GROUPS WITH BREATHING DIFFICULTIES IN PHYSICAL EDUCATION**

### **4.1. CREATE MENTAL HEALTH EDUCATION ACTIVITIES**

(1) During free time, the school organizes a "Mental Health Movie Salon" for groups of students with respiratory problems to help them develop a positive mindset by watching movies about mental health and to guide them to face their physical difficulties and problems properly.

(2) Create a mental health curriculum. Schools can create a mental health curriculum related to the actual situation of the group of students with respiratory difficulties, and achieve the cultivation of students' resilience qualities through targeted training.

(3) Provide mental health lectures. Schools can conduct a series of mental health lectures on a regular basis so that groups of students with breathing difficulties can understand the importance of the quality of resilience for life development and then take the initiative to develop a spirit of not giving up easily in the face of difficulties in their daily lives.

### **4.2. CREATE RELEVANT PHYSICAL EDUCATION ACTIVITIES**

Sports have a tough, competitive nature, and students need to have a strong will and perseverance when they participate in various sports and exercises. Therefore, a moderate amount of sports can develop the quality of resilience in the group of students with breathing difficulties while ensuring their safety. The series of physical education activities contribute to the overall development of students, and have certain boosting advantages for improving students' interest in sports, removing psychological barriers, strengthening students' behavioral qualities and enhancing their mental health. It enables students to have a strong heart, resourceful thinking and a calm and courageous will in the face of difficult and dangerous situations, which are all necessary qualities of toughness.

## 5. CONCLUSION

This paper gives a basic definition of the respiratory difficulty group, including epidemiological principles, pathogenesis, and definition criteria, and gives the role of physical education in improving physical fitness and toughness qualities. Based on physical education, the basic strategies for cultivating the toughness quality of the respiratory difficulty group are given, which can be promoted through mental health education activities and physical activities. For this reason, in the context of the Internet, the education of cultivating resilience quality through physical education in colleges and universities for the group of students with respiratory difficulties will not only help students to establish a resilient and healthy psychology. It can also cultivate the spirit of self-improvement, so that students can be resilient in the face of setbacks in life and eventually achieve victory.

## ABSTRACT

This paper explores the application of cognitive metaphor theory in English vocabulary teaching in the context of the Internet, constructs a controlled experiment, analyzes students' cognitive metaphor vocabulary levels, and tests the teaching effects. The mean value of the vocabulary post-test scores of the experimental group was 76.583 and the mean value of the post-test scores of the control group was 71.161, with a two-tailed significant level of  $0.020 < 0.05$ , and significant differences occurred between the experimental data of the two groups on the post-test. The students in the experimental class improved their metaphorical vocabulary level, which indicates that this way of teaching vocabulary is helpful for students to learn English vocabulary and verifies that the cognitive metaphor theory is feasible for teaching English vocabulary in English vocabulary teaching.

## KEYWORDS

Cognitive metaphor theory; Vocabulary level; English vocabulary teaching; Metaphorical vocabulary; Teaching style

## 1. INTRODUCTION

In studying English at university, especially in the process of preparing for English level 4 and English level 6, students need to spend a lot of energy and time learning and memorizing English words [1]. However, such a simple learning method does not achieve the best learning effect, resulting in a serious blow to students' learning motivation and a certain degree of influence on their English performance and English application ability [2-3]. The key to this situation is that students only memorize English words by rote and lack understanding of the regularity of words, which in turn has an impact on the solidity and profundity of vocabulary memory [4]. Therefore, constantly stimulating students' interest in learning English words and expanding their vocabulary have an important role in teaching English at university [5-6].

In college English teaching, a sound vocabulary teaching strategy can lead to better mastery and application of all basic skills [7]. The central task of second language acquisition is vocabulary acquisition, and the ideas and basic skills of foreign language teaching are very dependent on vocabulary [8]. Some foreign scholars are conducting research on metaphorical engineering, which is the construction of metaphors as well as analogical sets and the application of metaphors to explain abstract thinking, and their research topics are metaphors and literacy, metaphors and vocabulary teaching, and the relationship between metaphors and language learning in adolescents [9-10]. Therefore, it is feasible and necessary to apply metaphorical cognitive theory for teaching English vocabulary, which motivates students to be

more aware of the origin and development of word meanings and improves the interest of vocabulary teaching.

## **2. COGNITIVE METAPHOR THEORY APPLIED TO ENGLISH VOCABULARY TEACHING**

### **2.1. COGNITIVE METAPHOR THEORY**

#### **2.1.1. COGNITIVE METAPHOR THEORY PERSPECTIVE**

Metaphor is not only a purely linguistic phenomenon or literary rhetoric, but also a way of thinking and a tool for human beings to perceive the world and things, i.e., a cognitive activity in which people use experience in one domain to understand or explain experience in other domains. Currently, the main ideas about cognitive metaphors include:

(1) When people use language, they often encounter metaphors, such as those in poetry, which are not different in nature from the metaphors they use in everyday life.

(2) The main components of a metaphor are the target domain and the origin domain, which are used to construct and understand the target domain by mapping various structures of the origin domain schema onto the target domain.

(3) Metaphors have a certain degree of systematicity, i.e. a certain conceptual metaphor can produce a large number of linguistic expressions in harmony with each other, and the different metaphorical meanings can be used together to build a coherent and coordinated system that affects human logical thinking and verbal thinking.

#### **2.1.2. COGNITIVE METAPHOR THEORY APPLICATION**

From a cognitive point of view, all types of human language can be considered as systems with metaphorical properties. The process of cognitive vocabulary is a systematic and complex process. Many students in the process of cognitive vocabulary only deep processing leads to a deeper understanding of words. Metaphor is not only the main way to produce word meanings, but also a key mechanism to express the meaning of words and to compensate for the lack of vocabulary. Therefore, the use of cognitive metaphor theory in English vocabulary teaching is very meaningful. The scientific use of cognitive metaphor theory not only helps students to raise their daily language learning to the level of cognitive thinking, but also enables them to understand the deep metaphorical mapping between the brain and English vocabulary, and thus to understand, remember and use vocabulary more accurately.

## **2.2. APPLICATION OF COGNITIVE METAPHOR THEORY IN VOCABULARY TEACHING**

### **2.2.1. FOCUS ON THE UNDERSTANDING OF THE ESSENCE OF CHINESE-ENGLISH CULTURE**

Any language arises from the life of people. English and Chinese belong to different language families with different language and culture. Although the languages are different, people in each culture can have similar perceptions and understandings of the world through metaphors.

Teachers need to guide students to a systematic understanding of Chinese and Western culture in order to familiarize them with the essential similarities and differences between Chinese and English cultures. In the process of teaching vocabulary, teachers need to explain Western ways of cognition and culture, thus ensuring that students have a deeper knowledge of the culture contained in English vocabulary.

### **2.2.2. MASTERING BASIC CATEGORY VOCABULARY TEACHING**

Many contemporary teachers use the grammar teaching model to teach English-Chinese translation by combining the words provided in the textbook with the basic word meanings, phonology, word structures and collocations. In this model, many students are mechanical learners and do not actively participate in the learning process. This makes them not remember the words deeply and their learning effect is very poor. Therefore, teachers should help and guide students to analyze vocabulary metaphors, so that they can master the method, start from the basic category vocabulary, develop their metaphorical logic thinking, and consolidate the foundation of vocabulary.

### 2.2.3. IN-DEPTH UNDERSTANDING OF ENGLISH VOCABULARY

Cognitive metaphor theory is based on “similarity”, i.e., an all-embracing mapping within one’s own system through similar features. One of the main manifestations of metaphor is the multiple meanings of words and synonyms. In the new era, it is not enough for students to remember only the prototypical meaning of words. Students need to have a deeper understanding of the prototypical and basic meanings of words.

## 3. A STUDY ON THE APPLICATION OF COGNITIVE METAPHOR THEORY IN ENGLISH VOCABULARY TEACHING

### 3.1. COMPARATIVE ANALYSIS OF VOCABULARY LEVELS

In order to examine the differences in the pre-experimental English general and vocabulary levels between the two groups of students in the Internet context, a control experiment was constructed, and the data from the pre-test of cognitive metaphor vocabulary levels are shown in Table 1. The mean value of the pre-test scores of the experimental group was 72.670, and the mean value of the pre-test scores of the control group was 73.573. The two-tailed significance level in the pre-test was 0.085, and this value was greater than 0.05, indicating that there was no significant difference in the pre-experimental vocabulary levels between the experimental and control groups, so the students in both groups fully met the conditions for participating in this experiment. After the experiment, the mean value of the vocabulary post-test scores of the experimental group was 76.583 and the mean value of the post-test scores of the control group was 71.161, with a two-tailed significant level of  $0.020 < 0.05$ , which indicates that significant differences occurred in the experimental data from the two groups of the post-test. The metaphorical vocabulary level of the students in the experimental class has improved, and it also shows that this way of teaching vocabulary is helpful for students to learn English vocabulary.

**Table 1.** Vocabulary pre-test and post-test performance tests

	Mean	<i>N</i>	Standard deviation	<i>T</i>	Sig
Experimental Classes	72.670	50	11.6772	1.750	0.085
	73.573	50	9.5627	5.276	0.020
Control class	76.583	50	11.5849	1.750	0.085
	71.161	50	10.3411	5.276	0.020

### 3.2. ANALYSIS OF TEACHING EFFECT TEST

The data of the teaching effect significance test are shown in Table 2, and the results of the paired test were experimental class  $T = 5.427$  and control class  $T = 3.724$  (*T* indicates the test statistic). The two-tailed significance level of the control class is  $0.245 > 0.05$ , which means that the difference between the two test levels is not significant, while the two-tailed significance level of the pre- and post-test of the experimental class is 0.085, and this value is much less than 0.05, so it can be considered that the difference between the two vocabulary tests of the

experimental group is significantly different, that is, the effect of vocabulary teaching under the guidance of conceptual metaphor theory is considered significant.

**Table 2.** Sample *T* test results of vocabulary test scores

	Paired Differences					<i>T</i>	<i>df</i>	Sig
	Mean	Standard deviation	Standard Error Mean	Intervals for 95% confidence level differences				
				Lower	Upper			
Experimental Classes	5.5000	6.739	1.0503	3.2715	7.8028	5.427	50	0.085
Control class	0.6840	1.7749	0.3531	0.5898	1.0962	3.724	50	0.253

#### 4. CONCLUSION

By applying cognitive metaphor theory to English vocabulary teaching, teachers can guide students to understand the surface and deeper meanings of English vocabulary in the process of explaining the basic meanings of words, and make them think and analyze the inner connections of words through reasoning, induction and association. By mastering core English vocabulary and practicing metaphorical logic, students can increase their confidence in learning English and ultimately improve their overall learning efficiency.

Cognitive metaphors can not only be the best tool for students to learn English, but they can also be a good way to enhance students' creative thinking skills as well as their language learning abilities. The role of the teacher is crucial to the effective introduction of metaphors in teaching. Therefore, teachers should have a strong sense of metaphor and metaphorical ability themselves, constantly improve and refine their existing teaching methods, try to use cognitive metaphors in teaching English, and make students realize together that metaphors are commonly found in people's daily lives and that metaphors are essential.

# INNOVATION OF HIGHER EDUCATION MANAGEMENT MODEL IN THE ERA OF “INTERNET+”

---

Guiyang Lu\*

Zhengzhou University of Economics and Business, Zhengzhou, Henan, 450000, China

[xiaolu1989@aliyun.com](mailto:xiaolu1989@aliyun.com)

---

## ABSTRACT

This paper proposes a management model for university students' education under the full credit system in the era of “Internet+” and under the strategic planning of higher education reform from two aspects of university research management and service to society. The reliability of the management model is evaluated by using Cronbach's alpha coefficient. Based on the evaluation results, the bias of learning motivation is -0.5061, the bias of learning behavior is 0.15108, the bias of teacher quality is 0.06118, and the bias of teaching attitude is 0.07462. Only by adapting to the characteristics and requirements of “Internet+” era, we can follow the trend and innovate “Internet+ education”. Only by adapting to the characteristics and requirements of the “Internet+” era, innovating the new business mode of “Internet+ education” and promoting the deep integration between higher education and the Internet can we make the sustainable and healthy development of higher education.

## KEYWORDS

Reform strategy; Research management; Full credit system; Management model; New business

## 1. INTRODUCTION

With the acceleration of globalization, today any country, organization and individual is facing unprecedented challenges [1-2]. As the main sector of human resources training, excellence in teaching quality in higher education is the fundamental guarantee for its own development, social progress and improvement of the overall competitiveness of the country [3-4]. The quality of higher education has become the focus of attention of all countries and sectors [5]. In order to cope with the accountability of higher education from all walks of life, many higher education researchers and educators have focused their attention on the solution of teachers' teaching ability and teaching assurance problems [6-8]. With the development of learning theories, the subjective role of learners in the learning process that cannot be ignored has been gradually recognized [9-10]. Therefore, taking higher education teaching as a complete system, studying the mechanism of the role of key teaching factors on the quality of higher education teaching and their influence on teaching outcomes and carrying out teaching reform practice are not only the hot issues explored in the theoretical circles of higher education education reform, but also the basic problems urgently needed to be solved in higher education teaching practice.

## **2. EXPLORING THE NEW MODE OF “INTERNET+” HIGHER EDUCATION MANAGEMENT**

### **2.1. HIGHER EDUCATION MANAGEMENT INSIGHTS**

#### **2.1.1. STRATEGIC PLANNING OF HIGHER EDUCATION REFORM**

The loss of the competition of knowledge platforms among countries will lead to the loss of intellectual capital, the weakening of national famous universities, and the control of educational research big data by foreign countries, which will endanger national security. In a sense, university online education will become an important carrier of national culture and soft power export. From the strategic height of enhancing national cultural soft power and defending national security in the field of education, we should focus on creating high-quality online education courses in national universities and improving the competitive advantage of inter-national knowledge platforms. In international higher education cooperation, it is necessary to enhance negotiation ability and prevent big data of education research from being controlled by foreign countries.

#### **2.1.2. REFORM OF UNIVERSITY RESEARCH MANAGEMENT**

In the field of scientific research, the open and distributed collaborative innovation in scientific research in the era of “Internet+” brings new challenges to the scientific research management of universities. Universities should encourage collaborative innovation among researchers from different units, and reform the organizational management, personnel system, personnel evaluation and international cooperation system of collaborative innovation departments. Adopt different interest incentive mechanisms for scientific researchers and marketers in collaborative innovation centers, such as betting agreements and equity option incentives. People from different units should break the attributes of the units to carry out collaborative innovation, and let the scientific researchers “move but not transfer”.

#### **2.1.3. REFORM OF SOCIAL MANAGEMENT OF HIGHER EDUCATION SERVICES**

In the field of serving the society, the transformation of scientific and technological achievements of colleges and universities should use the Internet thinking, combine the Internet with the transformation of scientific and technological achievements of colleges and universities, aim at the user demand for research and development, actively develop the marketing mode by using the existing network platform for transformation of scientific and technological achievements, precisely match the market demand with the research and development of colleges and universities, and form the “Internet + service mode of transformation of scientific and technological achievements”.

### **2.2. EDUCATIONAL MANAGEMENT OF COLLEGE STUDENTS UNDER THE CONDITION OF FULL CREDIT SYSTEM**

#### **2.2.1. INNOVATIVE IMPLEMENTATION OF CREDIT-BASED EDUCATION MANAGEMENT MODEL**

The long-implemented student education management service system is not compatible with the full credit system reform, and a series of problems have emerged. For example, students’ one-sided pursuit of credits can lead to increased utilitarianism. Respecting students’ individual development can lead to individualism, etc. In order to adapt to the new situation of the credit system reform, in response to these series of problems, we must actively take countermeasures to reform and adjust the existing student education management service system to ensure the smooth implementation of the full credit system. The establishment of a student education management service model that is compatible with the full credit system is the original purpose of the full credit system reform and an important condition for realizing the

training goals of the school. Students are the main body of the school, and only good education and management of college students can ensure the smooth implementation of the credit system reform.

### 2.2.2. IMPROVE THE QUALITY OF TALENT CULTIVATION

The full credit system embodies the concept of people-oriented education. The core and soul of the full credit system is the course selection system, the essence of which is to take students' needs as the core, in fact, it respects students' individual development and reflects the human-centered education idea. Correspondingly, our education and teaching should also be based on students' needs, with the fundamental task of "establishing moral education", taking students as the foundation, love as the source, establishing a new type of teacher-student relationship, mutual respect, understanding and care, correctly guiding students to develop their individuality, encouraging them to be self-sufficient and develop comprehensively. The essence of the full credit system is to establish a rich "curriculum supermarket", to accept students' choices in a service posture, to achieve superiority in students' choices, to achieve teaching and learning, and to allow students to learn self-development and self-improvement in their choices.

## 3. RESEARCH ON HIGHER EDUCATION MANAGEMENT OF FULL CREDIT SYSTEM

### 3.1. RELIABILITY ANALYSIS

Theoretically, the observed variables corresponding to the same latent variable should be consistent, and the exploratory study latent variables are shown in Table 1. The Cronbach alpha coefficient is precisely a measure of the consistency between the observed variables corresponding to the same latent variable, i.e., the higher the correlation coefficient between the observed variables, the closer the Cronbach alpha coefficient is to 1, and the higher the confidence of the observed data. According to the criteria used in existing exploratory studies, the Cronbach alpha internal consistency coefficient data for that variable are retained if they are all greater than 0.7. Also, if it was found that removing a question would instead enhance the internal consistency value, the question was removed. Internal consistency analysis of the seven latent variable measurement scales for the study hypotheses was conducted using VisualPLS 1.04bl software, and it was found that no variable had a significant increase in its reliability after the deletion of a question item, and the internal consistency coefficients of all seven variables were greater than 0.7, which indicates that the measurement scales have good internal consistency.

**Table 1.** Cronbach $\alpha$  coefficients of latent variables in exploratory studies

Variable Name	Number of measurement items	Cronbach $\alpha$ Coefficient
Learning Motivation	5	0.776845
Learning Behavior	9	0.850951
Teacher Quality	4	0.859573
Teaching Attitude	4	0.837827
Teaching Behavior	10	0.915310
Teaching Environment	7	0.870851
Learning Results	4	0.745059

### 3.2. DESCRIPTIVE STATISTICAL ANALYSIS

The indicators of quality of higher education management are shown in Table 2. If  $\alpha=5\%$  and  $x=100$ , checking the table of bias kurtosis thresholds, we get  $C_1=0.39$  and  $C_2=0.77$ . The learning motivation bias is  $-0.5061$ , the learning behavior bias is  $0.15108$ , the teacher quality

bias is 0.06118, and the teaching attitude bias is 0.07462, all of which are less than 0.1. Therefore, the innovation of higher education management mode in the era of “Internet+” should focus on these educational management factors to improve the quality of higher education management.

**Table 2.** Descriptive statistics of measurement indicators

latent variable	Minimum value	Maximum value	Average value	Standard deviation	Skewness	Kurtosis
Learning Motivation	1	5	3.387724	0.879391	-0.35238	-0.5061
Learning Behavior	1	5	3.701478	0.914851	-0.30628	-0.1510
Teacher Quality	1	5	2.823428	0.737292	0.157643	0.06118
Teaching attitude	1	5	3.78307	0.857438	-0.23510	0.07462
Teaching behavior	1	5	2.751838	0.796224	-0.17372	0.07389
Teaching Environment	1	5	3.789826	0.902956	-0.49474	0.06483

#### 4. CONCLUSION

The “Internet+” era is changing the way of life, work and education, bringing disruptive impact and even revolution to higher education, but it is also important to be aware of the limitations of the “Internet+” itself and the risks it brings to higher education. Internet+ education should use Internet thinking to transform and upgrade or even subversively change the traditional education industry. The use of big data to reengineer the organizational process of traditional education, promote the deep integration of the Internet and traditional industries, and bring about disruptive changes in teaching methods and teaching organization and management. The implementation of the full credit system has broken the traditional restrictions of years of study and classes by department, class, and uniform class schedule, and is the embodiment of a student-centered educational philosophy and education model, an education and teaching management system that greatly respects individual differences and has no uniform program, triggering profound and fundamental changes in teaching and education. Comprehensive assessment has brought a great impact and strong influence on the evaluation standard of student work, which has an important influence on the education and management of college students.

## ABSTRACT

Rural tourism and rural revitalization are closely related, and they are interrelated and work together. Based on the new development idea of rural regeneration, this study investigates the link between the spatial structure of ecotourism and rural development. According to the coupling degree assessment approach, it also performs coupling degree analysis on the interactive and integrated growth of rural revitalization strategy and rural ecotourism. The combined development level of rural tourism was valued at 0.00435 in 2014, and it increased to 0.33762 in 2019. The combined development level of rural revitalization was valued at 0.08895 in 2014, and it increased to 0.48405 in 2019. To encourage the orderly and harmonious growth of tourism high-quality growth and rural regeneration, it is crucial to investigate the coupling and coordination connection between the two.

## KEYWORDS

Coupling degree evaluation model; Integrated development; Coupling degree; Tourism; Comprehensive development

## 1. INTRODUCTION

Rural rejuvenation has a leading and normative role in the development of rural tourism, and rural tourism is an essential approach to accomplish rural rehabilitation and plays a role in supporting rural development [1-2]. Rural tourism development has a new historical purpose in the context of rural regeneration strategy, and understanding how the two are related from a theoretical and practical standpoint is extremely important [3-4]. It advances the growth of rural tourism, strengthens the rural industrial structure, raises the standard of life for people, and boosts the effectiveness of the tourism reception system [5-6].

The coupling and coordination theory is used in this essay to examine the degree of coupling and cooperation between high-quality tourism development and rural rejuvenation [7]. This is important because it can be used to assess how well high-quality tourism development and rural revitalization have adapted to different regions and time periods as well as identify the distinctive laws governing the spatial and temporal evolution of these two phenomena [8-9]. It can find theoretical breakthroughs for the problems that arise in the interactive development of regional tourism and rural construction, and it may serve as a guiding principle for government agencies to create pertinent policies and strategies to encourage the high-quality and coordinated growth of tourism and rural rejuvenation in various eras and places [10].

## **2. BASIS OF INTERACTION BETWEEN RURAL REVITALIZATION AND RURAL ECOTOURISM**

### **2.1. CONCEPTUAL BASIS FOR THE STUDY OF INTEGRATION DEVELOPMENT**

#### **2.1.1. NEW DEVELOPMENT CONCEPT**

Development is the basis for solving all problems, and the concept of development is the precursor of development practice. The new development concept is a systematic theoretical framework, and its fundamental connotation has five dimensions: innovation is its primary driving force, coordination is its inescapable prerequisite, green is its universal manifestation, openness is its essential route, and sharing is its ultimate goal.

#### **2.1.2. THEORY OF TOURISM SPATIAL STRUCTURE**

An important scientific question in tourist geography study is the spatial organization of tourism. Tourism spatial structure theory regards the elements of tourism system within a certain spatial territory as an interconnected organic organization, and not only focuses on tourism spatial structure association, but also actively explores the temporal evolution law of tourism system. Based on tourism spatial structure theory, explaining the spatial patterns of China's regional tourism quality development and comprehensively examining the characteristics of spatial and temporal evolution, as well as the processes and mechanisms underlying the degree of coupling and coordination between tourism quality development and rural revitalization, are both useful from a theoretical and scientific standpoint. Strong practical advice is provided for the modernization of the spatial organization of regional tourist quality development and its integrated pattern of growth with rural rehabilitation.

#### **2.1.3. COUPLED COORDINATION THEORY**

Under the direction of the new development concept and the notion of high-quality development, linked coordination theory is a major theory and technique to explain the complex ecosystem and the coordinated growth of regional economies, which is a vital component of sustainable development. Tourism and rural revitalization are two important subsystems of the coupled coordination system of rural people and land. The coupling and coordination of the two is a complex interactive process of mutual support, integration and reconstruction and optimization of all elements within the system.

## **2.2. COUPLING AND COORDINATION BETWEEN RURAL TOURISM AND RURAL REVITALIZATION**

### **2.2.1. CONNOTATION OF HIGH QUALITY DEVELOPMENT OF TOURISM INDUSTRY**

(1) Make the best stock. The notion of tourist development should be modernized, the resource-dependent model of tourism development abandoned, the integration of innovative tourism resources accelerated, and the sustainability and resilience of regional tourism development improved.

(2) Improve quality. Adopt the new development idea and prioritize innovation as the primary engine behind tourist growth, enhance the capacity of independent innovation in tourism, and cultivate new tourism industry and new dynamic energy. Meet the cultural tourism consumption needs of urban and rural residents and their aspirations for a better life.

(3) Expand the incremental volume. Grasp the opportunity of technological revolution and industrial change, through technological progress and industrial restructuring of elements, accelerate the transformation of old and new dynamics, optimize the allocation of tourism elements and supply system to lead and create new demand for tourism with high-quality supply, cultivate new growth points for tourism development, and increase the tourist

industry's overall effectiveness.

### **2.2.2. RESOURCE SHARING LAYS THE FOUNDATION FOR COUPLING AND COORDINATION**

Resources are both an important factor in tourism development and a core element of rural development, and achieving resource sharing is the main way to maximize the benefits of resource utilization. The distinctive industrial, ecological, historical, and cultural resources of the countryside may be used to generate high-quality tourism while also being shared with one another.

### **2.2.3. VALUE CONVERGENCE FORETELLS THE PROSPECT OF COUPLED AND COORDINATED DEVELOPMENT OF THE TWO**

For a long time, China's tourism economic development has been more at the expense of resources and the environment, still belonging to a rough and unsustainable development model, which has seriously hindered the development prospects of tourism. The ecological transformation of tourism is a crucial component and a prerequisite for the high-quality growth of tourism in the context of the new era. An essential component and unavoidable trend for the future high-quality growth of tourism is the transformation to a green and ecological mindset. The interaction coupling of tourism development and rural rejuvenation will undoubtedly result from the convergence of both development values. Their coupled development can promote regional economic transformation and upgrading, social progress, and has a bright prospect of sustainable development.

## **3. COUPLING EVALUATION ANALYSIS OF RURAL TOURISM AND RURAL REVITALIZATION**

### **3.1. ANALYSIS OF THE COUPLING DEGREE BETWEEN RURAL TOURISM AND RURAL REVITALIZATION**

The coupling degree of rural tourism and the rural revitalization system is displayed in Table 1 in accordance with the coupling degree assessment model for coupling degree analysis. The integrated development level of rural tourism is valued at 0.00435 in 2014 and grows to 0.33762 in 2019, while the integrated development level of rural revitalization is valued at 0.08895 in 2014 and grows to 0.48405 in 2019, showing that both are expanding and developing quickly. From 2014 to 2016, the growth rates of the complete development levels of rural tourism and rural revitalization have a tendency to be similar., and the two increased gradually almost simultaneously. From 2016 to 2017, however, the value of the comprehensive development level of rural revitalization increased significantly, while the growth rate of the comprehensive development level of rural tourism did not change significantly compared to the two years prior. The entire development level of rural revitalization's growth rate fell from 2017 to 2018, year over year, while rural tourism's overall level of development climbed significantly and its growth rate increased year over year. Additionally, there was little change year-over-year in the growth rate of rural revitalization in 2018–2019. However, both the overall degree of development and the growth rate of rural tourism continued to rise year over year.

From 2017-2019, the coupling degree values show a smooth development, the coupling relationship tends to be stable, and the coupling degree values have been maintained in the range of (0.4, 0.5) from 2015 onwards, which is in the antagonistic level stage. The connection between rural tourism and the rural revitalization system is thought to be low level coupled in 2014 and earlier and hostile in 2014 to 2019. Additionally, it is expected that between 2014 and 2019, the rural tourist system and rural revitalization system's coordination

degree coefficients will be high, suggesting a high level of interaction and coupling between the two systems.

**Table 1** The coupling degree of rural tourism and rural revitalization system

Year	Revitalising the system $F(x)$	Tourism System $G(y)$	Integrated development $T$	Coherence $K$	Coupling $L$	Degree of development $P$	Coupling coordination Degree of coupling coordination
2014	0.08895	0.00435	0.4797	0.03933	0.22635	0.03736	Low level
2015	0.10428	0.03556	0.06983	0.46552	0.32590	0.23175	Low level
2016	0.16837	0.08285	0.13138	0.72870	0.45560	0.21558	Moderate
2017	0.30585	0.13827	0.23257	0.75018	0.46375	0.41309	Moderate
2018	0.39427	0.24097	0.40264	0.84552	0.48134	0.45068	Height
2019	0.48405	0.33762	0.36527	0.86510	0.48414	0.58090	Height

### 3.2. COUPLED DEVELOPMENT EVALUATION INDEX WEIGHTS

In order to prove whether the above coupling degree evaluation indexes are scientific and reasonable, Table 2 displays the coupling evaluation weights of rural rejuvenation and rural tourism after an analysis of the coupling evaluation indices of these two sectors. And the index weights of each layer are measured by Yaahp software and all the index weights of each layer pass the consistency test. The weight of rural revitalization is 0.6558, while the weight of rural tourism subsystem is 0.3442. As can be observed, in the assessment system of rural regeneration and rural tourist coupling development, rural revitalization is significantly more significant than rural tourism.

**Table 2.** Evaluation weights for coupling rural revitalization and rural tourism

System System Layer	Tier 1 indicators	Indicator weights	Total weighting of indicators
Rural revitalization	Rural Industries	0.3748	0.2582
	Rural Ecology	0.2174	0.1759
	Rural Culture	0.3572	0.1253
	Rural Governance	0.1783	0.0964
Rural tourism	Country Life	0.1367	0.0827
	Rural tourism demand	0.2510	0.0680
	Rural Tourism Resources	0.2152	0.0631
	Rural tourism economy	0.1539	0.0580
	Rural Tourism Services	0.0187	0.0676

## 4. CONCLUSION

The high-quality development of tourism and rural revitalization has recently attracted a lot of attention from academics, and the literature on the subject is expanding quickly. The tourism academic community is also attempting to understand the inner logical relationship and the path to synergistic development between tourism development and rural revitalization. The index system for evaluation of coupled growth in rural revitalization and rural tourism is formed by this paper, which, in contrast to prior studies, is primarily based on the system coupling perspective and the new development concept. The method of hierarchical analysis is used to determine the index weights.

# RESEARCH ON REFORMING THE CULTIVATION MODE OF INNOVATIVE ENTREPRENEURIAL TALENTS IN UNIVERSITIES UNDER THE BACKGROUND OF BIG DATA ANALYSIS

---

Donglai Luan\*

University of Shanghai for Science and Technology, Shanghai, 200093, China

[ldl150126@163.com](mailto:ldl150126@163.com)

---

## ABSTRACT

The paper investigates a fresh approach to talent development that emphasizes teacher preparation while merging professional education and moral education. It achieves this by examining the amount of innovation and entrepreneurial awareness among current college students, pursuing that route, and developing an analytical model of talent development influencing variables utilizing big data analysis. There are 57.45% of college students who do not know enough about innovation and entrepreneurship, 26.23% of college students who have narrow understanding, 23.87% of students who have wrong understanding and positioning, and 16.52% of students who have wrong understanding of the content. According to an examination of the existing scenario, it is critical that colleges and universities improve their methods for cultivating innovative and entrepreneurial potential.

## KEYWORDS

Innovation and entrepreneurship; Professional education; Faculty training; Moral education; Talent training

## 1. INTRODUCTION

Furthermore, the majority of earlier studies on education in entrepreneurship and innovation were based on developing students' ability to entrepreneurs from the perspective of the economy or management [1-3]. Innovation and entrepreneurship education only recently emerged in China and has not yet developed into a full education system. However, there are few investigations into the amount of political and ideological instruction motivation, and there are even fewer research on how to inspire students to engage in innovation and entrepreneurship [4-6]. In the modern period, college students' education in innovation and entrepreneurship must not only foster strong innovation and entrepreneurship skills but also be informed by socialist ideas with Chinese features [7-8]. Along with the interpretation and propagandizing of pertinent Party Central Committee policy documents to encourage the innovative spirit and business consciousness of college students, ideological and political education is used to encourage a variety of aspects and angles to inspire college students to innovate and launch their own businesses [9].

## 2. THE PRACTICE OF CULTIVATING TALENTS FOR INNOVATION AND ENTREPRENEURSHIP EDUCATION IN HIGHER EDUCATION

### 2.1. THE SITUATION OF INNOVATION AND ENTREPRENEURSHIP EDUCATION IN HIGHER EDUCATION

#### 2.1.1. DEGREE OF AWARENESS OF INNOVATION AND ENTREPRENEURSHIP

Innovation education is a brand-new approach to education that aims to develop students' innovation literacy and innovation potential in the context of the present reform of innovation and entrepreneurship talent nurturing in colleges and universities. Table 1 displays the present condition of the level of innovation and entrepreneurship awareness among college students using big data analysis. 57.45% of college students lack sufficient knowledge about innovation and entrepreneurship, 26.23% narrowly equate innovation and entrepreneurship with creating a technological or scientific project, 23.87% of students have incorrect understanding and positioning, and college students believe that innovation and entrepreneurship are only creative endeavors. Even 16.52% of students misinterpreted the material, believing that entrepreneurship and innovation are limited to founding a firm or organization. This demonstrates that the current status of education in entrepreneurship and innovation in colleges and universities is still a long way from the desired outcome, and that acceptance of college students' understanding of innovation and entrepreneurship is only at a passive level. The cause of this is that ideological and political education motivation's intended effect has not been realized, leaving only a very superficial knowledge of innovation and entrepreneurship in the heart and mind. This ultimately results in the innovation and entrepreneurship education's failure to produce the desired result.

**Table 1.** Awareness of innovation and entrepreneurship among college students

	Number of people	Number of people
Insufficient awareness	184	57.45%
Wrong awareness	98	26.23%
Wrong positioning	113	23.87%
Wrong content	78	16.52%

#### 2.1.2. LACK OF SOCIAL CONCEPT

College students who have spent a lot of time in the "adaptive education" atmosphere are heavily impacted by conventional and outdated thinking, showing insufficient self-confidence, poor independence, lack of strong innovation consciousness and entrepreneurial desire, afraid to accept challenges and express themselves, resulting in both the inability to build a true idea of innovation and entrepreneurship as well as the absence of a strong climate of innovation and entrepreneurship throughout the whole society. A strong culture of innovation and entrepreneurship is lacking across society, and the proper ideas about how to educate people about these topics and develop their inventive and entrepreneurial skills are not being established. The notion of innovation and entrepreneurship is not clearly understood by people from all walks of life, and their knowledge of its implications cannot keep up with the pace of the times. Therefore, the value of entrepreneurship and innovation education for developing talent, advancing society, and advancing the nation is not fully appreciated.

#### 2.1.3. DISCONNECT BETWEEN INNOVATION THEORY AND PRACTICE

There is a dearth of hands-on training for innovation and entrepreneurship at colleges and universities, and the understanding of these topics is exclusively taught in the classroom. College students who get this ineffective innovation and entrepreneurship education eventually

develop poor eyesight, shaky hand-eye coordination, a lack of imagination for innovation and entrepreneurship, and weak inventive thinking. The teaching of innovation and entrepreneurial abilities in Chinese colleges and universities is now inadequate in practice and unable to keep up with the demand of college students for these skills through time and distance. The fundamental challenge of developing innovation and entrepreneurship talent in colleges and universities will continue to be how to construct a suitable and efficient innovation and entrepreneurship training platform and combine various innovation and entrepreneurship resources.

## **2.2. NEW PATH OF INNOVATIVE ENTREPRENEURIAL TALENT CULTIVATION**

### **2.2.1. ESTABLISHMENT OF MORAL GUIDANCE**

Enterprise and innovation at the new age, education at colleges and universities must be founded on China's fundamental national conditions, strive to meet national strategic goals and promote economic and social growth, be driven by moral education, and support students' ideological and moral development. It is a current idea and trend to lead education in entrepreneurship and innovation via moral education, to lead innovation and entrepreneurial education through ideological and political theory, and to encourage college students to engage in innovation and entrepreneurship. The key to addressing the transformation of social contradictions and resolving a number of development challenges in the new era is to incorporate "moral education" into innovation and entrepreneurship education. In doing so, it will become clear that the individuals who receive such training go on to become the individuals required for contemporary social development and progress.

### **2.2.2. INTEGRATION OF PROFESSIONAL EDUCATION**

Curriculum plays a key role in the current implementation of innovation and entrepreneurship training in China, because it is directly related to the question of what kind of people to train and how to train them. To create a three-dimensional, integrated entrepreneurial and innovation curriculum system and a scientific teaching plan, colleges and institutions should actively reform the innovation and entrepreneurial curriculum system from many linkages and based on design thinking. Promote creativity in the development of professional entrepreneurial curriculum by integrating the subject matter of entrepreneurship and innovation instruction into the system of professional curriculum. By enhancing the study of career development in professional domains, you may direct the establishment of a professional education system that promotes innovation and entrepreneurship education and implement curriculum construction for training creative and entrepreneurial talents, increasing the weight of scientific research and technology development in professional fields, and improving the teaching of innovative and entrepreneurial cases in professional fields, so as to increase students' knowledge of job entrepreneurship and cultivate professionals who can start a business and entrepreneurial talents who understand their profession.

### **2.2.3. EMPHASIS ON TEACHER TRAINING**

Teachers are the architects of human souls, and the teaching staff is crucial to the success of innovation and entrepreneurship education. However, at the moment, a lack of qualified teachers and complicated qualifications have emerged as major obstacles to the development of innovation and entrepreneurship talent, making the urgent task of creating an interdisciplinary and multi-source teaching staff necessary. Universities need to set up a mentor system for innovation and entrepreneurship of college students, equip at least one "dual teacher" mentor with both theoretical and practical teaching quality for each student's innovation and entrepreneurship project, provide one-on-one guidance to the project, enhance the talent evaluation process and system to teach innovators and entrepreneurs to the highest

standards. In order to make the outcomes of the evaluation and assessment more scientific and impartial, we will enhance the process evaluation system for the quality of innovation and entrepreneurship training, optimize the content and standards of talent evaluation, and dynamically grasp the information of innovation and entrepreneurship.

### 3. ANALYSIS AND SUGGESTIONS OF FACTORS INFLUENCING THE CULTIVATION OF INNOVATIVE AND ENTREPRENEURIAL TALENTS

#### 3.1. ANALYSIS OF FACTORS AND INDICATORS

Table 2 provides an overview of the critical elements in the development of entrepreneurial and innovative potential at universities. Considering the main elements that shape the development of innovative and entrepreneurial potential in universities, the decision result is given a certain weight, and the calculation steps of DEMATEL method are used to derive a comprehensive influence matrix and analyze each factor, and the cause degree and centrality of each influencing factor are calculated in turn.

**Table 2.** Factors and indicators influencing innovation and entrepreneurship

Influencing factors	Influence degree	Centrality	Cause degree
University Policies	-0.64	-0.11	-0.52
Related Systems	3.05	-2.04	5.14
Cooperation Model	-3.82	-1.35	-2.41
Mentoring Institutions	-7.63	-0.17	-7.27
Teacher Qualifications	4.34	-0.93	4.81
Education and Training	2.07	-1.69	3.16
Innovation achievements	-3.90	-0.95	-3.34

#### 3.2. STRENGTHEN THE SENSE OF COOPERATION TO ESTABLISH

The dialectical relationship between the whole and the parts tells us that only the coordinated development of each part can realize the overall optimum. In order to develop innovative and entrepreneurial skills, conflicts and contradictions will inevitably arise in the process of collaborative cultivation of talents because there are different goals and interest demands among various subjects, with universities pursuing specific employment and entrepreneurship rates and enterprises focusing more on the economic benefits created by talents. So, in order to cultivate innovative and entrepreneurial talents, top-level design should be strengthened under the direction of the party committee, the enthusiasm of universities and businesses should be fully mobilized, guarantee mechanisms in policies and regulations should be provided, the conflict of interests between the subjects should be coordinated, and a favorable policy environment should be created for the cultivation of innovative and entrepreneurial talents.

### 4. CONCLUSION

The future of the nation and its fate are intimately correlated with talent, which is the key to the effective implementation of the Party and national plans. A crucial element in the achievement of the lofty aim of "two hundred years" is the development of talents who will work for the cause of constructing socialism with Chinese characteristics throughout their whole lives. In the modern period, China's efforts to develop inventive and entrepreneurial talent must contend with issues including cognitive bias, route inertia, and a lack of main body execution. Having a feeling of innovation, a strong desire for innovation and the readiness to take the initiative to study for it, as well as an interest and drive for innovation and entrepreneurship are the key ways that innovation and entrepreneurial awareness are displayed. The capacity to

innovate and be entrepreneurial is the foundation for achieving innovation and entrepreneurship. This ability includes invention, resource integration, organization and management, opportunity identification, and strategy layout.

# THE ROLE OF COGNITIVE PSYCHOLOGICAL ADJUSTMENT OF TEACHER-STUDENT RELATIONSHIP IN PROMOTING STUDENTS' LEARNING MOTIVATION

---

Lile Cao\*

Pingdingshan University, Pingdingshan, Henan, 467000, China

[caolile1991@126.com](mailto:caolile1991@126.com)

---

## ABSTRACT

This paper firstly analyzes the causes of students' low motivation to learn, showing that the internal factors such as unclear goals and lack of self-confidence make students less motivated to learn. Secondly, regression analysis was used to analyze the factors influencing students' learning motivation, and the factors influencing students' low motivation were shown through both endogenous and exogenous factors. The analysis showed that the significance levels of learning behavior, learning emotion, and social climate were 0.000, 0.0274, and 0.0482, respectively, all of which were less than 0.05. Finally, strategies to promote students' learning motivation were given based on metacognitive psychological adjustment, namely, regaining confidence, improving cognitive ability, and strengthening monitoring and adjustment of independent learning. This also indicates that metacognitive psychological adjustment can effectively promote students' learning motivation under good interaction between teachers and students.

## KEYWORDS

Teacher-student relationship; Metacognition; Psychological adjustment; Learning motivation; Regression analysis; Influencing factors

## 1. INTRODUCTION

A relaxed and pleasant classroom environment is easy for teachers and students to form a good teacher-student relationship, and students can unite and help each other. Compared with the strict didactic management model, a good relationship between teachers and students can make students more obedient to the teacher's management, which is beneficial to the management of the whole class. To establish a good teacher-student relationship, teachers should treat each student fairly and not discriminate against any of them [1-2]. This will lead to smoother teacher-student interaction in the classroom, students will be more cooperative with the teacher's teaching activities, the teaching progress can proceed smoothly or even speed up, and students' various abilities will be improved [3-4].

Lively and diverse teaching situations can stimulate students' interest in learning, and teachers can increase the interest of the classroom by role-playing and letting students do hands-on work, so that students can explore themselves in the activities, think about the problems by themselves, and gain knowledge through their own figuring out [5-6]. Nowadays, there are more and more new things, and if the previous teaching methods are continued, students will be more and more bored with learning. The use of teacher-student interaction can reduce students' boredom and even make them enjoy learning. Teachers can also optimize the traditional teaching structure and clarify the purpose of teaching through teacher-

student interaction [7-8].

Starting from the causes of students' low motivation to learn, this paper discusses that low motivation to learn is due to unclear goals, poor self-control, a strong sense of inferiority, and poor learning foundation. Regression analysis was used to analyze the factors influencing students' learning motivation, including both endogenous and exogenous factors. Based on the results of the regression analysis, a strategy based on metacognitive psychological adjustment is proposed to promote students' learning motivation, which also indicates that students' learning motivation can be effectively enhanced through metacognitive psychological adjustment in a good teacher-student relationship.

## **2. ANALYSIS OF THE REASONS WHY STUDENTS ARE NOT MOTIVATED TO LEARN**

### **2.1. UNCLEAR GOALS AND LACK OF SELF-CONFIDENCE AND LOW SELF-ESTEEM**

Many students enter school with a lack of professional knowledge and are not sure how the position they will take after graduation relates to the major they will now study. Even some parents treat the school as a custodian. Parents have no goals, students have no motivation, they just get by, and they lack initiative and motivation to learn. Because there are no clear learning goals and no pressure to advance to higher education, they are even more reluctant to study, and sleeping in class, playing with cell phones, reading novels and chatting are common. Most of the students have very poor academic performance in junior high school, so they still think they are not good at learning when they go to vocational school, and they always feel that they are inferior to others. Some students can't choose vocational school because they didn't get into high school due to their poor performance in the secondary school entrance examination.

### **2.2. STUDENTS HAVE POOR SELF-CONTROL AND NO GOOD LIVING HABITS**

Students are relatively young and generally have poor self-control. Some students disregard the school rules and regulations, they are late to class, leave early, and are absent from class, and they have loose discipline in class, they can sleep, talk, and play with their cell phones. Teachers often have to emphasize classroom discipline before they can continue their lectures, and the class learning atmosphere is poor. Some students know that this behavior is not good, but they just can't control themselves very well, and most of them don't have good living habits. It is known that many of them do not eat breakfast and often skip meals, replacing them with snacks of instant noodles. Since they go to bed late, wake up early, have irregular meals, and don't have enough sleep and adequate nutrition, they can't guarantee the quality of their classes well.

### **2.3. POOR LEARNING FOUNDATION AND LACK OF EFFECTIVE LEARNING METHODS**

Most students have poor learning foundation, so there will be some students although they want to learn the knowledge of professional courses, also spent a lot of time to read books and do problems, but often the learning efficiency is very low, can not really master the knowledge points. Some students don't have good learning methods, can't allocate their time and energy to study reasonably, and don't get the main points and lack of focus in learning. When they are promoted from junior high school to secondary school, they lack correct knowledge of professional courses, plus the teacher's teaching mode and progress are too different from junior high school, so they cannot keep up with the teacher's rhythm, which leads to lack of interest in professional courses and aversion to learning.

### 3. ANALYSIS OF FACTORS INFLUENCING STUDENTS' LEARNING MOTIVATION

#### 3.1. ANALYSIS OF THE INFLUENCE OF INTERNAL FACTORS ON STUDENTS' LEARNING MOTIVATION

Considering only the degree of influence of internal student factors on students' learning motivation, learning cognition, learning emotion, learning will, and learning behavior were taken as independent variables, and learning motivation was taken as the dependent variable. Using SPSS software, regression analysis can be conducted to find out whether there is a significant effect of the independent variables on the dependent variables and the magnitude of the effect, and the specific results obtained are shown in Table 1.

**Table 1.** Regression analysis of internal factors and motivation to learn

Model	Unstandardized		Standardisation	T	Saliency
	B	SD	Beta		
(Constant)	1.752	0.0312	-	5.612	0.0000
Learning Behaviors	0.415	0.102	0.563	4.113	0.0001
Learning emotions	0.138	0.060	0.251	2.264	0.0274
Learning cognition	-0.049	0.068	-0.098	-0.712	0.4783
Volition to learn	-0.026	0.067	-0.050	-0.0362	0.7195
R-squared	0.372				
Value of F-statistic	10.575				
Significance level	0.0001				

The results of the regression analysis showed that the R-squared reached 37.2%, indicating that all 37.2% of the change in learning motivation can be explained by the independent variables involved in this study. The significant level of the F-test was 0.0001, which is less than 0.05, indicating that at least one of the independent variables in this study may affect the dependent variable. Then, in order to further determine which specific factor influences learning motivation, it is necessary to continue to observe the t-value of each factor. The significance level of learning behavior is 0.000, which is less than 0.05, indicating that learning behavior can significantly affect learning motivation, and furthermore, the coefficient of influence of learning behavior on learning motivation is 0.415, which is greater than 0, indicating that the influence of learning behavior on learning motivation is significantly positive, implying that the more regular learning behavior is, the higher learning motivation follows.

In summary, among the internal influencing factors of students, learning cognition and learning will have no significant influence on students' learning motivation, learning emotion and learning behavior have a significant positive influence on secondary school students' learning motivation, and learning behavior has a greater influence on learning motivation.

#### 3.2. ANALYSIS OF THE INFLUENCE OF EXTERNAL FACTORS ON STUDENTS' LEARNING MOTIVATION

Considering only the degree of influence of social level factors on students' learning motivation, the social employment situation, social climate, and social acceptance were taken as independent variables, and learning motivation was taken as the dependent variable. Using SPSS software, regression analysis can be conducted to find out whether there is a significant effect of the independent variable on the dependent variable and the magnitude of the effect, and the obtained results are shown in Table 2.

**Table 2.** Analysis of exogenous factors on motivation to learn

Model	Unstandardized		Standardisation	T	Saliency
	B	SD	Beta		
(Constant)	3.215	0.237	-	13.504	0.0001
Social climate	0.133	0.062	0.292	1.932	0.0482
Social recognition of the school	0.015	0.061	0.035	0.256	0.6132
Forms of employment in society	-0.012	0.064	-0.023	-0.177	0.7011
R-squared	0.0752				
Value of F-statistic	7.4213				
Significance level	0.0082				

From the results of the regression analysis, it can be seen that the R-squared reached 7.52%, indicating that all 7.52% of the change in learning motivation can be explained by the independent variables involved in this study. The significance level of the F-test is 0.0082, which is less than 0.05, indicating that at least one of the social dimension factors of the independent variables in this study may affect the dependent variable learning motivation. From the results of the T-test, the significance level of social climate is 0.0482, which is less than 0.05, indicating that social climate can significantly influence learning motivation. Further, the coefficient of influence of social climate on learning motivation is 0.133, which is greater than 0. This indicates that the influence of social climate on learning motivation is significantly positive, which means that the better the social climate is, the higher the learning motivation will be. The rest of the indicators will not be repeated.

In summary, among the social level factors, there is no significant effect of social employment form and social recognition of school on students' motivation to study, and there is a significant positive effect of social climate on motivation to study.

#### **4. STRATEGIES TO PROMOTE STUDENTS' LEARNING MOTIVATION BASED ON METACOGNITIVE PSYCHOLOGICAL ADJUSTMENT**

##### **4.1. HELP STUDENTS BUILD CONFIDENCE AND GOALS**

Students often lack motivation and confidence in learning, are less clear about their own deficits, do not have a rational approach to learning, lack reflection on the learning process, and engage in useless learning week after week, resulting in unsatisfactory academic performance. Metacognitive psychological interventions can effectively allow students to recognize their own personal characteristics, learning styles, and strengths and weaknesses in different aspects of the learning process, such as listening, speaking, reading, and writing, through reflection and awareness of themselves. When students have a full knowledge and understanding of these, they can analyze and judge their own cognitive level and clarify their own learning goals. This in turn increases interest and motivation in learning, gradually builds confidence in learning, and drives students to find appropriate strategies to solve their learning difficulties.

##### **4.2. PROMOTE STUDENTS' COGNITIVE ABILITY TO IMPROVE**

When students understand the importance of "cognitive cognition", they will implicitly learn this metacognitive strategy and improve their cognitive ability. Usually, students who have difficulty in learning do not care much about the purpose of learning, the effect of learning, and the specific methods of learning, and they do not know and understand the nature of learning deeply enough, so they learn blindly without planning and effect. The reason for this is that their cognitive ability is poor, they do not have a clear way of thinking about learning, and their

cognitive understanding of learning is still relatively superficial. Through the teacher's interactive metacognitive psychological intervention, all students understand their current situation, understand the essential connotation of learning, and master specific independent learning tools to facilitate their learning through learning metacognitive strategies.

#### **4.3. STRENGTHEN THE MONITORING AND ADJUSTMENT OF STUDENTS' INDEPENDENT LEARNING**

Students usually adopt escape strategies when facing difficulties, without analyzing and adjusting the current situation, while metacognitive strategies require students to be able to address problems, propose solutions to problems, reflect on their learning strategies, adjust their learning styles, and achieve changes in the current situation through repeated practice. Therefore, with the regulation and intervention of metacognition, the monitoring and adjustment of students' independent learning can be effectively strengthened to get rid of the unfavorable situation in time, so that students can face the dilemma positively.

### **5. CONCLUSION**

In order to investigate the role of cognitive-psychological regulation of teacher-student relationship in promoting students' motivation, this paper analyzes the causes of students' low motivation as well as its influencing factors by using regression analysis. The regression analysis revealed that the significance level of learning behavior is 0.000, which is less than 0.05, the significance level of learning emotion is 0.0274, which is less than 0.05, and the significance level of social climate is 0.0482, which is less than 0.05. This indicates that learning behavior, learning emotion, and social climate all have significant effects on students' learning motivation. This gives strategies to promote students' learning motivation based on metacognitive psychological adjustment, and further enhance students' learning motivation through good teacher-student relationship and teacher-teaching interaction.

## ABSTRACT

This paper analyzes the stage of implementing inquiry-based teaching in the context of deep learning, explores the inquiry-based teaching model system, and analyzes the significance of the difference in students' mathematical quality under the inquiry-based teaching model in a controlled manner. The average mathematical quality score of 30 students randomly selected from the experimental group was 40.4 with a standard deviation of 18.3, while the average mathematical quality score of 30 students selected from the control group was 37.5 with a standard deviation of 17.4. It is important to change the teaching method through the innovative teaching mode of higher mathematics so as to mobilize students' enthusiasm and creativity in improving the mathematical quality of students.

## KEYWORDS

Inquiry-based teaching; Teaching model; Mathematical quality; Significance of differences; Student creativity

## 1. INTRODUCTION

With the increasing development of social economy and science and technology, the demand for high quality talents has increased significantly [1-2]. As an effective way to cultivate talents, colleges and universities have received great attention and wide concern from all walks of life [3-4]. In this situation, colleges and universities have been expanding their enrollment, which makes the problems hidden in the classroom teaching of mathematics in colleges and universities become more and more prominent. The traditional mathematics classroom teaching mode in colleges and universities can hardly meet the diversified development needs and individual learning needs of modern college students [5-6]. The mathematics course in higher education is an important course in higher education, especially for science students, and it is a fundamental tool for subsequent course learning, and with the popularization and innovation of technology, the importance of mathematics course learning in higher education has become more and more prominent [7-9]. The reasonable use of deep learning methods to improve the efficiency of teaching mathematics courses in colleges and universities has also become a common focus topic for teachers in colleges and universities, so it is imperative for colleges and universities to carry out the innovation of mathematics classroom teaching mode.

## **2. EXPLORATION AND PRACTICE OF INNOVATION OF HIGHER MATHEMATICS EDUCATION MODEL**

### **2.1. EXPLORATION OF INQUIRY-BASED TEACHING MODE OF ADVANCED MATHEMATICS**

#### **2.1.1. ESTABLISHING AN INQUIRY-BASED TEACHING SYSTEM**

Higher mathematics is an important public basic course in engineering colleges and higher teacher training colleges, and its teaching quality directly affects students' learning of subsequent courses. The original "lecture-based" teaching mode does not fully mobilize students' initiative and creative spirit. The key to solve the above problems is to change the lecture style to inquiry style, to collect, select, classify and compile classical problems before inquiry and discussion, and to carefully design the difficulty of the problems, to adopt the mode of easy first and then difficult, and to adopt the mode of graded progression, and to use the problems of different levels to stimulate students' learning interest for different students.

#### **2.1.2. REASONABLE DESIGN OF TEACHING GRADIENTS**

Teaching according to students' abilities is a principle that must be followed in education, and any teaching that is detached from the students' foundation and acceptance ability is a failure. Students can only cooperate with the teacher to teach well if they can keep up with the teacher's ideas, which requires the teacher to understand the students' foundation, master the syllabus, and be familiar with the teaching materials, so as to grasp the center of teaching, highlight the key points, and design reasonable teaching gradient, disperse the difficult points, and design reasonable inquiry topics and contents, so that students can think positively under the teacher's guidance, and teachers and students can interact to achieve the teaching and learning Resonance.

#### **2.1.3. OPTIMIZE CLASSROOM TEACHING PROCESS**

Enriching classroom teaching activities and transforming the traditional teaching mode enable students to experience the process of abstract knowledge learning, conceptual knowledge learning, and to enhance the ability to discover problems, analyze problems, and solve problems through knowledge point induction knowledge point comparison, etc. On the basis of ensuring the understanding of mathematical knowledge, a solid foundation is laid for the subsequent learning of more difficult mathematical knowledge. At the same time, the introduction of inquiry-based teaching mode, experiential teaching mode and mathematical modeling activities ensure that students can understand the main knowledge content more comprehensively.

### **2.2. ANALYSIS OF THE STAGES OF IMPLEMENTING INQUIRY-BASED TEACHING**

#### **2.2.1. PROBLEM INTRODUCTION PHASE**

Teachers start from students' cognitive base, and design problems in accordance with the teaching content to make students clear the goal of inquiry, while stimulating students' enthusiasm and initiative in inquiry learning. Students use their own thinking to come up with some initial ideas for solving problems based on their original knowledge and experience, and learn and solve problem-related content independently. Fully demonstrate their own thinking process and methods to reveal the laws of knowledge and the methods and approaches to solve problems.

#### **2.2.2. PROBLEM SOLVING STAGE**

Teachers try to provoke students to think deeply and exchange and discuss again as much as possible, and guide them to summarize what they have learned and how to solve problems,

so that new knowledge can be consolidated and internalized on the original basis. So that students can flexibly use what they have learned, they can broaden their thinking, experience success and explore innovation, so as to refine and sublimate their thinking and construct their own knowledge system.

### 3. RESEARCH ON INNOVATIVE MODELS OF TEACHING HIGHER MATHEMATICS

#### 3.1. MATHEMATICS QUALITY INDICATORS

Mathematical quality is the characteristic and basis of a socialized person's mature personality in mathematics, and for students it is a facet of their professional quality. In the process of learning mathematics and applying mathematics, students internalize mathematical knowledge and abilities in their own development, and gradually develop a sense of mathematical thinking and the ability to use "mathematical" methods to observe the world and solve practical problems. The mathematical qualities of students are shown in Table 1. "Mathematical thinking and awareness", "ability to calculate mathematical problems", "ability to reason and argue", "ability to apply in practice" and "sustainable development of mathematical psychology". These five level 1 indicators are subdivided into several level 2 indicators.

**Table 1.** Indicator system for assessing students' quality in mathematics

Tier 1 Indicators	Secondary indicators
Mind and Awareness	Knowledge perception
	Quantitative awareness
Numeracy	Open-mindedness
	Accurate calculations
Ability to reason and argue	Analytical skills
	Logical reasoning
Practical application skills	Creative ability
	Thinking and thinking
Mathematical psychology	Quality of will
	Thinking and attitude

#### 3.2. SIGNIFICANCE ANALYSIS OF MATHEMATICAL QUALITY

In order to investigate the differences of students' mathematical quality under the innovative mode of teaching higher mathematics education, students were randomly selected to carry out a control experiment, and the significant data of mathematical quality between the control group and the experimental group are shown in Table 2.

The weight vector was taken as:

$$W = \omega_1, \omega_2, \omega_3, \omega_4, \omega_5 = (0.20, 0.20, 0.25, 0.25, 0.1) \quad (1)$$

Take confidence level  $\lambda = 0.66$ .

From the experimental group, 30 students were randomly selected with an average mathematical quality score of 40.4 and a standard deviation of 18.3, while the control group was selected with an average mathematical quality score of 37.5 and a standard deviation of 17.4. Through the above analysis, the overall quality of the students in the experimental group improved greatly after the implementation of inquiry-based teaching, especially the ability to reason and argue, and the practical application ability changed greatly, while the control group The overall quality of the students in the control group did not improve significantly. This fully

illustrates the importance of changing teaching methods and mobilizing students' enthusiasm and creativity to improve students' mathematical quality. This evaluation provides the necessary support for the scientific evaluation of the quality of education after the innovation of the teaching model.

**Table 2.** Data on the significance of students' quality in mathematics

Types	Thought and Awareness	Mathematical Calculation	Reasoning and argumentation	Practical Application	Mathematical Psychology	Overall score
Experimental group	9.5	8.5	8.0	8.0	8.5	0.49
	8.5	7.0	8.5	8.0	7.5	0.39
	9.0	8.0	6.5	8.5	9.5	0.47
Control group	8.5	7.5	7.0	9.5	6.5	0.41
	7.5	7.5	8.5	7.5	8.5	0.37
	9.0	8.0	7.5	7.0	9.0	0.41

#### 4. CONCLUSION

Deep learning methods are highly compatible with the reform of mathematics curriculum in colleges and universities, and there are many interactions between them. By scientifically summarizing, scientifically summarizing teaching contents, setting deep learning objectives, appropriately introducing deep learning contents, scientifically organizing teaching activities and optimizing classroom teaching process, we can significantly improve the teaching effect of mathematics in colleges and universities, and lay a solid and stable foundation for students' learning ability and mathematical thinking development while ensuring the level of mathematics teaching in colleges and universities. Help students to enter into a deep learning state. The second is to combine the students' interest characteristics and cognitive level to carry out targeted training, to ensure that the students' understanding of the depth of the content learned on the basis of the students' key abilities and higher-order thinking can also be solidly improved.

## ABSTRACT

This paper explores the English text information translation framework, embeds the alignment model into the knowledge graph to construct the MTransD model, carries out a comparative analysis study of the MTransD model and the traditional method, and analyzes the factors affecting the model effect. The four metrics of MRR, Hits@1, Hits@3, and Hits@10 were improved by 1.7, 4.3, 3.8, and 1.7 percentage points. On the WN18RR dataset, the MTransD model achieves optimal results on all metrics, and improves at least 1.6, 3.9, 4.6 and 8.6 percentage points on the four metrics of MRR, Hits@1, Hits@3, and Hits@10 compared to the knowledge graph complementation model using graph neural networks. It proves that the MTransD knowledge graph model has better generalization ability in English text information translation.

## KEYWORDS

Knowledge graph; WN18RR dataset; MTransD model; translation framework; Alignment model

## 1. INTRODUCTION

The concept of Knowledge Graph was born in 2012. In order to systematize knowledge and information so that users can obtain a complete system of relevant knowledge by any keyword and improve the quality of search, Google proposed the concept of knowledge graph and constructed the initial knowledge graph [1-3]. Since knowledge graphs can accurately reflect real-world facts and can express abstract knowledge such as concepts and hierarchies well [4-5]. In recent years, knowledge graphs have been applied to several fields and a lot of research has been conducted around them [6-7]. In this paper, we analyze and solve a series of problems and propose solutions for the alignment and fusion of knowledge graphs for English textual information translation to improve the internationalization of linked data between different languages and the globalization of knowledge sharing, and to facilitate applications such as natural language processing for English textual information translation, English information retrieval, simultaneous translation, and cross-lingual knowledge Q&A [8-10].

## 2. KNOWLEDGE BASE MODEL AND ENGLISH TEXT INFORMATION TRANSLATION

### 2.1. ENGLISH TEXT INFORMATION

#### 2.1.1. ENGLISH TEXT INFORMATION TRANSLATION FRAMEWORK

The focus of information translation in English texts is on “external situations, facts about a

subject”, “ontology beyond language”. Therefore, conveying true and accurate information is the core of such texts, and the language is plain and objective, and the author of the text is only in an “anonymous” position in the text, only conveying information objectively, with little personal emotion. For the translation of English text information, the translator should put the reader's understanding and reaction in the first place, that is to say, pay attention to the effect of information transmission, and it is important to transmit information accurately and truthfully. In informational texts, the text structure is focused on the semantic syntactic level, and literary techniques take a back seat to the communication of content as the primary task.

### **2.1.2. TRANSLATION PRINCIPLES**

Translation of English text information should follow the following three principles:

(1) The principle of fidelity, the translation is concerned with the professionalism of expression and must be 100% faithful, aiming to deliver true and accurate information to the readers.

(2) The principle of accuracy, which means that the translator cannot arbitrarily miss the information of the original text. The core function of English text information translation is “authenticity”, mainly to express information, which requires that the translation must be accurate and clear in order to achieve the purpose of transmitting true and effective information.

(3) The principle of readability refers to the fact that the translator can not stick to the original text, make corrections to the original text and restructure the sentences to enhance the readability of the translation. The advantages of the translated language should be brought into play to enhance the readability of the text.

## **2.2. KNOWLEDGE GRAPH FOR ENGLISH TEXT INFORMATION TRANSLATION**

### **2.2.1. KNOWLEDGE GRAPH EMBEDDING ALIGNMENT MODEL**

The knowledge graph embedding model is a model that uses vectors to express knowledge by embedding the knowledge graph into a low-dimensional real vector space. Compared with the knowledge expressed in discrete form in the knowledge graph, vectors have continuity and thus can model the association between entities and relations in the knowledge graph with the help of spatial relations of vectors. Based on previous work in the field of knowledge graph embedding models, this paper proposes a multilingual knowledge graph embedding alignment model MtransD that dynamically constructs spatial connections.

### **2.2.2. THE IDEA OF MTRANSD MODEL**

The MTransD model takes advantage of the TransD model's separation of semantic and spatial information, opens up new meanings and functions for the projection vectors in the TransD model, and improves on previous work in the area of multilingual knowledge graph embedding. The MTransD model uses the knowledge model and the alignment model together to learn a multilingual knowledge graph embedding model. The knowledge model embeds the entities and relations of each language into the corresponding vector space separately, and the alignment model performs cross-linguistic transformation of the learned entities and relations for each language. In the following, the knowledge model and alignment model of MTransD model are introduced with two languages as examples. Since the MTransD model has the advantage of multi-lingual knowledge graph embedding innately, it is possible to either learn a series of alignment models or train the models separately to form an overall alignment model for a knowledge graph set of more than two languages.

### **2.2.3. MTRANSD MODEL APPLIED TO ALIGNMENT AND FUSION PROBLEMS**

Ideally, the semantic vectors corresponding to entities or relations with the same semantics in the knowledge graph of different languages should be identical in the embedding vector space. Although the semantic vectors corresponding to entities or relations with the same semantics in the knowledge graphs of different languages are not exactly the same in the trained models due to the limitations of the training set and training process, however, the corresponding semantic vectors have a tendency to converge to the same during the training process, so they can be applied to the alignment and fusion of cross-language entities and relations.

### 3. STUDY ON THE KNOWLEDGE BASE OF ENGLISH TEXT INFORMATION TRANSLATION

#### 3.1. COMPARATIVE ANALYSIS OF MTRANSD MODEL AND TRADITIONAL METHODS

In this paper, we compare popular knowledge graph complementation models in recent years to evaluate the performance of the MTransD model, and compare the difference in effectiveness between the MTransD model and the above models on four datasets, FB15K237, WN18RR, Kinship, and UMLS. a comparison of the effectiveness of the MTransD model and the baseline model on the four datasets is shown in Table 1. Compared with the four baseline models using graph neural networks, the model in this paper improved at least 1.7, 4.3, 3.8 and 1.7 percentage points on the four metrics of MRR, Hits@1, Hits@3 and Hits@10. On the WN18RR dataset, the model in this paper achieves optimal results on all metrics. Compared with the knowledge graph complementation model using graph neural networks, the model in this paper improves at least 1.6, 3.9, 4.6, and 8.6 percentage points on four metrics, MRR, Hits@1, Hits@3, and Hits@10. On Kinship dataset and UMLS dataset, the model also achieves the best results on all metrics, Hits@1 metrics improved by at least 17.8 and 5.3 percentage points compared to the five baseline models, indicating that the model can be effectively applied to domain-specific datasets, proving that the model has good generalization ability and proving the effectiveness of the model in this paper.

**Table 1.** Results of MTransD Model and Baseline Models on the WN18RR Datasets

Models	WN18RR			
	MRR/%	Hits@1/%	Hits@3/%	Hits@10/%
TransE	22.2	4.9	35.2	32.4
TransH	22.5	5.3	32.8	40.3
TransR	23.0	8.2	32.5	40.9

#### 3.2. ANALYSIS OF FACTORS INFLUENCING MODEL EFFECTS

In order to investigate the effect of each module on the effect of MTransD model, this paper conducts ablation experiments on the general domain dataset WN18RR. The results of the ablation experiments of MTransD model on the WN18RR dataset are shown in Table 2. The

two experiments include removing the contrast learning loss and removing the entity relationship fusion module. It can be seen that the model effect is reduced to different degrees after removing both the contrast learning loss and entity relationship fusion modules. After removing the contrast learning loss, the MTransD model is reduced by 1.6, 2.0, 2.2 and 0.9 percentage points on the WN18RR dataset, respectively. After removing the entity relationship fusion module, it is reduced by 1.9, 4.7, 2.0 and 2.7 percentage points on the WN18RR dataset, respectively. The results of the ablation experiments demonstrate the effectiveness of the above two modules in the MTransD model.

**Table 2.** Ablation Experimental Results of MTransD Model on the WN18RR Dataset

Models	MRR/%	Hits@1/%	Hits@3/%	Hits@10/%
MTransD	45.6	48.9	52.2	61.9
w/o Contrast learning loss	44.0(-1.6)	46.9(-2.0)	50.0(-2.2)	61.0(-0.9)
w/o Entity relationship integration	44.5(-1.9)	44.2(-4.7)	50.2(-2.0)	59.2(-2.7)

#### 4. CONCLUSION

The research direction of this paper is knowledge graph, and the main research content is alignment and fusion of knowledge graphs for English textual information translation. Based on the previous work in the field of knowledge graph embedding model, a knowledge graph embedding alignment model MTransD for English text information translation is proposed, and the idea of the model, knowledge model, alignment model, and training process are elaborated. The form of separating semantic vectors and spatial vectors is used in the model, and the alignment model is constructed between different languages with the help of semantic vectors and spatial vectors. Based on this, two kinds of loss functions for the alignment model and a model training process adapted to the characteristics of multilingual knowledge graphs are proposed in this paper. After experiments, the feasibility and effectiveness of the model are verified.

## ABSTRACT

This paper analyzes the employment and entrepreneurship guidance strategies in colleges and universities, and analyzes the current teaching situation at this stage, and explores the level of students' entrepreneurial practice according to the level of their ability, and strengthens the guidance strategies and ability development based on the analysis of the problems. 38% of students do not understand the employment policy, 59% of students do not have timely access to employment information, 28% of students lack experience in online application, 65% of students lack of interview experience, and 23% and 48% of students, respectively, chose vague career planning and little work experience. Colleges and universities in the development of guidance strategies and ability development plan from the practical perspective of contemporary solutions to college students' job search dilemmas, so that students have the ability to employment and entrepreneurship.

## KEYWORDS

Employment and entrepreneurship; Student entrepreneurship; Guidance strategy; Ability development; Job search dilemma

## 1. INTRODUCTION

The Internet era has brought unprecedented opportunities for career guidance in colleges and universities, and new impetus for educational reform and innovation [1-2]. The employment guidance in colleges and universities is generally guided by the concept of career selection and self-employment of college students [3]. With the gradual increase of graduates, the market competition is also getting stronger, so the application of employment guidance should be carried out for the shortcomings of college students in entrepreneurship [4-5]. Through the development of employment projects for college students, students are encouraged to practice while ensuring that they can have the ability to start their own businesses as a way to cope with social employment pressure [6-7]. In this paper, we combine the background of the Internet era, deeply analyze the advantages of the Internet in unifying social resources and its influence on college students' employment and entrepreneurship guidance, and explore new strategies and capacity development of employment guidance in combination with the long-standing traditional strategies of college students' employment guidance [8-9]. In order to improve the awareness and ability of college students' employment and entrepreneurship in the context of Internet and further promote the prosperous development of Internet and the reform of college education.

## **2. ANALYSIS OF THE CURRENT SITUATION AND PROBLEMS OF EMPLOYMENT AND ENTREPRENEURSHIP IN COLLEGES AND UNIVERSITIES**

### **2.1. EMPLOYMENT AND ENTREPRENEURSHIP IN UNIVERSITIES IN THE INTERNET ERA**

#### **2.1.1. THE PHENOMENON OF SOCIAL DISCONNECTION IN HIGHER EDUCATION**

Due to the current overall environment in China, employment and entrepreneurship education starts late compared to developed countries. Students are still in the early stage of understanding about employment and entrepreneurship, and there is no good atmosphere and environment for entrepreneurship due to the overall general environment of the school. In general, college students lack attention to entrepreneurship under the long-term influence and limitation of the traditional closed teaching mode, while most of them do not have the spirit of employment entrepreneurship.

#### **2.1.2. THE LEVEL OF STUDENTS' ENTREPRENEURIAL PRACTICE ABILITY**

Teachers of employment and entrepreneurship in colleges and universities still have a narrow knowledge and understanding of entrepreneurship education and inaccurate positioning. The curriculum focuses on improving students' professional skills and does not pay attention to creating an entrepreneurial atmosphere to improve students' enthusiasm and enthusiasm for entrepreneurship. This leads to a weak level of students' entrepreneurial practical skills, insufficient knowledge reserves, lack of entrepreneurial motivation and self-confidence, and then insufficient overall self-confidence in entrepreneurship. They hold a skeptical attitude towards their technical level, capital source, communication ability, organization ability, management level, etc.

### **2.2. STRATEGIES FOR EMPLOYMENT AND ENTREPRENEURSHIP GUIDANCE IN HIGHER EDUCATION**

#### **2.2.1. EMPLOYMENT SITUATION GUIDANCE**

In order to better help students to make their life choices, we should combine the market development trend to ensure that college students understand the employment prospect, enhance the awareness of market concepts, and know their own advantages and shortcomings, so as to effectively ensure that college students can quickly integrate into the development of society. Colleges and universities should lead college students to establish a clear perception of the employment situation and look at it correctly, avoid having too high expectations of themselves, avoid the appearance of excessive "superiority", do not be blinded by the traditional employment concept, uphold the mentality of striving hard and be well prepared for employment competition.

#### **2.2.2. KNOWLEDGE AND COMPETENCY GUIDANCE**

Only with sufficient knowledge can one exert one's ability. However, knowledge does not mean having the ability, but in the process of improving the ability, it should be based on understanding and applying the knowledge. With the continuous development of the society, there are brand-new requirements for "talents": a perfect knowledge structure, the existence of innovative ideas and abilities, the ability to manage and express, etc. Therefore, in order to better choose a career and employment, contemporary university students should pay attention to the cultivation of abilities in addition to the guidance that they should improve their knowledge under the condition of systematic and comprehensive knowledge structure.

#### **2.2.3. COLLEGE STUDENTS' CAREER PLANNING DESIGN**

Career planning design is of great importance to individuals in choosing their careers. Only

through continuous understanding of one's own situation and comprehensive self-cognition can one purposefully determine career direction and thus complete career design. The cognition of self is to analyze the strengths and weaknesses of oneself more deeply, and to gain insight into the level of one's ability. Combined with my work experience, I study the direction of future employment, so as to know the question of "what can I do". In the process of career planning, college students should analyze their own highlights and continuously improve and enrich them, so as to realize their life value.

### 3. ANALYSIS OF COLLEGE STUDENTS' EMPLOYMENT AND ENTREPRENEURSHIP GUIDANCE STRATEGIES AND CAPACITY DEVELOPMENT

#### 3.1. CAREER GUIDANCE STRATEGIES FOR COLLEGE STUDENTS

In order to explore the countermeasures in college students' career guidance strategy to cope with students' difficulties in seeking help, the factors of college students' difficulties in seeking jobs were analyzed, and the factors of college students' difficulties in seeking jobs are shown in Figure 1. 38% of students did not understand the employment policy, 59% of students did not have timely access to employment information, 28% of students lacked experience in online application, 65% of students had insufficient interview experience, 6% of students had unsatisfactory written exams, 23% and 48% of students, respectively, chose vague career planning and little work experience. Therefore, among the problems that affect job seekers applying for jobs, they are more seriously affected by untimely employment information on the one hand and insufficient interview experience on the other. Therefore, college students' employment guidance strategy should focus on these factors of job search difficulties, realistically help to solve the problem of difficult job search and improve students' employment and entrepreneurial ability.

**Figure 1.** Factors that make it difficult for university students to find work

#### 3.2. CAREER AND ENTREPRENEURSHIP DEVELOPMENT COURSES

In order to study the cultivation of college students' employment and entrepreneurial skills by the college employment courses, the analysis was conducted on the students who participated in the employment guidance courses. 25% of the students chose the career plan,

28% chose the written test skills, 29% chose the interview skills, and the numbers of those who chose the online application skills, the skills of adjusting the mindset of the career, making personal files and others were 4%, 5%, 8% and 2% respectively. From this we can see that in the process of job hunting, employment refers to the teacher as the main body of teaching, whose theoretical knowledge determines the depth of teaching, and whose social level of knowledge determines the students' ability to cope in the specific practical process.

**Figure 2.** Analysis of students' choice of career guidance content

#### 4. CONCLUSION

At the present stage, the cultivation of employment and entrepreneurial ability for college students is an important demand for economic and social development, and the construction of employment guidance mode and the strengthening of employment ability cultivation on this basis is a basic goal to enhance the effect of higher education. In the current employment and entrepreneurship education for college students, there are various problems such as imperfect discipline system and poor entrepreneurial environment. Therefore, in order to guarantee the effect of employment guidance for school students, students should be cultivated with innovative thinking and entrepreneurial consciousness. The school should also optimize the employment and entrepreneurship ability by updating the concept of employment and entrepreneurship guidance and strengthening the faculty construction at the same time. In the strengthening of the strategy, the overall construction effect is ensured by strengthening the entrepreneurial concept and consciousness and introducing innovative employment models on the basis of improving the entrepreneurial employment team, so as to improve the entrepreneurial ability at the same time.

## ABSTRACT

This paper analyzes the effectiveness of teaching applications in primary and secondary schools in the context of education informatization by exploring the overall level of information technology teaching in primary and secondary schools and conducting research on teaching reform strategies in primary and secondary schools. 38.21% of teachers think that information technology is of great value, 57.24% of teachers think it is of great value, 52% of teachers strongly support the application of information technology to classroom teaching, 36% of teachers were more supportive, and another 12% of teachers had little or no recognition of the teaching application of information technology. Therefore, the teaching reform in primary and secondary schools should be student-oriented and adhere to the use of information technology teaching to guide students' independent learning, so as to achieve the fundamental purpose of teaching reform.

## KEYWORDS

Primary and secondary school teaching; Teaching reform; Education informatization; Independent learning; Application effectiveness

## 1. INTRODUCTION

With the continuous development of information technology, education informatization and curriculum reform, various modern educational technology media and information resources have been introduced into schools, and information technology, represented by computers and the Internet, has been commonly used in schools and universities [1-3]. The pace of education modernization has greatly accelerated, and teachers' lesson preparation and teaching methods have undergone fundamental changes [4-5]. In this context, information-based instructional design has emerged and gradually replaced traditional instructional design methods, and teachers' ability of information-based instructional design has become an important criterion for teachers' professional quality [6-8]. However, as a new type of instructional design, some problems inevitably occur in the process of teaching application [9-10].

## 2. EFFECTIVENESS OF TEACHING APPLICATIONS IN PRIMARY AND SECONDARY SCHOOLS IN THE CONTEXT OF EDUCATION INFORMATIZATION

### 2.1. OVERALL LEVEL OF TEACHING IN PRIMARY AND SECONDARY SCHOOLS

#### 2.1.1. TEACHERS ARE ACTIVE IN INFORMATION-BASED TEACHING

To explore teachers' enthusiasm for information technology teaching, the application of information technology teaching by primary and secondary school teachers was analyzed, and the value of information technology teaching reform to improve teaching effectiveness is shown in Figure 1. 38.21% of teachers thought that information technology was of great value, 57.24% thought it was of great value, 52% strongly supported the application of information technology to classroom teaching, and 36% Another 12% of teachers did not recognize the application of IT in teaching very much or not very much. Primary and secondary school teachers' recognition of IT application in teaching and learning was high, between very supportive and relatively supportive.

**Figure 1.** Value identity of information technology to improve teaching effectiveness

#### 2.1.2. ABILITY TO APPLY INFORMATION-BASED TEACHING

In terms of teachers' ability to apply information technology, the subject teachers' ability to search for teaching resources, ability to create teaching resources, ability to present information using technology, ability to use technology as a cognitive tool, ability to use technology as an interactive tool, and ability to use technology as an evaluation tool were examined. The results of descriptive statistics of teachers' application of information technology in teaching are shown in Table 1. The observation statistics revealed that 51.5% of the teachers were relatively proficient in using information technology, 30.3% were less proficient, and 18.2% were not proficient.

**Table 1.** Teachers applied information teaching descriptive statistics results

<b>Dimensionality</b>	<b>Average value</b>	<b>Standard deviation</b>	<b>Variance</b>
Teaching Resource Search	3.58	0.738	0.573
Teaching Resource Production	2.71	0.748	0.551
Media presentation of information	3.20	0.782	0.536
As a cognitive tool	3.09	0.728	0.628
As an interactive tool	3.01	0.672	0.527
As an evaluation tool	2.51	0.662	0.529

## **2.2. NEED FOR TEACHING REFORM**

### **2.2.1. STIMULATE STUDENTS' INTEREST IN LEARNING**

Under the traditional “blackboard + chalk” teaching mode, students always receive knowledge passively and often learn only for the purpose of exams, without applying mathematical methods to solve practical problems. In the background of education information technology, the new classroom teaching can create effective teaching scenarios and animation effects to help students understand the classroom knowledge, thus enhancing students' interest in learning and helping to promote the teaching reform in primary and secondary schools.

### **2.2.2. 2.2.2 ENRICHING TEACHING RESOURCES**

Traditional teaching methods have a lack of teaching resources, and textbooks are almost the only source of information. This kind of learning cannot broaden students' horizons and acquire more, newer and broader knowledge. Teachers should encourage students to expand their thinking space and build a bridge for them to realize the leap from concrete perception to abstract thinking. Information technology in education not only provides rich resources for teaching, but also develops students' knowledge and cultivates their creative spirit and innovative consciousness. The rich teaching resources provided by information technology not only further expand students' knowledge horizons, enhance their motivation to learn, but also enable them to enjoy classroom learning.

### **2.2.3. REALIZE RESOURCE SHARING**

Teaching resources are an important part of the teaching and learning system, which is directly related to the quality of teaching and learning. There is a relatively serious problem of educational equity at present. The differentiation of educational resources is an important reason for the problem of educational equity, and excellent teachers and advanced equipment become the primary consideration. Reasonable use of information technology to realize the sharing of high-quality educational resources is an important way to solve the problem of educational resource equity.

## **3. STUDY ON THE STRATEGIES OF TEACHING REFORM IN PRIMARY AND SECONDARY SCHOOLS**

### **3.1. RATIONALIZATION OF CAPITAL INVESTMENT**

Increase the proportion of funds invested in less developed areas to narrow the distance between regions and between urban and rural areas. Make education get balanced development. Set up relevant special funds for informatization teaching design to effectively meet the different needs of informatization teaching design for computers, campus network, multimedia classrooms and other hardware environments. In addition, after all, the education department's allocation is limited, and schools or relevant education departments with conditions can also obtain more funds for information teaching equipment through the means

of funding from other enterprises or institutions in society.

### **3.2. IMPROVE INFORMATION-BASED TEACHING DESIGN ASSESSMENT**

Schools should system a scientific and reasonable assessment system of informatization teaching design according to the actual situation of their schools, clarify the assessment criteria for teachers at different levels, and include the assessment of informatization teaching design in the assessment of teachers' performance. In addition, different assessment methods should be chosen for teachers of different levels according to their characteristics.

### **3.3. CHANGING TRADITIONAL TEACHING PHILOSOPHY**

For a long time, teachers in primary and secondary schools have been under pressure from various aspects, such as completing teaching tasks, i.e. teaching objectives, and are accustomed to a teaching-oriented teaching style. Therefore, in order to change this way of teaching, teachers must first understand that the traditional teaching-oriented teaching mode is no longer able to meet the requirements of the development of the educational situation. Modern educational thinking requires teachers to reflect the main position of students in teaching activities in the teaching design. Therefore, teachers should pay attention to informatization teaching design from the concept, use modern education ideas and concepts to guide informatization teaching design, and continuously improve their own professional development level.

## **4. CONCLUSION**

In recent years, against the background of the rapid spread of information technology and the rapid development of the information society, information technology has begun to enter classroom teaching rapidly and comprehensively. "The integration of information technology and teaching has received unprecedented attention from the government, schools and teachers. The teaching reform effectively improves learning efficiency, reduces students' learning burden, and effectively strengthens the effective communication between students and teachers, which is very effective in cultivating students' interest in learning mathematics and logical thinking ability and improving students' learning efficiency. It enables education informatization to serve teaching well, and can integrate high-quality teaching and education resources from the society, provide a better learning platform for students and bring more effective teaching support to teachers.

# RESEARCH ON INNOVATIVE PRACTICAL TEACHING MODE OF COLLEGE CIVIC SCIENCE COURSE IN THE INTERNET ERA

---

Jingyu Han\*

Heilongjiang University of Technology, Jixi, Heilongjiang, 158100, China

[hjy20230410@163.com](mailto:hjy20230410@163.com)

Yunyan Fu

Heilongjiang University of Technology, Jixi, Heilongjiang, 158100, China

---

## ABSTRACT

This essay examines the problems with the way civics is currently taught in colleges, examines how students can take civics courses in an online classroom setting, looks at how online teaching is evolving, and offers recommendations for the creative design of civics curricula in colleges and universities. In 39.59% of colleges and universities, the development style for online civics courses is based on a social public platform, in 37.32% on a hybrid teaching platform, and in 19.35% of colleges and universities, on a self-developed online platform. It is clear that in the age of the Internet, colleges and universities rely on the Internet platform for online instruction in order to implement the innovation of civics and political science courses and alter the conventional teaching approach.

## KEYWORDS

College Civics; Teaching mode; Online teaching; Curriculum innovation; Internet platform

## 1. INTRODUCTION

The fast advancement of information network technology and the onset of the Internet era, as well as the Internet's tight relationship to several facets of human social existence [1-2]. Among these, Internet education creates a new paradigm in the field of education by fusing Internet technology with pertinent instructional materials, changing and modernizing educational practices, and enhancing educational outcomes [3-4]. The online classroom education mode of the ideology course has emerged, bringing new changes to the teaching and development of the ideology course in colleges and universities [5-6]. The focus of innovation in the Civic Science course in modern colleges and universities has been the integration of the Internet with ideological and political education, and the combination with the course. While the Internet promotes the teaching innovation of Civic Science course, there is still much to be done, it is also essential [7].

As a useful supplement to classroom teaching, online teaching focuses on guiding students to learn basic knowledge, basic theories and other contents [8-9]. To ensure that conventional teaching techniques may be naturally merged with contemporary information technology and that its form can be continually developed, it is necessary in the present day to examine the content design and function of online teaching.

## **2. INNOVATIVE TEACHING MODE PRACTICE OF CIVIC SCIENCE COURSE IN HIGHER EDUCATION**

### **2.1. TEACHING MODE OF CIVICS**

#### **2.1.1. SINGULARITY OF TEACHING SYSTEM**

Higher education institutions advocate independent learning, and teachers' classroom lectures play the role of refining and summarizing the core content, in order to effectively supplement the Civics and Political Science curriculum. To create a rich and varied teaching system for the civics and political science course, active introduction of Internet teaching and practical teaching should be made in addition to traditional classroom teaching techniques. The content of the Civics course is certainly theoretical, but its main value is to serve the growth of students. Diversified teaching methods can improve students' understanding of Civics theory and regulate their behavior and establish correct values according to the relevant requirements.

#### **2.1.2. LACK OF SCIENCE IN TEACHING**

Today's university courses focus mostly on theory, which is dry and abstract. As a result, professors must provide a lot of examples to assist students better understand the theoretical material. The classroom teaching of civics is deficient in theoretical and practical aspects due to the credit hour system adopted by universities, and students are unable to develop a rich understanding of the connection between this theoretical knowledge and study, employment, and personal growth. As a result, it is challenging to achieve good teaching results.

#### **2.1.3. THE PRINCIPLE OF EQUAL EMPHASIS ON THEORY AND PRACTICE**

Higher education institutions lack the awareness and conditions for high-quality practical teaching in the teaching of Civics, and many Civics teachers think that practical teaching in Civics is to organize students to write papers, participate in classroom discussions or conduct extracurricular investigations. Many students lack interest in civics classes because they are unable to articulate how these topics apply to everyday life. Due to the lack of high-quality practical Civics learning programs and the fact that the majority of practical courses have evolved into extensions of theoretical assessment, the level of attention given to the practice of Civic Education in higher education institutions is far from sufficient and even cannot keep up with the rhythm of the times.

### **2.2. CIVICS COURSES IN UNIVERSITIES BASED ON THE INTERNET**

#### **2.2.1. CIVIC THEORY CLASS ONLINE CLASSROOM**

In the traditional classroom teaching, the form of carrying out the Civics course is relatively single, and the application of network classroom brings a new form of experience to the Civics course, this increases the room for teaching civics courses at colleges and universities and gives the subject more flexibility. At the present stage, the close combination of online classroom and college Civics course, students love the online classroom teaching form of Civics course as shown in Table 1. There are 54.35% students choose recorded teaching, 36.12% students choose live teaching, and 8.53% students choose to refer to textual materials on the Internet. Colleges and universities are gradually mixing the forms of online classroom for Civics courses, combining the uniqueness of Civics courses themselves, gradually increasing the investment in the form of live streaming, effectively connecting live teaching with recorded teaching, and at the same time using the literature on the network platform as an auxiliary teaching.

**Table 1.** Students' favourite forms of online classroom teaching in Civics

Type	Number of people	Proportion
Recorded instruction	117	54.35%
Live Streaming	289	36.12%
Web reference text material	82	8.53%

### 2.2.2. MULTIPLE DEVELOPMENT MODELS TO IMPLEMENT ONLINE TEACHING

Universities cannot teach civics online in a classroom setting without the assistance of appropriate technological platforms, but the online teaching platforms now in use in universities have a significant influence on how online classes are implemented. The fundamental principles and fundamental notions of ideological and political education in universities are offered in this article through a study of the existing situation of online teaching of civics and political science classes in universities. Schools with social public platforms account for 39.59%, schools with mixed platforms account for 37.32%, and schools with independent research and development account for 19.35% of schools offering civics and political science courses online. The implementation of civics courses in online classrooms at universities may use a range of various development models or a combination of many development techniques.

**Table 2.** Modes of online teaching development for school Civics courses

Model	Number of colleges	Proportion
Self-developed by the university	86	19.35%
Social public platform	205	39.59%
Hybrid development model	197	37.32%

## 3. INNOVATIVE CONSTRUCTION OF CIVIC SCIENCE COURSES IN UNIVERSITIES IN THE INTERNET ERA

### 3.1. OPTIMIZATION OF TEACHING COURSE OBJECTIVES

It is feasible for educators to perform more effectively if they grasp the oriented ideological and political instruction that is implied in the creation of curricular objectives. We should understand the course goals and adhere to the laws of political and ideological work, teaching and education, student growth and success, etc. when carrying out ideological and political education in colleges and universities. Finally, in order to achieve the synergistic optimum of ideological and political course objectives at colleges and universities, we need develop a teaching style and methods that are student-oriented and teacher-assisted.

### 3.2. ADHERE TO THE MAIN CHANNEL OF COURSE TEACHING

Classroom teaching as the main channel of course teaching, when innovating the teaching mode of college Civics course, no matter what kind of teaching mode construction innovation, the most fundamental thing is to adhere to this main channel. In classroom teaching, teachers explain the lecture content through their professional theoretical knowledge, while students can directly communicate with the lecturer face to face in the process, and students' difficult and doubtful problems can be effectively solved in the classroom. The classroom-based teaching method has some positive significance for students to acquire new knowledge to a certain extent. There are still some problems in classroom teaching that need to be changed. While students are the targets of education in the teaching process, some classroom instruction merely emphasizes the "teaching" of teachers and minimizes the "learning" of students. In the classroom teaching, students' subjective status should be effectively played by using more easy-to-understand language, common examples in life, and open teaching

forms to cultivate students' independent thinking and independent learning ability. Only when classroom teaching is truly quality and effective, and the combination of student subject and teacher dominance is truly achieved, can the construction of the curriculum be truly put into practice.

### **3.3. INTERACTIVE E-LEARNING MODEL**

The current era is one in which network information is developing quickly. In this context, curriculum teaching should also be timely innovation. If educators want to achieve the innovation of teaching mode for civics and political science classes, network teaching should be the first thing they take into consideration. In teaching activities, network teaching refers to the creation of an interactive network learning education platform for instructors and students. In this method, students study online while teachers provide answers to their queries and work out difficulties. the development of a varied, all-encompassing learning style through a number of effective learning methods with the Civics course's "classroom teaching and practical teaching" manner of instruction. Combine it with reality, followed by the scientific approach to continual development, to increase the impact of political and ideological education.

## **4. CONCLUSION**

The most fundamental educational goals of civics classes are to mold students' perspectives on life, assist in enhancing their political philosophy and literacy, and cultivate their moral character. These goals are also of utmost importance to students' future development because they have a hundred advantages and no disadvantages. But in the traditional teaching model, there is insufficient integration between teachers' teaching processes and students' learning processes, which is evident in the Civic Science course's single teaching methodology and the weak connections between Civic Science teaching and professional courses. The teaching impact of civics courses in higher education institutions is influenced by two factors: the teaching activities of the teachers and the learning process of the students. However, in the traditional teaching mode, these two links are not sufficiently integrated, which lowers the quality of civics instruction. A variety of educational activities should be carried out, as well as the active development of a network education platform, in order to fully realize the role of civics in civics education. Colleges and universities should also constantly work to prioritize teachers and students as the primary body.

## ABSTRACT

By analyzing the cultivation of journalism communication talents in colleges and universities, this paper explores the current situation of contemporary teaching excellence in journalism communication based on three aspects: curriculum system and curriculum setting, the proportion of theory and practice courses and classroom teaching and journalism practice, and proposes a strategy for cultivating journalism communication talents based on school-based model according to the knowledge quality of journalism communication talents. The mean value of risk awareness is 4.87, the mean value of professional ethics is 4.26, the mean value of ideal is 4.25, the mean value of social value is 4.86, and the mean value of humanistic care is 4.26. Universities should closely follow the goal of cultivating journalism communication talents with excellence and create a school-based model for cultivating journalism communication talents with excellence.

## KEYWORDS

Journalism and communication talents; Talent training; School-based model; Knowledge quality; Training objectives

## 1. INTRODUCTION

Under the background of information communication globalization and media integration, journalism and communication industry is in urgent need of excellent journalism and communication talents [1-2]. As a university, it should follow the development of information technology and new changes in the industry, keep in mind the goal of cultivating excellent journalism and communication talents on the Internet, seek breakthroughs in the construction of curriculum system, reform of training mode, construction of practical training platform, and construction of faculty, and build an excellent journalism and communication talents cultivation mode with school-based characteristics [3-5]. Excellence in journalism talent cultivation is still a new topic for journalism education, which needs to be explored and enriched continuously [6]. Explore the exploration and practice of school-based model for cultivating excellence in journalism talents in universities in the context of Internet [7-8]. Under the influence of the reform and development era and the great change of media industry, how to cultivate journalistic talents of excellence in colleges and universities, based on reality, break through limitations, create characteristics, and cultivate journalistic talents who can tell Chinese stories and spread Chinese voices is an urgent problem to be solved [9].

## **2. EXCELLENCE IN JOURNALISM AND COMMUNICATION PERSONNEL TRAINING MODEL AND EXPLORATION**

### **2.1. MODEL OF EXCELLENCE IN JOURNALISM AND COMMUNICATION IN HIGHER EDUCATION**

#### **2.1.1. BASIC MODEL**

Excellence in journalism and communication talent training mainly consists of two models.

(1) It is to cultivate applied and composite talents with all-media skills.

(2) Cultivating international communication talents with international vision and cross-cultural communication ability.

The two models correspond to different talent specifications and reflect different levels of education. The journalism departments of the first batch of universities selected for the Excellence Program have carried out reforms in the talent cultivation mode, exploring new modes of cultivating excellence in journalism talents through such initiatives as building journalism colleges together with ministries and schools, and building internship bases through cooperation between schools and media, and their schooling philosophy and practical experience have provided inspiration and reference for journalism education in other universities.

#### **2.1.2. SCHOOL-BASED MODEL**

Since the universities are located in different regions and at different levels, there are bound to be differences in the cooperation resources and school conditions. Therefore, colleges and universities should clarify the media resources they have and establish a journalism and communication talent cultivation mode that meets their own conditions and has characteristics when formulating the mode. In the era of diversified interests, diversified public opinions and stratified society, we should select journalists with high sense of social responsibility, mission and public sentiment in terms of talent specification.

### **2.2. EXPLORING CONTEMPORARY EXCELLENCE IN JOURNALISM AND COMMUNICATION TALENT CULTIVATION**

#### **2.2.1. COURSE SYSTEM AND CURRICULUM**

There is an imbalance in the ratio of journalism major courses to non-major courses. Many journalism majors in local colleges and universities are established on the basis of Chinese language majors, which inevitably leaves traces of Chinese language majors in the curriculum. As a professional class under the discipline of literature, journalism and communication is the main disciplinary foundation, therefore, the curriculum of journalism cannot lack the support of basic courses in language and literature. But because journalism has its own knowledge system and ability requirements, if the curriculum is not targeted, it will lead to students' distraction in the learning process, superficial cognition of the profession, professional skills are not solid, and they cannot adapt to the requirements of media positions after graduation.

#### **2.2.2. WEIGHTING OF THEORETICAL AND PRACTICAL COURSES**

The traditional curriculum of journalism emphasizes theoretical courses, and the number of practical and skill courses and class hours are relatively small, and the methods and means of practical teaching are also relatively single. Although some practical courses are designed with practical links, they are constrained by the number of teaching hours and conditions, and cannot provide systematic and effective practical training in classroom teaching, resulting in an imbalance between the proportion of theoretical courses and practical courses.

### 2.2.3. CLASSROOM TEACHING AND JOURNALISTIC PRACTICE

One of the distinctive features of journalism is its practical nature. Compared with the traditional training mode which is mainly based on theoretical teaching, the training mode of excellent journalism and communication talents pays more attention to the implementation and effectiveness of practical teaching. The gap between journalism education and the demand of journalism media talents is obvious, and there is a significant gap between journalism students' cognition, adaptability and practical ability of media and media requirements. The root cause of this is the separation of theory and practice in professional education.

## 3. RESEARCH ON THE EXPLORATION OF EXCELLENCE IN JOURNALISM AND COMMUNICATION TALENT CULTIVATION

### 3.1. RELIABILITY AND VALIDITY ANALYSIS

Before conducting data analysis, the evaluation of reliability and validity was carried out to ensure the validity and reliability of the results of this data collection. The reliability test coefficient proposed by Cronbach is a widely used reliability index, which can more correctly show the degree of internal consistency and the goodness of internal structure of the tested object. Generally speaking, Cronbach's test coefficient is greater than 0.7 that is a test with a better coefficient, and the results of data reliability calculation are shown in Table 1. The test coefficients are all higher than 0.9, indicating that the subjects have good internal consistency and the experiment meets its required reliability requirements.

**Table 1.** Cronbach's reliability analysis

Variables	Number of items	Cronbach
Quality and Awareness	9	0.929
Personality and Motivation	18	0.973
Knowledge Qualities	15	0.933
Skill Qualities	25	0.953

### 3.2. KNOWLEDGE QUALITY ANALYSIS

In order to explore the importance of professional literacy in the cultivation of current excellence in journalism and communication talents, a study was conducted on the professional literacy of contemporary journalism and communication talents, and the mean values of the quality factors of journalism knowledge were analyzed as shown in Table 2. The mean value of cultural cultivation is 3.60, the mean value of news sensitivity is 4.12, the mean value of social justice is 4.27 the mean value of professionalism is 3.79, the mean value of risk awareness is 4.87, the mean value of professional ethics is 4.26, the mean value of truthfulness is 3.35, the mean value of ideal is 4.25, the mean value of social value is 4.86, and the mean value of humanistic care is 4.26. It reflects that under the Internet environment, excellent journalism communication talents should have a broad professional knowledge and the demand for knowledge quality should be not only professional but also comprehensive.

**Table 2.** Knowledge quality factors for excellence in journalism and communication

Intellectual factors	Average value
Cultural Cultivation	3.60
Journalistic sensitivity	4.12
Sense of social justice	4.27
Professionalism	3.79
Risk Awareness	4.87
Professional ethics	4.26
Truthfulness	3.35
Ideals	4.25
Social Value	4.86
Humanistic Care	4.26

#### 4. CONCLUSION

Faced with the current transformation of the news communication landscape, journalism and communication faculties in colleges and universities have begun to make corresponding adjustments to journalism and communication education and carry out the cultivation of excellence in journalism and communication talents in colleges and universities. They strengthen the connection and cooperation with the media industry and pay attention to the cultivation of students' practical ability. In addition, in terms of experimental and practical teaching platforms, some universities have gradually begun to pay attention to and increase the financial investment in the teaching hardware and equipment system, and have achieved initial results, providing valuable reference for the cultivation of journalism communication talents of excellence in journalism schools of other universities. Strengthen the design of practical courses. The design of the practical courses is based on the actual practice of journalism, including both in-class practice and extra-curricular practice. The in-class practice is closely coordinated with the content of practical courses, including news writing, work evaluation, news planning, newspaper editing, news photography, TV program production, graphic image processing and other practical training, focusing on cultivating students' professional thinking and operational skills. The university keeps up with the development of information technology and the new changes in the industry, focuses on the goal of training journalism and communication talents, makes good use of its own and local media resources, and creates a new model of training excellence in journalism and communication talents with school-based characteristics.

## ABSTRACT

This paper describes the latest research results and methods of image semantic segmentation, reviews three common neural networks for semantic segmentation, namely, convolutional neural networks, probabilistic graphical models, and recurrent neural networks are used to highlight how neural networks have contributed to the area of semantic segmentation and to provide a summary of the most popular public datasets at the moment. The SBD dataset is broken down into a training set of 8490 photos and a validation set of 2850 images. The SiftFlow dataset is a subset of the LabelMe dataset, which has 33 semantic categories with 2683 labeled images. The semantic segmentation of pictures based on neural networks is examined and thoroughly researched in response to the more challenging condition of future application needs.

## KEYWORDS

Image semantic segmentation; Recurrent neural network; Convolutional neural network; Dataset; Validation set

## 1. INTRODUCTION

The effectiveness of semantic segmentation has been greatly enhanced by the deep learning technology's quick growth and widespread implementation in this area [1-2]. The disciplines of computer vision, pattern recognition, mapping and remote sensing, geographic information science, etc. have all seen an increase in research outcomes in recent years. Semantic segmentation, the subject of study in the aforementioned domains, has received considerable interest from academics and has a wide range of potential applications [3-5]. Semantic segmentation is a common computer vision challenge that organizes pixels or points in accordance with the many semantics represented by the raw data through a sequence of technical procedures. Raw data inputs include planar pictures and 3D point clouds [6-8]. In this paper, from the perspective of the application of semantic segmentation and the development of deep learning, we analyze and summarize some image semantic segmentation methods with more outstanding performance in terms of algorithm characteristics and model structure, and classify, sort and evaluate them to compare their segmentation effects on commonly used data sets [9]. Facing the future situation of richer application requirements and more demanding performance requirements, the development of semantic segmentation technology will also face more challenges.

## **2. NEURAL NETWORKS COMMONLY USED FOR SEMANTIC SEGMENTATION**

### **2.1. CONVOLUTIONAL NEURAL NETWORK**

The fundamental tenet of the attention mechanism is to dismiss unimportant information and concentrate on important information while performing. The attention mechanism uses a neural network to compute the gradient and learns to gain attention weights through backward and forward feedback. The fixed convolutional kernel structure of FCN-based semantic segmentation framework can only accept short-range contextual information. To capture long-range dependent information, scholars have proposed methods such as dilation convolution and spatial pyramids, however, these methods cannot generate dense contextual information. Introducing the attention mechanism to the semantic segmentation task, PSANet networks are proposed to learn to aggregate the contextual information at each location by predicting the attention graph. However, these attention mechanism-based approaches need to generate huge attention graphs to compute the relationship between each pixel, which has high computational complexity and occupies a large amount of GPU memory. A number of suggested network architectures, such as the crossover attention module, the BiSeNet network, the ACNet network, the HMANet network, etc., have been made in an effort to increase the effectiveness of semantic segmentation. The CCNet module can be inserted into any fully convolutional neural network to achieve efficient end-to-end segmentation. The ACNet network balances RGB image features and depth image features in RGB-D images using a three-parallel branching architecture with an integrated attention mechanism and an attention-assisted module. HMANet is a hybrid multi-attention network for semantic segmentation of aerial images. By introducing the attention mechanism into the semantic segmentation task, the attention mechanism module learns the contextual information and optimizes the attention mechanism to obtain the crossover attention module or self-attention mechanism module, it can increase the perceptual field and, as a result, lessen the reliance on external information by more readily catching the internal importance of data or characteristics.

### **2.2. PROBABILISTIC GRAPHICAL MODEL-BASED APPROACH**

Using pixel points as nodes and probabilistic correlations between pixel points as edges, CNNs serve as the basis for probabilistic graph models that efficiently capture the dependencies between pixel points, obtain global image information and pixel-level semantic information, and provide rich image contextual content for the semantic segmentation process. PGMs are often used and include conditional random fields, Markov random fields, Bayesian networks, etc. CRF model is one of the most commonly incorporated probabilistic graph models into deep learning frameworks. Researchers have combined the use of CRF with CNN for structured prediction to predict information during the transfer inference of information, avoiding the computation of additional learning or information evaluation, thus improving the speed and reducing the amount of operations, which is more scalable in the case of semantic segmentation of images with large data volumes. Although the above methods obtain richer contextual information, they only input images into CRF monadic and pairwise terms for structured prediction, while neglecting to make full use of higher-order potential terms in CRF, resulting in coarse results in image semantic segmentation. Thus, some researchers proposed to embed 2 types of HOPs into CNN for end-to-end training, which improved the segmentation performance.

### **2.3. RECURRENT NEURAL NETWORK BASED APPROACH**

Another popular deep learning model today is the recurrent neural network, which can not only learn information for the present but also draw on information from earlier sequences. This capability makes it possible to model global content, retain historical information, and

encourage the use of image contextual information.

Borrowing from the idea of RNN, the researcher proposed ReSeg network based on image segmentation model using the dependency of local features extracted by CNN and global space retrieved by RNN. The researchers proposed the LSTM-CF network, which can input both photometric and depth images. The LSTM-CF model employs a fusion layer based on long and short temporal memory (LSTM) to combine the contextual data from the photometric and depth channels in the vertical direction to finish end-to-end training and testing of the network. However, image processing using only LSTM requires cutting images into fixed-size blocks, which is inflexible. To solve this problem, some researchers propose Graph-LSTM networks, which simulate long-term relationships and spatial connectedness by creating distance-based superpixel networks and using LSTM to spread neighborhood information. These methods employ each arbitrarily shaped superpixel as a node and adaptively generate undirected graphs for pictures.

RNNs can quickly extract pixel sequence information from pictures, can recursively process historical information and model historical memory, can preserve previous knowledge, and can capture contextual knowledge by simulating long-term semantic relationships of images. In addition, RNNs can be embedded into deep neural networks by combining them with convolutional layers, which can be used to extract local spatial features on the one hand and pixel sequence features on the other hand.

### 3. PERFORMANCE ANALYSIS AND COMPARISON OF SEMANTIC SEGMENTATION ALGORITHMS

#### 3.1. COMMON DATASETS FOR IMAGE SEMANTIC SEGMENTATION

In this paper, we have compiled the commonly used large public datasets, and the common public datasets for semantic segmentation are shown in Table 1. The SiftFlow dataset, a subset of the LabelMe dataset, contains 33 semantic categories with 2683 annotated images, most of which are taken from 8 different outdoor scenes, each with a pixel value of  $256 \times 256$ . The KITTI Autonomous Driving Scene is the most commonly used dataset, containing images collected from German countryside, cities, and highways, for challenges such as road detection, visual ranging, 3D object detection, and tracking. The SBD dataset extends the PASCAL VOC dataset and inherits 11340 semantically annotated images from PASCAL VOC. The dataset is separated into an 8490 picture training set and a 2850 image validation set, which have gradually replaced the PASCAL VOC dataset in practical applications. Originally created as an international competition for target detection tasks, PASCAL VOC has evolved from 2005 to 2012, producing a series of high-quality data, with PASCAL VOC 2012 currently being the most commonly used. There are 21 categories (with context) in the dataset, including people, animals, vehicles, indoor objects, etc.

**Table 1.** Common datasets for semantic segmentation

Data set	Time	Number of categories	Training set	Validation set	Test set
Stanford background	2009	8	745		
SiftFlow	2011	33	2683		45
KITTI-Ros	2015	11	163		115
KITTI-Zhang	2015	10	163		
SBD	2011	21	8490	2850	
PASCAL VOC 2012	2012	21	2850	1559	1459

## Performance Comparison of Semantic Segmentation Algorithms

Since only the points at the junctions predicted to be different classes on the segmentation graph have the possibility of being repaired, i.e., there are adjacent pixel points at the locations of these points in the current prediction graph that are different from the present pixel points, after taking 500 random images, Table 2 displays the results of the performance tests conducted on the official PASCAL VOC 2012 training set and validation set. Therefore, future semantic segmentation will explore how to further improve the segmentation speed while maintaining high accuracy.

**Table 2.** Performance comparison of PASCAL VOC 2012 and KITTI-Zhang measurement sets

PASCAL VOC 2012		KITTI-Zhang	
Method	Performance%	Method	Performance%
Large Kernel Matters	83.6	FCN-8s	82.5
Multipath RefineNet	84.2	PixelNet	87.8
PSPNet	85.7	Context-CRF	76.3
Deeplabv3	86.2	DeepLab-v2	87.2
SDN	87.8	Global-Context	84.1

## 4. CONCLUSION

As a mid-level task in image processing technology, image segmentation aims to extract the target of interest from a complex background, and it is widely used in many fields such as transportation, remote sensing, and medicine. However, it is still difficult to design suitable algorithms to achieve the best segmentation accuracy when segmenting different types of images. Traditional image segmentation techniques, such as pixel-level clustering-based segmentation approaches, etc., process and analyze pictures based on attributes including color, spatial organization, and texture information. The approaches of this era can only analyze some grayscale maps and segment by extracting low-level characteristics of pictures, which cannot achieve semantic segmentation due to limited computing power and no data training stage. Deep learning technology is extensively applied in image processing, computer vision, medical imaging, robot control, and other sectors because to the GPU's quick development, which effectively supports the advancement of semantic segmentation technology. Many image segmentation techniques based on particular theories have gained popularity in a variety of domains thanks to the ongoing research and refinement of ideas in related disciplines.

## ABSTRACT

By examining the three components of logistics infrastructure, the degree of industry coordination, and the platform and system for cooperation, this paper examines the current model of global trade and cross-border logistics. It also examines the two sectors' complementary development strategies by examining the degree of synergy in the growth trajectory of global trade and cross-border logistics. With an average annual growth rate of 38.5%, cross-border e-commerce transactions have grown dramatically in size from 1.4 trillion in 2010 to 9.6 trillion in 2018. In 2010 and 2011, the transaction scale grew at a pace of roughly 30%, after which it began to slow down. Along with the ongoing status quo of expanding cross-border e-commerce gradually and smoothly, it is necessary to promote the expansion of cross-border logistics and international trade in a way that is mutually beneficial.

## KEYWORDS

International trade; Cross-border logistics; Synergistic development; Cross-border e-commerce; Transaction scale

## 1. INTRODUCTION

E-commerce has quickly evolved as a new trade model and increased its effect on several nations against the backdrop of global economic integration and more advanced Internet technology [1-3]. The fast rise of e-commerce has accelerated cross-border logistics, a vital link in the development of cross-border e-commerce, and the two are mutually beneficial and encourage one another [4]. In China, cross-border e-commerce is still in its infancy and is only beginning to flourish. How to promote healthy growth of both cross-border e-commerce and cross-border logistics and minimize mutual constraints between the two is a serious problem that needs to be addressed [5-7]. The government should take the lead in expanding the new logistics model, promoting the synergy of cross-border e-commerce and reverse logistics, concentrating on developing an integrated network platform, encouraging cooperation and synergy among various subjects, and increasing domestic demand in the market to realize the synergistic development of the virtuous cycle of cross-border e-commerce and cross-border logistics [8-10].

## **2. E-COMMERCE INTERNATIONAL TRADE AND CROSS-BORDER LOGISTICS EXISTING MODEL**

### **2.1. CROSS-BORDER LOGISTICS AND INTERNATIONAL TRADE**

#### **2.1.1. LOGISTICS INFRASTRUCTURE**

China's logistics sector didn't get off to a quick start, and despite its rapid growth, it still lags behind more industrialized nations in this area. E-commerce international trade has high requirements for any one of storage, transportation, distribution and information, but at present, a variety of transportation methods are not closely connected, the logistics system is unreasonable, and the infrastructure is still not very perfect. This restricts the development of international trade in e-commerce, so it is urgent to improve the logistics environment and improve the infrastructure.

#### **2.1.2. DEGREE OF COORDINATION OF RELATED INDUSTRIES**

At present, some trade enterprises have an old concept of international trade, and the concept of trade industry chain and enterprise development synergy is still not deep enough. Some businesses find it challenging to adjust to the rate of expansion of cross-border e-commerce, and they struggle to market and sell new items in the new industrial state brought about by the development of digital technology. Cross-border e-commerce and global commerce firms now have a low degree of coordination and integration, and cross-border e-commerce's potential to take the lead in promoting the coordinated growth of global trade enterprises is yet to be fully realized. Industry to industry synergy isn't very strong.

#### **2.1.3. COOPERATION PLATFORM AND SYSTEM**

The ongoing effects of the epidemic, as well as the persistence and repetition of trade frictions, have had a significant impact on the integration and growth of cross-border e-commerce and international trade in the post-epidemic era. Additionally, there is still room for improvement in the system and platform development for international e-commerce. It mostly consists of the following elements. On the one hand, there is a need to strengthen the international trade dispute resolution process as cross-border e-commerce develops. Cross-border e-commerce problems are now difficult to settle through trade dispute systems and communication across borders, which would, in part, hold down the rate of coordinated expansion of electronic commerce across borders and international trade.

## **2.2. INTERNATIONAL TRADE COORDINATION AND CROSS-BORDER LOGISTICS DEVELOPMENT STRATEGY**

### **2.2.1. CROSS-BORDER E-COMMERCE LOGISTICS MODEL**

With the continuous development of science and technology, various support policies proposed, and the gradual improvement of infrastructure, more new logistics models will emerge. The new logistics model has the characteristics of modern logistics, which can meet the needs of enterprises and consumers more conveniently and efficiently. However, this does not mean that traditional logistics models should be eliminated. Businesses that rely on established cross-border logistics models for survival should incorporate new components into their already developed logistics system, perfect it over time, offer high-quality services, increase customer satisfaction, In order to achieve the coordinated expansion of logistics companies across borders and international e-commerce firms, it is necessary to strengthen the synergy among cross-border logistic and cross-border e-commerce.

### **2.2.2. BUILD A CROSS-BORDER E-COMMERCE PLATFORM**

Cross-border e-commerce is one of the new avenues for the growth of international trade

and is one of the developing modes of foreign trade development on a worldwide scale. Enterprises carrying out international trade should actively build cross-border e-commerce system to achieve optimization and allocation of multilateral resources and establish interconnection and win-win cooperation mode with foreign enterprises. In terms of platform mall, enterprises should build a multi-platform model. preventing foreign cross-border e-commerce from functioning as a barrier to growth and, to some extent, effectively integrating cross-border e-commerce. To help create a new development pattern, encourage the expansion of international trade integration and cross-border e-commerce on all fronts.

### 2.2.3. IMPROVE THE EFFICIENCY OF CROSS-BORDER LOGISTICS TRANSPORTATION

To encourage the synergistic growth of cross-border e-commerce and global trade and to increase the degree of connection between the two, cross-border shipping and logistics efficiency should be improved, and the construction of warehouses abroad should be strengthened. A platform for international cross-border logistics commerce should be created, and the platform should take the lead in integrating the status of goods transit. Cross-border goods transportation data is promptly analyzed using GIS, GPS, and other global positioning systems (GPS), enabling the exchange of such data and offering logistics and transportation assurance for the growth of commerce.

## 3. SYNERGY AND DEVELOPMENT TREND DATA ANALYSIS

### 3.1. ECONOMIC SCALE

Revenue comparison between international social logistics and e-commerce. Figure 1 shows the upward trend in China's social logistics income and cross-border electronic commerce over time. Of these, the scale of cross-border e-commerce transactions develops significantly, from 1.4 trillion in 2010 to 9.6 trillion in 2018, with an average yearly increase of 38.5%. The growth rate of the transaction scale in 2010 and 2011 is also very fast, at approximately 30%, but after that the growth rate starts to slow down. Although the overall income generated by the logistics sector as a whole exceeds that of international e-commerce transactions, the sector's growth rate is just 9.67% on average annually, which is not a significant gain.

Figure 1. Cross-border e-commerce and social logistics revenue comparison

### 3.2. LOGISTICS DEVELOPMENT

Since 2010, affected by the deep-rooted international financial impact, external demand continues to be sluggish, the growth rate of foreign trade has dropped significantly, the cost of domestic factors has risen, and the corresponding international logistics has been greatly affected, part of the development of logistics as shown in Figure 2, the average annual growth rate for coastal major cargo throughput is just 2.51%, and the pace of growth decreased after 2013. In 2010, the coastal major port throughput was 5.4 billion tons, rising to 7.1 billion tons in 2013 and 7.6 billion tons in 2016. Cargo turnover on international routes showed a decline in 2010 and continued for two years, standing at 12.7 billion ton-kilometers in 2010, 11.7 billion ton-kilometers in 2012, and 10.7 billion ton-kilometers in 2013.

Figure 2. Partial logistics development status

### 4. CONCLUSION

Cross-border e-commerce is a tangible example of "Internet + Foreign Trade," the development trend in global trade, and a new engine of growth for e-commerce in the context of national strategic growing industries. Cross-border e-commerce development may help individuals fulfill their expanding material and cultural requirements, expand the market for small and medium-sized businesses, and advance the nation's economy. E-commerce that is conducted across borders creates new company development chances and is essential for the expansion of the national economy. Understanding the factors influencing the expansion of cross-border e-commerce is essential for businesses and governmental organizations to make choices. Raising the threshold for its development, international politics and the new crown pneumonia pandemic's heightened unpredictability make the expansion of international logistics riskier and subject it to developments that haven't been witnessed in a century.

# A STUDY ON THE INTEGRATION STRATEGY OF IDEOLOGICAL AND POLITICAL EDUCATION AND THE CONCEPT OF RULE OF LAW FOR COLLEGE STUDENTS BY APPLYING MULTIPLE INFORMATION FUSION

---

Yin Xiong\*

Law School, Sichuan Normal University, Chengdu, Sichuan, 610066, China

[xy697xy@126.com](mailto:xy697xy@126.com)

---

## ABSTRACT

In this essay, examined is the impartial underpinning of contemporary political and ideological teaching on the rule of law. Additionally, a framework for assessing political and ideological instruction at colleges and universities is created. Through legalizing the views of instructors and college students, the melding of ideological and political instruction with the concept of the rule of law is also investigated, and the comparison and evaluation of students' evaluations of the teaching effects of doing so is also discussed. The students' ideological and political awareness was 78.5% before the combination and 87.4% after the combination, the political concept was 76.2% before the combination and 81.8% after the combination, and the ideology and morality was 69.8% before the combination and 87.9% after the combination. It demonstrates how the application of the multiple information integration model to ideological and political education in colleges and universities completely integrates with the idea of the rule of law and has certain benefits for raising students' political awareness.

## KEYWORDS

Ideological and political education; Concept of rule of law; Evaluation of teaching effectiveness; Integration of multiple information; Political literacy

## 1. INTRODUCTION

The construction of a socialist system of law government and a communist rule of law framework with Chinese characteristics is the primary goal of the rule of law formation process [1]. Strengthening schooling on the socialist idea of the rule law is an essential requirement to advance the rule of law construction process in China, and one of the main functions of political and ideological education within higher education institutions is to cultivate excellent talents with a rule of law awareness [2-3]. Ideological and political instruction in higher education institutions presently faces the urgent and pressing challenge of assisting college students in developing a solid grasp of the rule of law [4-5] as it directly impacts whether a full socialist state of the law of law can be constructed. Due to the continual development and improvement of rule of law construction, college students' understanding of rule of law training has completely changed from "legal education" to "rule of law education" [6]. The goal of education, according to the contemporary legal system's perspective, is to promote a theoretically sound knowledge of law and to teach individuals how to know, understand, and uphold the law [7-8]. In higher learning institutions that are constructed from the standpoint of the rule of law, students may take lessons in the theory of politics and ideology that develop their grasp of the law and their perception of identity [9]. Their notion of the rule of law is strengthened and their legal literacy is improved, establishing a strong basis for them to enter society by

understanding the authority of the law and its significance in social life.

## **2. OBJECTIVE BASIS FOR THE INTEGRATION OF IDEOLOGICAL AND POLITICAL EDUCATION WITH THE CONCEPT OF RULE OF LAW**

### **2.1. EDUCATION ON THE CONCEPT OF RULE OF LAW UNDER THE DIMENSION OF IDEOLOGICAL AND POLITICAL EDUCATION**

#### **2.1.1. PERIODIC REQUIREMENTS**

To properly educate college students, schools and universities should integrate the needs of the period with the features of ideological and political education. Students at colleges participate in and carry out social construction. College students who have received instruction in the socialist notion of the rule of law have come to understand that this concept is essential to the growth of socialism because it ensures social change and advancement. The objective of political and ideological learning in colleges and universities ought to be to raise students' knowledge of the law, encourage them to apply it, and gradually instill the notion of the rule of law in their beliefs and actions. Strong rule of law students have a variety of positive personal traits, and if they enter the workforce within the future, they'll not only actively adhere to the rules while adapting to the situation, but they will additionally be able to influence the ones around them and further advance the cause of the supremacy of law.

#### **2.1.2. PRACTICAL REQUIREMENTS**

The ultimate purpose of political and ideological instruction is to raise "four new men" who have strong moral principles and adhere to social norms. It is practical in nature. The effect of rule of law education upon the ideological and political operations of colleges and universities can only be assessed when the learning experience of undergraduates is placed in the context of rule of law practice. It is necessary to integrate social reality into ideological and political education in colleges and universities if we are to improve the content of rule of law education, encourage college students to actively engage in rule of law practice, learn about the law, cultivate legal literacy, and enhance the ability of rule of law in practice.

#### **2.1.3. INTRINSIC PROPERTIES**

The rule of law serves as the theoretical foundation for political and intellectual education. The subjects of ideological and political instruction are actual living beings, because everyone has his own moral standards and behavior standards in his heart, if there is morality first and then there is law, everyone will first deal with the world according to his inner moral standards, then the construction of the legal order will also lose balance, which makes it simple to recognize that the legal system is the theoretical forerunner of political and ideological education.

Political and ideological education is an essential element of the rule of law. The rule of law encourages making compliance with the law into a religious and moral necessity in order to change college students' attitudes of law-abiding from passive to proactive and their comprehension of it from compulsory to conscious. College students should be taught political and ideological principles that will encourage them to intentionally follow rules and regulations. Rule of law education should begin and finish with the development of students' legal concepts.

## **2.2. EXPLORING WAYS OF INTEGRATION STRATEGY**

### **2.2.1. RULE OF LAW FOR TEACHERS**

The rule of law should be better understood by teachers. Teachers need to have a strong belief in the rule of law as well as the essential understanding of teaching and learning in order to be loyal defenders of the socialist legal system. With an innovative fighting force team,

political and ideological education activities cannot be implemented. Teachers should use the main teaching strategy in the classroom to its fullest potential. Classroom education is the most effective way to promote the ethos of the letter of law and legal concepts. In order to more effectively educate students about the rule of law for the parts where they have rule for law awareness and the parts where they have imprecise legal knowledge, college lecturers should positively and actively interact in students' lives. College students should be guided by legal principles and the formation of a rule of law spirit more in the instructional materials.

### **2.2.2. RULE OF LAW FOR UNIVERSITY STUDENTS**

(1) Increase student understanding of the concept of socialist rule of law. In order for the concept of the rule of law to be broadly accepted among college students, it is crucial to raise legal awareness among them and teach them about the importance of rule of law education.

(2) Students should be encouraged to develop a love for their own legal studies. College students who study law are expected to have a thorough awareness of the legality of their acts as well as the importance of the state preserving the rule of law. Through the promotion of the rule of law, the study of law also seeks to promote the ideas of justice and gain..

Let the rule of law constantly encompass college students in its humane care, by encouraging students to uphold the law and allowing them to experience the depth and breadth of the rule of law dimension in the political and ideological training provided by colleges and universities, is an effort to raise college students' understanding of the law and actively instill a sense of legal faith.

## **3. CONSTRUCTION OF IDEOLOGICAL AND POLITICAL EVALUATION MODEL OF UNIVERSITIES UNDER THE FUSION OF MULTIPLE INFORMATION**

### **3.1. DETERMINATION OF WEIGHTS OF EVALUATION INDICATORS**

As a part of the integration of the idea of the rule of law and the intellectual and political training of college students, the assessment system of students' intellectual and politics quality is displayed in Table 1 below. Using the row average method, and after normalizing the calculation results, we get the secondary index set political quality weight of 0.356, ideological quality weight of 0.312, moral quality weight of 0.343. Tertiary indicators for importance comparison rating, to teachers tertiary indicators judgment matrix, using language evaluation set  $S_1 = \text{Difference}$ ,  $S_2 = \text{General}$ ,  $S_3 = \text{Excellent}$ ,  $S_4 = \text{Merit}$  to compare the degree of importance between the two indicators each person evaluated a judgment matrix. The consistency of the direct and indirect information of these four judgment matrices was calculated, and the evaluation opinions were assembled according to the strength of consistency of the elements, and then calculated using the row-weighted average method.

**Table 1.** Students' ideological and political quality evaluation system

Primary Indicators	Primary Indicators	Primary Indicators	Primary Indicators	Primary Indicators
Ideological and political quality	Political quality	Political Theory Contest	0.205	0.032
		Political Attitude	0.225	0.031
		Scientific worldview	0.255	0.037
		Enterprising spirit	0.265	0.039
	Quality of thought	Hard work and dedication	0.176	0.025
		Dormitory Construction	0.163	0.022
		Volunteer Activities	0.243	0.034
		Integrity	0.185	0.027
	Quality of Rule of Law	Discipline	0.283	0.036
		Law-abiding	0.183	0.025
		Legal concept	0.265	0.028
		The concept of rule of law	0.237	0.027

### 3.2. EFFECTIVENESS EVALUATION ANALYSIS

Figure 1 illustrates how students' influence on the instruction of political and ideological lessons combined with the rule of law idea depends on the topic of the study, which is students. Students' ideological and political consciousness before combining is 78.5%, after combining is 87.4%, political concept before combining is 76.2%, after combining is 81.8%, ideological and moral before combining is 69.8%, after combining is 87.9%. Since it is obvious that students' political and ideological training, together with their comprehension of the concept of the rule of law, is gradually expanding, it is vital to increase the influence of ideological and politics teaching at universities and colleges.

**Figure 1.** Effect of teaching ideological and political education

### 4. CONCLUSION

The political and ideologically-based courses given at higher education institutions are currently the main source of advise for college students. If the ideas taught in ethics and rule of law teaching are coupled with those taught in political and ideological instruction to form a holistic framework, rule of law school may play a stronger role. College students may expand

their understanding of the law, its authority, and its significance in social life by taking courses in political and ideological principle, which is very advantageous for bolstering their understanding of the rule of law, enhancing their legal literacy, and laying the groundwork over their future success. The majority of students at colleges and universities are college students, therefore improving their knowledge of the concept is crucial to improving the rule of law's overall structure in such institutions. Additionally, it may guarantee the early accomplishment of the goal of vigorously supporting the rule of law.

## ABSTRACT

This paper describes the connotation of university library information service, carries out library informatization construction based on the three aspects of information construction hardware and software, personalized information service and information database feature construction, builds a big data library informatization service system, and analyzes the satisfaction of using intelligent library equipment. In terms of equipment related to electronic reading room, 73.87% of students are satisfied, 12.15% of students think it is average, and in terms of using self-service library equipment, the percentage of dissatisfied is 10.43%, the percentage of average is while the percentage of satisfied is 89.57%. Therefore, the scientific planning of the construction of the information library makes it serve the students and teachers better.

## KEYWORDS

University library; Information construction software and hardware; Personalized service; Information database; Intelligent equipment

## 1. INTRODUCTION

With the rapid development of knowledge economy and the rapid progress of science and technology, university libraries have become an important social information resource with their rich library materials [1-2]. Especially in the background of informationization, the traditional service mode of libraries gradually fails to meet the demand for cultural knowledge and information of teachers and students in colleges and universities [3-4]. Instead of a single demand for knowledge, more personalization, specialization and diversification are pursued. Therefore, it is urgent for libraries to change the old service mode [5-6]. In this background, university libraries are greatly challenged in service concept and service mode [7]. Therefore, in the informatization construction of university libraries, the advantages of digitalization, networking and the library's own characteristics should be given full play to the effective development and utilization of information resources [8-9]. Only by applying personalized service method through innovative service mode, university libraries set up personalized information service channels according to users' information demand behavior and meet users' potential information needs by analyzing and studying users' habits of information needs and personal own characteristics in order to push information service needs to users actively [10].

## 2. INFORMATION SERVICE CONSTRUCTION OF UNIVERSITY LIBRARIES

### 2.1. INFORMATION SERVICE OF UNIVERSITY LIBRARY

#### 2.1.1. PERSONALIZED SERVICES

Personalized service in the context of informationization is the development vision of

university libraries. Personalized service is a way to change the fixed service of “providing information mechanically and receiving information passively” in university libraries, but a way to recommend information to users actively. The library in the background of informationization, through the network, obtains the preferences, habits and interface requirements formed by the fixed users of the library in the process of using information, and provides users with personalized information needs of a kind of integrated information push service. User-oriented library personalized service is a targeted service. Different information resources are provided to different users, and different latest information is recommended to different information users.

### **2.1.2. INFORMATION SERVICE OF UNIVERSITY LIBRARY**

The information service of university library is to acquire a large number of ordered information resources as the starting point and explore the needs of users in order to be able to provide information and services that meet the needs of users. The library processes, researches, analyzes, and synthesizes the collected information to form orderly and directly usable data resources, and provides them to users using specific technical means to meet their needs.

## **2.2. INFORMATION CONSTRUCTION OF UNIVERSITY LIBRARIES**

### **2.2.1. INFORMATION CONSTRUCTION SOFTWARE AND HARDWARE**

In the university education system, the library plays an important role and is an important guarantee foundation for the school’s professional construction, teaching and research, and scientific research work. Therefore, it is necessary to increase the investment in hardware and software in the informatization construction in combination with library characteristics and informatization features, to maintain the sense of being ahead of the curve, to always keep in line with the frontier of social development and library informatization development, and to be able to complete the matching and updating of library informatization management system in the process of network information development. In addition, library informatization management and service system should have its own independent system and at the same time be able to achieve compatibility with social systems, which requires the advantages of local area networks and the Internet to unify software and hardware standards for information sharing and utilization.

### **2.2.2. PERSONALIZED INFORMATION SERVICE**

With the popularization of network, university libraries gradually expand their service scope under the promotion of informatization and network construction and go out of campus into society, which requires their service mode to adapt to the market-oriented development trend and be able to provide personalized information services, which is also an important trend of digital library development and a necessary path of informatization construction. We make full use of the advantages of network technology, increase the construction of information services in the informatization construction, provide personalized services, customized services and recommended services to readers by relying on the informatization system, and better provide diversified forms of information services for the majority of users.

### **2.2.3. INFORMATION DATABASE FEATURE CONSTRUCTION**

On the one hand, the informatization construction of university library should reflect the characteristics of electronic, digital, virtualization, network, platform and sharing, on the other hand, it should also closely combine with the characteristics of university library itself, highlight the characteristic advantages of the library itself and build a digital library with the characteristics of the university itself. Relying on the university’s own characteristics and advantages for accurate positioning, pay attention to the construction of characteristics, deal

with the relationship between the current demand and potential demand, and can highlight the special advantages of universities and students' research results, so as to achieve the target, and then meet the needs of the majority of teachers, students and social readers.

### 3. BIG DATA LIBRARY INFORMATION SERVICE SYSTEM CONSTRUCTION

#### 3.1. INFORMATION RETRIEVAL SERVICE

In the information service of university library, the construction of information retrieval service based on the background of big data is crucial, and the analysis of information retrieval usage frequency is shown in Table 1. Students know that it is often used by 27.59%, teachers know that it is often used by 35.6%, students who know but do not use it by 23.46%, teachers by 31.70%, students who do not know but would like to try it by 15.30%, teachers by 28.68%, and students who do not know by 13.26%, teachers by 9.52%. This percentage indicates that there is a high demand for information retrieval among teachers and students, and a small number of teachers and students do not know about this service, revealing that the library's efforts to publicize and offer special lectures are insufficient, and timely improvement of the service system is needed to improve the quality of services for retrieving information and the frequency of teachers' access to information through the use of retrieval.

**Table 1.** Frequency of information retrieval use by faculty and students

Identity	Situation	Proportion
Students	Knowing the frequent use of	27.59%
	Known but not used	23.46%
	Don't know but would like to try	15.30%
	No idea	13.26%
Teachers	Knowing the frequent use of	35.68%
	Known but not used	31.70%
	Don't know but would like to try	28.68%
	No idea	9.52%

#### 3.2. LIBRARY SMART DEVICES

Under the conditions of the construction of the library information management system, the hardware and software equipment of the library information construction is updated, and the satisfaction with the use of intelligent library equipment is shown in Table 2. In terms of equipment related to the electronic reading room, 73.87% of students are satisfied, 12.15% of students think it is average, and 8.98% are dissatisfied with it. Regarding the use of self-service library equipment, 10.43% of students are dissatisfied and 89.57% of students are satisfied. Overall, the informatization service construction of university libraries based on the background of big data can help improve the satisfaction of library services.

**Table 2.** Satisfaction with the use of smart devices in the library

Aspect	Aspect	Aspect
Related Equipment	Satisfied	73.87%
	General	12.15%
	Unsatisfactory	8.98%
Self-service equipment	Satisfied	76.57%
	General	13%
	Unsatisfactory	10.43%

#### 4. CONCLUSION

With the rapid development of social informatization, digitization and networking, the construction of university library informatization service has become an important part of social informatization. With its rich library materials, the university library has become an important social information resource. Therefore, in the construction of university library informatization, the advantages of digitization, networking and the library's own characteristics should be given full play, and effective information resources should be developed and utilized. In today's knowledge economy society, people's work and life are increasingly dependent on the network, and the demand for information and knowledge resources is increasing, and the demand of university users is even greater. The users of information utilization are different and their needs for information are also different. The university library is also the information resource center of school and society, and should provide different information sources for users.

## ABSTRACT

This study provides a method for evaluating physical education teachers and use hierarchical analysis to ascertain the relative weights of each component in the medium physical education teaching model. The focus of the study is college physical education. The teaching assessment model for college physical education courses is built using the nonlinear mapping capability of the BP neural network. The consistency indexes obtained from the program operation are management mechanism = 0.0708, teaching concept = 0.0325, curriculum system = 0.0914, teaching method = 0.0923, supporting facilities = 0.0537, and quality of teachers = 0.0842, all of which are less than 0.1. The concept was built on the foundation of college physical education, and it has the potential to encourage more innovation in this field.

## KEYWORDS

College physical education; BP neural network; Teaching evaluation model; Hierarchical analysis method; Consistency index

## 1. INTRODUCTION

Teaching physical education is a crucial component of higher education, and evaluating the quality of the instruction is the cornerstone of educational evaluation [1]. Correct physical education teaching quality evaluation is crucial in fostering the growth of physical education teaching in the direction of student-centered and teacher-led education and instruction [2-4]. College and university physical education programs must adapt to the modernization of sports concepts and the demands of social development, make constant advancements and innovations based on the original teaching model, raise the bar for students' fundamental sports knowledge and abilities, and encourage the development of positive sports concepts and habits [5-7]. The most popular neural network model is called the BP neural network, which is a multilayer feedforward neural network trained using the error backpropagation technique. The heart of educational assessment in faculties of physical education and a crucial component of educational administration is teaching quality evaluation [8-9].

## **2. COLLEGE PHYSICAL EDUCATION AND BP NEURAL NETWORK**

### **2.1. THE CURRENT SITUATION OF PHYSICAL EDUCATION IN COLLEGES AND UNIVERSITIES**

#### **2.1.1. THE OBJECT OF PHYSICAL EDUCATION IS BLURRED**

As humanistic education has evolved into a fundamental requirement and principle of higher education under the direction of scientific development concepts, college sports should pay more attention to its implementation and shoulder the responsibility of the times to cultivate the humanistic spirit of contemporary college students. The teaching mode of "I teach you to learn, I demonstrate you to imitate" in colleges and universities, which emphasizes repetitive exercises, not only destroys the life of sports as an organism, but also neglects the emotional experience and creativity cultivation of college students. This teaching mode is not only far from sports itself, but also far from the spirit of university education, which makes physical education class become an exercise class that most university students reject, and ignores the humanistic attributes that physical education should have.

#### **2.1.2. TEACHING EVALUATION PURSUIT**

The evaluation of physical education instruction at colleges and universities is a crucial component of the physical education teaching system in these institutions, and it plays a crucial role in creating a comprehensive and efficient teaching procedure. The participation of physical education teaching evaluation as an essential operation step to be evaluated is required for all questions regarding the validity of the development of the physical education teaching plan, objectives, and principles as well as the viability of the specific physical education teaching process implementation methods and the quality of the students' learning outcomes. Instead of continuing with the evaluation of each student using a particular type of index as the standard, the evaluation of physical education in colleges and universities should establish and improve the evaluation system for physical education as well as the comprehensive evaluation of the academic performance of physical education.

#### **2.1.3. TEACHING OBJECTIVE TENDENCIES**

Physical education in higher education has lost its specificity and independence, deviated from the essence of physical education, and become a tool for learning a certain skill. Physical education in higher education does not exclude the learning of sports skills, which is a basic element of physical education, but if this technical learning exists independently of the students' emotional experience of physical education, it defeats the original purpose of physical education. The goal of physical education in colleges and universities is to "establish human beings," and this is the fundamental tenet of physical education. However, the entire development of the university, which is at its center, has been overlooked due to the highly technical and rational view of physical education in contemporary colleges and universities.

## **2.2. BP NEURAL NETWORK**

### **2.2.1. BP NEURAL NETWORK ALGORITHM**

Artificial neural networks come in a variety of varieties and take on many shapes. Artificial neural networks may be categorized into two types: forward neural networks and feedback neural networks, depending on how the neurons are linked. Artificial neural networks may be separated into tutored and tutorless neural networks based on how they are trained, and they can also be categorized into fitting neural networks, classification neural networks, and other types of artificial neural networks based on the purposes they are used for. Neurons are often arranged into layers, and neural networks have numerous layers. Its capacity to learn intricate mappings is significantly improved by the complicated layered structure. The

forward-proceeding, error-back propagation, self-learning, and high adaptive properties of the BP neural network method. In order to acquire the best network structure model, the training error may be minimized by continuously self-learning correcting the weights and thresholds corresponding to the neurons in each layer.

### 2.2.2. BP NEURAL NETWORK TRAINING

The BP neural network is a type of feed-forward neural network that may be repeatedly rectified by determining the appropriate input-output relationships by repeatedly training the network's weights and thresholds. The most popular type of three-layer neural network has just one implicit layer and has three layers total: input, output, and implicit. By conducting BP neural network training with known data samples from schools as the foundation for generating the final comprehensive index weights, it is possible to decrease the complexity of the comprehensive assessment process. To build the BP neural network by AHP assignment and calculate the physical education evaluation scores, the original data sub-indicators are utilized as input samples and the evaluation scores are used as output samples.

### 2.2.3. EVALUATION MODEL OF PHYSICAL EDUCATION TEACHING IN COLLEGES AND UNIVERSITIES

Evaluation of physical education that is effective Higher education's endeavor to oversee practical teaching's efficient operation also serves as a catalyst for teaching innovation and reflection. Based on student evaluations of the courses and routine inspections by the teaching administration, physical education courses are now being evaluated. The assessment standards are comparable to those for theoretical courses, which makes it difficult for them to successfully match the requirements of physical education courses and stifles new approaches to teaching physical education in colleges and universities. Establishing a model of a college physical education teaching assessment system based on BP neural network algorithm is therefore necessary.

## 3. APPLICATION OF BP NEURAL NETWORK COLLEGE PHYSICAL EDUCATION TEACHING MODEL INNOVATION

### 3.1. CALCULATING THE COMBINATION OF INDICATORS

For each index of the physical education teaching mode variables, a graded index judgment matrix is built in order to realize the innovation of the BP neural network-based college physical education teaching mode, and the weights of sub-index combinations are displayed in Table 1. The consistency indexes obtained from the program operation are management mechanism = 0.0708, teaching concept = 0.0325, curriculum system = 0.0914, teaching method = 0.0923, supporting facilities = 0.0537, and teacher's quality = 0.0842 all of which are less than 0.1 and meet the consistency test requirements.

**Table 1.** Combination weights of sub-indicators

Sub-indicators	Portfolio weights
Management Mechanism	0.0708
Teaching Philosophy	0.0325
Course System	0.0914
Teaching Method	0.0923
Supporting facilities	0.0537
Quality of Teachers	0.0842

### 3.2. SIMULATION PREDICTION

The Neural Net Fitting toolbox in MATLAB software was used to implement 4-layer neural network training and prediction. Thirty groups of data were imported into the toolbox, and the

number of nodes was modified to 2. The neural network reached its convergence after 15 iterations of training, and a linear correlation of 0.96269 was found between the training output and the predicted output. Following the training, the remaining 6 groups of data were simulated using the sim function, and the results of the BP prediction, anticipated output, and relative errors are displayed in Table 2. It shows that the model has a high rate of accuracy and that the assessment procedure is straightforward and quick, allowing it to be used to the subsequent evaluation of college physical education courses.

**Table 2.** BP predicted values and expected output results and relative errors

Serial number	Serial number	Serial number	Serial number
1	5.6269	5.4741	0.073%
2	5.3157	5.2848	-0.362%
3	6.1928	6.3198	0.215%
4	6.4094	6.2867	0.318%
5	5.2661	5.4287	-0.738%
6	5.8795	5.6493	-0.083%

#### 4. CONCLUSION

New demands for the development of skills in colleges and universities as well as new difficulties in the teaching of physical education have been posed by the current economic and social growth. The new system for evaluating physical education should be based on the idea of students' growth, reduce the amount of summative evaluation at the end of the semester, increase the amount of evaluation of students' performance during instruction, and use various evaluation techniques. To encourage teachers' ongoing development of their teaching strategies and techniques and to increase the efficacy of physical education instruction, the evaluation of teachers' instructional effectiveness within the evaluation system has to be steadily enhanced. In order for students to learn about their strengths and shortcomings in the evaluation process and exercise in a focused way, it is important to establish an evaluation system that they are willing to accept and actively engage in.

## ABSTRACT

This paper investigates the two current problems of personal subjective consciousness and professional role dysfunction of teachers' values in colleges and universities, discusses the role and connotation of teachers' values, studies the values of college teachers, and analyzes the factors of teachers' career choice in the digital context. The factors of teachers' choice of the profession are 77.4% knowledge, 45.4% money, 19.7% status, 77.9% health, 39.4% fame and 77.5% career. The value orientation of college teachers is directly related to the value theory construction of the school, so the construction of contemporary college teachers' values has an important role in the enrichment of the content and extension of the meaning of the socialist core value system.

## KEYWORDS

Teachers' values; digital context; career choice factors; value orientation; value theory construction

## 1. INTRODUCTION

The values of college teachers are not only related to their own development, but also to the direction of the school and the healthy growth of current college students [1-3]. The values of college teachers are a stable view or a thinking posture about the value of objects based on their needs and interests, which reflect the current feelings, wishes and needs of college teachers and stipulate the attitudes and behaviors taken by current college teachers [4-6]. In the context of digital era, college teachers' their values have been strongly impacted [7-8]. As far as the current actual situation is concerned, the current values of college teachers are still in the stage of basic maturity, perfection and consolidation, and although their mainstream is positive and healthy, there are still many problems [9].

## 2. THE ROLE AND INVESTIGATION OF TEACHERS' VALUES IN HIGHER EDUCATION

### 2.1. THE ROLE OF VALUES

#### 2.1.1. ROOTS OF NATIONAL COHESION

Each nationality has a different national culture due to the influence of its regional environment, economic development and living customs, and thus each nationality has its own unique values that are compatible with its own culture. Values are the product of the long-term life and practice of the members of the nation for generations, and they are the reflection and deep accumulation of their practice in the spiritual field. Because values are not only national, but also contemporary. If we demand development and progress, we must have the

consciousness of actively striving for and innovating. If a nation takes the courage to explore, not to lag behind, and to keep up with the times as its esteemed values, and faces up to the current situation of the nation with a correct and sincere attitude, then even the greatest difficulties and disadvantages will surely turn into the driving force of progress and development, and become the advantage of society.

### **2.1.2. HUMAN ACTIVITY INDICATOR**

Value orientation is the orientation and direction of people's value choices according to certain values. The role of values in guiding people is comprehensive and profound; the direction and manner of individual activities permeate the values held by individuals. Different values play a decisive role in each person's choice of life path. Correct values will guide people in a good direction, while wrong values are not conducive to personal development and the realization of self-worth, and may even lead people astray. Therefore, it is extremely important to promote the development of positive and correct values for each individual to grow and develop.

### **2.1.3. CONNOTATION OF HIGHER EDUCATION TEACHERS' VALUES**

Education is divided into primary education, secondary education, higher education and vocational education. Among them, the quality of teachers is crucial for higher education, which directly delivers construction talents to the society. Teachers in contemporary universities should not only enrich their professional knowledge and understand the latest educational concepts and models, but also keep abreast of the times, actively exert their subjective initiative in teaching and educate students creatively, and continuously improve their scientific research level and enrich their scientific research achievements to promote the prosperity of talents and science and technology.

## **2.2. SURVEY ON TEACHERS' VALUES IN KORAN SCHOOLS**

### **2.2.1. PERSONAL SUBJECT AWARENESS**

Subject consciousness means self-awareness with the ability of autonomy and self-reliance, including the spirit and ability of self-reliance and self-emancipation of the subject. While opening up to the outside world and the market economy have awakened people's individual subject consciousness, they have inevitably awakened people's greed and materialistic desires. The values and beliefs of collectivism, which used to be respected by the society and people, have been impacted, and people have become confused, and their ideals have been placed in front of reality. This state of confusion and disorder makes college teachers, as senior intellectuals, feel anxious.

### **2.2.2. PROFESSIONAL ROLE MALFUNCTION**

The existing salary level cannot satisfy all teachers, which largely causes the loss of professional ideals and value guidelines of college teachers and the deviation of educational behaviors, which are the manifestations of the professional role of college teachers' misconduct. Many college teachers' professional role consciousness begins to fade, their spiritual pursuit and professional ideal are more lacking, and their social responsibility of being a teacher is missing, which seriously damages the professional image of college teachers and even affects the formation of students' correct outlook on life and values. In the process of education and teaching, there is a lack of professionalism and a serious attitude of treating academics cautiously and seriously, and there is no dedication in treating teaching.

## **3. RESEARCH ON THE VALUES OF UNIVERSITY TEACHERS IN THE CONTEXT OF THE DIGITAL AGE**

### 3.1. ANALYSIS OF CAREER CHOICES

Life view, the most basic value, is the driving force that inspires people's struggle. The factors influencing the career choice of college teachers in the digital era are shown in Figure 1. Among them, knowledge accounts for 77.4%, money accounts for 45.4%, status accounts for 19.7%, health accounts for 77.9%, fame accounts for 39.4% and career accounts for 77.5%. From this, we can see that at this stage, college teachers are more concerned about their health and career, the value of knowledge and career success, and the role of "money" in social life. This shows that under the background of digital era, it has become a basic development trend for college teachers to pay attention to their health and pursue their career success, improve their living environment and upgrade themselves continuously.

**Figure 1.** Factors influencing the career choice of college teachers in the digital age

### 3.2. ANALYSIS OF TEACHERS' ETHICAL LEVEL

The virtues revered by college teachers at this stage are shown in Figure 2. Among them, kindness accounts for 80.3%, sincerity accounts for 58.9%, justice accounts for 58.3%, frankness accounts for 35.9%, diligence accounts for 37.2%, honesty accounts for 25.7%, devotion accounts for 26.2% and hard work accounts for 31.7%. In the background of digital era, with the deepening of reform and the reform of university system, contemporary university teachers pay more and more attention to their own interests, and more and more of them agree to "balance righteousness and profit". This indicates that seeking the value of unity between giving and taking has become the goal to which college teachers aspire at this stage.

**Figure 2.** Virtues espoused by college teachers at this stage

#### 4. CONCLUSION

Values are people’s fundamental views on value issues and play an important role as behavioral guidance, emotional stimulation and evaluation criteria in people’s value activities, thus the issue of values has been one of the main contents of philosophical research. In the context of the digital age, the state of values of university teachers has received extensive attention. Values, a major topic in academia. It depends not only on teachers’ pursuit of self, their efforts to improve their own cultivation and their teaching and research abilities, but also on the motivation of the whole society and schools to guarantee the smooth reconstruction of core values of university teachers. Therefore, it is of great importance to investigate and study teachers’ values and guide them to establish correct values.

## ABSTRACT

This paper explores the concept of big data technology and business performance improvement as a basis for analyzing the mechanism of the role of enterprise commodity model, in which enterprise operation process and business model innovation are the main factors. The impact of big data technology on business performance improvement is analyzed, and the hypothesis of business performance improvement of enterprises is constructed. The Cronbach's  $\alpha$  value of big data technology is 0.887, and the Cronbach's  $\alpha$  values of its three dimensions, i.e., real-time insight and prediction capability, in-depth analysis capability and resource integration capability, are 0.813, 0.804 and 0.852, respectively, and the Cronbach's  $\alpha$  value of business model innovation Big data has become an opportunity for modern enterprises to improve productivity.

## KEYWORDS

Business performance improvement; Commodity model; Forecasting capability; Productivity; Modern enterprise

## 1. INTRODUCTION

As the country with the highest number of Internet users in the world, China faces an explosive growth of data every day, and there is rich information behind these massive user data, and more and more enterprises are beginning to realize the importance of fully mining the rich information behind these big data [1-3]. Therefore, developing their own big data analysis capabilities has become a key concern for enterprises [4]. How enterprises can achieve superior corporate performance or build competitive advantage in a complex and changing business environment has been one of the hot topics of research among academics and practitioners [5-7]. The widespread use of next-generation information technologies such as the Internet of Things and artificial intelligence has led to the explosive growth and massive concentration of data worldwide, and big data has gradually penetrated into enterprise business performance improvement [8-9]. How to empower enterprise performance improvement with big data and realize business value addition has become a real problem that most enterprises need to solve urgently [10].

## 2. THE VALUE OF BIG DATA AND ITS IMPACT EFFECTS

### 2.1. BIG DATA TECHNOLOGY AND BUSINESS PERFORMANCE IMPROVEMENT

#### 2.1.1. BIG DATA TECHNOLOGY

The main goal of big data technology is to help enterprises optimize operation management and respond to market changes through the analysis of data resources, so it is more relevant

to analyze from the perspective of dynamic capabilities. Big data resource acquisition capability is the ability of enterprises to acquire big data itself and resources such as data equipment and talents, and update them in a timely manner. Big data analysis and integration capability refers to the ability of enterprises to screen and process diversified data and realize data integration. Big data application capability mainly emphasizes the enterprise's ability to use big data to achieve internal decision optimization and market value mining.

### **2.1.2. CORPORATE COMMODITY PERFORMANCE**

Big data technology is the whole process of acquiring, analyzing and integrating big data resources and realizing their application based on a dynamic perspective. Although the construction of big data technology requires additional capital investment in digital infrastructure and human resources, it can also improve operational efficiency and decision-making science, and ultimately achieve comprehensive benefits. Big data technology enhances SME performance through cost reduction and profit point increase. Digital capabilities help SMEs to expand existing business areas, and the sale of data resources in advantageous areas also forms a new point of interest growth.

## **2.2. MECHANISM OF THE ROLE OF ENTERPRISE COMMODITY MODEL**

### **2.2.1. BUSINESS OPERATION PROCESS**

Big data technology improves SME performance through operational process improvement.

(1) Big data technology integrates diverse data to form a new value network containing various stakeholders. For example, consumers are no longer passive recipients, and multidimensional data such as transactions, emotions, and communications make them participants of the value network.

(2) Big data technology has changed the previous decision-making method dominated by managers' experience, making information a supporting element and improving the scientificity of decision-making.

(3) Big data technology helps SMEs break through the data barriers of different systems such as production and sales, realize data interoperability and sharing, and thus improve the level of refinement management. The new value network, scientific decision-making paradigm and the development of refined management all play a positive role in promoting the improvement of enterprise operational efficiency and performance.

### **2.2.2. BUSINESS MODEL INNOVATION**

Business model innovation gains focus advantage and enhances SME performance through value proposition. Tapping into potential customer needs and focusing on niche markets not only meets the current situation of companies with limited capacity to implement diversification strategies, but also provides conditions for SMEs to carry out product innovation. In addition, the focus on products can also provide the subsequent advertising investment. Customer loyalty maintenance, traffic monitoring, etc. lock the target and direction, and thus improve the enterprise performance. Business model innovation gains low-cost advantages and improves enterprise performance through value transfer and creation. In the absence of independent R&D capability, business model innovation creates new relationship network, which is conducive to collaborative cooperation among value chain participants and reduces R&D risks and transaction costs. Optimization of cost structure and change of revenue model in business model innovation is the key to gaining differentiation advantage and thus improving enterprise performance.

### 3. ANALYSIS OF ENTERPRISE BUSINESS PERFORMANCE IMPROVEMENT BASED ON BIG DATA TECHNOLOGY

#### 3.1. DATA RELIABILITY TEST

The reliability and validity of the data are important indicators of the value of the scale, and the quality of the data will be directly affected by the research design, which will ultimately affect the research results. To study the impact of big data technology on business performance improvement, Cronbach's  $\alpha$  coefficient values between 0-1 were used, and the results of the data reliability test are shown in Table 1. The Cronbach's  $\alpha$  value of big data technology is 0.887, and the Cronbach's  $\alpha$  values of its three dimensions, namely, real-time insight and prediction ability, in-depth analysis ability and resource integration ability, are 0.813, 0.804 and 0.852, respectively, and the Cronbach's  $\alpha$  value of business model innovation What can be seen is that the Cronbach's  $\alpha$  values of the above variables range from 0.860 to 0.960, which are all higher than the critical value of 0.70, and the CR values of each variable are are greater than 0.80, indicating that the data reliability is good.

**Table 1.** Data reliability test

Variables	Dimension	Cronbach's $\alpha$ value for each	CR value	Cronbach's $\alpha$ value for each variable	Experimental Cronbach's $\alpha$ value
Big Data Technology	Predictive capability	0.813	0.8324	0.887	0.950
	In-depth analysis	0.804	0.8461		
	Resource Integration	0.852	0.8137		
Strategic Orientation	Market Orientation	0.817	0.9047	0.973	
	Entrepreneurial orientation	0.912	0.8824		
Corporate Performance			0.8261	0.864	
Business Model Innovation			0.8695	0.869	

#### 3.2. BUSINESS PERFORMANCE IMPROVEMENT HYPOTHESIS ANALYSIS

The hypothesis testing of big data technology and enterprise performance was realized by SPSS25.0 linear regression, and the results of enterprise performance hypothesis testing are shown in Table 2. Model 1 examines the impact of each control variable on enterprise performance, and models 2~4 are based on model 1 by adding three dimensions of big data technology: real-time insight and prediction capability, in-depth analysis capability and resource integration capability, respectively, to test their impact on enterprise performance. The results show that the regression coefficient value of real-time insight and prediction ability is  $\mu=0.528$ ,  $p<0.001$ , indicating that real-time insight and prediction ability has a significant positive impact on enterprise performance, and the regression coefficient value of resource integration ability is  $\mu=0.426$ ,  $p<0.001$ , indicating that resource integration ability will have a significant positive impact on enterprise performance.

**Table 2.** Analysis of the impact of big data technology on business performance

Variables		Corporate Performance			
		Model 1	Model 2	Model 3	Model 4
Control variables	Business Age	0.139	0.041	0.083	0.119
	Enterprise nature	-0.095	-0.063	-0.058	-0.098
	Enterprise scale	0.025	0.037	-0.007	-0.053
Independent variables	Timely Forecast		0.417		
	In-depth analysis			0.453	
	Resource Integration				0.379
Model Fitting	R <sup>2</sup>	0.037	0.319	0.273	0.217
	Ad-R <sup>2</sup>	0.028	0.267	0.218	0.183
	F	2.847	25.86	26.17	16.38

#### 4. CONCLUSION

The rise of Big Data has driven both academic and business communities to focus on the impact of Big Data on management theory and business practice, with major research findings focusing on the role of Big Data as a driver of business model innovation. Big data has gradually blurred the boundaries of the enterprise and brought it closer to the consumers, thus making it possible to create disruptive, disruptive and customized business models. To a certain extent, this helps enterprises to establish competitive barriers and further expand their value-added space. In this paper, we explore the mechanism of the effect of enterprise big data technology on enterprise performance, and introduce the typical moderator “environmental uncertainty” into this mechanism. The moderating effect of environmental uncertainty is explored. This study fills a theoretical gap and provides a certain degree of insight and guidance for business practice.

## ABSTRACT

In the era of big data, many archival theories have been unable to adapt to the changes and development of the whole information environment. This paper discusses the current changes in the theoretical system of big data archives management, analyzes the current situation of data-based archives user needs, and constructs a management system innovative metadata collation technology and non-metadata collation technology. The user demand for archives services information consulting service is 56.28%, online inquiry service is 92.59%, material storage service is 87.36%, and archival exhibition service is 42.55%. We should pay attention to the changes of archives management in the era of big data and actively improve the work level of archives management as well as the management capability practically with the help of big data technology.

## KEYWORDS

Information environment; Archival theory; Management system; Metadata organization; Service requirements

## 1. INTRODUCTION

Facing the advent of the big data era, all industries in society are facing the same opportunities and challenges [1-3]. The opportunity is that with the advanced technology and big data mindset of the big data era, the industry undergoes timely transformation and upgrading, which is an effective means for the industry to achieve sustainable development [4-5]. The rapid development of the information society has slowed down archival science, and the world development situation with cloud computing, big data, mobile Internet, and Internet of Things as the propositions of the times does not allow archival science to slow down and abandon its traditions [6-7]. Many archival data that can restore the original appearance of society have been neglected, and the material for constructing social memory has been missing [8]. Under this sense of crisis of the times, the exploration of archival organization theory has stimulated archival work to be managed and developed according to information technology, boldly abandoning the shackles and using information technology to achieve another upgrade of archival organization [9].

## 2. THEORETICAL SYSTEM OF ARCHIVES MANAGEMENT IN THE ERA OF BIG DATA

### 2.1. CHANGES IN THE THEORETICAL SYSTEM OF FILE MANAGEMENT

#### 2.1.1. BIG DATA THEORETICAL SYSTEM

With the dramatic increase in the volume of archival data, traditional work models and

management styles are stretched to the limit and encounter realistic data processing and analysis dilemmas. However, in the big data mindset, all data has the value to be utilized. In the current era, the data represents the archives, so the archives department should timely establish the big data theory system of archives management.

### 2.1.2. ARCHIVAL THEORY SYSTEM

On the one hand, all data generated in the society with preservation value and use are archives, and the object of archives management is open. In the age of the Internet, more timely information is generated in society, and timely information is fleeting, so the awareness and scope of archival management should be extended to these grassroots and grassroots information. On the other hand, data exists in all corners of the Internet, which is completely different from the traditional information actively linked and stored in the archives. It is usually the subject who is required to perform the search and the target data is presented.

## 2.2. STATUS OF DATA-BASED ARCHIVE USER NEEDS

### 2.2.1. FILE MANAGEMENT SERVICES

To improve and innovate the theoretical system of archives management and to understand users' demand for archives' services, users expect archives to provide service types as shown in Figure 1, among which 56.28% are information consulting services, 92.59% are online inquiry services, 87.36% are material storage services, and 42.55% are archival exhibition services, and users' preferred archival inquiry method is remote inquiry. Based on the current background of the big data era, it is only logical that users expect archival services to be online search services. Archives should respond to the needs of archives users, actively explore digital full-text scanning of archives, open archives on the Internet, provide online search and retrieval of archives, and continuously innovate service means so that archives users can search for the information they need without leaving home and improve the utilization rate of archival resources.

Figure 1. Services that users expect from the archive

### 2.2.2. BARRIERS TO FILE ACCESS

Not all archival users will get 100% of the archival resources and services they need, so analyzing the user access barrier situation provides ideas for archives to improve their work. The barriers to user access to archives are shown in Figure 2. It can be seen that the main

obstacles encountered by users in searching archives are 46.82% for less digitized archives, 57.95% for a single search method, 45.83% for not enough rich collections, etc. Archives should reflect on these aspects to provide better services to the public, improve the problems embedded in the archives management system, and promote system improvement and innovation.

**Figure 2.** Analysis of obstacles to user file search

### **3. INNOVATION OF THEORETICAL SYSTEM OF ARCHIVES MANAGEMENT IN THE CONTEXT OF BIG DATA**

#### **3.1. METADATA COLLATION TECHNIQUES**

Metadata is the data that defines and describes other data, where the first data represented is the information object to be described, and the second data is the relevant information stored for understanding this information object. Metadata organizing technology is to record and construct the metadata of archival documents when they are formed, and to use the metadata in organizing them to build up the connections between archival documents and realize the organizing of archival documents. Metadata provides the background information of social practice at the time of electronic document generation, and there is a correspondence between it and the process of social practice. By collecting and organizing metadata of electronic documents, it is actually organizing electronic documents, and the dual structure of archival material entities is embedded in the electronic document entities.

#### **3.2. NON-METADATA COLLATION TECHNIQUES**

Non-metadata collation techniques mainly include mixed collation techniques of different carriers, double-set collation techniques, collation techniques with pieces as collation units, and other non-metadata collation techniques shall be carried out for archival entity collation, and the entity referred to here means that archives are material entities rising into an archival existence, which not only contains the physical entities that can be traditionally rolled and shelved, but also contains entities in the form of binary codes such as electronic documents. This sheds new light on the reconceptualization of the material entity of electronic documents. It is a rational understanding and summary of the practice model of “business contractor-archive-archive”, and the exploration made in the face of electronic document arrangement, and the non-metadata arrangement technology may be more suitable for the current status of

archival arrangement.

#### 4. CONCLUSION

Archival science is a highly practical science. Classical archival science believes that documents without archiving are unconnected materials that cannot record and restore history, and cannot be called archives, so archival arrangement is destined to become a key concern of archival science. The core theories of archival science, from the principle of provenance and the theory of the whole archive to the theory of the document life cycle, are all closely related to archival arrangement, a link that lies at the heart of the archival management process. In the information environment, a new research philosophy has gradually emerged in the study of electronic documents, and two archival research forms, archival information resources research and knowledge management research, have taken on more characteristics of librarianship intelligence research. This has prompted us to reflect and discover that archives are a unity of logical and historical connections, and that the organization of archives is not only the organization of historical connections, but also the organization of logical connections.

# RESEARCH ON HYBRID INFORMATION-BASED TEACHING OF COLLEGE CIVICS COURSES IN THE ERA OF BIG DATA

---

Xiangyan Ding\*

School of Marxism, Yulin Normal University, Yulin, Guangxi, 537000, China

[xb12602@sina.com](mailto:xb12602@sina.com)

---

## ABSTRACT

In this study, the hybrid information teaching conundrum is investigated, the teaching design concept for a civics course is covered, the constructed evaluation index system is subjected to a reliability analysis using SPSS software, and finally a more rigorous evaluation index system for civics course instruction in colleges and universities is developed. The evaluation index teaching technique is known to have a consistency ratio of 0.0998, which is less than 0.1, according to the yaahp software. The greatest eigenvalue, max, is 5.4047, and it is regarded to meet the consistency test requirement in accordance with the consistency test concept. By creating an assessment index system for civics and political science instruction in college courses, we want to enhance the hybrid information-based instruction of civics and political science in colleges.

## KEYWORDS

Information-based teaching; Teaching of Civics courses; Evaluation index system; SPSS software; University Civics

## 1. INTRODUCTION

The widespread use of new generation technology in education has had a significant impact on instructional reform and innovation as well as the educational environment [1-2]. Teachers of religious and political science courses in colleges and universities must keep up with the times, speed up the pace of teaching informatization, changes the conventional instructional concept, and encourage innovation in the delivery of ideological and political theory courses in order to successfully teach in such a diverse environment [3-5]. To achieve a deep and comprehensive educational impact on students [6]. An essential component of creating an ideological and political science course is assessing its effectiveness as a teacher. Additionally, an in-depth analysis of the course's teaching evaluation index and the development of its teaching evaluation index system are both important components of the ideological and political science course development [7-9]. It can assist to play a part in the establishment of moral education in addition to offering direction for the teaching of civics and political science classes in colleges and universities.

## 2. HYBRID INFORMATION-BASED TEACHING DESIGN AND DILEMMA

### 2.1. TEACHING DESIGN CONCEPT OF CIVICS COURSE

#### 2.1.1. HUMAN-CENTERED CONCEPT

We view the establishment of ethical education as an essential task, build an entire curriculum system and teaching style primarily for the acceptance of students, establish an

open learning environment using the modern age of information technology, create excellent teaching materials that meet the educational needs of college students, change students' attitudes toward learning, and enhance their capacity for independent learning.

### **2.1.2. CONSTRUCTIVIST CONCEPT**

Civic and political science courses are taught in a constructivist learning environment, which modifies the traditional teaching model by allowing professors to be more than just lecturers and information imparters, students are no longer passive recipients and objects of theoretical indoctrination, teachers and students are equal subjects and can communicate and discuss with each other.

### **2.1.3. CURRICULUM DEVELOPMENT CONCEPT**

Curriculum choreography is a product of the integration of multiple fields such as technology, education and art. Information-based teaching is a comprehensive process, and teachers of Civics and Political Science courses, as course writers and directors, should not only complete the work of excavating, choreographing, editing and developing high-quality teaching resources, but also follow consistent design principles, cross-fertilize related theories such as communication theory and film creation theory, and construct a new curriculum teaching system.

## **2.2. HYBRID INFORMATION-BASED TEACHING DILEMMA**

### **2.2.1. FACULTY TEACHING COMPETENCY**

The elements of competency that professional teachers should possess include a combination of personal characteristics, ideological and political awareness, knowledge and skills, values and attitudes, which are the elements and structure of competency as explained by competency theory and the "iceberg model". Some teachers lack philosophical and ideological concepts, have not received training in systematic political and ideological education theories, lack political aptitude and theoretical resolve with the capacity to distinguish the right from the wrong as fundamentally, and their ideological characteristics are weakened. Lacking the concept and awareness of carrying out implicit ideological and political education, they pay significantly less attention to students' learning dynamics and ideological cognition. In addition, teachers' informatization teaching literacy, information technology ability, and ability to adapt to the information society are uneven, and the design problems and tasks of online teaching of ideology and politics are unreasonable. Teachers use a single information technology resource platform, have poor classroom interactivity, and pay insufficient attention to higher-order thinking activities.

### **2.2.2. HYBRID TEACHING EVALUATION SYSTEM**

The assessment and guarantee systems are the main factors that influence how blended learning is used in civic education courses. At this time, however, the evaluation system for the integrated teaching of citizenship to professional programs in colleges and universities is not ideal; it lacks an evaluation standard, an evaluation content, and a strong institutional support system. The relevant assessment and evaluation system focuses on achievement assessment, less on the effectiveness of teaching in moral education of students, and the process evaluation and result evaluation are difficult to be put into practice. The teachers' mixed teaching effectiveness in Civics and Political Science courses gradually tends to be formalized and insufficiently focused due to the difficulty of quantification.

### **2.2.3. HOLISTIC INTEGRATION OF BLENDED LEARNING**

Some of the professional courses in higher education Civics body system and reasonable

realization of hybrid teaching integration is not deep. Although the blended teaching of civic and political science courses can successfully blend systematic learning and fragmented learning, there are still problems like excessive resource allocation on the teaching division, poor connection between online and offline civic and political science course elements, poor grasp of the integration of information platform technology and course teaching strength, and failure to mix, interoperate, and collaborate. It is difficult to establish a completely closed loop in education.

### 3. TEACHING EVALUATION INDEX WEIGHTING ASSIGNMENT

#### 3.1. TEACHING METHOD WEIGHTS

In order to explore the hybrid information-based teaching method of the college Civics course, SPSS software hierarchical analysis was used to determine the index weights and investigate the importance of each index, and finally the index weights were determined using yaahp10.1 software to evaluate the weight of teaching method factors as shown in Table 1, which was used to construct the Civics course teaching evaluation index system. According to yaahp software, it is known that the consistency ratio of evaluation index teaching methods is 0.0998, and the consistency ratio is less than 0.1, according to the consistency test principle, it is considered to meet the consistency test requirements, and the maximum eigenvalue  $\mu_{max}$  is 5.4047.

**Table 1.** Weighting analysis of factors for evaluating teaching methods

Teaching Method	Didactic	Inspirational	Seminar	Problem-based	Case Study	Wi
Didactic	1.0000	0.3000	0.3223	0.2500	0.2500	0.0555
Inspirational	4.0000	1.0000	2.0000	0.4000	1.0000	0.2500
Seminar	3.0000	0.2333	1.0000	0.5000	0.5000	0.1510
Problem-based	5.0000	2.0000	2.0000	1.0222	0.5000	0.2525
Case Study	4.0000	2.0000	1.0000	2.0000	1.0000	0.3025

#### 3.2. VALIDITY ANALYSIS OF THE EVALUATION INDEX SYSTEM

The evaluation index system was created using the information in Table 1, and an experiment using factor gravel plots created using SPSS software and spinning the makeup of the matrix as described in Table 2 was carried out to test the structural validity of the system. The total column of initial eigenvalues is greater than 1, which is a common criterion for useful factors, that is, components 1 to 5 are shown, indicating that these 5 factors can explain the overall variables. From the rotated sum of squares, we can find that the variance explained by the five principal components are 25.568%, 18.325%, 19.836%, 15.986%, and 18.250%, respectively, and the cumulative variance explained is 74.684%, which is more than 60%. It indicates that these five principal components can replace the overall data better.

**Table 2.** Rotated component matrix

Serial number	Initial Eigenvalue			Rotating Sum of Squares		
	Total	Variance %	Cumulative %	Total	Variance %	Cumulative %
1	7.526	45.542	41.672	3.185	27.558	26.795
2	2.033	12.636	52.128	2.328	15.035	42.723
3	2.091	13.276	62.407	2.258	18.586	58.179
4	1.942	10.269	75.151	2.641	12.886	72.065
5	1.109	6.313	81.544	2.203	16.590	85.574

#### 4. CONCLUSION

The teaching of civics courses faces previously unheard-of opportunities and difficulties as a result of education reform. We concentrate on developing a set of efficient quantitative methods that may assess the instruction of Civics courses in higher education institutions in order to comprehensively enhance the development of these courses. While teachers of civics courses actively practice, update the concept of information technology education, change the teaching method, and promote innovative aspects of civics course teaching, turn civics courses into influential courses, and achieve a profound and comprehensive effect on college students, educational institutions should build a platform, create conditions, and build a team for informatization teaching.

Civics course education is a thorough and organized effort. The hybrid teaching reform integrates elements of hybrid teaching and the development of the Civic Science instruction, which helps to improve the teaching system of the Civic Science curriculum and realize the goal of nurturing people by enhancing the Civic Science curriculum. It is an efficient way of implementing the Civic Science curriculum in colleges and universities.

## **ABSTRACT**

In this paper, based on the current situation of big data mechanical design research, two configuration module partitioning methods, modular product configuration design rules and product family module fuzzy clustering, are divided, and non-uniform granularity module clustering is optimized, and intelligent tape conveyor product features and corresponding redirected roller module family feature data are collected as sample data. The values of the normalized matrix feature parameters are 0.0887, 0.0544, 0.2319, 0.1353, 0.0020, 0.4622, 0.6383, 0.1787, 0.2176, and 1.083. This research is of great importance for building a modular configuration design method system for complex mechanical products based on artificial intelligence, and its engineering application technology.

## **KEYWORDS**

Normalization matrix; Mechanical design study; Modular product configuration; Product family; Non-uniform granularity module

## **1. INTRODUCTION**

With the development of network technology and its application in various industries, the data traces left by people on the network have been increasing, and the amount of data on the network shows a trend of massive growth [1-2]. The widespread application and deep integration of information technology such as the Internet and information systems of manufacturing enterprises have accumulated and formed manufacturing big data with the characteristics of massive, high speed, diversity and value [3-4]. Effective analysis and research of manufacturing big data is of great significance to accelerate the promotion of intelligent manufacturing [5-6]. And big data analysis can provide rich information resources for each industry, which is beneficial to the development and decision making of each industry [7-8]. For mechanical product manufacturing enterprises, the application of big data technology also has a certain role in promoting mechanical product design [9]. However, from the current stage of application, the application of big data in mechanical product configuration design is still inadequate, for which the relevant personnel should pay attention to the characteristics of the current mechanical product configuration design information for effective mechanical product configuration design in the big data environment.

## **2. BIG DATA MECHANICAL PRODUCT CONFIGURATION DESIGN TECHNOLOGY**

### **2.1. CURRENT ISSUES IN MECHANICAL PRODUCT CONFIGURATION DESIGN RESEARCH**

#### **2.1.1. DATA MODEL REPRESENTATION INFORMATION**

The application of the existing data model for mechanical product configuration design lacks relevance in the extraction of unstructured data, and the expression of unstructured data is unclear and inaccurate, making it difficult to clearly show the relationship between the extracted data and mechanical product parts.

#### **2.1.2. UNSTRUCTURED DATA MODEL**

The attributes extracted for unstructured data are rather broad and not very specific. They extract attributes that are unique to unstructured data, but some of these attributes are not applicable to the mechanical product configuration design domain. For example, the file hotness attribute in the galaxy model behavior attribute class indicates information about the frequency of operations on the unstructured data files themselves, and this attribute information is of little use in the mechanical product configuration design process.

### **2.2. MECHANICAL PRODUCT CONFIGURATION DESIGN MODULE DIVISION METHOD**

#### **2.2.1. MODULAR PRODUCT CONFIGURATION DESIGN RULES**

The development of various industries in the context of the development of the new era emphasizes innovation, and manufacturing production is also facing the double test of personalization and scale production. From the macro analysis of product production, it is necessary to divide the products into different module forms with little coupling between modules, which can form personalized product patterns through sequential arrangement between modules. From the micro analysis, the structure within a module has a strong degree of aggregation, so it is possible to use the assembly line high volume production method, which can ensure the stability of production quality, but also effectively reduce production costs. For production companies, the main task is to build standardized and complete product configuration design rules through the integration of the original product configuration scheme, combined with customer demand mining configuration design rules.

#### **2.2.2. PRODUCT FAMILY MODULE FUZZY CLUSTERING**

The field of informatics considers granularity as a relatively small sub-domain or kind of study, formed after classification according to a certain theoretical domain from a certain system of functional relations, uncertain relations. Combined with the principle of granularity, the clustering operation can be understood as an equivalence between samples in a sample set, that is, the equal weight occupied between different subsamples in the sample set based on a certain threshold value. The clustering process is generally described by means of a clustering spectrum map, and the corresponding granularity aggregation scheme can be obtained by extracting different threshold constraint mappings, and different schemes can satisfy the analysis of different equivalence relations of granularity. The granularity of the clustering results is uniform with the same threshold values, and on the contrary the granularity obtained with different threshold constraints will have large differences.

### 3. NON-UNIFORM GRANULARITY MODULE CLUSTERING AND OPTIMIZATION

#### 3.1. MODULE CLUSTERING AND OPTIMIZATION PROCESS

The tape conveyor is the most used aggregate conveying equipment in concrete mixing plant. The tape conveyor basically consists of tape, drive unit, drive drum, redirecting drum, rollers, pull-in unit, discharge unit, brake unit and sweeper. For an enterprise production of intelligent fixed tape conveyor, through the analysis of product features, the collection of the establishment of pan-product family, further through the market demand analysis, the use of the platform to divide the grid as a tool to divide the resulting pan-product family to generate a number of subdivision product family, intelligent fixed tape conveyor product family characteristics of parameter values as shown in Table 1. Here, one of the subdivision product family  $SPF = \{P_1, P_2, P_3, P_4, P_5, P_6, P_7, P_8, P_9, P_{10}\}$  is composed of nine functional modules, including tape, drive unit, drive roller, reversing roller, rollers, tensioning device, unloading device, braking device and sweeper. Now we have to build a product platform for this subdivision product family, and complete the bottom-up product platform construction according to the process of mapping, clustering and matching analysis in turn. The various thresholds involved in the platform design process are determined for specific cases, and the values are given here directly:  $\mathfrak{R} = 10, \delta_1 = \delta_2 = 0.65, \delta = 8, \eta = 7$ .

**Table 1.** Intelligent tape transporter sub-product family characteristic parameter family

	$P_1$	$P_2$	$P_3$	$P_4$	$P_5$	$P_6$	$P_7$	$P_8$	$P_9$	$P_{10}$
$t_1$	550	500	550	700	650	650	700	850	800	800
$t_2$	0.9	1	1.5	1.8	0.9	1.2	1.52	1.1	1.2	1.4
$t_3$	32	40	50	65	53	67	84	110	120	174

#### 3.2. FEATURE PARAMETER VALUES

The neural network requires large sample data for training, and the intelligent tape conveyor product features and the corresponding redirected roller module family feature data are collected as the sample data. The implicit layer nodes are set to 10 and other parameters are defaulted, and the network is built and trained with the sample data as input. The data in Table 1 is input to the trained network structure, and the values of the feature parameters are calculated. The “product-function module parameters” matrix is shown in Table 2. The  $t_1$  values of the normalized matrix characteristic parameter  $P_1 \sim P_{10}$  are 0.0887, 0.0544, 0.2319, 0.1353, 0.0020, 0.4622, 0.6383, 0.1787, 0.2176, and 1.083. It shows that this bottom-up product platform construction method can fully form a product platform based on the existing enterprise design resources, which ensures a high It also helps to find a good balance between the generic requirements for mass production and the performance requirements for individual customization, which makes the established product platform have good representativeness and rationality.

**Table 2.** Values of feature parameters taken by mapping analysis

Products	Initial Matrix		Normalization matrix	
	$t_1$	$t_2$	$t_1$	$t_2$
$P_1$	347	7811	0.0887	0.2311
$P_2$	320	7818	0.0544	0.2931
$P_3$	370	9631	0.2319	0.1384
$P_4$	320	10390	0.1353	0.4872
$P_5$	350	11063	0.0020	0.2348
$P_6$	320	17045	0.4622	0.1345
$P_7$	470	21028	0.6383	0.3148
$P_8$	514	11103	0.1787	0.4812
$P_9$	318	2016	0.2176	0.0600
$P_{10}$	426	22025	1.083	1.0000

#### 4. CONCLUSION

Modularity-based product configuration design technology is the core and key to realize rapid product customization under mass customization production mode. This paper proposes a non-uniform granularity module clustering method, which solves the problems that the traditional uniform granularity-based module identification and formation method is difficult to achieve the best module division results and the lack of flexibility in module clustering, and establishes a multi-objective optimization model for module clustering. By normalizing the existing design resources and exploring the possibility of forming a product platform, the method achieves the full utilization of existing design resources, ensures a high reuse rate of resources, and makes the established product platform have good inheritance and innovation.

# TRANSMISSION OF CHINESE CULTURE UNDER CROSS-CULTURAL COMMUNICATION-A CASE STUDY IN THE FIELD OF "WE MEDIA"

---

Xue Yuan\*

Lanzhou Technology and Business College, Lanzhou, Gansu, 730101, China

[yuan\\_xue\\_@126.com](mailto:yuan_xue_@126.com)

---

## ABSTRACT

This paper examines the necessity of international communication of Chinese culture, explores the characteristics of openness and speed of cultural communication in self-media under cross-cultural communication, analyzes the effect of Chinese cultural communication in self-media, and explores the relationship between content tendency and communication effect. In all 2000 samples, there are 473 videos with 0 likes, 1527 videos with the remaining number of likes greater than 0, and there are 213 videos with 0 likes or stomps. There are 1,787 videos with the number of likes, 1,527 videos with the number of stomps, 1,787 videos with the number of stomps, 213 videos with the number of stomps greater than 0, and 1,452 videos with the number of likes or stomps of 0 in the ratio of the number of likes divided by the number of stomps. The results based on the empirical analysis can provide support for the optimization of Chinese culture international communication practice.

## KEYWORDS

Chinese cultural communication; Intercultural communication; Self-media; Content tendency; Communication effect

## 1. INTRODUCTION

With the increasing comprehensive strength of China, its status and influence in the international arena are rising, and exchanges with other countries are increasing [1-2]. How to present China's development achievements and ideology to the world in a comprehensive and vivid way and how to promote the international communication of Chinese culture is getting more and more attention from the state [3-4]. The continuous development of the self-media industry has brought new opportunities for the international communication of Chinese culture [5-6]. How to effectively disseminate Chinese culture under international cross-cultural communication and how to establish a national image that matches Chinese civilization [7]. To let more foreigners understand Chinese culture and know China correctly, to promote understanding and communication between countries, to give China more discourse power in the international arena, and to better convey the voice of China, has become a topic of the times and is receiving more and more attention from the state [8-9]. Short videos in the era of self-media, from the perspective of cross-cultural communication, unlike their intentional weakening of their own cultural identity as communication subjects, many short videos reflecting the culture of different countries focus on showing cultural differences instead.

## **2. INTERNATIONAL COMMUNICATION OF CHINESE CULTURE IN THE CONTEXT OF SELF-MEDIA**

### **2.1. THE NEED FOR INTERNATIONAL CULTURAL COMMUNICATION**

#### **2.1.1. SPREADING THE VOICE OF CHINA**

As a national “soft power”, culture has gradually become an important embodiment of the core competitiveness of countries around the world and a symbol of national comprehensive strength, and attaching importance to the foreign communication of culture helps China’s excellent culture to go out better, stand on the international stage and make its voice heard, and become a medium for peaceful communication and emotional communication between China and people of different regions and languages in other countries around the world. It has become a medium for peaceful exchange and emotional communication between China and people from different regions and languages in the world. By insisting on cultural outreach and giving full play to the pioneering and fundamental role of cultural communication in the great rejuvenation of the Chinese nation, we will gradually realize the country’s wealth and strength and the nation’s revitalization. Through the international communication of culture, we will tell Chinese stories, explain Chinese characteristics and show Chinese style to people all over the world.

#### **2.1.2. NATIONAL INFLUENCE**

Cultural communication plays an important role in promoting economic cooperation, enhancing the country’s international status and expanding China’s influence in the international arena. People all over the world are increasingly enthusiastic about learning Chinese and have a growing need to understand Chinese culture, making full use of China’s excellent and profound, extensive cultural resources to show the world the unique style and charm of Chinese culture. The international dissemination of culture can not only highlight China’s great power sentiment, but also demonstrate the country’s comprehensive national power, which has profound strategic significance for the realization of the great rejuvenation of the Chinese nation. Cultural communication creates a more harmonious and favorable soft environment for China’s economic and diplomatic development, provides more powerful “soft protection” and helps to improve China’s international status.

### **2.2. SELF-MEDIA CULTURE DISSEMINATION**

#### **2.2.1. STRONGER OPENNESS**

Compared with traditional media, self-media using network and digital technology has a strong openness, which enhances the two-way interaction between communicators and audiences. People gain the initiative in receiving information, can subscribe to the information content they are interested in on the platform, and can express their opinions and attitudes anytime and anywhere. The audience can also interact and communicate with each other, so that the influence of cultural communication has been greatly enhanced. At this stage, the audience of self media is young people, with more open minds, facing multi-culture, with strong interest, and at the same time with extremely strong acceptance ability. Positive and good presentation and guidance should be carried out to make the audience group form a good impression of Chinese culture and be willing to pass it on to people around them.

#### **2.2.2. DISSEMINATION SPEED**

The rise of self-media has not only provided audiences with convenient and fast access to information, but also broadened the avenues for cultural communication. In terms of speed of dissemination, self media has unparalleled advantages compared to traditional media. Self-media has made up for the shortcomings of traditional media, and the culture dissemination

vehicle has changed from national schools, international radio stations, and cultural magazines and journals to the Internet and cell phones for all people to participate and spread online. The large number of daily video views, along with audiences' rebroadcasting or enthusiastic comments, break the boundaries between countries and regions, and between people, and realize the organic combination of cultures, so that the plurality and openness of cultural communication are fully enhanced.

### 3. ANALYSIS OF COMMUNICATION EFFECT AND ITS INFLUENCING FACTORS

#### 3.1. CONTENT TENDENCY AND COMMUNICATION EFFECT

Using the number of times the video of a post in Twitter was clicked and watched as an indicator to examine the effect of dissemination, the video evaluation tendency on the number of views for these 2000 sampled videos was analyzed by multiple linear regression as shown in Table 1. The posts were set with options for viewers to like and step on them, and they reflected the tendency of the content of the post. Among all 2000 samples, there were 473 videos with 0 likes and 1527 videos with the remaining number of likes greater than 0. There were 1787 videos with 0 likes and 213 videos with the remaining number of stomps greater than 0. The ratio of the number of likes divided by the number of stomps had 1452 videos with 0 likes or stomps, and there were 548 videos with this value not being 0. The distribution of the number of likes, the number of stomps and the number of likes/stomps of the videos is as follows: the mean number of likes is 253, the median and the plural is 0, and the mean number of stomps is 893.5. The analysis by Pearson correlation showed that both the number of likes and the number of stomps were correlated with the communication effect at the significance level of 0.01. The analysis by meta-linear regression (using a stepwise strategy) was consistent with the Pearson correlation analysis with correlation coefficients of 0.85 and 0.895, respectively, which showed the association between the emotional color and the degree of tendency of the posts and the communication effect.

**Table 1.** Multiple linear regression of video rating propensity on the number of views

Models		Non-standardized coefficient		Standard coefficient	<i>t</i>	<i>Sig.</i>
		<i>B</i>	Standard Error	Trial version		
1	constant	1386.245	5876.9		0.046	0.854
	Number of steps	2673.479	64.125	0.858	30.584	0.000
2	constant	153.475	23652.5		0.005	0.927
	Number of steps	1446.996	241.2	0.517	14.512	0.000
	Number of likes	36.712	5.724	0.357	10.328	0.000

#### 3.2. COMMUNICATION LINKS AND COMMUNICATION EFFECTS

The variability of spreading recommenders in the process of post dissemination is shown in Table 2. Among the 2000 valid samples, the number of those with recommenders was 38. The independent sample *t* test shows that there is no significant difference between the number of video posts with and without recommenders, although the mean difference in the number of clicks and views is 1839 and 52104, respectively. *Sig.* is 0.629. That is, the factor of having or not having recommenders in the dissemination process has no significant effect on the dissemination effect of video posts.

**Table 2.** Effect of the presence or absence of referrer on the effect of communication

Independent sample test		Levene's test for variance equations		<i>t</i> -test for the mean equation						
		<i>F</i>	<i>Sig.</i>	<i>t</i>	<i>df</i>	<i>Sig.</i>	Difference of means	Standard error value	Lower limit	Upper limit
Click to watch number	Equal	0.571	0.342	0.383	2651	0.732	5335.00	1531.92	-3423.52	2314246
	Unequal			3.764	2477.727	0.000	5321.00	1473.87	-2674.87	87452

#### 4. CONCLUSION

At present, the development of new media forms such as self-media, integrated media, and social media is flourishing and rising strongly in the world. Twitter is a new global powerful media space with the characteristics of self-media, social media and integrated media, and is an important field for international media discourse. As a new vehicle for the international communication of Chinese culture, it should seize the opportunity of the times and make full use of its advantages in cultural communication to show the world a true, three-dimensional and comprehensive image of China. Let people from all over the world understand China and get to know China, enhance foreigners' recognition and goodwill towards China, clarify China's willingness to live in harmony with all clogiountries in the world and develop together, and create a good international atmosphere for China's development, which is of great strategic significance and promotion to improve China's status in the international arena and achieve the great rejuvenation of the Chinese nation.

## ABSTRACT

This paper firstly analyzes the definition of intelligent terminal devices oriented to film communication, and selects intelligent terminal devices in a narrow sense based on the research content. Secondly, it gives the analysis of movie dissemination effect and marketing, including the connotation of word-of-mouth marketing, consumer culture and new consumerism. Finally, the data analysis is carried out with the example of movie dissemination data on the Tik Tok short video platform under the smart terminal device. The results show that through the Tik Tok platform, consumers can more clearly understand the theme, word-of-mouth, main actors, and highlights of the movie. In turn, it promotes consumers to go to cinemas or other viewing methods to realize the consumption of movies, further expanding the scope of movie dissemination.

## KEYWORDS

Intelligent terminal device; Communication effect; Marketing analysis; Consumer culture; Tik Tok; short video platform

## 1. INTRODUCTION

In the historical context of the gradual increase of national per capita income, continuous supply-side structural reform and the continuous development of new media technology, new industries and new models driven by digital technology are promoting the upgrading of consumption structure of Chinese residents, new concepts of consumption are breeding new culture of consumption, and new phenomena of consumption are creating new social changes [1-2]. At present, China has entered a new consumer society, and short videos on smart terminals are not only an important channel for people to obtain consumption information, but also a major source of content consumption. It plays an important role in advocating new consumption concepts, shaping new consumption values, spreading new consumption culture and guiding new consumption behaviors [3-4].

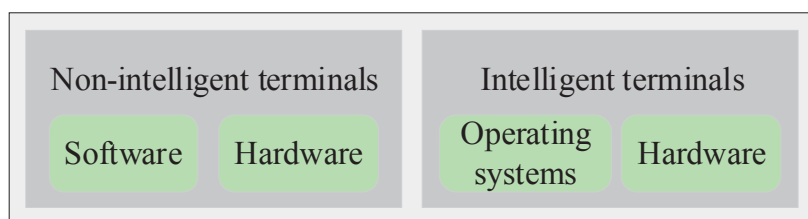

The push of mobile smart terminal devices, as a new media form formed by the combination of short video and self-media, short video self-media under smart terminals integrates the advantages of both [5-6]. It is able to disseminate rich information content related to movies in a more intuitive and three-dimensional way, which meets the current consumer demand for shorter, faster, and easier to understand information and conforms to people's fragmented

information consumption habits [7-8]. Along with many favorable factors such as favorable policy guidance, huge consumer market, and increasing economic level, Chinese domestic movies have been given great opportunities for development, and box office results have reached record highs.

The article takes the definition of intelligent terminal devices for film communication as the starting point, analyzes the difference between terminal devices in a broad sense and terminal devices in a narrow sense, and selects intelligent terminal devices in a narrow sense for analysis based on the research content. For the analysis of film communication effect and marketing, the theory of communication effect and word-of-mouth marketing are given, and the connotation of consumer culture and new consumerism is also proposed. The quantitative analysis of data based on the Tik Tok short video platform on smart terminal devices shows that the smart terminal devices can effectively enhance consumers' curiosity about movies and promote consumers to enter cinemas to pay for movies. The smart terminal devices can also further expand the scope of movie dissemination and give more consumers a way to learn about movies.

## 2. DEFINITION OF INTELLIGENT TERMINAL DEVICES FOR FILM DISSEMINATION

Smart terminals, in a broad sense, refer to all terminals with reconfigurable features, and in a narrow sense, they come with an operating system, provide APIs, and can install and run applications developed by third parties, which are discussed in this paper in a narrow sense. Therefore, developers other than terminal manufacturers can also develop third-party applications for smart devices with these operating systems, as shown in Figure 1.

**Figure 1.** The architecture of the terminal

From the operating system to study, the mainstream operating system of intelligent terminal includes Android operating system led by Google, IOS operating system of Apple, windows phone operating system of Microsoft, etc. In addition, there are Symbian, B1ackBerry OS, etc.

## 3. FILM COMMUNICATION EFFECT AND MARKETING ANALYSIS

### 3.1. COMMUNICATION EFFECT THEORY AND WORD-OF-MOUTH MARKETING

Communication effectiveness theory, in a broad sense, refers to the impact of all information produced by the mass media on the recipients, and in a narrow sense, to the psychological, attitudinal and behavioral changes induced in the recipients by communication behaviors with persuasive motives. The psychological, or cognitive, level is mainly the level of awareness and familiarity, the attitudinal level is mainly the level of values, and the behavioral level is mainly the level of action. These three levels usually show a progressive relationship, and the deeper the level reached, the better the communication effect.

Word-of-mouth marketing refers to the oral, written or electronic communication between people about the benefits or experiences of buying or using a product or service. Word-of-mouth exists as a spontaneous propaganda and promotion between people, spreading information about personal experience of using a product or brand, attitude perceptions, etc., prompting the recipient of the information to spontaneously experience, try or buy it. Based on the personal trust endorsement of the promoter, word-of-mouth marketing far exceeds other

marketing methods in terms of credibility.

### 3.2. INTELLIGENT TERMINAL DEVICES AND CONSUMER CULTURE

As a new consumption phenomenon emerging from the new change of media, the new consumption means the birth of a new consumption culture. The study of the construction of film communication and consumption reality by self-media under smart terminals includes the study of the construction of film consumption culture by media.

In the face of the rise of new consumption in film communication, the emergence of new consumption concepts and culture, and the booming development of short videos on smart devices as the main content form of film communication. What are the connotations and characteristics of the new consumption, how does the short video media on smart devices construct the new consumption, what are the characteristics in the construction process, and what are the specific construction methods, strategies, paths and construction models. In the context of the current government's strong advocacy and promotion of new consumption, what are the inspirations for the construction of new consumption in film communication under short-form video media?

### 3.3. CONNOTATIONS OF NEW CONSUMERISM

The new consumerism is an ideological expression of the new consumption, unlike the new consumption which is a process of consumption behavior. It can be understood as a new way of life, values and culture of consumption bred out of the new consumption behavior, consumption pattern and this new social phenomenon. At present, scholars mainly divide into three research paradigms when studying the new consumerism: the inheritance-critical paradigm, the inheritance-construction paradigm, and the fragmentation-rebellion paradigm.

## 4. INNOVATION OF TIK TOK IN SMART TERMINAL DEVICES ON THE WAY OF FILM DISSEMINATION AND CONSUMPTION

Based on the previous analysis, this chapter focuses on the marketing communication of domestic movies in Tik Tok, therefore, people who have not used or downloaded Tik Tok are not included in this survey. Among the 550 questionnaires distributed and filled out through the Internet from January 2021 to December 2021, there were 50 invalid questionnaires and 500 valid questionnaires, with an effective rate of 90%.

### 4.1. DATA ANALYSIS ON THE COGNITIVE LEVEL

At the cognitive level, we mainly investigated the audience's awareness of movie content on Tik Tok and their perception of frequency. In this section, we analyzed the data with the question "Have you ever swiped a movie-related video on Tik Tok", and the results are shown in Figure 2.

Figure 2. Cognitive level data analysis

From the analysis of the cognitive data, 42.3% of the respondents chose “often”, 33.6% chose “generally”, 12.8% chose “frequently” and 8.2% chose “rarely”. The percentage of “rarely” is 8.2%. It can be seen that there are more movie contents on Tik Tok, and the audience has higher awareness and familiarity with it.

#### 4.2. DATA ANALYSIS ON ATTITUDE LEVEL

The attitudinal questionnaire mainly investigated the audiences’ enjoyment, trust and attractiveness of movie content. In this section, we analyzed data from the question “What kind of movie content do you think is attractive to you”, and the results are shown in Figure 3.

From the analysis of the attitudinal data, “movie highlights” has the highest proportion, followed by “movie shooting footage”, “movie theme song”, “movie word of mouth”, “movie star” and “director promotion”, “movie word-of-mouth”, “movie starring” and “director’s publicity”. The movie clips are far ahead, which shows that audiences have the highest recognition of this content. When marketing and disseminating Chinese movies in Tik Tok, they can focus on this content as the main promotional content and make full exposure.

Figure 3. Attitude level data analysis

#### 4.3. FILM COMMUNICATION MARKETING COMMUNICATION CONSUMPTION STRATEGY

After opening an official account on the Tik Tok platform, how to operate it in depth is a top priority. Relying on short video accounts on smart terminal devices, uploading movie-related content, such as behind-the-scenes footage, highlights, and starring recommendations, content marketing has become an important initiative. In addition to content marketing, more diversified marketing and communication means have been tapped, such as theme song marketing, topic marketing, viral marketing and celebrity marketing becoming the normal operation. As Tik Tok continues to develop new ways of playing and means, more interesting marketing and communication methods continue to give audiences a sense of freshness and stimulate them to raise their attention to the movie.

#### 5. CONCLUSION

With the development of smart terminal devices and the emergence and development of various new media platforms, domestic movies actively adopt various methods, platforms and channels as the marketing and communication means of movies to further strengthen their

communication ability and thus promote the innovative development of consumption methods. In this paper, the basic connotation of new consumerism is given from the analysis of film communication effect and marketing, and the quantitative analysis of data is carried out with the example of Tik Tok short video platform under smart terminal devices. The results show that the Tik Tok platform can better promote the dissemination of movies and increase consumers' understanding of movies, which in turn provides impetus for the dissemination of movies.

## ABSTRACT

This paper first explores the use of documentary video discourse in the education industry and its importance. Then, an empirical study is conducted to analyze the effectiveness of cloud-based management in enhancing the production and dissemination of documentaries. Cloud-based management of documentary video discourse is innovative, and social media and cloud computing play an important role in improving the effectiveness of documentary distribution. The results show that more than 80% of viewers have accessed documentary film information through social media. This suggests that the proposed use of cloud computing management in documentary production and dissemination is effective in the innovation and dissemination of documentary video discourse. The research in this paper provides worthy innovative ideas and practical experience for documentary production and dissemination, which helps to promote the further development of the documentary field.

## KEYWORDS

Documentary film; Video discourse; Education industry; Cloud management; Innovative change; Social media

## 1. INTRODUCTION

Documentary images have always been one of the important forms of cultural expression and an important way for people to learn about society, culture, history, etc. [1-2]. However, the traditional ways of documentary production, editing, and dissemination can no longer meet the needs of modern society [3-4]. With the development of cloud computing technology, more and more documentary production and dissemination have started to rely on cloud computing technology in order to achieve more efficient, convenient, and accurate documentary production and dissemination [5]. Cloud computing technology, as an emerging information technology, has been widely used in various fields [6]. In the media field, cloud computing technology has also been widely used in the production, storage, and dissemination of documentary images [7]. Some scholars have also started to focus on the effect of cloud-based management on documentary image discourse and dissemination [8]. This paper introduces the background and importance of cloud-based management of documentary image discourse dissemination, especially in the education industry. Then, the objectives and implications of the empirical study are presented, and a quantitative research method is used for data

collection and analysis. The effect of social media and cloud computing on the dissemination of documentary films is analyzed through the data.

## 2. CLOUD-BASED MANAGEMENT OF DOCUMENTARY VIDEO DISCOURSE DISSEMINATION

### 2.1. DOCUMENTARY VIDEO DISCOURSE IN THE EDUCATION INDUSTRY

In the education industry, student information management systems have become an essential part. The traditional student information management system is mainly based on local server management, which has problems of difficult maintenance and data security. With the development of cloud computing technology, the student information management system based on cloud computing management has gradually been widely used. This system not only improves data security and reliability, but also enables real-time data sharing and remote access, which is convenient for students, teachers and parents to query and manage information. At the same time, the cloud-based student information management system can also provide more convenience and support for students' learning and life, such as online course selection, online assignment submission, online examination and other functions. Therefore, cloud-based student information management system has become an important trend and development direction in the education industry. The documentary video discourse in the education industry is shown in Table 1.

**Table 1.** Documentary video discourse in the education industry

Student group characteristics	Learning Needs	Learning Style
Digital Natives	Personalized Learning	Teaching in the classroom at Transfusion Iron
Diversity	Open Learning	Online Learning
Autonomy	Interactive Learning	Social Learning
interactivity	Hands-on learning	Gamification Learning
Feedback	Feedback Learning	Interest-based Learning

### 2.2. THE IMPORTANCE OF DOCUMENTARY VIDEO DISCOURSE

As a non-fictional video art form, documentary film has the function of recording, transmitting and presenting the real thing. The importance of documentary video discourse lies in its ability to convey information through the form of video, so that viewers can understand and feel the presented themes and contents more vividly and intuitively. At the same time, documentary video discourse is also an important way of cultural transmission, which can record and convey information about human culture, history, social phenomena, etc., and is of great significance to the protection and transmission of human cultural heritage. In the context of cloud computing management, the importance of documentary image discourse is even more prominent, because cloud computing management can provide a more convenient and efficient way to produce, disseminate and manage documentaries, thus better promoting innovative changes in documentary image discourse.

## 3. AN EMPIRICAL STUDY ON THE EFFECT OF DOCUMENTARY VIDEO DISCOURSE COMMUNICATION

### 3.1. RESEARCH SIGNIFICANCE

This study aims to explore the innovative changes in documentary video discourse and communication effects based on cloud computing management, with the following specific research implications:

- (1) Promoting innovative changes in documentary video discourse

The production and dissemination methods of traditional documentary video discourse can no longer meet the needs of today's society, and cloud-based documentary video discourse has higher autonomy and innovation, which can greatly improve the quality of documentaries and the audience's experience.

(2) Promote innovative changes of documentary film dissemination effect

Cloud computing management-based documentary film dissemination method has higher efficiency and convenience, which can better meet the needs of the audience and also let more people understand the content and value of documentary films.

### **3.2. RESEARCH OBJECTIVES**

The objectives of this research paper are:

(1) To investigate the ways and effects of achieving innovative changes in documentary video discourse based on cloud computing management.

(2) To analyze the dissemination effects of the documentary video discourse based on cloud computing management, including the scope, speed, and effectiveness of dissemination.

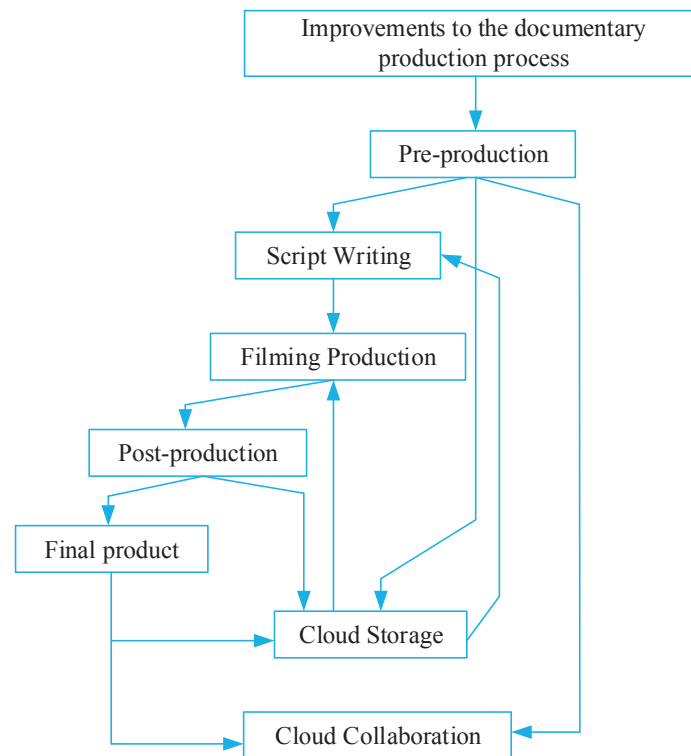

(3) To explore the impact of the innovative change of the documentary video discourse based on cloud computing management on the traditional documentary production and dissemination mode.

## **4. THE RESULTS AND ANALYSIS OF EMPIRICAL RESEARCH ON THE EFFECT OF DOCUMENTARY VIDEO DISCOURSE COMMUNICATION**

### **4.1. ANALYSIS OF INNOVATIVE CHANGES IN IMAGE DISCOURSE**

#### **4.1.1. IMPROVEMENT OF DOCUMENTARY PRODUCTION PROCESS BASED ON CLOUD COMPUTING MANAGEMENT**

The improvement of the documentary production process based on cloud computing management is shown in Figure 1. In the traditional documentary production process, producers need to purchase or rent a large amount of equipment and venues, as well as recruit a large number of staff to complete the production work. These costly elements not only increase the difficulty of production, but also limit the scope and volume of documentary production. However, the emergence of a cloud-based managed documentary production process allows producers to complete productions with resources in the cloud. This not only reduces production costs, but also increases production efficiency, allowing more people to participate in documentary production.

**Figure 1.** Improvement of documentary production process based on cloud computing management

#### 4.1.2. ENHANCEMENT OF DOCUMENTARY COMMUNICATION EFFECT BASED ON CLOUD COMPUTING MANAGEMENT

In the traditional way of documentary film distribution, producers need to publicize and promote documentaries through traditional media such as TV stations and movie theaters. However, the publicity effect of these traditional media is limited and often can only reach a portion of the audience. In contrast, cloud-based documentary distribution can be done through the Internet, which not only can reach a wider audience, but also can make personalized recommendations for different audiences to improve the distribution effect. At the same time, cloud computing management of documentary film dissemination can also be disseminated through social media and other emerging media to further enhance the dissemination effect.

#### 4.1.3. INNOVATIVE CHANGES IN DOCUMENTARY VIDEO DISCOURSE BASED ON CLOUD COMPUTING MANAGEMENT

The emergence of cloud-based management of documentary production processes and dissemination methods also provides more possibilities for innovative changes in documentary video discourse. The producers can use the resources in the cloud to carry out innovative processing of video discourse, such as adding virtual reality technology and interactive experience to enhance the audience's participation and experience. At the same time, cloud-based documentary distribution can also provide more distribution channels and opportunities for innovative changes in video discourse, so that innovative video discourse can be better accepted and distributed by audiences.

### 4.2. RESULTS AND ANALYSIS OF DOCUMENTARY COMMUNICATION EFFECT

#### 4.2.1. SOCIAL MEDIA-BASED COMMUNICATION EFFECT ENHANCEMENT

Social media has become an important channel for people to obtain information and communicate in today's society. This study effectively enhanced the communication effect by

posting documentary video discourse on social media. Specifically, we posted the trailer of the documentary on social media platforms such as Weibo and WeChat, and directed viewers to visit our website to watch the full version of the documentary. This approach not only attracts more viewers, but also makes it easier for viewers to access information and viewing methods of the documentary. Through a survey of viewers, we found that more than 80% of viewers obtained information about the documentary through social media and eventually watched the full version of the documentary.

#### **4.2.2. CLOUD-BASED COMMUNICATION EFFECT ENHANCEMENT**

This study adopts a cloud computing-based video storage and transmission method, which effectively improves the dissemination of documentaries. We uploaded the documentary to the cloud server and achieved high-speed transmission and smooth playback through cloud computing technology. This approach not only improves the viewing experience of viewers, but also reduces the lag and loading time during transmission, thus increasing the viewing rate and viewing time of viewers. Through a survey of viewers, we found that more than 90% of viewers were satisfied with the transmission speed and smoothness of the documentary.

### **5. CONCLUSION**

This paper presents the objectives and implications of the empirical study, and uses quantitative research methods for data collection and analysis. The study shows that cloud-based management of documentary production and dissemination has a significant role in enhancing the innovation and dissemination of documentary video discourse. By improving the documentary production process and adopting a cloud-based distribution model, production efficiency can be improved, production costs can be reduced, and a broader audience can be reached. In addition, social media and cloud computing also play an important role in improving the communication effectiveness of documentaries. Based on the findings, it is recommended that documentary filmmakers should consider adopting cloud-based management for production and dissemination to enhance the innovation and dissemination of documentaries. In conclusion, this study provides useful references and lessons for the development of the documentary film industry.

## **ABSTRACT**

In light of big data, this research examines the project-based administration of physical education instruction in higher education institutions, explains how project-based management is used in physical education teaching management at higher education institutions and creates a project-based management-based physical education teaching management system. The study shows that the adoption of project-based management has great advantages in physical education teaching management, which can strengthen teamwork, improve teaching efficiency and enhance teaching management quality. It is possible to effectively increase the effectiveness and quality of teaching management, address management issues, and better serve the general fitness teaching staff and students by building an athletics teaching management structure based on project-based management.

## **KEYWORDS**

Big data; Higher education institutions; Physical education; Project-based management; Teaching management system; Teamwork

## **1. INTRODUCTION**

The administration of physical education instruction in higher education institutes is confronting several new opportunities and problems with the advent of the big data era [1-2]. Traditional teaching management approaches are no longer enough to satisfy the demands of modern education, thus project-based construction is required to innovate and enhance physical education teaching leadership in institutions of higher learning [3-4]. The use of big data technology can assist project-based development with more accurate, thorough, and timely data and encourage ongoing optimization of the administration of physical education instruction in educational institutions [5]. Project-based management instruction has been widely employed in the field of education [6]. Additionally, in the age of big data, a project-based teaching management can assist higher education institutions in managing physical education instruction and learning more accurately and efficiently [7]. In order to maximize teaching quality through the examination and extraction of educational data, the literature [8] presented a teaching management model that utilized big data technologies. This study examines how project-based management is used to manage physical education teaching at

higher education institutions and develops a project-based management system for managing physical education teaching. Additionally, the PPM-based PE teaching management system's functional organization and platform architecture are suggested, and the key issues and solutions encountered during the system's deployment are covered.

## **2. PROJECT-BASED CONSTRUCTION OF PHYSICAL EDUCATION TEACHING MANAGEMENT IN HIGHER EDUCATION INSTITUTIONS**

### **2.1. THE CONCEPT AND CHARACTERISTICS OF PROJECT-BASED MANAGEMENT**

#### **2.1.1. THE CONCEPT OF PROJECT-BASED MANAGEMENT**

Management of management aims, objectives, and activities as a relatively autonomous project is referred to as project-based management. Project-based management may break down the goals and responsibilities of teaching management into separate sub-projects in the management for athletics in educational institutions, which can increase management effectiveness and teaching quality.

#### **2.1.2. FEATURES OF PROJECT-BASED MANAGEMENT**

Project-based management has the following characteristics:

(1) Relative independence: each project is relatively independent, with its own goals, tasks and resources.

(2) Temporary: Each project has a clear start and end time, and ends as soon as the task is completed.

(3) Organizational: Each project requires a certain organizational structure and management system to manage.

(4) Risk: Each project has certain risks and requires risk assessment and control.

(5) Goal-oriented: each project is carried out to achieve a specific goal, and needs to be managed in a goal-oriented way.

In the management of physical education teaching in higher education institutions, the adoption of project-based management can better achieve teaching goals and improve teaching quality, as well as improve management efficiency and resource utilization.

### **2.2. APPLICATION OF PROJECT-BASED MANAGEMENT IN THE MANAGEMENT OF PHYSICAL EDUCATION TEACHING IN HIGHER EDUCATION INSTITUTIONS**

#### **2.2.1. PROJECT-BASED MANAGEMENT PROCESS**

The use of project-based management in higher education institutions' physical education teaching management can better foster the growth of teaching management. The following steps are primarily included in the project-based management process:

(1) Project initiation stage: determine project objectives, scope, time and resources, and establish project organization structure.

(2) Project planning stage: Develop project plan, schedule and resource plan, and conduct risk assessment and quality management.

(3) Project implementation phase: Execute the tasks according to the project plan, while monitoring and controlling.

(4) Project Closing Phase: Complete project objectives and perform acceptance, summarize project experience and lessons learned, and perform project closing and archiving.

## **2.2.2. APPLICATION OF PROJECT-BASED MANAGEMENT**

Project-based management may be used to encourage the growth of various tasks in the administration of physical education instruction in higher education institutions. For instance, various tasks such as teacher training, facility development, reforming the teaching of physical education, and other work might be managed as separate projects. Project-based management allows for better coordination of the work and increases the effectiveness and standard of management of the instructional process. The project experience and lessons acquired may also be distilled to constantly strengthen the project-based management process and raise the bar for management education.

Compared with traditional management methods, adopting project-based management can bring the following advantages:

(1) Goal-oriented: project-based management is oriented to project goals, which can better achieve teaching management goals.

(2) Flexibility: Project-based management may be adaptably modified and updated based on the project's actual circumstances to meet various demands for managing teaching and learning.

(3) Resource integration: Project-based management can integrate different departments and resources and make full use of teaching management resources.

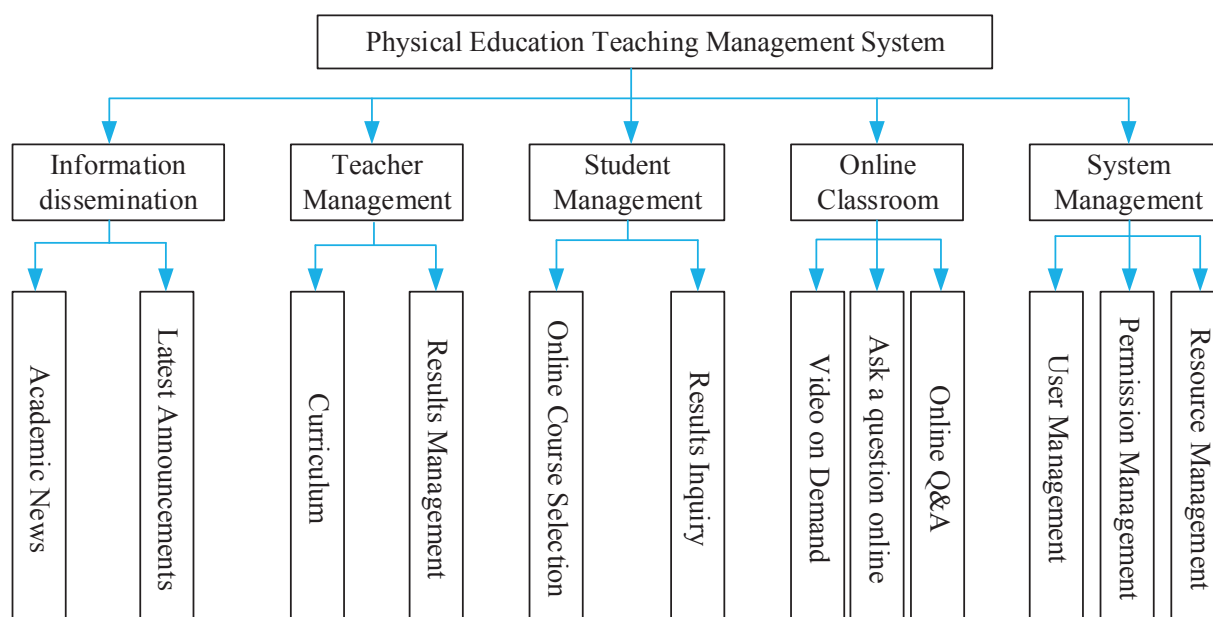

(4) Risk control: Project-based management can reduce the risk of teaching management through risk assessment and control.

## **3. PROJECT-BASED MANAGEMENT OF PHYSICAL EDUCATION TEACHING MANAGEMENT SYSTEM**

### **3.1. FUNCTIONAL STRUCTURE OF PHYSICAL EDUCATION TEACHING MANAGEMENT SYSTEM**

The functional structure of the system for teaching physical education refers to the overall system's functional framework, which serves as a prototype for the system's functional application. The functional structure diagram identifies the system's future functional capabilities. This paper creates a thorough functional organizing of the physical education teaching administration system via the functional needs analysis as well as useful orientation of the system, which contains the entire functional design of the system and breaks down into four major functional modules: news release leadership, teaching management, online classroom, and system administration. Sub-functional modules are contained in each major functional module. Figure 1 depicts the structure of the management system for physical education instruction.

**Figure 1.** Functional structure of physical education teaching management system

### 3.2. PHYSICAL EDUCATION TEACHING MANAGEMENT SYSTEM PLATFORM ARCHITECTURE

The physical education system uses a B/W/S structure; the system end-user logs in through a browser; the WEB server serves as the application server; and the database server handles data processing and storage. Users experience less problems with the system upgrade because it is exclusively performed on the server side and is not open to end users. Overall, the platform structure of the app's system on the one hand satisfies our system's design criteria and on the other hand boosts system performance. On the other hand, there are many other applications that may be made in practice. Table 1 displays the architectural table for the management system for physical education.

**Table 1.** Architecture of Physical Education Management System

Category	Platform / Technology
Server Platforms	Windows Server 2016
Database Server	MS SQL Sever
Scripting Languages	ASP.net
Client Platform	Windows XP
System Architecture Model	B/W/S

### 4. CONCLUSION

This article examines how project-based management is used to manage physical education teaching at higher education institutions and suggests the functional framework and platform design of a project-based management system for physical education teaching. Teamwork can be boosted, teaching effectiveness can be increased, teaching management quality can be improved, and a solid management framework for instructor management can be built through project-based management. In practice, creating a teaching management system for physical education based on project-based management can successfully increase the effectiveness and quality of teaching management, address management issues, and better serve all physical education teaching staff as well as students. Therefore, to increase physical education teaching management and enhance teaching quality, higher education institutions might make use of the project-based management system for physical education

teaching that is suggested in this work.

## ABSTRACT

In order to be able to better realize patients' postoperative pain experience and analgesic needs in the era of artificial intelligence, a scientific and standardized patient postoperative pain care management model is constructed on this basis to provide theoretical guidance for the development of clinical pain care work. In this paper, an application comparison experiment was designed to compare and analyze patients who underwent arthroscopic rotator cuff repair in a tertiary hospital in a city. The results showed that the observation group had a higher rate of excellent shoulder function than the control group at 20 weeks postoperatively, with a p-value less than 0.05. This indicates that MPMM can effectively help patients with postoperative pain care.

## KEYWORDS

Artificial intelligence; Postoperative pain; Pain care; MPMM; Shoulder joint mobility; Comparative experiment

## 1. INTRODUCTION

The word pain comes from the Latin word "poena", which means "punishment". In 2020, the IASP revised the definition of pain as "pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage, or an experience similar to it" [1-2]. Pain has received more attention and discussion in the eyes of the medical community and the public. Acute pain is the most common in surgery and not only delays the patient's postoperative recovery, but also increases the postoperative shock of the patient's altered physiological status [3-4]. It has an impact on the recovery of both physiological and psychological health of patients after surgery, so postoperative pain management is crucial for patients' recovery.

In recent years, with the continuous development of the era of artificial intelligence and pain management research, the concept of multimodal analgesia has been proposed and developed, and under the guidance of this concept, the combined application of pharmacological analgesic treatment and non-pharmacological analgesic techniques has significantly improved the analgesic effect [5-6]. However, at present, there are still some

patients whose postoperative pain cannot be controlled timely and effectively. The reasons for this mainly include the following three aspects: first, the lack of awareness of the importance of pain control among medical and nursing staff, second, the incorrect attitude of patients toward pain, and third, the lack of attention to pain in medical institutions and the lack of relevant pain management systems [7-8]. Therefore, experts suggest that the key to solving the problem of imperfect analgesia is to establish an effective pain management model.

In this paper, a patient who underwent arthroscopic rotator cuff repair in a tertiary hospital in a city was used as an example to conduct a comparative experiment in terms of shoulder mobility, excellent shoulder function rate and complications during hospitalization. The experiment was conducted to demonstrate the effectiveness of the application of MPMM in the patient's postoperative pain care management model. The results showed that MPMM can effectively help patients reduce postoperative pain, decrease the length of hospital stay, and effectively reduce the possible complications during the patient's postoperative hospital stay.

## 2. CLASSIFICATION OF PATIENT POSTOPERATIVE PAIN CARE MANAGEMENT MODELS

The basic principles of postoperative pain management are based on the concept of pain management proposed by Lohman. Pain management was initially led by anesthesiologists, and interest in alternative analgesic modalities to opioids grew with the ongoing concern about opioid overuse in the United States. Various pain management models were subsequently proposed by researchers, including the Acute Pain Service Model, the Manchester Pain Management Model, the Greene Model, the Pain Free Ward Management Model, and Multimodal Analgesia.

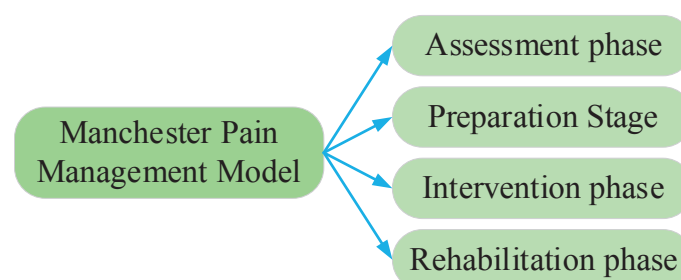

### 2.1. POSTOPERATIVE PAIN AND PAIN MANAGEMENT

(1) Postoperative pain is the acute pain that ensues after surgery, an adaptive response to physical trauma caused by surgical procedures, a predictable, short-term self-limiting outcome that requires timely management and treatment.

(2) Pain management refers to the process of relieving or alleviating pain through medical services and other means. Pain management is not completely pain-free, but is based on the implementation of various medical treatments and care measures by healthcare professionals for patients to minimize their pain and provide them with a relatively safe and comfortable recovery environment.

### 2.2. MANCHESTER PAIN MANAGEMENT MODEL

This study uses the Manchester Pain Management Model (MPMM), which was developed by Keyte et al. at the University of Manchester in 2011, as a theoretical framework, and divides pain management into four phases, namely "preparation, assessment, intervention, and rehabilitation". It is mainly applicable to three types of pain, namely acute and chronic pain and manipulative pain caused by medication changes. The basic structure of the Manchester Pain Management Model is shown in Figure 1.

## Figure 1. Manchester Pain Management Model

(1) The preparation phase refers to the phase in which the main task is to do the basic work necessary for pain management, focusing on understanding the current situation of pain management of medical and nursing staff and improving pain management capabilities.

(2) Assessment phase refers to the phase in which the focus is on selecting appropriate assessment tools and conducting effective pain assessment according to the patient's physical and mental condition and pain type.

(3) Intervention phase refers to the phase that focuses on the adoption of effective analgesic treatments according to the patient's pain condition, including the implementation of pharmacological analgesic therapy, non-pharmacological analgesic therapy and the observation of efficacy.

(4) Rehabilitation phase is the phase that focuses on restoring the patient to "normal", including physical, psychological and social functions, and aims to help the patient achieve the best possible status and improve the quality of life.

### 3. RESEARCH OBJECT AND METHOD

#### 3.1. RESEARCH SUBJECTS

One hundred patients who underwent arthroscopic rotator cuff repair from January 2020 to May 2021 in a tertiary care hospital in a city were conveniently selected. To prevent patients in the experimental and control groups from communicating with each other and interfering with the study results, patients from January 2020 to December 2020 were classified as the control group and patients from January 2021 to May 2021 were classified as the experimental group according to the order of hospitalization. Patients in both groups were treated with a standardized surgical approach and anesthesia.

#### 3.2. RESEARCH METHODOLOGY

##### (1) Conventional postoperative care

In the control group, routine care was provided from the day of admission to the day of discharge, with follow-up until 20 weeks after surgery. After admission, patients were given routine education, functional exercise instruction, proper cleaning of the operating area, and were instructed to fast and abstain from water for 6 h before surgery. After the operation, the patient was sent to the ward safely, asked to lie down with the pillow removed for 6h, fasted from food and water for 6h, paid attention to the observation of physical signs, iced the affected shoulder joint according to the doctor's prescription, instructed to take the correct medication and started rehabilitation training as soon as possible. Patients were given an education manual, which mainly included the knowledge of rotator cuff injury treatment and postoperative rehabilitation points. Patients were given oral health education, and postoperative precautions and potential adverse reactions were explained in detail to them. Regular telephone follow-up after discharge from the hospital.

##### (2) MPMM rehabilitation care

a. Preparation stage, the pain management team was formed, and pain management experts were invited to be responsible for training team members, learning relevant knowledge and assessment methods together systematically, and refining, improving and standardizing the pain management system.

b. Assessment phase, patients were assessed for their pain level immediately after admission using visual simulation scoring method to clarify information about their pain location,

nature and intensity. Patients were informed about their knowledge of rotator cuff injury and pain management, as well as their socio-cultural background.

The pharmacological analgesia was administered according to the pain assessment results, and the patients were observed for any adverse reactions during the administration of the medication. Non-pharmacological analgesia focused on the use of music therapy and muscle relaxation therapy, and taught patients to learn pain self-assessment.

d. During the rehabilitation phase, patients should be encouraged to do activities at an early stage, but the principle of gradual progress should be followed, and the intensity, frequency and form of activities should be gradually adjusted according to individual differences.

#### 4. EXPERIMENTAL RESULTS AND ANALYSIS

##### 4.1. COMPARISON OF SHOULDER JOINT MOBILITY

In this section, shoulder mobility was selected to measure the patient's postoperative recovery, which was analyzed by measuring the angles of external rotation, internal rotation, posterior extension and forward flexion of the patient's shoulder joint, and the specific measurements were obtained as shown in Table 1.

**Table 1.** Comparison of shoulder joint mobility

Group	N	External rotation		Internal rotation	
		Pre-operative	20 weeks post-op	Pre-operative	20 weeks post-op
Observation	50	21.41	66.64	18.25	51.66
Control	50	22.09	62.87	19.03	48.72
T Value		0.803	2.554	0.925	2.456
P Value		0.425	0.013	0.355	0.015
Group	N	Backward extension		Forward flexion	
		Pre-operative	20 weeks post-op	Pre-operative	20 weeks post-op
Observation	50	23.65	29.97	30.63	120.95
Control	50	22.49	27.18	31.15	115.09
T Value		0.865	2.584	0.541	2.492
P Value		0.388	0.012	0.593	0.013

From the comparative data in the table, it can be seen that at 20 weeks after surgery, the external rotation, internal rotation, posterior extension and forward flexion angles of the shoulder joint in both groups were greater than those before surgery, and the p-value was less than 0.05, and the observation group was greater than the control group.

##### 4.2. COMPARISON OF THE EXCELLENT RATE OF SHOULDER JOINT FUNCTION

In this section, the excellent rate of shoulder function was selected for comparative analysis, and the University of California shoulder score assessment was performed at 20 weeks after surgery, and patients were classified as excellent, good, moderate and poor according to their scores, and the excellent rate was calculated. The specific comparison results are shown in Table 2.

**Table 2.** Comparison of excellent shoulder function rates

Group	N	Excellent	Good	Moderate	Poor	Total excellent
Observation	50	25	21	3	1	46
Control	50	22	19	10	9	41
$\chi^2$ Value						6.852
P Value						0.008

As seen from the comparative data in the table, the excellent rate of shoulder joint function in the observation group was greater than that in the control group at 20 weeks after surgery.

#### 4.3. COMPARISON OF THE OCCURRENCE OF COMPLICATIONS DURING HOSPITALIZATION

In this section, the occurrence of complications during hospitalization was selected as an evaluation index, and the occurrence of shoulder swelling X1, incision infection X2, rivet loosening X3 and secondary tear X4 in patients was observed and recorded, as shown in Table 3.

**Table 3.** Occurrence of complications during hospitalisation

Group	N	X1	X2	X3	X4	Total occurring
Observation	50	2	0	0	1	3
Control	50	5	3	2	4	14
$\chi^2$ Value						6.125
P Value						0.012

As seen from the comparative data in the table, the occurrence of complications during hospitalization was lower in the observation group than in the control group at 20 weeks after surgery.

In conclusion, the intervention method in this study can increase shoulder joint mobility, relieve pain and promote shoulder joint function recovery in patients with rotator cuff injury. The reason for this is that MPMM can take into account various factors affecting pain management and develop a comprehensive and systematic pain management model based on reality. It provides patients with thoughtful and comprehensive pain management services and reduces the occurrence of complications during hospitalization.

#### 5. CONCLUSION

In this paper, the Manchester Pain Management Model was used as a framework to analyze the postoperative pain management model for patients undergoing arthroscopic rotator cuff repair in hospitals. Examples were compared and analyzed by shoulder mobility, excellent shoulder function, and the occurrence of complications during hospitalization. The results showed that the external rotation, internal rotation, posterior extension and forward flexion angles of the shoulder joint in the observation group were greater than those in the control group, and the excellent shoulder function rate in the observation group was higher than that in the control group at 20 weeks after surgery, with a P value of less than 0.05. This indicates that MPMM can significantly reduce postoperative pain in the early postoperative period, improve patients' comfort and satisfaction with pain control during hospitalization, and promote multidisciplinary cooperation, standardize pain management, and provide a reference for clinical postoperative pain care management of hepatocellular carcinoma patients.

## ABSTRACT

The study of new energy vehicle batteries and their energy is an important basis for the development of electric vehicles. This paper explores the factors affecting the service life of new energy vehicle batteries and analyzes the battery loss characteristics in terms of battery technology and battery usage. For the power system control of the electric vehicle with hydrogen fuel cell + photovoltaic cell + battery, the energy conversion efficiency is studied from different strata respectively. The most influential role of battery life is the engine of the vehicle, which reaches 24.03%. The electronic system factor was 3.37% and the drivetrain factor was 16.78%.

## KEYWORDS

New energy vehicles; Battery loss characteristics; Energy conversion efficiency; Service life; Powertrain

## 1. INTRODUCTION

New energy vehicles are the trend of future development and are becoming more and more important in people's lives [1]. The lithium battery, as the most widely used and technically mature new power supply product, is also a key technology affecting the future development of new energy vehicles [2-4]. The immaturity of the technology leads to serious changes in the internal structure of the battery during charging, which is prone to short-circuiting and other problems, and the lack of corresponding supporting equipment in practical applications, resulting in short battery life and low efficiency [5-6]. Thanks to China's "three vertical and three horizontal" strategy and the important deployment of new energy policy, the new energy vehicle industry is developing rapidly [7]. The structural properties of lithium-ion batteries determine the specific energy and specific power of renewable energy vehicles, and fundamental innovations in battery systems depend on structural properties, among which graphene and concentration gradient structures are increasingly forward-looking [8]. New energy vehicle battery temperature sensors are often subjected to three types of forces and changes in magnitude during loading and unloading, which can be made possible by clever battery management strategies so that the sensors do not fall off and work properly while the vehicle

is in motion [9].

## 2. NEW ENERGY VEHICLE BATTERY LOSS RESEARCH

### 2.1. DEVELOPMENT OF NEW ENERGY VEHICLE BATTERY

The new energy vehicle battery is the most technically difficult and basic component in the development of energy vehicles. In order to get better development of new energy vehicles, it is necessary to work on the battery to fully ensure that the battery is compatible with the vehicle power system and guarantee its safe driving. Currently, in China, there are hundreds of manufacturers of new energy vehicle batteries. However, most of them have problems such as low degree of battery production automation, unqualified product quality and insufficient sharing of performance information and data, which add negative impact on the development of new energy vehicle battery modules. The most widely used lithium-ion batteries have the advantages of higher kinetic energy and long service life, and are widely used in oil-electric hybrid vehicles and pure electric vehicles. To improve the performance of the battery, manufacturers need to start from materials, solution performance and other aspects, and these index values are often contradictory, requiring careful evaluation and consideration of the relevant performance of the battery.

### 2.2. NEW ENERGY VEHICLE LOSS ANALYSIS

New energy vehicle batteries are slow to be researched in terms of service life management, and many factors can lead to a reduction in battery service life during the current use of the battery, affecting the experience and user safety of new energy vehicles. The factors that affect the battery of new energy vehicles are shown in Figure 1. The biggest influence is the engine of the car, reaching 24.03%. The electronic system factor is 3.37% and the transmission system factor is 16.78%.

Figure 1. Factors affecting the new energy vehicle battery

#### 2.2.1. BATTERY TECHNOLOGY

China's new energy vehicle development started late and is still in the development stage, and the battery technology is at a low level. From the perspective of battery design, different battery designs will determine how the battery operates, its performance and the materials used. In the design of positive and negative electrodes of new energy batteries, different material designs will affect the performance of the battery, and the magnetic substances generated during the operation of the battery will also have an impact on the performance of the battery, leading to a reduction in battery capacity and a serious impact on the service life of the battery. In the design process, it is necessary to do more experimental analysis on the material application of the battery to avoid unstable factors affecting the designed service life of the battery.

## **2.2.2. BATTERY USAGE**

If the design of the battery is the internal reason that affects the use of the battery, then the wrong way of using the battery is the external reason that leads to the decrease of the battery life. Battery problems are the main factor affecting the operation of new energy vehicles, and wrong usage is an important cause of battery failure. Over-discharging and over-charging of the battery will have a non-recoverable impact on the battery capacity, which will directly lead to the reduction of the battery life. The battery discharge process is the process of energy conversion and material consumption inside the battery. At present, the battery management system lacks real-time detection of the battery performance status, and cannot predict and monitor the battery charge status, remaining service life and performance status.

## **3. NEW ENERGY VEHICLE BATTERY ENERGY CONVERSION ANALYSIS**

### **3.1. COORDINATED CONTROL AND MANAGEMENT OF NEW ENERGY VEHICLES**

This paper analyzes the power system control of an electric vehicle with hydrogen fuel cell + photovoltaic cell + battery. The energy management strategy design control management of three energy sources is more complex, and it can be controlled by layering management control. Using layered energy management control can divide the three energy sources into two layers, and each layer carries out energy management control for two energy sources. According to this design idea, the power system of this research can be divided into energy management control of hydrogen fuel cell and battery, and energy management control of photovoltaic cell and battery.

### **3.2. HIERARCHICAL ENERGY MANAGEMENT ANALYSIS**

#### **3.2.1. UPPER LAYER ENERGY CONVERSION ANALYSIS**

The zones are divided according to the steady-state operating characteristics of the fuel cell. Then the different operating states are divided according to the internal characteristics of the fuel cell, i.e., the characteristics of the internal resistance of the cell during charging and discharging. Finally, the actual demand power of the vehicle is analyzed to allocate energy and the energy management strategy of the fuel cell is designed. The change curve of the internal resistance of the battery with SOC is shown in Figure 2. When the SOC value of the battery changes, the working efficiency is consistent with the change of the SOC value of the battery. The energy management strategy of the fuel cell designed in this paper is based on the SOC value of the battery and the internal parameters of the system to drive the motor driving power to judge the usage. When SOC is at 0.5~0.75, the battery is in the best condition.

**Figure 2.** Variation curve of internal resistance of battery with SOC

### 3.2.2. LOWER LEVEL ENERGY CONVERSION ANALYSIS

The energy management strategy of the lower level is mainly for photovoltaic cells and batteries. Since the photovoltaic cell is generating electricity through sunlight, it is almost cost-free compared to hydrogen resources, and try to use the photovoltaic cell energy. When the lower layer management strategy cannot support the normal operation of the drive motor, the upper layer energy management strategy is then introduced. The magnitude of electricity generated by PV cells is based on the radiation intensity of sunlight and the surrounding ambient temperature, so the output characteristics of PV cells are not linear. In this paper, the control of PV cell power generation is only in terms of light intensity. By changing the light intensity to judge the power generation effect of PV cell, combined with the SOC value of the battery and switching the settings according to the working state of the battery, the lower layer energy management strategy can be derived.

## 4. CONCLUSION

This paper is oriented to the new energy vehicle battery system of the energy storage system, and analyzes the loss characteristics by exploring the influencing factors of its service life, and analyzes the energy conversion efficiency for the layered electric vehicles. Increasing the level of battery testing and maintenance for electric new energy vehicles can continuously promote the industrialization of new energy electric vehicles, and also drive energy conservation and emission reduction in the transportation field and low-carbon sustainable development of the automotive industry. Vigorously improving the methods of battery testing and maintenance for new energy vehicles promotes the use of electricity instead of oil, improves the use of energy, and reduces the dependence of the automotive industry on petroleum energy. This is not only adapted to China's national conditions, but also meets the requirements of the low-carbon era for the development of environmentally friendly vehicles.

## ABSTRACT

In this paper, a simple regression model and a multiple regression model are established in the context of deep learning, and multiple independent variables are used to portray a response variable, specifically, changing national culture, modern thought, Japanese “soup culture”, and eastern and western monsters are selected as independent variables, and the effect of Japanese monsters’ cultural impact is selected as the response variable. The multiple regression analysis of the impact of Chinese traditional culture on Japanese demon culture was analyzed. The tolerance of each variable is greater than 0.1, the  $VIF < 10$  times of the principal component analysis of the independent variables is also much greater than the characteristic root, and the conditional index is much less than 30. Thus, it is feasible to analyze the impact of Chinese traditional culture on Japanese monster culture by multiple regression.

## KEYWORDS

Deep learning; Simple regression model; Multiple regression model; Traditional culture; Japanese demon culture

## 1. INTRODUCTION

China and Japan are closely linked by water, and the two countries have had close relations since ancient times, either in peace or war, subordination or hostility [1-2]. The combination of cultural and geographical pressures in Japan has created its contradictory character traits [3-4]. While having no way to vent their pressure, the Japanese created and constructed many kinds of demons [5]. The gods and monsters of each country and nation are an important part of folk culture, and the gods and monsters are one of the earliest folk beliefs developed from primitive religions [6].

Although Japanese demon culture was introduced to the Japanese homeland from China, it was not later developed and developed by China itself, but was brought to life by neighboring Japan [7]. Japanese demon culture has influenced a range of aspects of society that are closely related to people, such as shikigami novels in literature, art works, film and animation works [8]. In this paper, we analyze the degree of cultural identity of our traditional culture in Japanese demon culture by regression analysis, as a way to dissect the impact influence of analyzing our traditional culture on Japanese demon culture in the context of deep learning.

## 2. ANALYSIS OF THE REGRESSION MODEL OF THE INFLUENCE OF OUR TRADITIONAL CULTURE ON THE CULTURE OF JAPANESE MONSTERS

### 2.1. REGRESSION MODELING

While regression analysis is mainly used to study the relationship between variables that

can be measured, the relationship studied by linear regression analysis is more specific in that it is a class of linear quantitative relationships that can be described by a straight line. This paper is a study of outliers and covariance in the influence of our traditional culture on Japanese demon culture.

### 2.1.1. ESTABLISHMENT OF SIMPLE REGRESSION MODEL

In the univariate regression equation, there are only two variables. One is the independent variable  $X$  and the other is the dependent variable  $Y$ . And these two variables can be represented by a linear equation:

$$Y = b_0 + b_1X_i + e \quad (1)$$

$e$  represents the error,  $b_0$  is called the intercept, which is the value of  $Y$  when  $X$  is taken 0, and  $b_1$  is called the slope, which represents the amount of change in  $Y$  when  $X$  changes by one unit.  $b_0$  and  $b_1$  are collectively called the parameters of the regression equation, and when they take all possible values, the above equation can represent all possible straight lines taken in the plane. In regression analysis, where the parameters are unknown, we are trying to estimate the parameters based on the values of the collected variables.

### 2.1.2. MULTIPLE REGRESSION MODELING

Multiple regression analysis is the use of multiple independent variables to characterize a response variable. If  $n$  case is observed, then each of the data for all variables in the  $n$  cases is recorded. For example, when the number of independent variables is  $p$ , then the multiple linear regression equation can be expressed as:

$$Y = b_0 + b_1X_1 + b_2X_2 + \dots + b_pX_p + e \quad (2)$$

Similar to the one-variable regression equation, each  $b_i$  is a parameter and  $e$  is an error. If the data collected for each  $x_i$  are given  $x_{ij}$  and the data collected for  $Y$  are given  $Y_i$ , the multiple regression equation can also be rewritten as:

$$y_i = b_0 + b_1x_{i1} + b_2x_{i2} + \dots + b_px_{i\phi} + e_i \quad (3)$$

We need to be concerned with the estimation of  $b_i$  and the interpretation of it.

## 2.2. LEAST SQUARES METHOD

In a binary regression analysis, we generally assume that the expectation of error  $e_i$  is zero and that the errors are uncorrelated and have a common variance  $\sigma^2$ , which is expressed in mathematical terms as, for  $j = 1, 2, \dots, n$ :

$$nE(e_i) = 0 \quad (4)$$

$$(e_i) = \sigma^2 \quad (5)$$

$$(e_i, e_j) = 0 \quad (6)$$

Similarly, in the multiple regression analysis, we describe the following hypothesis in matrix form:

$$E(e) = 0 \quad (7)$$

$$\text{var}(e) = \sigma^2 I_n \quad (8)$$

Where  $\text{var}(e)$  is the covariance matrix of  $e$ ,  $I_n$  is a unit array of order  $n$ , and 0 is a  $n$ -dimensional vector. Together with the condition that each  $e_i$  is mutually independent, has mean 0 and all variances are  $\sigma^2$ , the general assumption of multiple regression analysis can be written as:

$$e \sim N(\sigma^2 I_n) \quad (9)$$

### 3. MULTIPLE REGRESSION ANALYSIS OF OUR TRADITIONAL CULTURE ON JAPANESE DEMON CULTURE

In order to further explore the role of each variable of Chinese traditional cultural identity on the impact of Japanese demon culture, based on the previous study, this paper takes the impact on Japanese demon culture as the dependent variable and regresses it with each other variable.

The correlation results above show that there is a correlation between the variables. Therefore, a multiple cointegration test should be performed before performing multiple regression analysis. When the independent variables are highly correlated with each other, the independent variables in the regression equation will mutually weaken their respective marginal effects on the dependent variable, causing their own regression coefficients to decrease and the standard errors to expand, when the correlation coefficients of the respective variables may have cointegration problems.

#### 3.1. MULTIPLE REGRESSION ANALYSIS OF THE CULTURAL IMPACT OF JAPANESE MONSTERS

The multiple regression analysis test of the impact of Chinese traditional culture on Japanese monster culture is shown in Table 1. It can be seen that the tolerance of each variable of changing national culture, modern thought, Japanese "soup culture", and eastern and western monsters of Japanese monster culture is greater than 0.1, and the characteristic root of  $VIF < 10$  times of the principal component analysis of independent variables is also much greater than, and the conditional index is much less than 30, so it is reasonable to think that before regression analysis, there is no There is a problem of multicollinearity, and the regression analysis is meaningful.

**Table 1.** Multiple covariance test for multiple regression of Japanese demon culture shock

	Ethnic Culture	Modern thought	Japanese "hot spring culture"	Eastern and Western Monsters
1	1.000	1.000	0.056	8.095
2	0.949	1.728	0.086	5.871
	0.894	1.041	0.027	12.752

#### 3.2. REGRESSION ANALYSIS OF THE DEGREE OF IMPACT OF SHOCKS

In order to further explore the direct relationship between the impact influence of Chinese traditional culture on Japanese monster culture, the degree of impact influence of Japanese monster culture was tested for multiple covariance by multiple regression as shown in Table 2. We used the degree of impact on Japanese monster culture as the dependent variable, and the intensity of change of national culture, modern thought, Japanese "soup culture", and

eastern and western monsters as independent variables for the regression analysis.

It can be seen that all variables are normally distributed within the range and there is no problem of multiple cointegration, so multiple regression analysis can be performed.

**Table 2.** Multiple covariance test with multiple regression for the degree of impact of shocks

	<b>Ethnic Culture</b>	<b>Modern thought</b>	<b>Japanese “hot spring culture”</b>	<b>Eastern and Western Monsters</b>
1	1.000	1.000	0.099	16.571
2	0.990	1.402	0.058	10.619
	0.954	1.019	0.836	19.651

#### 4. CONCLUSION

Where there are people, there is culture, there is folklore, and folklore is alive and well and is a reflection of everyday life. The modern young people’s acceptance of demons and the change of people’s perception of demons, people’s acceptance of demons and the influence of demons on people are interactive. People’s perception of monsters will change with the times and a series of changes. Although the culture of monsters was formed earlier in the period and gradually influenced people’s lives, there is no shortage of topics linked to the culture of monsters and monsters in the current film and television works, which are analyzed from the ethnic perspective.

This paper is also an attempt to do a systematic exploration and sorting out of the influence of Chinese traditional culture on Japanese demon culture, revealing the main problems in Japanese demon culture, and on this basis, analyzing the regression model of the influence of Chinese traditional culture on Japanese demon culture.

## ABSTRACT

In this paper, in exploring the curriculum logic and practical path of the integrated construction of the Civics course in universities and colleges, the theoretical basis of the Civics course construction is explored, the Civics teaching goal construction is constructed with the Civics teaching framework design based on the ADDIE model, and the implementation effect of the Civics teaching method of the ADDIE model is verified using  $t$  test to analyze the Civics teaching participation. Students were statistically significant in 3 dimensions of overall knowledge cognition degree and cognitive-emotional experience, and knowledge cognitive skills. This indicates that the Civics teaching method using the construction of ADDIE model is conducive to promoting the integration of Civics courses in universities and schools.

## KEYWORDS

Civics integration; Civics curriculum construction; ADDIE model; Teaching framework

## 1. INTRODUCTION

The ideological and political theory course is a key course for implementing the fundamental task of establishing moral education and forging the soul to educate people [1]. Using the systemic and holistic concept, it has an important contemporary value to promote the integrated construction of ideological and political science courses in universities and colleges [2]. The integrated construction of Civics and Political Science courses is conducive to the implementation of the fundamental task of establishing moral education, to the promotion of the spiral of Civics and Political Science courses, and to the realization of the connotative development of Civics and Political Science courses [3].

To truly realize the connotative development of ideological and political courses and the cultivation of talents with good ideological and political quality, the implementation of integrated construction of ideological and political theory courses in universities and schools is the way to go and the necessary policy [4]. Curriculum content is the soul of curriculum construction, and the integrated curriculum construction of ideological and political science courses in universities and schools is the key grasp to realize the integrated construction of ideological and political science courses in universities and schools [5-6]. In this paper, on the basis of in-depth analysis and research on the problem of integrated construction of ideology and politics courses and its causes, we insist on combining theory and practice, and launch a systematic

exploration around the specific path of integrated construction of ideology and politics courses. It is led by the systemic concept, followed by gradual and spiral progress, and based on the theory of cognitive development, while insisting on the unity of political and academic rationality, and the unity of global and stage [7]. With the design of Civics teaching objectives as the key, the system is constructed and promoted as a whole, with a view to achieving the integration of Civics courses in universities and schools [8].

## **2. CURRICULUM LOGIC OF THE INTEGRATED CONSTRUCTION OF CIVICS COURSES**

### **2.1. RATIONALE FOR CURRICULUM DEVELOPMENT**

#### **2.1.1. THEORY OF COMPREHENSIVE HUMAN DEVELOPMENT**

The theory of all-round human development is the highest value ideal of Marxism and the highest ideal realm of real human development. Based on the Marxist theory of comprehensive human development, the integrated construction of college and university thought and political science classes must take the comprehensive development of students as the starting point and end point of the integrated construction, must meet the internal and external development needs of students, to achieve the comprehensive development of students as the ultimate goal of education, planning the integrated construction system of college and university thought and political science classes to achieve its proper effect.

Education is a continuous process, which requires us to follow the law of physical and mental development and growth and the law of ideological and political education to orderly connect the content of the curriculum of the ideological and political courses of universities and colleges, to carry out ideological and political education in a variety of forms that students like, and to carry out targeted ideological and political education activities in accordance with the cognitive level and favorite preferences of students in each school period, so as to stimulate and motivate students' independent This will stimulate and motivate students' independent learning and promote their all-round development.

#### **2.1.2. SYSTEMS SCIENCE THEORY**

Systems science, as the study of the patterns, principles and laws of all systems, has the following distinctive features:

a) Integrity. All kinds of things and processes in the world are not a mechanical superposition of the functions and properties of the constituent elements, but an organic whole formed by an orderly combination of essentials.

b) Orderly. The development of the movement of the system and the internal behavior and function of the system can usually be unfolded as a process.

c) Dynamicity and openness. The two are interrelated, and any system is in motion and change, constantly adjusting its structure and elements under the interaction of the internal and external environment, in order to adapt to changes and development.

d) Optimization. The ultimate goal of systems science as a method of research is to achieve the optimization of things, which is essentially a kind of control of things.

#### **2.1.3. SPIRAL CURRICULUM THEORY**

Bruner's spiral curriculum theory, analyzed from a disciplinary logic perspective, is found to focus on the logic of arranging graded curriculum content, emphasizing basic disciplinary concepts and principles, and capturing the latest disciplinary knowledge. Taking a psychological perspective, it is found that it emphasizes the cognitive base and cognitive state

of learners, the transformation of subject knowledge into pedagogical knowledge, and the guidance and discovery of students' initiative and creativity.

In view of this, the integrated construction of Civics and Political Science courses in universities and colleges must be based on spiral curriculum theory, to ensure that the knowledge content of each school section goes from simple to complex, from shallow to deep, and ascends in a cycle, adhering to the principle of gradation and progression in content setting, and maintaining a reasonable gradient system, step by step.

## 2.2. THE PRACTICAL PATH OF THE INTEGRATED CONSTRUCTION OF CIVIC STUDIES

### 2.2.1. DESIGN OF CIVICS TEACHING OBJECTIVES

Based on the ADDIE model, the teaching objectives, learning objects and teaching environment are comprehensively analyzed, and the teaching practice design is carried out in stages by combining the actual characteristics of Civics course learning. The teaching design of Civics and Mathematical Statistics based on ADDIE model includes the design of Civics teaching objectives, teaching mode design and teaching process design. Combining with practical problems or real life, we reasonably design vivid problem situations or course Civics situations and carry out exploratory teaching by using the form of questioning.

### 2.2.2. TEACHING FRAMEWORK DESIGN

The design of Civics teaching framework based on ADDIE model is shown in Figure 1. The Civics teaching model based on the ADDIE model is combined with the syllabus and teaching schedule of the Probability and Mathematical Statistics course to sort out the Civics teaching elements of the course. Using the above Civics elements, the pre-course learning scenario construction stage is guided by the engineering development theory of the analysis and design of the ADDIE model, and the pre-course knowledge of the Civics teaching primer in the teaching example of introducing the origin and development sources of probability theory.

**Table 1.** Framework of teaching Civics based on ADDIE model

## 3. IMPLEMENTATION AND EVALUATION OF THE INTEGRATED CONSTRUCTION OF CIVIC STUDIES

### 3.1. UNITE TO BUILD CONSTRUCTION MECHANISM

To build an effective mechanism for the integrated construction of the Civic and Political Science course, and insist on strengthening the ideological and political theory course in the improvement, it is necessary to uphold the concept of the Great Civic and Political Science, follow the “three logics”, and achieve integration and synergy. Follow the logic of vertical deepening of the discipline of education. Different schools, different grades, different regions of the Civic and Political Science class can not be conceptualized, one-sided, fragmented, but need to implement the “integration” concept. Follow the horizontal synergy of the same direction of common education logic. The company's main goal is to provide the best possible service to its customers. Follow the logic of spiral progressive cognitive progression. The construction of each school section of the Civics course should reflect the idea of “a chess game”.

### 3.2. ANALYSIS OF THE PARTICIPATION OF CIVICS TEACHING

Comparing the effectiveness of the implementation of the Civics teaching method based on the ADDIE model, a *t*-test was used to verify the differences in students' cognitive levels of classroom knowledge points before and after implementation as shown in Table 1. The students have statistical significance in 3 dimensions of overall knowledge recognition level and cognitive-emotional experience and knowledge recognition skills. It shows that the model has improved and enhanced the students' knowledge recognition and emotional recognition in Civics, and the effectiveness of the method will be enhanced in the future by increasing the frequency and depth of teacher-student and student-student interactions.

**Table 1.** *t*-test of involvement in teaching Civics

Cognitive dimensions	Pre-test Means	Post-test Mean	Mean value of change	<i>t</i> -Mean	<i>p</i> -Mean
Civic Knowledge Identity	3.82	3.26	0.11	2.62	0.005
Individual Cognition	3.81	3.14	0.06	0.74	0.358
Civic task cognition	3.49	3.60	0.30	1.85	0.629
Emotional identity	3.63	3.17	0.09	0.62	0.007
Metacognitive experience	3.74	3.63	0.13	0.75	0.005
Civic cognitive experience	3.95	3.37	0.21	2.18	0.293

### 4. CONCLUSION

Education is the great plan of the country and the party, and it bears the fundamental task of establishing moral education. The Civics course is the key course to implement the fundamental task of establishing moral education, and has been highly valued in all school sections. In the new era to promote the integration of the construction of the Civics course in schools and universities is a complex and systematic project, can not be achieved overnight, need to strengthen the Civics course integration of the operational mechanisms and institutional safeguards, the formation of a strong synergy, the need to dialectically deal with the relationship between all parties. As a fundamental part of the integrated construction of Civics and Political Science class, the integrated construction of Civics and Political Science teaching goal design should become an important grasp to promote the reform and innovation of Civics and Political Science class. When the integration of Civics and Political Science courses in universities, schools and colleges is realized, it can effectively enhance the scientific nature of Civics and the effectiveness of Civics and Political Science education and teaching.

## ABSTRACT

This paper explores the cultivation of innovative and entrepreneurial talents in art and design majors in Inner Mongolia in the context of data collection, analyzes the demand for a web-based distance education system that meets the characteristics of Inner Mongolia, develops a platform for cultivating innovative and entrepreneurial talents in B/S mode, implements automated testing of the API data interface by combining Postman and Newman, and tests the performance of the platform data collection module. The response time of the interface of the course management module for a certain request sent was 88ms, and the response time of most interfaces was within 100ms. Therefore, the development of innovation and entrepreneurship talent cultivation platform in B/S mode helps ensure the quality of innovation and entrepreneurship talents in higher education institutions.

## KEYWORDS

Data collection; Innovative and entrepreneurial talents; Web-based distance education system; B/S model; Data collection module; Course management module

## 1. INTRODUCTION

With the onset of the employment wave, the problem of difficult employment is increasingly mentioned, and the state has begun to encourage college students to start their own business [1-2]. In this way to broaden the ways and channels of employment of college students employment is an important factor about social stability and harmony, and the return path of college students after graduation is an object that society needs to focus on [3]. Therefore, innovation and entrepreneurship coursework has also gradually come into the vision of the society, and regional governments have started to build the model of innovation and entrepreneurship talent training [4-5]. Higher education institutions in Inner Mongolia region are no exception, and several higher education institutions in Inner Mongolia region have started to explore the best way to cultivate innovative and entrepreneurial talents in order to cultivate high-quality innovative and entrepreneurial talents through high-quality innovative and entrepreneurial education, which can provide good knowledge accumulation for college students' entrepreneurship and richer prospects for college students' employment [6-7]. A practical research project about innovation and entrepreneurship teaching reform of art and design students in Inner Mongolia region in the context of data collection to improve their innovation and entrepreneurship ability [8-10]. In this paper, we start from improving the training program corresponding to social needs, building a curriculum system corresponding to industrial needs, reforming teaching strategies and methods, deepening teaching practice and practical training, strengthening the construction of innovative and entrepreneurial faculty,

and optimizing teaching evaluation and management [11-12].

## **2. DEVELOPMENT MODEL OF INNOVATIVE AND ENTREPRENEURIAL TALENT TRAINING SYSTEM IN INNER MONGOLIA REGION**

### **2.1. B/S MODE**

B/S, the so-called browser/server model, is now widely used in the development of information systems in various fields and is a new model of network architecture. WEB browser is the main application software for the client, the architecture is relatively simple, the client only needs to install a browser, and the server installs the database. With the help of Web server, the browser is connected to the database for data interaction.

The B/S architecture reduces the client workload, and the client does not need to install cumbersome client-side software. The data processing is done in the interaction between the browser and the server. Database access, application execution, and other tasks are more often done by the server. WEB SERVER is responsible for data request, processing, result return and dynamic web page generation. The B/S structure shifts the load to the WEB server, reducing the pressure on the client.

### **2.2. NETWORK DISTANCE EDUCATION SYSTEM REQUIREMENT ANALYSIS**

#### **2.2.1. FEASIBILITY OF EDUCATION SYSTEM DEVELOPMENT**

With the increasing degree of information technology, online courses are developing, and some schools are starting to implement online distance learning programs while building their own course websites based on traditional teaching.

Coupled with the continuous maturity of network technology, the art design course on the system page design through the use of software such as Dreamweave, while using SQLServer2005 for database design, using ASP.NET programming language and C# programming language technology to combine the specific design and implementation of the site.

In distance education, the networked system will play an irreplaceable role in the whole process, and the networked distance learning system will be an indispensable means to create new standards in education in the future.

#### **2.2.2. ART AND DESIGN COURSE PRACTICE**

Although the practice of art and design courses cannot completely replace art and design education, it is still an important part of learning for art and design students. The purpose of training art and design students is to enable them to better adapt to society, integrate into society, and provide products and services to society after completion of their studies. The domestic art and design curriculum still lacks the necessary connection with market demand, and this phenomenon is mainly related to the way the curriculum is set up, resulting in art and design schools having little opportunity to contact society in the process of teaching, especially online distance learning, and students basically have no opportunity to conduct relevant practical learning. In the design process of distance learning network, modules like “practice garden” must be set up, and modules like “school-enterprise home” can be set up according to their specific conditions, so that network distance learning can gradually come out from the traditional “academic” teaching mode.

### 3. PERFORMANCE TESTING OF THE INNOVATION AND ENTREPRENEURSHIP TALENT TRAINING PLATFORM IN THE CONTEXT OF DATA COLLECTION

#### 3.1. BACKEND INTERFACE TESTING

Postman and Newman are combined to automate the testing of API data interfaces. Several interfaces are selected for testing in the permission management module, personnel management module, course management module and competition management module respectively.

Test procedure: Using Posman software, we send request operations for each interface, save the requested records to the test.json file, and subsequently, run the json file through Newman software, set the number of runs to 200, and obtain the results of the response time of the bulk calls to the API data interface.

Interface response time test analysis is shown in Table 1. For Postman, the results of a certain request sent to the interface of the course management module, the response time of the interface is 88ms, and the response time of most interfaces is within 100ms. Therefore, the test results meet the requirements of the performance indicators for response time.

**Table 1.** Interface response time test analysis

Achieved function	Number of tests	Average response time
User role information call	200	78ms
Current role information for system teachers	200	37ms
Personal information management	200	72ms
List of student information details	200	91ms
Audit function call	200	86ms
List of related information	200	107ms
Get the list of course information	200	84ms

#### 3.2. DATA ACQUISITION MODULE PERFORMANCE TEST

For the measurement of keyword extraction algorithm, the method of comparing the results automatically extracted by the algorithm with those manually extracted is usually adopted, and the data such as accuracy rate, recall rate and  $F$  value are obtained as the measurement results.

The accuracy formula,  $P$ , is the algorithm's ability to extract the exact keywords:

$$P = \frac{|N \cap M|}{|N|} \quad (1)$$

Recall formula,  $R$  is the ability of the algorithm to extract keywords:

$$R = \frac{|N \cap M|}{|M|} \quad (2)$$

Reconciling the mean equation:

$$R = \frac{2PR}{P + R} \quad (3)$$

The test was conducted by manually labeling two to three keywords and setting the number of keywords extracted by the algorithm to three uniformly. According to the above formula,

three performance indexes such as accuracy  $P$ , recall  $R$ , and  $F$  values were used to evaluate the performance of the two algorithms in extracting keywords. Table 2 shows the test results of  $P$ ,  $R$ , and  $F$  values for keyword extraction by TF-IDF and TextRank algorithms.

**Table 2.** Algorithm test comparison results analysis

Algorithm	Accuracy	Recall	$F$ -value
TF-IDF	76%	87%	73%
TextRank	68%	73%	79%

#### 4. CONCLUSION

With the introduction of national policies to encourage innovation and entrepreneurship, the demand for innovative and entrepreneurial talents is increasing, and higher education institutions, as the cradle for breeding high-quality talents, have an important significance in the process of cultivating innovative and entrepreneurial talents. Although the concept of innovative and entrepreneurial talents cultivation has been accepted and recognized by major institutions, research on the quality and measures of innovative and entrepreneurial talents cultivation in higher education institutions is still in a blank stage. The study of the quality and measures of innovation and entrepreneurship training in colleges and universities is still in a gap. It indirectly solves the problem of lack of effect evaluation and dynamic monitoring of the quality measures for the cultivation of innovative and entrepreneurial talents in Inner Mongolia art and design. Thus, we can ensure the quality of innovative and entrepreneurial talents in higher education institutions and truly implement the policies related to the cultivation of innovative and entrepreneurial talents.

[hanjiaguo2022@sina.com](mailto:hanjiaguo2022@sina.com)

---

## ABSTRACT

This paper discusses the addition of key audit matters to corporate class bond audits. Based on the concepts of key audit matters and decision-making framework, this paper discusses the application of key audit matters in bond audits, and analyzes and discusses the positioning of responsibilities, issues that should be paid attention to, and special provisions for considering special bonds in bond audits with regard to the addition of key audit matters. Finally, it is concluded that in the context of big data algorithm, bond auditing needs to consider more critical audit matters to protect investors' interests and stable market development.

## KEY WORDS

Bond audit; Key audit matters; Decision-making framework; Investor interest; Duty orientation

## 1. INTRODUCTION

In the era of big data, corporate class bond auditing has become one of the important financial auditing areas [1]. With the continuous development of information technology, various data collection, storage, and analysis technologies have been widely used in corporate class bond auditing [2]. The application of these technologies not only improves audit efficiency and accuracy, but also helps auditors to better understand the financial position and operations of the company [3]. Critical audit matters are important matters that affect the authenticity, integrity and reliability of a company's financial reports [4]. In the context of big data algorithms, key audit matters may involve multiple aspects such as data collection, processing, and analysis [5]. Therefore, strengthening the study of key audit matters can help auditors better grasp audit priorities and improve audit quality and efficiency [6].

The literature [7] explored aspects of disclosure of key audit matters, types and influencing factors. The results indicate that most listed companies in the Chinese A-share market have chosen to disclose critical audit matters and that these matters usually involve significant accounting estimates and accounting policies. The literature [8] found that the disclosure of critical audit matters increases auditor liability and there is some self-protective behavior of auditors in the disclosure of critical audit matters by analyzing the assessment reports of Thai auditors between 2018 and 2019. The literature [9] explored the definition, disclosure, and assessment of critical audit matters through in-depth interviews with 15 audit professionals. It was found that although the concept and requirements of critical audit matters have been clearly defined by the IAASB, in practice, their understanding and application still vary among auditors and companies.

This paper adopts a combination of literature review and case study for the study. First, by combing and analyzing the relevant literature, we summarize the key audit matters and their decision-making framework that need to be added in the audit of corporate class bonds based on the background of big data algorithm. Secondly, based on this, the application of key audit matters in bond auditing is explored, and the issues that bond auditors need to pay attention to when adding key audit matters and the positioning of responsibilities are analyzed in depth.

## **2. KEY AUDIT MATTERS AND DECISION-MAKING FRAMEWORK**

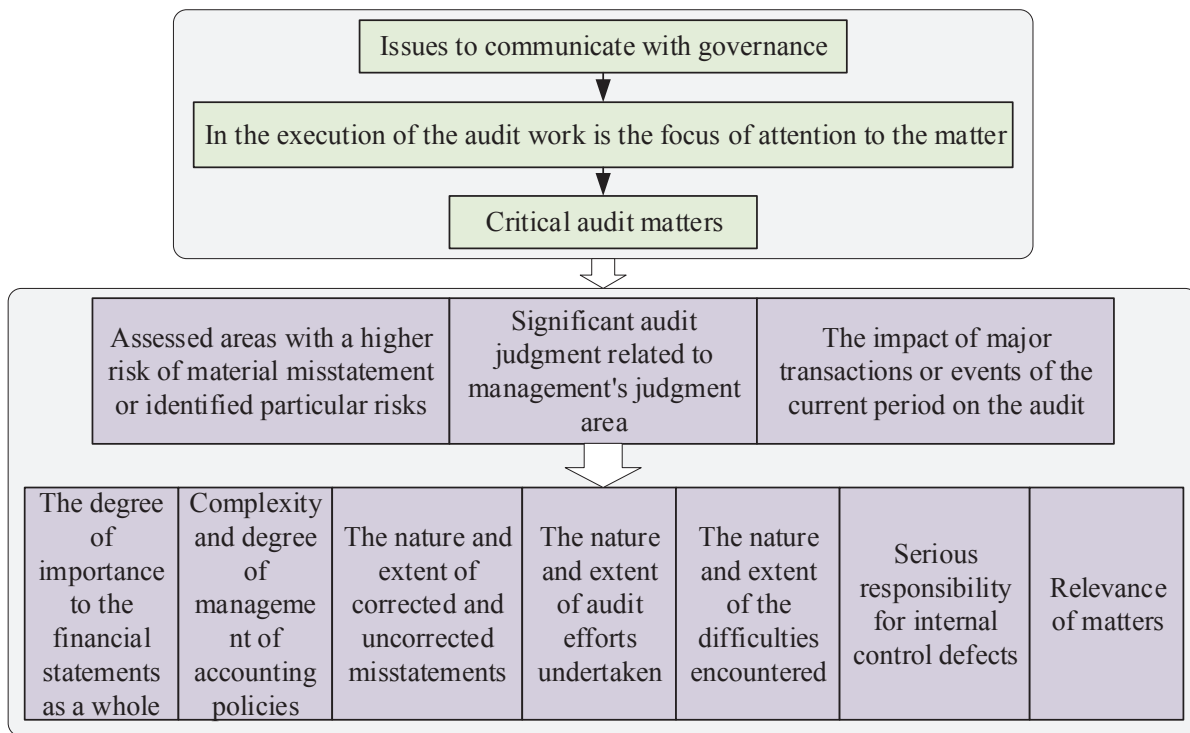

### **2.1. KEY AUDIT MATTERS**

A key audit matter is a matter that the CPA considers, based on professional judgment, to be the most important for the audit of the financial statements for the current period. The CPA is required to exercise professional judgment in determining critical audit matters and, after taking into full consideration the nature of the audited entity, industry conditions and other key factors, carefully select matters from among those matters communicated with the management of the audited entity and those matters that have been the focus of the audit work performed. Although critical audit matters, emphasis of matter and other matters all require the CPA to use professional judgment, critical audit matters are different from emphasis of matter and other matters. An emphasis of matter paragraph is a matter that is properly presented or disclosed in the financial statements and that, in the CPA's professional judgment, is critical to the financial statement user's understanding of the financial statements. An other matter paragraph is a matter that is not presented or disclosed in the financial statements and that, in the CPA's professional judgment, is relevant to the financial report user's understanding of the audit, the CPA's responsibilities, or the audit report.

### **2.2. DECISION-MAKING FRAMEWORK FOR KEY AUDIT MATTERS**

In determining the key audit matters, the CPA should first take the matters communicated with the governance as the starting point, and look for matters among them that the CPA has focused on in performing the audit work, and then combine the influence of all relevant factors to finally determine the key audit matters. The matters that CPAs have focused on in performing audit work are mainly in the following three areas:

- (1) Areas with a high risk of material misstatement or special risks identified.
- (2) Significant audit judgments related to areas of management judgment, usually involving difficult or complex CPA professional judgment.
- (3) The effect of significant transactions or events in the period on the audit. In identifying the most significant matters in these three major areas, special consideration is given to seven areas, and the decision-making process for key audit matters is shown in Figure 1.

**Figure 1.** Decision-making process of key audit items

### **3. EXPLORATION OF THE APPLICATION OF KEY AUDIT MATTERS IN BOND AUDITING**

#### **3.1. BOND AUDIT TO INCREASE THE POSITION OF RESPONSIBILITY FOR KEY AUDIT MATTERS**

Since debt financing instruments in the interbank bond market do not fall under the category of “securities” listed in the Securities Law, China’s largest corporate credit bond issuance and trading market is outside the regulation of the new Securities Law, and as a direct result, issuers of debt financing instruments are not included in the scope of implementation of the new auditing standards. However, since corporate bonds, corporate bonds and debt financing instruments are not different in terms of the nature of the bonds (they are all corporate credit bonds), regulators often combine them as corporate credit bonds. Based on the fairness of protecting the rights and interests of bond investors, every investor should enjoy the right to equal access to capital market information. Therefore, regulators (Ministry of Finance, PBoC, dealers’ associations, etc.) should clarify that in the annual audit of corporate credit bond issuers, CPAs should apply Standard 5104 and disclose key audit matters in the audit report to lay the foundation for the implementation of the standard at the policy level.

#### **3.2. ISSUES TO FOCUS ON WHEN ADDING KEY AUDIT MATTERS IN BOND AUDITS**

The recognition of asset impairment and income is closely related to the financial performance of listed companies and is also a high-risk area for financial fraud. Therefore, during the audit of a listed company, CPAs communicate more with the audited entity about the business related to income and asset impairment and often disclose them as key audit matters. However, when auditing debt-issuing companies, bond investors are more concerned about the company’s solvency, such as whether the cash flow is reasonable and whether there are enough funds to repay the principal and interest, than whether the company can achieve high profitability.

### **3.2.1. FOCUS ON RELATED PARTY TRANSACTIONS**

When auditing bond issuers, attention needs to be paid to their transactions with related parties, especially for corporate credit bond issuers, which are prone to audit risks such as irregular handling of related party transactions and untimely disclosure of information due to their complex related party relationships. The auditor needs to particularly review the related party transactions of the audited entity to exclude the risk of concealing or inflating the transactions. For non-listed issuers, there is a lack of supervision by regulators and more attention should be paid to this.

### **3.2.2. ATTENTION TO THE EXISTENCE OF MONETARY FUNDS**

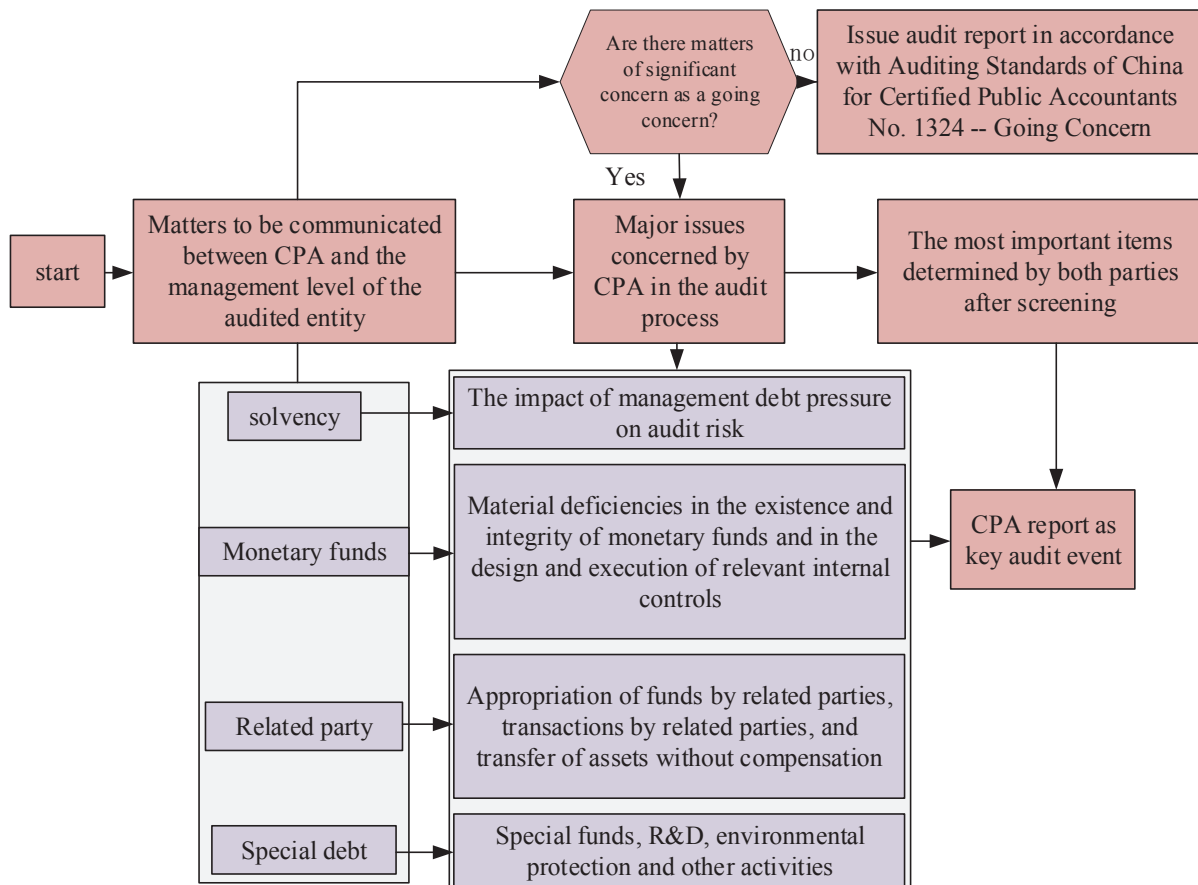

When auditors review the accounts of bond issuers, they need to focus on the authenticity and existence of the presentation of monetary funds, especially when the enterprise group adopts centralized fund management, which is prone to the risk of funds being tied up. Therefore, the auditor needs to focus on the centralized management of funds in an enterprise to determine whether monetary funds or internal controls related to monetary funds should be identified as a key audit matter.

### **3.2.3. FOCUS ON REFINANCING CAPACITY**

The nature of bonds is a fixed-term, fixed-income investment, and bond investors are more concerned about the refinancing ability of the bond issuer, i.e., its ability to repay its debts as they mature. Therefore, when auditing a bond issuer, auditors need to focus on its refinancing ability, which is affected by factors such as changes in the external business environment. The auditor needs to assess whether the issuer is facing operating difficulties and whether it has sufficient bank credit to determine whether it affects the issuer's ability to continue as a going concern or to service its debts.

### **3.2.4. CONSIDER SPECIAL PROVISIONS FOR SPECIAL DEBT**

In recent years, policy-oriented bonds, such as green bonds, carbon neutral bonds and innovation bonds, have become increasingly popular in China due to their low financing costs and the advantages of rapid registration and issuance. These bonds have special regulations, and auditors need to pay attention to issues such as the use of bond funds, project effectiveness and third-party certification when auditing a company's issuance of special bonds. For example, for green bonds, companies must establish a special fund account and use the funds only for specified purposes, or the company may face disciplinary action. Auditors should consider these factors when determining key audit matters for bond audits. Based on the relevant auditing standards, this paper draws a flow chart of the process and factors to be considered by CPAs in determining key audit matters for bond audits as shown in Figure 2 to help auditors in their bond audit work.

**Figure 2.** Process and concerns of key audit matters

#### 4. CONCLUSION

This paper discusses the exploration of adding key audit matters to corporate class bond audits based on the context of big data algorithms. Starting from the concepts of key audit matters and decision-making framework, this paper discusses the application of key audit matters in bond audits and provides an in-depth analysis of the positioning of responsibilities, issues that should be paid attention to, and special provisions for considering special bonds in bond audits by adding key audit matters. Therefore, adding key audit matters can improve the transparency and stability of the bond market and protect the interests of investors. In the future, as technology continues to advance and regulatory policies continue to improve, corporate bond audits will become more stringent and standardized.

## ABSTRACT

This paper first analyzes the external and internal factors affecting the change of corporate organizational structure, including information technology, market competition, corporate strategy, size and development stage, organizational culture, and management factors. Then it proposes a design plan for optimizing the company's organizational structure, including strengthening the management control platform programmatic management, establishing a common belief system, rationalizing the team structure and paying attention to performance management and reshaping the compensation structure. Therefore, for companies, optimizing organizational structure is a process of continuous adjustment and improvement, and requires constant adaptation to changes in the market environment to achieve more efficient management.

## KEYWORDS

Business organizational structure; Shared belief systems; External factors; Internal factors; Performance management; Artificial intelligence

## 1. INTRODUCTION

In recent years, artificial intelligence has gradually penetrated into various industries and fields, and it has had a profound impact on the design and management of enterprise organizational structures [1-2]. Traditional enterprise organizational structures are often dominated by vertical hierarchies, with inefficient information transfer and slow decision-making processes that cannot adapt to rapidly changing market demands [3-4]. In contrast, the design of enterprise organization structure based on artificial intelligence can achieve rapid information transfer and processing, improve the reaction speed and decision-making efficiency of enterprises, and make management more efficient and targeted [5-6]. Therefore, exploring how to use artificial intelligence to optimize enterprise organizational structure design and management style is a current research hotspot in the field of business [7]. Kurpayanidi, K explored how to establish an effective management system for industrial enterprises in terms of organizational structure design, process optimization, and information technology application [8]. Foster, W. M used in-depth interviews with 10 managers, analyzed how corporate restructuring changes the nature of managerial work. The study found that corporate restructuring leads to changes in the scope of management work, increased responsibilities, and decreased job security, as well as negative effects on career paths, promotion opportunities, and compensation [9]. The purpose of this paper is to explore the organizational

structure design and management change system of companies in the era of artificial intelligence. In order to achieve this goal, we will first analyze the impact of external and internal factors on the organizational structure change of a company. Next, we will propose some feasible design options for optimizing the company's organizational structure and specify the implementation measures.

## **2. INFLUENCING FACTORS OF ORGANIZATIONAL CHANGE IN ENTERPRISES**

### **2.1. EXTERNAL FACTORS AFFECTING ORGANIZATIONAL CHANGE IN ENTERPRISES**

#### **2.1.1. THE IMPACT OF INFORMATION TECHNOLOGY**

Information technology, especially network technology, has triggered a global change in business. The word "network" is beginning to enter the life of the public, and it is performing the important function of changing people's concept of time and space, and influencing the structure and operation of business organizations. The improvement of enterprise information efficiency only provides the possibility of sharing, but to make it a reality, the cooperation of all members of the organization is indispensable, and it can only become a necessary condition for the change of the enterprise organization.

#### **2.1.2. THE IMPACT OF MARKET COMPETITION**

Market competition is becoming more and more intense, there are more ways to test the success or failure of an enterprise, and the time is shorter. For most enterprises, the life cycle keeps shortening, the frequency of enterprise creation and bankruptcy gradually accelerates, and the instability of market transactions increases. Facing the complex and changing market, if the enterprise organization structure cannot be adjusted in time, the probability of business failure or even bankruptcy will be increasing.

### **2.2. INTERNAL FACTORS AFFECTING ORGANIZATIONAL CHANGE IN ENTERPRISES**

#### **2.2.1. IMPACT OF CORPORATE STRATEGY**

Corporate strategy is a long-term goal and achievement strategy in the design of organizational structure, developed for factors such as market positioning, competitive advantage and growth objectives. A differentiation strategy focuses on improving customer perception and value of products and services, and is therefore better suited to a flexible organizational structure. Cost leadership strategy, on the other hand, requires a more prescriptive organizational structure to control costs. Corporate organizational structure must be adapted to the growth strategy and business characteristics of the company and take into account the actual changes in the ownership structure adjustment.

#### **2.2.2. THE INFLUENCE OF ENTERPRISE SIZE AND DEVELOPMENT STAGE**

Most companies are in the growth and transition period and need to learn from international corporate management experience. The different nature of enterprises leads to different organizational management characteristics, and they need to learn and understand other enterprises in all aspects to adapt to future development requirements and actual situation. In the learning process, we need to conduct discriminative analysis and find the suitable organizational structure model for ourselves.

#### **2.2.3. INFLUENCE OF CORPORATE ORGANIZATIONAL CULTURE**

Since each company has its own cultural history, corporate culture has a certain global dimension and is decisive for all levels of the company. Therefore, the organizational structure

of a company is a vehicle for the dissemination of corporate culture and the implementation of strategy, and is bound to be influenced by culture and strategy at the origin stage.

#### **2.2.4. INFLUENCE OF CORPORATE MANAGEMENT FACTORS**

In private enterprises, top managers centralize all kinds of rights in their own hands. And this over-centralized management mode, in the initial stage, has a certain promotion of the development of enterprises, but, with the development of the enterprise's scale bigger and bigger, the allocation of functions and staffing of various departments appear to be vague and inappropriate, and finally more and more detrimental to the development of enterprises.

### **3. COMPANY ORGANIZATION STRUCTURE OPTIMIZATION DESIGN PLAN**

From the perspective of the enterprise development stage, the optimized design of the organizational structure is as follows:

(1) First of all, we should set up additional human resources department to improve the modern enterprise management system.

(2) For the phenomenon of general manager, we can consider setting up several positions of deputy general manager to be in charge of engineering quality, operation, personnel, etc., and setting up three general masters to provide suggestions and decisions for the company's decision-making, and three general masters to act as managers of departments of various specialties.

(3) For the comprehensive consideration of the contribution and performance of the enterprise after the restructuring, some department managers are promoted to the position of deputy general manager. For reasonable departments to retain, there is a cross-functional part of the merger or split. For the merged departments, the managers of the main functional departments are retained based on the main functions.

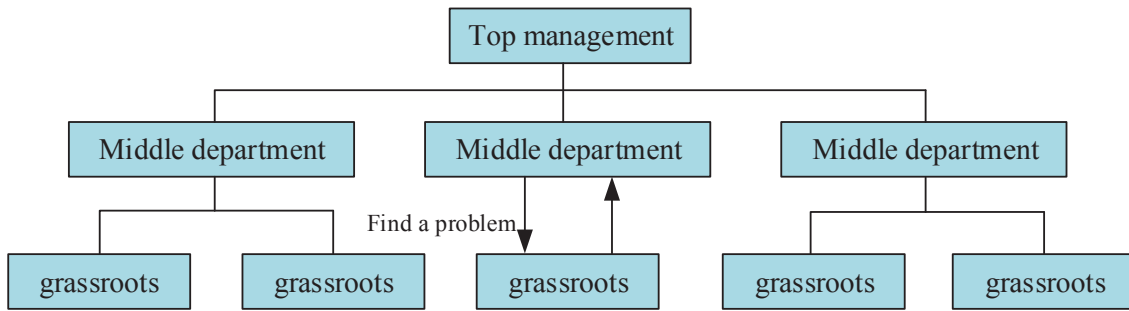

(4) The organizational structure of the project department will not be adjusted, but new recruits will be assigned to the project department every year for training and practice, and reasonable arrangements will be made according to individual performance and company needs for at least one year.

(5) set up a branch, in the past, some companies have the ability but not promoted most of their own outside the project or project, can be set up through the branch to let them serve as the branch leader, retain these people have the ability and relationship, but also to maintain and encourage their enthusiasm.

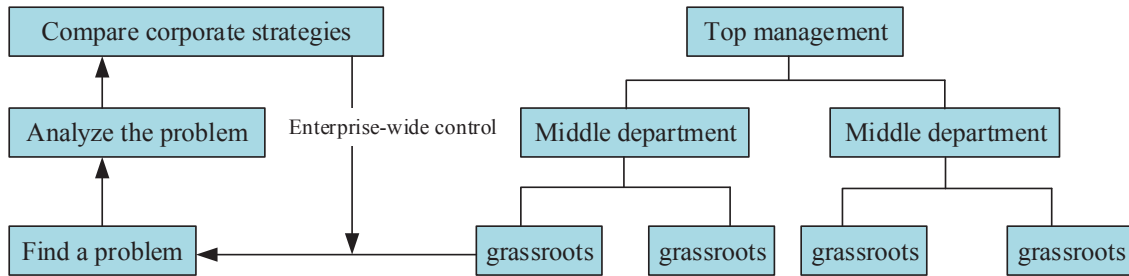

### **4. IMPLEMENTATION MEASURES FOR OPTIMIZATION OF THE COMPANY'S ORGANIZATIONAL STRUCTURE**

#### **4.1. STRENGTHEN MANAGEMENT CONTROL PLATFORM PROGRAMMATIC MANAGEMENT**

At each stage of the organizational optimization and adjustment, the corresponding management system is developed and the procedure is strictly implemented. The flow chart of control in management is shown in Figure 1. The management system cannot be replaced at will, and the implementation process needs to prevent interference and abolish the system that cannot be applied. The management system is regularly updated to ensure its effectiveness. The management control platform needs to be implemented into the actual work to control specific projects to ensure the successful completion of the project and demonstrate good corporate control. The management control system flow chart is shown in Figure 2.

**Figure 1.** Controls in administration

**Figure 2.** Management control system

#### 4.2. ESTABLISHING A COMMON BELIEF SYSTEM

We integrate the concept of “people first” into our corporate culture, establish a common belief system, and strengthen communication between employees and managers. The criteria for corporate values include a unique corporate agenda, salary and benefits, beliefs and cultural heritage, and long-term development strategies. Establishing a belief system to transmit corporate values, mobilizing employees’ initiative, and giving them a sense of belonging will lay a good foundation for corporate development.

#### 4.3. RATIONALIZE TEAM STRUCTURE

A good team is the core competitiveness of a company and can develop a work plan according to the employees. The achievement of corporate goals cannot be achieved without the cooperation of a good team and requires effective cooperation among team members to better complete projects. Adjusting the team structure needs to pay attention to several points: complementary abilities, differences in abilities, and the pursuit of results. According to the project needs to form a team with complementary abilities, consider the differences in employee abilities, and pursue the team effect.

#### 4.4. EMPHASIS ON PERFORMANCE MANAGEMENT AND RESHAPING THE COMPENSATION STRUCTURE

Quantify the performance appraisal standards, make each performance standard scientific and precise, avoid disputes caused by the administrative department management evaluation, reduce employee satisfaction, and employees have the right to know the performance details. Sound performance system, clear performance goals for each employee, department and enterprise, and adjust according to the actual situation. Set up a communication and feedback mechanism to monitor employees’ performance completion in real time, give help, answer and change unreasonable places.

Performance is about pay, establish a reasonable performance management mechanism to motivate employees to work enthusiastically, reduce turnover rate and improve corporate performance. Enhance salary transparency, disclose salary structure and promotion positions, protect employees’ personal salary privacy, and ensure salary fairness.

## 5. CONCLUSION

By analyzing the external and internal factors influencing the change of corporate organizational structure, this paper proposes a design plan for optimizing the company's organizational structure and further proposes implementation measures. Among them, measures such as strengthening the procedural management of management control platform, establishing a common belief system, rationalizing the team structure, attaching importance to performance management and reshaping the compensation structure are expected to achieve better results in practice. Through the implementation of these measures, enterprises can better adapt to market competition and the development trend of information technology, and enhance their overall competitiveness and innovation capability. At the same time, this paper also provides some reference values for the subsequent research.

## ABSTRACT

This paper discusses the new idea of integrating low carbon fitness concept in college physical education in the context of deep learning, analyzes the demand of college physical education under the concept of low carbon fitness, explores the concept of “low carbon fitness” in college physical education, verifies the teaching behavior of low carbon fitness concept in physical education classroom, and tests the system with intra- and inter-rater methods. The reliability of the system was tested by intra- and inter-rater methods. There was a positive correlation between the data coded by the three observers,  $r = 0.91 - 0.95$ ,  $p \leq 0.01$ . The ANOVA results showed that there was no significant difference between the data coded by the three observers,  $F = 0.00$ ,  $p = 1.00$ . The physical education classroom behavior analysis system was used to provide a convenient curriculum model for the integration of low-carbon fitness concepts in college physical education.

## KEYWORDS

Deep learning; Low carbon fitness concept; College physical education; Classroom teaching behavior

## 1. INTRODUCTION

With the continuous improvement of people's living standard, low-carbon and healthy life has gradually become people's pursuit, thus, the concept of low-carbon fitness has emerged [1-2]. In order to meet the needs of the development of the times, colleges and universities began to innovate and reform physical education, and incorporate the low-carbon fitness concept into physical education to improve students' comprehensive physical fitness on the basis of reducing the waste and consumption of resources, thus improving the effect of teaching [3-4].

Taking the low-carbon fitness concept extended by ecological civilization as the entry point, we analyzed the theoretical demands of college physical education of low-carbon fitness concept and low-carbon teaching mode, and proposed the concept of light physical education [6]. It aims to guide that physical education in colleges and universities should reduce energy and resource consumption, lower carbon dioxide emissions, and make full use of the natural environment to achieve the purpose of physical education [7-8]. Physical education courses are all important parts of the teaching curriculum, and teachers can should call for low-carbon fitness and low-carbon sports for students in the process of teaching to reduce carbon emissions on the basis of ensuring the effect of sports, so as to achieve the purpose of protecting the environment [9-11]. This paper explores the physical education teaching in colleges and universities under the concept of low-carbon fitness and puts forward several

suggestions.

## **2. LOW CARBON FITNESS CONCEPT COLLEGE PHYSICAL EDUCATION IN THE CONTEXT OF DEEP LEARNING**

### **2.1. COLLEGE SPORTS UNDER THE CONCEPT OF LOW CARBON FITNESS**

#### **2.1.1. NEW MODEL OF “LOW-CARBON FITNESS” CONCEPT IN COLLEGE SPORTS**

“Low-carbon fitness” is a healthy fitness concept, the public in the process of fitness began to consider whether such fitness is low-carbon, environmental protection, whether ecological? And take the initiative to choose a more environmentally friendly way to exercise to reduce carbon dioxide emissions. Nowadays, “low-carbon fitness” has received attention and recognition from all walks of life, and many colleges and universities have taken the initiative to integrate the concept of “low-carbon fitness” into their physical education and tried to enhance their environmental awareness through innovative teaching methods, so that The concept of “protecting the environment and low-carbon development” is deeply rooted in people’s hearts.

#### **2.1.2. DEMAND FOR PHYSICAL FITNESS IN MODERN LIFESTYLES**

With the development of economy, social progress and the transformation of modern life style, rich material life is no longer a sign for people to enjoy life, but a rich and colorful spiritual life is more and more people pursue the goal, and people’s concern for their own health begins to gradually increase. Ecological sports and fitness is a modern fitness concept in terms of the relationship between people and the environment and nature, which requires people to carry out fitness exercises not only to achieve the purpose of physical exercise, but also to promote healthy psychology, improve the standard of living, improve the quality of life and other aspects of the purpose.

## **2.2. NEW IDEAS OF “LOW-CARBON FITNESS” CONCEPT IN UNIVERSITY SPORTS**

### **2.2.1. OPTIMIZE THE STRUCTURE OF COURSE SYSTEM**

The goal of higher education in the 21st century is “to know, to do, to co-exist and to survive”, which is to let students learn to learn, to master learning methods, to develop learning potential, to cultivate students’ ability to adapt to society, and to apply the learned knowledge to practical work and study. Therefore, in order to realize the transformation from “teacher as the main body” to “student as the main body” and optimize the structure of curriculum system, we must design the teaching curriculum from the perspective of stimulating students’ learning wisdom and ability, and arrange the teaching process from the law of students’ understanding of the content of physical education materials. The teaching process is arranged from the perspective of stimulating students’ learning intelligence and ability.

### **2.2.2. STIMULATING STUDENTS’ INTEREST IN SPORTS**

Interest is the initial motivation for learning and the guarantee of effective learning. Sports habits and interests are the prerequisites for promoting students’ independent learning and lifelong adherence to exercise. Interest plays a very important role in whether students can form sports hobbies and exercise habits through the learning of physical education courses. Only by stimulating and maintaining students’ interest in sports can students actively, consciously and positively learn and exercise in physical education courses, and further develop students’ “low-carbon fitness” habits. Therefore, in the physical education curriculum, from the selection of teaching materials, teaching methods, teaching process arrangements should be fully considered students’ interest in sports, and effectively promote the development of students’ “low-carbon fitness” habits.

### 3. AN EMPIRICAL TEST OF A BEHAVIORAL ANALYSIS SYSTEM FOR PHYSICAL EDUCATION CLASSROOM TEACHING

#### 3.1. RELIABILITY ANALYSIS OF PHYSICAL EDUCATION CLASSROOM TEACHING BEHAVIOR ANALYSIS SYSTEM

To verify the reliability of the behavioral analysis system for teaching low-carbon fitness concept physical education classroom in the context of deep learning, 10 videos of quality physical education classroom teaching under the Chinese health physical education curriculum model were observed separately, and intra-rater and inter-rater methods were used to test the reliability of the system. Pearson  $r$  correlation, ANOVA and two-way random group intra-rater correlation were conducted on the observed and recorded coded data to analyze the system reliability parameters as shown in Table 1.

**Table 1.** Analyzing the results of the system reliability parameters

Observers A/B/C	Pearson $r$	$F / P$	Inter-rater ICC	Intra-rater ICC
A×B	0.95**	0.00/1.00	0.95	
A×C	0.92**		0.92	
B×C	0.91**		0.91	
C				0.92

\*\*Significantly correlated at the 0.01 level.

There was a positive correlation between the data coded by the 3 observers,  $r = 0.91-0.95$ ,  $p \leq 0.01$ . ANOVA results showed no significant differences between the data coded by the 3 observers,  $F = 0.00$ ,  $p = 1.00$ . Reliability analysis results indicated that both inter-rater and intra-rater reflected good reliability, 0.91-0.95 for inter-rater and 0.92 for intra-rater.

#### 3.2. RELIABILITY OF A SYSTEM FOR ANALYZING TEACHING BEHAVIOR IN PHYSICAL EDUCATION CLASSROOMS

There was a need for standardized training for coders in this study to provide them with a better understanding of the operational definitions of physical education teacher behaviors, interactive behaviors, and student behaviors in the context of the low-carbon fitness concept and to enable them to make the right choices when observing and recording specific behaviors. As a result of a comprehensive and standardized training protocol, there was a positive correlation between the coded data recorded by the three observers for physical education teacher behaviors, interactive behaviors, and student behaviors  $r = 0.91-0.95$ ,  $p \leq 0.01$ , reflecting good inter-rater and intra-rater reliability of 0.91-0.95 for inter-rater and 0.92 for intra-rater. This indicates that the observers were effective in interpreting and evaluating physical education in the context of the low-carbon fitness philosophy curriculum model in the context of deep learning consistency across indicators of classroom teaching behaviors. Overall, these results provide empirical support for the reliability of the system for analyzing physical education classroom teaching behaviors in a low-carbon fitness philosophy curriculum model.

### 4. CONCLUSION

Based on the theoretical basis of sustainable development of ecological civilization construction, physical fitness under modern lifestyle and reform of traditional sports teaching mode in colleges and universities, we actively explore the reform of college sports under the concept of "low-carbon fitness". We will optimize the structure of college sports curriculum, cultivate the habit of "low-carbon fitness" among college students, and advocate the light sports

style.

Schools should take the initiative to comply with the requirements of the development of the times and incorporate “low-carbon fitness” into physical education, helping students to develop good “low-carbon fitness” habits by optimizing the curriculum structure, improving their interest in participation and enhancing their environmental protection concepts. At the same time, physical education teachers should incorporate light sports into classroom teaching, so as to realize the low carbonization of physical education and fitness in colleges and universities, and contribute to the overall coordinated and sustainable development, and strive to realize the low carbonization of physical education and fitness in colleges and universities, so that physical education in colleges and universities can not only develop comprehensively, but also develop in a healthy and sustainable way.

## ABSTRACT

This paper studies the research of home medical care path and scheduling based on artificial intelligence algorithm, explores the current existing intelligent model of home medical care path and scheduling, establishes the distance and scheduling modal algorithm, and conducts sensitivity analysis of artificial intelligence algorithm parameters. The study shows that there are great advantages of using artificial intelligence algorithms in home medical care, which can effectively alleviate the current nursing staff scheduling problems, establish a model to optimize the service time and travel time of medical staff, help solve the problems in scheduling paths and services, and better serve the majority of medical staff to improve efficiency.

## KEYWORDS

Home health care; Artificial intelligence algorithms; Intelligent models; Sensitivity; Work efficiency; Pathways and scheduling

## 1. INTRODUCTION

At the present stage, the crisis of population aging and the shortage of resources for medical services have become inevitable social problems [1]. Home medical care is based on clients, caregivers and care institutions, and according to the needs of clients, care companies arrange caregivers to provide services such as medicine, drug injections and physical therapy at home [2-3]. It is a variation of traditional medical services and can effectively alleviate the shortage of medical resources and reduce the cost of services [4-5].

The needs of elderly people are complex, and they often need a variety of health care services in addition to daily care and spiritual comfort [6-7]. The home health care model is an effective way to address the needs of elderly people in old age and disease management by combining the functions of living care and medical services [8-10].

This paper investigates the home health care worker routing and scheduling problem based on artificial intelligence algorithms. An opportunity constrained planning model for the home health care worker path and scheduling problem with the objective of minimizing the total work time of health care workers is developed considering the stochastic nature of health care workers' service time and travel time, and the need for work load balancing among health care workers [11-13].

## 2. HOME HEALTH CARE WORKER PATHWAY AND SCHEDULING MODEL

### 2.1. CURRENT SCHEDULING PROBLEMS

Clients distributed in different locations make appointments for care services in advance according to their needs, and the care enterprise arranges the visit routes and service

recipients for the care personnel according to the appointments made by the clients. The care personnel depart from the care enterprise, need to provide and complete the services within the service window of the clients, and finally return to the care enterprise. Each client can only be served by one caregiver, and each caregiver can only serve one client at a time. The care enterprise reasonably arranges the order of caregivers' services so that the road travel cost, fixed cost and service cost are minimized.

## 2.2. ROUTING AND SCHEDULING INTELLIGENCE MODEL

The subjective perceptions of the actors are combined with interference management methods to carry out the following five areas of research:

(1) Assume that the time spent by clients receiving services obeys uniformly distributed interference management:

$$\sum_{k=1}^m x_{ik} = 1, \quad i = 1, 2, \dots, n \quad (1)$$

(2) Travel time of the paramedic from the previous client to the next client:

$$\sum_{i=0}^{N+1} \sum_{k=1}^m y_{ijk} = 1, \quad j = 1, 2, \dots, n \quad (2)$$

(3) Time factor for health care workers to serve clients:

$$\sum_{i=0}^{n+1} y_{0ik} = 1, \quad k = 1, 2, \dots, m \quad (3)$$

(4) Confidence level that medical staff workload is less than the upper limit of medical staff workload:

$$\sum_{i=0}^{n+1} y_{i(n+1)k} = 1, \quad k = 1, 2, \dots, m \quad (4)$$

(5) The range of values of decision variables:

$$\sum_{i=0}^{n+1} y_{ijk} - \sum_{i=0}^{n+1} y_{jik} = 0, \quad j = 1, 2, \dots, n; k = 1, 2, \dots, m \quad (5)$$

## 3. EXPERIMENTAL ANALYSIS OF HOME MEDICAL CARE PATHWAY AND SCHEDULING MODEL

### 3.1. ROUTING AND SCHEDULING MODAL ALGORITHM ESTABLISHMENT

The home health care worker path and scheduling problem has stochastic characteristics and complex constraints, and evolutionary methods are prone to too slow convergence. The modal algorithm memetic algorithm (MA) is an efficient algorithm that combines global search with local search. The algorithm was proposed by Moscato and simulates the principle of cultural evolution, i.e., the offspring individuals have a higher probability of being better than their parents. The modal algorithm consists of four phases: generation of initial population phase, population evolution phase, local search phase, and algorithm termination phase. In this paper, MA is designed based on the problem characteristics. The algorithm uses genetic algorithm (GA) for global search and local search based on full neighborhood search operator to improve the rate of algorithm convergence.

### 3.2. SIMULATION CONDITIONS AND ANALYSIS

In this paper, the results of the simulation experiments of 12 arithmetic cases were tested by paired samples rank sum test using SPSS data analysis software. The magnitude of  $P$  values is observed, and if  $P \leq 0.05$ , it indicates that there is a significant difference between MA and GA on the computational performance of the model, and the test results of each arithmetic case are shown in Table 1.

Under the same experimental parameters, the mean value of the MA calculation results among the 12 cases is smaller than that of the GA. by comparing the standard deviations of the calculation results, it can be obtained that the MA has better calculation ability in most cases. The results of the paired-sample rank-sum test can fully illustrate that the computational power of MA is significantly better than that of GA.

**Table 1.** Paired sample rank sum test results for the results of two algorithms

Example of an algorithm	GA		MA	
	Average value	Standard deviation	Average value	Standard deviation
C11101	226.52	6.23	221.02	28.52
C11102	267.28	8.314	131.23	19.08
C11103	184.23	34.32	171.23	10.63
C11104	276.95	8.351	109.09	10.59
R12201	778.34	28.75	359.60	13.24
R12202	912.81	24.97	346.43	14.52
R12203	625.54	24.44	464.68	57.98
R12204	546.82	24.81	469.68	19.59
RC12201	1348.42	248.16	569.54	27.34
RC12202	5201.48	240.45	639.24	34.92
RC12203	2852.42	146.85	527.68	35.59
RC12204	1281.40	281.64	348.72	75.23

### 3.3. SENSITIVITY ANALYSIS

In order to determine the number of caregivers and the maximum number of tasks for the model and to illustrate the effect of their different values on the optimal solution, several operations were performed using matlab in order to determine the approximate range of these two values. In order to enable all clients to be cared for, the maximum number of tasks cannot be too small, and the values are taken from 6 to 12, and the number of caregivers is chosen from 8 to 18. Since the number of caregivers is 1 less than the number of caregivers for low skill S1 corresponding to the number of caregivers for 15, 16, and 17, respectively, the optimal solutions obtained from the operations of the last three cases often contain the first three, so the operations on the first three cases are removed. The number of caregivers selected and the number of caregivers for each skill are shown in Table 2.

**Table.2** Number of nursing people and the number of nursing people in each skill

Number of nursing staff	The number of nursing staff corresponding to each skill		
	S1	S2	S3
9	3	3	4
10	2	5	3
11	3	5	6
14	4	6	7
16	3	6	7
18	2	4	4

#### 4. CONCLUSION

The home health care service model is an effective way to solve the problem of aging population and an important part of the integrated health care service system. At present, home health care services are late in starting and the overall supply of resources is insufficient. Therefore, a reasonable allocation and dispatch of home healthcare resources can promote the full utilization of existing resources, improve the operational efficiency of home healthcare management, and enhance patient and caregiver satisfaction.

Therefore, this paper conducts a study of the problem of scheduling home health care workers across regions. A comparative analysis of genetic algorithms and non-dominated sorting genetic algorithms was performed, and a sensitivity analysis of two parameters, the number of caregivers and the maximum number of tasks, was conducted. The influence of the two parameters of the model, the number of caregivers and the maximum number of tasks, on the results is analyzed and their reference ranges are determined, which can help to promote modern information and refinement management of home medical care.

## ABSTRACT

This paper discusses how to improve the quality and satisfaction of study tour products through strategies such as rational development and utilization of resources, enriching the types of tourism products, focusing on the balance of quality study tours, comprehensive protection of tourism safety, and evaluation and optimization of tourism products using intelligent data analysis methods. The feasibility and effectiveness of the proposed strategies are also further verified by analyzing the study tour products in Hailuogou Scenic Area, showing how to optimize the design of tourism products using intelligent data analysis methods, and by optimizing the design of study tour products in the high school section. Among them, the satisfaction rates of study master plan and study harvest were higher, 4.23 and 4.14, respectively.

## KEY WORDS

Study tour; Tourism product; Intelligent data analysis; Hailuogou Scenic Area; Tourism safety

## 1. INTRODUCTION

As an emerging educational approach, study tours have gradually received attention and focus. In study tour activities, the design and development of tourism products is a crucial aspect [1]. However, in the current market, most study tour products are still stuck in the traditional mode, lacking innovation and personalization [2-3]. Meanwhile, due to the fierce competition in the tourism market, many enterprises tend to focus only on commercial interests and ignore the real needs of tourists in the process of product design and operation [4]. Therefore, how to evaluate and optimize study tour products through intelligent data analysis methods and focus on tourists' needs and experiences in independent design has become a current problem to be solved [5-6].

The literature [7] proposes the application of the human activity approach in the study of tourism behavior and describes the importance of the approach for understanding tourist decision making and behavior. The literature [8] explores the aspects of risk perception, information search, information processing, choice and subsequent behavior in tourism decision making from both the tourist and destination perspectives, respectively. On the tourist

side, the authors emphasized the influence of individual differences and socio-cultural background on risk perception and decision making

In order to better meet the needs of different tourists, tourism product development needs to consider resource utilization, product type enrichment, quality and safety assurance. At the same time, the use of intelligent data analysis methods to evaluate and optimize tourism products is also an important means to improve product competitiveness. Taking Hailuoguo Scenic Area as an example, this paper proposes an optimized design plan for the study tour product for the high school section through analysis and satisfaction survey of its study tour product.

## **2. PRODUCT DEVELOPMENT STRATEGY OF STUDY TOUR BASED ON INTELLIGENT DATA ANALYSIS**

### **2.1. RATIONAL EXPLOITATION OF RESOURCES**

Active use of local tourism resources, and school teaching objectives close to the design and development of educationally meaningful study tour products is the main issue at hand. Study tours are not simply the understanding of spring and autumn tours, science tours, red tours or even a second classroom, the need for in-depth local visits, so that young people to broaden their horizons, understanding of the countryside, local residents, including farmers, workers, scholars and other understanding of local culture, employing them as study instructors to achieve the study tour function is more beneficial.

### **2.2. ENRICH THE TYPE OF TOURISM PRODUCTS**

The current study tours are still mainly collective activities organized by schools, designed by teachers and participated by students. If we want to fully spread this activity, improve product quality and enrich product connotation, we should be more flexible in the specific operation. Correct understanding of the concept of study tours and their characteristics, according to different purposes, different needs, students of different ages and conditions of enterprises and institutions to design and organize, forming a rich product system and design differentiated tourism products.

### **2.3. FOCUS ON THE QUALITY OF LEARNING AND TRAVEL AT THE SAME TIME**

Study tour products should be developed to enrich students' cultural knowledge and improve the overall quality as the starting point and anchor point. Youth study tours are not purely sightseeing and leisure, and not purely scientific research, but according to the psychological needs of young people, education and fun, around the quality of body education, patriotic education and cultural learning, arranged with educational characteristics of the content, so that young people in the acquisition of self-improvement, youth study tours are definitely not the same as conventional tourism or a taste of suffering education.

### **2.4. COMPREHENSIVE PROTECTION OF TOURISM SECURITY**

First, should strengthen the safety education for students, increase the efforts of tourism safety education for students, regulate behavior, overcome the mentality of fluke, put travel safety in the first place; Second, schools should strengthen tourism safety management measures, improve the quality of supervisory service personnel, strengthen security and protection, and actively purchase accident insurance for students, equipped with health care doctors to prevent accidents; Finally, the use of scenic tourism safety emergency rescue mechanism, strengthen tourism safety information communication, for the accident that has occurred can not be avoided should take positive measures to deal with, as far as possible to minimize the loss.

## 2.5. EVALUATION AND OPTIMIZATION OF TOURISM PRODUCTS USING INTELLIGENT DATA ANALYSIS METHODS

Smart data analysis methods can be divided into external data, internal data and market data depending on the source of data. Among them, external data includes social network data, online reviews, forums, blogs, etc. Internal data includes customer satisfaction surveys, booking data, logs, etc. Market data, on the other hand, includes industry reports, market research reports, etc. Combining these data, the analysis and forecast of tourism products can be carried out, thus helping tourism companies to discover customer needs, grasp market trends, and develop more targeted marketing strategies and product designs.

In practice, the commonly used intelligent data analysis techniques are predictive modeling, multiple regression and cluster analysis. Predictive modeling is the use of existing data to predict future trends and outcomes. Predictions are made through algorithms and model building and are used to identify bottlenecks and directions for product improvement. Multiple regression is to analyze the relationship between multiple variables to help companies determine the strengths and weaknesses of each aspect and provide support for product formulation. Cluster analysis is to divide similar objects or things into categories and find similarities within categories and differences between categories, and is used to determine the needs of different types of customers.

### 3. HAILUOGOU SCENIC AREA STUDY TOUR PRODUCT ANALYSIS

#### 3.1. HAILUOGOU SCENIC AREA STUDY TOUR PRODUCTS

At present, Hailuogou Scenic Area actively develops study tours, relying on its own rich study tour resources, for student groups, and cooperates with schools and travel agencies to develop and launch the following kinds of study tour products as shown in Table 1. The “Ruo Ding Mountain Metamorphosis” is a 3-5 day study tour product for primary and secondary schools developed by Hailuogou Scenic Area in cooperation with travel agencies, which includes a number of courses on red culture knowledge, nature exploration, traditional farming culture, etc. Hailuogou scenic area launched a number of study tour products, but the existing product content fragmented, lack of a complete system, need to be further optimized.

**Table 1.** Research travel products of Hailuogou Scenic spot

Product name	Target population	Study the types of travel products
The Metamorphosis of Mount Ruoding	Primary and middle school students	Experiential investigation type
“Red” + “Green”	College student	Inspirational expansion type + experience type
“Red Road, Three agricultural conditions, Chinese Dream”	Chengdu Golden Apple Jincheng No.1 Middle School	Inspirational expansion type + experience type

#### 3.2. HAILUOGOU SCENIC AREA RESEARCH AND STUDY TRAVEL PRODUCT SATISFACTION ANALYSIS

The survey results found that the respondents were satisfied with the study tour products in Hailuogou Scenic Area as shown in Table 2. The satisfaction of study tour products is not very high in general, and the products have a lot of room for optimization. Among them, the satisfaction of study master plan, study harvest and study instructor is high, with scores above 4, 4.23, 4.14 and 4.02, respectively, and the highest score is study master plan. The rest of the options have similar scores, with the lowest score of 3.20 for the study course content and relatively low scores of 3.66 and 3.58 for the study travel resources and study bases, respectively, which can be found that respondents are satisfied with the overall degree of Hailuogou study travel products, especially with the study master plan, study harvest and study

instructors, as well as with its Hardware conditions, such as the construction of study bases and the degree of development of study resources, are not very satisfying, and the optimization of study tour products can be prioritized from relatively low satisfaction items in order to improve the satisfaction of study tour products.

**Table 2.** Satisfaction of research travel products in Hailuogou scenic area

Satisfaction factor	Very satisfied	Be satisfied	In general	Not satisfied	Very dissatisfied	score
Research travel resources	23.13	36.23	25.48	10.68	4.48	3.66
Research supervisor	39.98	37.75	14.53	4.72	3.02	4.02
Master plan for research	39.31	42.49	13.78	3.17	1.25	4.23
Research objective	29.16	37.73	21.58	6.95	4.58	3.67
Research course content	29.92	37.72	23.00	6.20	3.16	3.20
Arrangement of research activities	27.83	36.87	23.59	7.71	4.00	3.84
Ability cultivation	30.67	34.53	22.22	7.83	4.75	3.80
Research harvest	41.72	33.76	19.32	3.39	1.81	4.14
Research base	19.26	36.86	26.34	12.24	5.30	3.58
security	38.55	33.10	19.27	5.27	3.81	4.02

### 3.3. OPTIMIZED DESIGN OF STUDY TOUR PRODUCTS FOR HIGH SCHOOL SECTION

The type of study product design should be mainly experiential expedition type and inspirational expansion type, and the provincial and national conditions as the main study content. Study theme: experience the most beautiful glaciers and examine the primitive forests. Feel the humanistic history and inspire patriotic feelings. The study itinerary is shown in Table 3.

**Table 3.** Research schedule

schedule	Itinerary arrangement	
The first day	morning	Go to Hailuogou Scenic Spot by bus from school
	afternoon	Visit Moxi Red Army Long March Memorial Hall, Moxi conference site and other red research bases
The next day	morning	Explore Camp 3 and 4 in Hailuogou
	afternoon	Decrypt the virgin forest of Hailuogou scenic area
The third day	morning	Experience folk customs and religious culture
	afternoon	Experience farming culture
The fourth day	morning	Retrace the ancient Tea Horse Road
	afternoon	Go back to school by bus from Hailuogou Scenic spot

## 4. CONCLUSION

Through the research in this paper, it is also essential to use intelligent data analysis methods to evaluate and optimize tourism products in the design of study tour products. This approach can help us better understand tourists' needs and feedback, so that we can target product design and improvement. Finally, taking Hailuogou Scenic Area as an example, we analyzed the satisfaction of the study tour products in this area. Among them, the satisfaction scores of study master plan, study harvest and study instructor are higher, with scores above 4, 4.23, 4.14 and 4.02, respectively, and the highest score is the study master plan. In summary, the research results of this paper are expected to provide some useful references and guidance for the independent design of tourism products in study tour activities.

# INNOVATION OF COLLEGE COUNSELORS' CAREER GUIDANCE MODE FOR COLLEGE STUDENTS IN THE BACKGROUND OF BIG DATA

---

Wei qiao Liu\*

College of Pharmacy, Changchun University of Chinese Medicine, Changchun, Jilin, 130117, China

[13844192299@163.com](mailto:13844192299@163.com)

---

## ABSTRACT

In the paper, based on the current challenges of university employment work, we proposed to build an employment information platform by applying the model of MVC under J2EE platform, developed a university graduate employment management information system based on J2EE technology, and tested the system performance and graduate login security. When the number of concurrent users is 400, the transaction success rate is 100%, the average transaction response time is 1.957, the maximum transaction response time is 3.519, and the average traffic volume is 5003 bytes/second. The graduate employment information platform developed based on J2EE technology has the advantages of improving the efficiency of college counselors and promoting the grassroots employment of graduates.

## KEYWORDS

College employment; J2EE platform; MVC model; Employment information platform; Employment management; College counselor

## 1. INTRODUCTION

The employment of college students has always been a topic of great concern, and with the expansion of colleges and universities, more and more graduates enter the society, the employment pressure continues to increase and the employment situation becomes increasingly severe [1]. Promoting college students' employment is conducive to solving the problems of lack of grassroots talents and difficult employment of college graduates [2-3]. Counselors can play an important role in the employment guidance work at the grassroots level, taking career guidance class as a carrier and playing its role as a link in the employment guidance of college students through the daily work penetration of counselors [4-6]. Cultivate students' noble ideals and basic grassroots employment quality, while improving counselors' influence and competency in college students' employment guidance. As college educators, they should adapt to the development requirements of the times and improve the quality of employment work [7].

The system can greatly improve the work efficiency of college counselors, reduce their workload, and provide good employment guidance and information for graduates' employment.

## **2. SPECIFIC INITIATIVES OF THE MECHANISM OF THE COLLEGE STUDENT CAREER GUIDANCE SYSTEM**

### **2.1. CHALLENGES OF THE CURRENT EMPLOYMENT WORK IN UNIVERSITIES**

#### **2.1.1. SOCIAL PRACTICE FOR GRADUATES**

High school graduates have shallow social experience and lack of social practice, and their understanding of employment mainly comes from family and school education, and their understanding of grassroots employment is not sufficient and comprehensive. The publicity of grassroots employment for graduates in colleges and universities lacks attraction for students. The lack of encouragement and incentive policies for grass-roots employment is the fundamental reason for the lack of attractiveness of publicity.

#### **2.1.2. EMPLOYMENT INFORMATION PLATFORM**

At present, graduates get employment information mainly from employment recruitment software on the market, but many of them can't choose suitable careers for themselves because of the confusion they face in employment. The purpose of developing Graduate Employment Management Information System is to provide a good service platform for graduates' smooth employment, so that teachers in charge of employment work in schools can make full use of the system to timely release recruitment information, provide graduates with some necessary employment guidance and related policies of the state and schools about graduates, etc., and help students get more employment information and sort out good employment concepts.

## **2.2. SYSTEM KEY TECHNOLOGIES**

### **2.2.1. DYNAMIC COLLABORATION BETWEEN MODELS AND VIEWS**

The collaborative relationship between the model and the view is typical of the observer design pattern. The Observer pattern is a behavioral design pattern. The observer pattern defines a one-to-many dependency between objects, where when the state of an object changes, all objects that depend on it are notified and automatically updated.

The key objects defined in the Observer pattern are the observer and the target, and a target can have any number of observers that depend on it. Once the state of the target changes, all observers are notified. In response to this notification, each observer will query the target to synchronize its state with that of the target.

### **2.2.2. APPLY THE MVC MODEL UNDER J2EE PLATFORM**

Under the component-based J2EE platform, how to organize the application for simple and efficient application upgrade and maintenance, and how to let people who do not know the program code to avoid the program data, become the first problem to solve. And this is why the MVC design pattern is used.

Clear division of labor among development staff. MVC clearly separates computation from display, with no processing appearing on the JSP page and no data formatting in the Servlet or business logic. Java programmers focus on Servlet code and business processing code, and frontend personnel focus on JSP and display effects. The division of labor is refined so that all kinds of personnel focus on dealing with their familiar areas, which improves the development efficiency of the project.

## **3. CLASSIFICATION OF SYSTEM TESTING AND ANALYSIS OF RESULTS**

### **3.1. SYSTEM PERFORMANCE TESTING**

Because the number of graduates is generally large, so the performance of the system

should meet certain requirements, so the system performance simulation test was conducted to develop the employment guidance system under J2EE platform, and the system performance simulation test results are shown in Table 1. When the number of concurrent users is 200, the transaction success rate is 100%, the average transaction response time is 1.238, the maximum transaction response time is 1.982, and the average traffic is 5318 bytes/sec. When the number of concurrent users is 400, the transaction success rate is 100%, the average transaction response time is 1.957, the maximum transaction response time is 3.519, and the average traffic is 5003 bytes/sec.

The system performance meets the requirements, and the running speed does not exceed 4 seconds, and the transaction success rate is 100%, which can meet the current needs of employment guidance for graduates and help college counselors to innovate the employment guidance mode for college students.

**Table 1.** System performance simulation test results

Number of concurrent users	Average Transaction Response Time	Maximum Transaction Response Time	Average number of transactions per second	Transaction Success Rate	Hits per second	Average Traffic
200	1.238	1.982	7	100%	119	5318
400	1.957	3.519	9	100%	204	5003

### 3.2. GRADUATE LOGIN TEST CASE DESIGN

In the whole college employment management system, including login module, graduate user login sub-module and administrator login sub-module, there are always big or small problems in the testing process, so the graduate login module is tested and the results of student login test are shown in Table 2.

Based on the fact that it is not possible to log into the system normally under abnormal circumstances, the graduate user login sub-module meets the system security requirements.

**Table 2.** Student Login Test

Input Conditions	Test content	Test cases	Test results
001	Graduate Name	Correct input	Information is displayed correctly
002	Graduate's school number	Incorrect input	Wrong information is displayed
003	Graduate's ID card	Correct input	Information is displayed correctly
004	Graduate Information	Incorrect input	Wrong information is displayed

## 4. CONCLUSION

Promoting the grassroots employment of college students can alleviate the lack of grassroots talents and the employment pressure of college graduates, while the guidance of colleges and universities is the guarantee of the grassroots employment of college students, and colleges and universities should do a good job of talent training orientation, which is in line with the economic and social development and social human resource structure. Counselors can play an important role in the guidance of grassroots employment, take career guidance class as a carrier, play its role as a link in the guidance of grassroots employment of college students through the daily work penetration of counselors, cultivate students' noble ideals and basic grassroots employment quality, improve the influence and competence of counselors in the guidance of grassroots employment, make good use of the platform built by the state and school for college students, and guide more ideal and ambitious young students to join the grassroots. We will guide more young students with aspirations and ambitions to join the grassroots, dedicate their youth and achieve their dreams in life.

Most of the current J2EE-based college student employment information platforms can support multi-platform access and control, and adopt distributed data management. Through the system to call the interface of sending short messages to cell phones, which is conducive to the employment information timely for students to understand.

## **ABSTRACT**

This paper is based on exploring the deep integration of artificial intelligence and college Civics class to build an online teaching interactive platform for college Civics class, based on the characteristics of BP neural network, looking for the organic combination of technology as a tool and educating people, analyzing the skill weights and ideological security by combining the training objectives of college Civics class, and analyzing the factors affecting the application of online teaching interactive platform for Civics class. The construction of online teaching interactive platform is the dominant factor influencing the operation status with a weight of 0.812, university support is the secondary factor with an influence weight of 0.764, and the influence weight of teachers' team is 0.839. Qualitative analysis is conducted on the teacher-student interaction mode of online teaching platform, and interaction design strategies to stimulate teachers and students to participate in interaction are derived.

## **KEYWORDS**

Artificial intelligence; College Civics course; Deep integration; Online teaching interactive platform; BP neural network; Skill weights

## **1. INTRODUCTION**

With the advent of the network era, information technology has penetrated into many fields such as politics, economy, and culture, and major changes have occurred in human production, lifestyle, and learning [1-2]. The traditional education model has been difficult to meet the diverse needs of students, and education reform and development are facing unprecedented challenges, while the modernization of education driven by education informatization is the breakthrough point of education reform [3-4]. The wide application of artificial intelligence technology promotes the reform and innovation of university teaching of ideology and politics, realizes the personalization, differentiation and precision of teaching of ideology and politics courses in colleges and universities, as well as the precise grasp of the educational situation of teaching of ideology and politics for college students, and promotes the formation of new teacher-student relationship of equal, dialogical and participatory type [5-7]. In order to give full play to the effectiveness of ideological and political education and promote the deep integration of AI and college Civics education, the new requirements of AI on teachers' literacy

should be focused on [8-10]. The construction of an interactive platform for online teaching of college Civics class should be based on the pivot points of enhancing teachers' level, respecting students' reality, reforming classroom teaching and casting the soul to educate people, and realizing the innovation of teaching mode of Civics class at four levels: ideology, system, technology and action [11-12].

## **2. DEEP INTEGRATION OF ARTIFICIAL INTELLIGENCE AND COLLEGE CIVICS COURSE**

### **2.1. VALUE RATIONALE FOR DEEP INTEGRATION**

#### **2.1.1. THE ORGANIC COMBINATION OF TECHNOLOGY AS A TOOL AND HUMAN EDUCATION**

Artificial intelligence is a new technology based on the latest technological achievements of information technology, which is formed by the collection of big data, algorithms and other technologies. With the help of big data, algorithms and other technologies, artificial intelligence can statistically analyze and predict the dynamics of individuals' thoughts as well as behavioral development changes, which can strongly promote the innovation of teaching mode of college Civics class. Artificial intelligence belongs to a new type of tool, and its use in the process of Civics class must be highly vigilant to ensure that the subject position of human beings is not alienated, and that Civics class is empowered by artificial intelligence to truly achieve the goal of educating people and improving the classroom effect of Civics class.

#### **2.1.2. SKILL WEIGHTS AND IDEOLOGICAL SECURITY**

Since human society entered the 21st century, the pace of development of science and technology has become faster, especially the iterative cycle of information technology has become shorter and shorter, and the development results of modern information technology have appeared one after another. Through the use of artificial intelligence technology in the college Civics course, in addition to the instrumental and functional nature of artificial intelligence technology, it can further distinguish the educational subject and object.

It is necessary to pay high attention to this, should be combined with the training objectives of the college Civics course, continue to enhance the technical discourse identity, the development and development of strategic goals consistent with the development of strategic planning for the development of artificial intelligence, through artificial intelligence technology to empower the college Civics course, improve the effectiveness of Civics course, has an important significance to build a firm university ideological main position.

## **2.2. BP NEURAL NETWORK**

### **2.2.1. SELF-LEARNING AND SELF-ADAPTIVE CAPABILITIES**

The connection weights between the nodes of each layer of the BP neural network are adjustable, and the BP neural network learns the "reasonable rules" between the input and output data during the training process, and adaptively stores the learning contents in the weights of the network, i.e., the BP neural network has a high degree of self-learning and self-adaptability.

### **2.2.2. NONLINEAR MAPPING CAPABILITY**

BP neural networks essentially implement a mapping function from input to output, and mathematical theory demonstrates that a three-layer neural network can approximate any nonlinear continuous function with arbitrary accuracy. This nonlinear mapping capability of BP neural networks makes them very suitable for solving problems with complex internal mechanisms.

### 2.2.3. COMPUTATIONAL PARALLELISM AND STORAGE DISTRIBUTIVITY

BP neural networks use connection weights between nodes to store information. The distributed information storage approach of BP neural networks is reflected in the fact that information is distributed throughout the network by content, rather than being stored in only one place. A node on the network stores parts of multiple pieces of information, i.e., the information is processed as necessary during the network training process, and then the information is stored decentralized throughout the network.

## 3. ANALYSIS OF FACTORS INFLUENCING THE APPLICATION OF ONLINE TEACHING INTERACTIVE PLATFORM FOR CIVICS CLASS

### 3.1. DETERMINATION OF THE WEIGHTS OF FIRST-LEVEL INDICATORS

The direction of the role of the setting of the weight of the first-level indicators is positive, and the direction of the role of the second-level indicators of each first-level indicator is positive, which determines the degree of influence of the 4 factors of the first-level indicators is positive, that is, the larger the value, the greater the influence value.

The calculation of the influence degree of the 4 leading factors of the first-level indicators is as follows:

$$Y_g = W_g * \left( \frac{1}{2} * X_{ga} + \frac{1}{2} * X_{gb} \right) \quad (1)$$

$$Y_p = W_p * \left( \frac{1}{4} * X_{pa} + \frac{1}{4} * X_{pb} + \frac{1}{4} * X_{pc} + \frac{1}{4} * X_{pd} \right) \quad (2)$$

$$Y_j = W_j * \left( \frac{1}{3} * X_{ja} + \frac{1}{3} * X_{jb} + \frac{1}{3} * X_{jc} \right) \quad (3)$$

$$Y_x = W_x * \left( \frac{1}{3} * X_{xa} + \frac{1}{3} * X_{xb} + \frac{1}{3} * X_{xc} \right) \quad (4)$$

Through the relevant scores of the expert rating method, combined with the above calculation formula, the weights of the 4 dominant factors are derived, and it can be seen that the scores of the 4 dominant factors are more evenly scored by the expert rating method, basically maintaining around 0.75, but there are differences. The online teaching interactive platform of Civics class is shown in Table 1. The construction of online teaching interactive platform is the dominant factor affecting the operation status, with a weight of 0.812, and the lagging construction of online teaching interactive platform is the main problem. The support of universities is the secondary factor, with an influence weight of 0.764, and the influence weight of teachers' team is 0.839. Teachers have a significant influence on the effective use and functional development of the online teaching interactive platform of Civics and Political Science class, and they have a guiding role in the use of the teaching platform, and have the responsibility to promote and encourage students to use the online teaching interactive platform of Civics and Political Science class, and at the same time, they should improve and adjust the teaching content and enrich the teaching form in a timely manner, etc. It is also necessary to improve and adjust teaching contents and enrich teaching forms. Students' awareness, demand and commitment to the online teaching and interactive platform of Civics and Political Science class directly affect the use of the platform.

**Table 1.** Weighting of first-level indicators

Target layer	Tier 1 Indicators	Weighting
Factors influencing the online teaching interactive platform of Civics class	Support from colleges and universities	0.764
	Online Teaching Platform	0.812
	Teachers' team	0.839
	Students	0.737

### 3.2. IMPACT DEGREE OF SECONDARY INDICATORS

The determination of the degree of influence of the secondary indicators is based on the preference of students for each indicator selected, after the assignment of the preference degree and the results measured by combining the above formula, the analysis of the degree of influence of the secondary indicators is shown in Table 2. The results focus on the students' willingness for the secondary indicators and can also be considered as the students' ratings for each secondary indicator. From the calculation results, it can be seen that the indicators with higher scores are mainly distributed in the construction of online teaching interactive platform, among which the convenience, module integrity and management and maintenance of online teaching interactive platform of Civics and Political Science class are the three indicators with the highest scores, which are 2.825, 2.715 and 2.696 respectively. This indicates that students' knowledge of participating in the online teaching and learning platform for Civics and Political Science is relatively lacking.

**Table 2.** Impact degree of secondary indicators

Target layer	Tier 1 Indicators	Tier 2 Indicators	Impact degree
Factors influencing the online teaching interactive platform of Civics class	High School Support	Network Infrastructure	2.481
		Related Training	2.285
	Online Teaching Platform	Convenience	2.815
		Resourcefulness	2.227
		Module Integrity	2.624
		Management and Maintenance	2.538
	Faculty	Level of emphasis	2.753
		Faculty Outreach	2.228
		Self-application	2.382
	Students	Student Awareness	2.237
		Student Input	2.141
		Student demand	2.266

## 4. CONCLUSION

In the context of the growing number of online teaching platforms and more diversified teaching methods, this paper focuses on the interaction mode of teacher-student participation from the perspective of interaction design and explores the design strategies to stimulate teacher-student interactivity in the current online teaching interactive platform. A set of applicable and scientific online teaching interactive platform quality evaluation index system and model is constructed, which can provide some reference value for the evaluation and improvement of online teaching interactive platform and help improve the quality of online teaching.

This paper constructs an online teaching interactive platform quality evaluation index

system and model based on BP neural network theory, and conducts an empirical study to provide suggestions for teachers' teaching improvement and online teaching interactive platform perfection based on the empirical results.

# EXPLORING THE PATH OF SHORT VIDEO COPYRIGHT PROTECTION UNDER AUTOMATED DECISION-MAKING

---

Zhirui Gong\*

School of Culture and Communication, Shenyang City University, Shenyang,  
Liaoning, 110100, China

[15840514066@163.com](mailto:15840514066@163.com)

---

## ABSTRACT

Improving the protection path of short video copyright is a necessary prerequisite for the flourishing of short video. Based on the exploration of the characteristics of automated decision-making, this paper proposes the analysis obligations of data processors in automated decision-making based on the concept of meta-regulation. The copyright protection path is constructed by combining the development history of short videos with the analysis of infringement cases. The overall trend of short video copyright infringement cases occurred from 2012 to 2022 is on the rise. It soared from the initial 10 cases a year to 466 cases a year. The number of infringement has doubled dozens of times compared with the time when short videos first emerged.

## KEYWORDS

automated decision making; short video; copyright protection; meta-regulation; infringement cases

## 1. INTRODUCTION

In recent years, short videos have become a new choice for Chinese Internet users for leisure and social sharing. Short videos harbor a huge market value, attracting a large amount of capital and traffic into the short video industry [1-3]. Although the development of the short video industry is strong, the problems of it are also gradually highlighted [4-5]. Driven by economic interests, the unhealthy competition in the industry has become more and more serious, leading to the intensification of copyright infringement in short videos.<sup>6</sup> Since 2018, major departments have jointly launched special copyright rectification actions for online infringement and piracy in key areas such as short videos, and short video rights holders have started to defend their copyright interests through legal means. After the official establishment of the Beijing Internet Court, the first case accepted was a short video copyright infringement dispute.

The primary condition for short videos to be protected by copyright is to have originality. The literature [7] proposes a new approach to digital video watermarking copyright protection using two different algorithms that employ continuous estimation of

statistical metrics to detect scene boundaries. The literature [8] analyzes the unexpected shutdown of the main platforms for unauthorized video streaming in the German market and helps to understand the reasons for the high rate of online piracy. The literature [9] considers copyright as an institution and examines the decline of online video piracy in China embedded in the institutional changes of three copyright-related institutions.

## **2. REASONABLE ANALYTICAL OBLIGATIONS OF DATA PROCESSORS UNDER AUTOMATED DECISION MAKING**

### **2.1 THE IMPACT OF AUTOMATED DECISION MAKING ON SOCIAL LIFE**

#### **2.1.1 AUTOMATED DECISION MAKING**

Automated decision making is an activity that uses computer programs to automatically analyze and evaluate the behavior, interests, or financial, physical, and economic status of the individual subject of the information and make decisions. Banks can use the algorithms in automated decision making to screen and evaluate the economic strength of information subjects in order to classify loans based on the evaluation results, and governments can use the same process to improve social welfare measures such as poverty alleviation. Automated decision making is changing people's lives, and the algorithmic society is coming.

#### **2.1.2 CHARACTERISTICS OF AUTOMATED DECISION MAKING**

The characteristics of automated decision making include the following:

- (1) The subject of automated decision making is a personal information processor.
- (2) The object of automated decision-making is a database formed by a large amount of collected personal information.
- (3) The way of automated decision making is non-manual in nature by using computer programs.

Since the information subject is in an information-poor position compared to the information processor and the algorithm of the computer program is obscure, these characteristics lead to the information subject's right to know and consent to personal information being easily violated, and therefore, certain rules must be observed.

### **2.2 THE DUTY OF REASONABLE ANALYSIS UNDER THE CONCEPT OF META-REGULATION**

#### **2.2.1 A META-REGULATORY APPROACH TO AUTOMATED DECISION RISK**

There are at least three risks associated with automated decision making. First, data processors must collect large amounts of data, and there is a tension between privacy protection and data collection and circulation. People who value privacy are less likely to share personal information, which makes them less visible in the era of big data and thus less likely to be affected by automated decision-making. Second, it impairs human autonomy. Automated decision making creates a digital portrait of an individual based on their interests, hobbies, abilities, credit, health, etc., and provides various services

and information to the person that match the portrait. Again, creating algorithmic discrimination. For example, merchants use user portraits for big data killing and creating price discrimination.

### **2.2.2 NORMATIVE BASIS FOR THE OBLIGATION TO REASONABLY ANALYZE**

According to the governance stance of the meta-regulatory approach, the legislation should impose some targeted duties of care and legal responsibilities on personal information processors who have gained information dominance through "technological empowerment". There are at least three factual bases for imposing such legal obligations on personal information processors:

(1) The personal information processor has the technology and talents to carry out systematic risk control, is familiar with the technical and market information related to personal information processing, and has the ability to undertake reasonable analysis obligations.

(2) The personal information processor enjoys "algorithmic power" and can benefit from information processing activities, while the security of personal information is in a state of uncertainty and danger, so the information processor should assume the same power.

(3) The information processor is the designer or controller of the algorithmic decision, and determines the purpose and manner of information processing activities, so it is direct and convenient for him/her to assume the obligation of reasonable analysis.

## **3. EXPLORING THE PATH OF COPYRIGHT PROTECTION FOR SHORT VIDEOS**

### **3.1 ANALYSIS OF THE OPERATION STATUS OF SHORT VIDEO**

#### **3.1.1 THE DEVELOPMENT HISTORY OF SHORT VIDEO**

The development of short video has experienced the budding development stage from none to many, the growth explosion stage from many to many, and the maturity and stability stage from many to excellent, and the current development is in the third stage. the scale and usage rate of short video users from 2016 to 2022 are shown in Figure 1. The scale of short video users grew from 191 million in 2016 to 905 million in 2022, and the usage rate of short video also grew from 26.05% to 87.95%. after 2016 China ushered in the Internet+ era, Baidu, Tencent and other Internet giant companies actively responded to the development of the Internet era, carried out to explore new development models, and unified their efforts to the short video industry. Typical such as Tencent's Weishi, Baidu's Good Video, etc. Influenced by the short video platform, so that the short video into the national trend, followed by a number of short video platforms such as Jieyin also appeared one after another. The number of short video platform users as well as network users watching short video time increased in a wide range, short video is explosive growth.

**Figure 1** Short video user size and usage rate from 2016 to 2022

### 3.1.2 INFRINGEMENT OF SHORT VIDEOS

While seeing the prosperous development of the short video industry, it is also necessary to pay attention to the new problems and challenges brought by the new object of short video. In the era where everyone is a creator, everyone also faces the risk of infringement and being infringed, and a large number of infringement disputes have been concentrated, and the issue of copyright protection has become increasingly prominent. In order to objectively analyze the infringement problems occurring in the short video field. The number of short video copyright infringement cases is shown in Figure 2. the overall trend of short video copyright infringement cases occurring from 2012 to 2022 is on the rise. It soared from the initial 10 cases a year to 466 cases a year. Although the number declined in 2021 benefiting from the national remediation action, it still clearly reflects that the current number of infringement has doubled dozens of times compared with the time when short video first emerged.

**Figure 2** Number of Short Video Copyright Infringement Cases

### **3.2 THE PATH OF COPYRIGHT PROTECTION UNDER AUTOMATED DECISION-MAKING**

At present, the existing laws and regulations mainly on the network platform has a small amount of regulation, but in the face of the general environment of multiple subjects, only one party to make the requirements that want to cure the short video industry development of the persistent problems, is a drop in the bucket. Only through the linkage of multiple subjects to form a synergy, to crack down on short video infringement, in order to take into account the interests of all parties, to achieve the goal of stable and rapid development of the industry. Throughout the development of short video so far, the market the "invisible hand" in the allocation of resources to play a decisive role, but in the hundreds of billions of traffic, the government the "visible hand" should play a good guiding, compensatory, regulatory role. In response to the controversy of infringement liability of short video platform, it should be determined whether the platform constitutes infringement based on the standard of dichotomy of behavior, and then the platform's duty of reasonable care should be analyzed rationally. At the same time, the specific application of the "notification-deletion" rule should be clarified to meet the challenges brought by the development of high-tech.

### **4. CONCLUSION**

This paper explores the analysis obligations of data processors under automated decision-making, and puts forward the protection path of short video copyright through the data analysis of short video development and infringement cases. In response to the problem of insufficient regulation of the development of short video industry, the government and its relevant departments should play a good guiding role, timely introduce necessary policy measures, establish a practical and relaxed punishment mechanism, and promote the benign and ecological development of short video industry. With regard to the controversy over the liability of infringement of short video platforms, the specific application of the "notification-deletion" rule should be clarified, the duty of care of short video platforms should be appropriately increased, and it is suggested that platforms should set different processing time for different situations after receiving the notification. With regard to the determination of copyright infringement of short videos, consideration should be given to introducing the theory of transformative use into the fair use system by means of judicial interpretation.

## ABSTRACT

This article is based on the diversity teaching method by introducing various forms of activities and teaching methods in order to increase students' interest and participation in physical education. The article firstly explores the promoting effects of diversity on physical education in colleges and universities, including the promotion of students' physical literacy, competitive awareness and interest in learning. Then the comparison of soccer skill scores between the experimental and control groups was used to verify whether the teaching model could effectively improve students' comprehensive quality and competitive consciousness. The results showed that the overall skill performance of the experimental group was 18.58 seconds faster than that of the control group by 1.9 seconds.

## KEY WORDS

Diversified pedagogy; Physical education; Physical literacy; Competitive awareness; Interest in learning; Soccer

## 1. INTRODUCTION

The diversified teaching method is a student-centered teaching mode characterized by diverse teaching methods and approaches [1-2]. This model focuses on cultivating students' independent thinking and innovation ability, and emphasizes the combination of practical operation and theoretical knowledge [3-4]. The application of the diversity teaching method in leisure sports can promote students' in-depth understanding of the leisure sports industry and improve their practical skills [5-6]. Silva, A et al. theoretically discussed the concept and meaning of the diversity teaching method and proposed how to design and implement the training program of the diversity teaching method in practice [7]. Quennerstedt, M argued that traditional methods of teaching physical education overemphasize skills and performance at the expense of students' individual needs and development. On the contrary, the use of a transformative learning approach can help students to understand and apply what they have learned in greater depth and facilitate their growth and development [8]. In the literature [9], a physical education and physical education pedagogy called the "constraint-led approach" was studied. The authors discuss the theoretical basis and practical application of this approach,

which aims to help coaches and teachers better guide students to develop skills and improve performance. The literature [10] explores how the thinking model can be used to develop students' creative thinking and problem-solving skills, and to improve their literacy and competence in the field of physical education. The literature [11] emphasizes the important role of physical education in promoting students' physical and mental health, improving general quality and developing social responsibility.

This paper focuses on an innovative study of a teaching model based on a diversified teaching method for leisure sports majors. Through the introduction of various forms of activities and teaching methods, including group cooperation, game competition, case study and other forms, in order to improve students' interest and participation in physical education. Also, this paper will verify whether the teaching model can effectively improve students' overall quality and competitive consciousness by comparing the soccer technical performance between the experimental and control groups. The purpose of this paper is to provide a new way of thinking and method for teachers of recreational sports and to provide a reference for the reform of physical education in colleges and universities.

## **2. THE PROMOTING EFFECT OF DIVERSITY ON COLLEGE PHYSICAL EDUCATION**

### **2.1. PROMOTING STUDENTS' PHYSICAL LITERACY**

Physical literacy reflects the student's ability to integrate physical education knowledge with other cultural knowledge, and the student has to integrate physical education knowledge with other knowledge to make the most of physical education in learning and life. Most of the physical literacy is cultivated later in life. Students develop their interest in sports through some necessary physical exercises in college physical education classes, including the learning of theoretical knowledge of sports, the cultivation of sports awareness and the continuous improvement of sports skills and sports quality, which play a great role in college physical education. The diversified way of physical education focuses on the overall development of students in physical education classroom, cultivates students' sports personality, and puts the cultivation of physical education theoretical knowledge and sports consciousness on the same status as practical activities, which makes the diversified teaching play a role in promoting the improvement of students' sports literacy.

### **2.2. PROMOTE THE DEVELOPMENT OF STUDENTS' SENSE OF COMPETITION**

Competition consciousness refers to a psychological state that students want to surpass others in study or life. A proper competition consciousness can make students maintain a certain sense of crisis and promote their continuous progress, and the cultivation of healthy competition consciousness should also be paid attention to in college physical education so that students can make continuous progress in the process of competition. In the process of diversified physical education, teachers often organize students to watch large sports events such as Olympic Games and World Championships, through watching these events, students can experience the healthy competition consciousness among excellent athletes, realize that they are in the big environment of constant competition, learn the excellent quality of being positive and striving in athletes, so as to improve themselves continuously. Not only can students learn more about sports and the rules of the game, but appropriate competition can provide motivation for students to focus more on their studies.

### **2.3. PROMOTE STUDENTS' INTEREST IN LEARNING**

In the design process of diversified physical education courses, teachers will develop different teaching methods according to students' interests and enrich the teaching contents appropriately. The diversified teaching methods can enhance teachers' understanding of

students and promote communication between teachers and students, and students can have a deeper understanding of the rules and benefits of sports, and only when they fully understand sports will students be willing to participate in diversified teaching physical education classes.

#### 2.4. PROMOTE THE CREATION OF A VIBRANT CLASSROOM ATMOSPHERE

Classroom atmosphere is a very important part of the teaching process, too relaxed classroom atmosphere will cause students to be too relaxed in the classroom, not fully focus on learning. A classroom atmosphere that is too stressful will make students feel too much pressure and is not conducive to their understanding of knowledge, so teachers should grasp the process of creating classroom atmosphere so that the physical education classroom has both a relaxed learning atmosphere and a stressful learning rhythm. After the implementation of diversified teaching methods, the classroom atmosphere can be appropriately active, so that students can really understand the meaning of learning, rather than treating learning as a kind of pressure. Such diversified teaching methods are conducive to the creation of classroom atmosphere, reduce students' learning pressure, and also increase the communication opportunities between students and teachers, which makes the whole process of physical education more scientific and promotes the continuous development of physical education.

### 3. COMPARISON OF SOCCER TECHNICAL PERFORMANCE BETWEEN THE EXPERIMENTAL AND CONTROL GROUPS

#### 3.1. COMPARISON OF SOCCER TECHNICAL PERFORMANCE OF THE EXPERIMENTAL GROUP BEFORE AND AFTER THE SEMESTER

Paired samples t-test was performed on the soccer skill scores of the experimental group before and after the semester, and the mean score of ball sense post-test was 12.5 seconds higher than that of the semester before by 2.65 seconds.  $p < 0.01$  There was a highly significant difference between the two. The mean score on the back and forth dribbling post-test was 2.58 seconds higher than the pre-semester score.  $p < 0.01$ . There was a highly significant difference between the two. The average score of 5 on the inside kick post-test was 0.96 points higher than before the semester, with a significant difference between the two. The average score of 17.51 seconds in the post-test of comprehensive skills was 1.93 seconds higher than that of the semester before, with a significant difference between them at  $P < 0.05$ . The results of the t-test for the basic soccer skill level of the experimental group are shown in Table 1. Compared with the pre-semester, all the post-semester tests showed significant improvement, and the soccer skills of the students in the diversified teaching group showed significant improvement.

**Table 1.** t test of basic football skill level of experimental group

Test index	pretest (M±SD)	post-test (M±SD)	T	P
Ball sensation (seconds)	15.15±4.68	12.50±4.51	4.51	<0.01
Round trip Dribble (seconds)	11.02±3.92	8.44±3.38	3.38	<0.01
Inside kick (points)	4.04±2.64	5.00±1.63	1.63	<0.01
Combined Skills (seconds)	20.51±6.78	18.58±6.79	6.79	<0.05

#### 3.2. COMPARISON OF SOCCER TECHNICAL PERFORMANCE OF THE CONTROL GROUP BEFORE AND AFTER THE SEMESTER

Paired samples t-test was performed on the soccer skill scores of the control group before and after the semester. The mean score of 14.53 seconds on the post-test of ball sense was 0.58 seconds higher than that before the semester, and there was a significant difference between them at  $P < 0.05$ . The score of 4.11 points on the inside kick post-test was 0.85 points higher than the score before the semester, with a significant difference of  $P < 0.05$ . The post-

test score of 8.61 seconds for back and forth dribbling was 0.06 seconds higher than that of the semester before, with no significant difference between the two. The post-test score of integrated skills was 20.45 seconds higher than that of the semester before by 0.02 seconds, with no significant difference between the two at  $P>0.05$ . The results of the t-test for the basic soccer skill level of the control group are shown in Table 2. The study showed that the traditional teaching method had a certain effect on improving students' soccer skills, but it did not have a significant effect on improving the performance of comprehensive skills.

**Table 2.** t test of basic skill level of football in control group

Test index	pretest (M±SD)	post-test (M±SD)	T	P
Ball sensation (seconds)	14.61±2.86	14.03±4.58	-2.27	<0.05
Round trip Dribble (seconds)	8.67±2.50	8.61±3.36	-2.03	>0.05
Inside kick (points)	4.96±1.46	4.11±1.55	2.80	<0.05
Combined Skills (seconds)	20.50±4.95	20.48±6.89	-2.00	>0.05

### 3.3. COMPARISON OF SOCCER TECHNICAL PERFORMANCE BETWEEN THE EXPERIMENTAL AND CONTROL GROUPS AFTER THE SEMESTER

Independent sample t-test was conducted on the technical performance of soccer in the experimental and control groups, and the average performance of ball sense in the experimental group was 12.5 seconds faster than that in the control group, 1.53 seconds,  $P<0.01$ . There was a significant difference between them. The mean score of round-trip dribbling in the experimental group was 8.44 seconds, 0.17 seconds faster than that of the control group,  $P<0.05$ . There was a significant difference between the two groups. The average score of kick accuracy in the experimental group was 5 points higher than that of the control group, 0.89 points higher than that of the control group,  $P<0.01$ . There was a significant difference between the two groups. The overall skill score of the experimental group was 18.58 seconds faster than that of the control group, 1.9 seconds faster than that of the control group,  $P<0.01$ . There was a significant difference between the two groups. The results of the t-test for the soccer skill level of the students in the experimental and control groups after the semester are shown in Table 3. The study showed that the teaching effect of the diversified teaching method was significantly better than the traditional teaching method in improving the soccer skills of elementary school students.

**Table 3.** t test of football skill level of experimental group and control group

Test index	Experimental group (M±SD)	Control group (M±SD)	T	P
Ball sensation (seconds)	12.50±4.51	14.03±4.58	-2.190	<0.01
Round trip Dribble (seconds)	8.44±3.38	8.61±3.36	-2.137	<0.05
Inside kick (points)	5.00±1.63	4.11±1.55	2.830	<0.01
Combined Skills (seconds)	18.58±6.79	20.48±6.89	-2.211	<0.01

## 4. CONCLUSION

In this paper, we compare the soccer technique performance of the experimental group and the control group based on the innovation research of teaching mode of recreational sports profession based on diversified teaching method. The average performance of ball sense of the experimental group was 12.5 seconds faster than that of the control group by 1.53 seconds. The average score of round-trip dribbling in the experimental group was 8.44 seconds faster than that of the control group by 0.17 seconds. The average score of kick accuracy in the experimental group was 5 points higher than that of the control group by 0.89 points. The

overall skill score of the experimental group was 18.58 seconds faster than that of the control group by 1.9 seconds. Therefore, the teaching mode of leisure physical education profession based on diversified teaching method is an effective method worth promoting and applying. Meanwhile, this paper also provides some reference value for the reform of physical education in colleges and universities.

## ABSTRACT

This paper first discusses the value and future trends of neuromarketing research, including the development from “neuroscience” to “neuromarketing”. Then, we discuss the application of neuromarketing and big data in artwork preference research, including the application of neuromarketing in artwork preference research and the application of big data in artwork preference research. Finally, we analyze the music style preferences of college students as a whole, as well as the music style preferences of different school types and major types. “Pop” is the most popular music style among college students, accounting for 42.03%. The next one is “folk”, accounting for 18.01%.

## KEYWORDS

Neuromarketing; Big data; Artwork preference; Neuroscience; Musical style

## 1. INTRODUCTION

Neuromarketing is a marketing approach based on neuroscience that optimizes marketing strategies by studying the human brain’s response to stimuli such as advertising and branding [1]. And in the field of art, neuromarketing can be used to study people’s preferences and reactions to different types, styles, themes, and other artworks [2-3]. Through big data analysis, we can collect and analyze a large amount of user evaluation and feedback data on different types, styles, themes, and other artworks [4]. These data can include user browsing records, purchase records, comment contents, etc. Through these data analysis, we can get more objective and comprehensive preferences and trends of people’s artworks, provide more targeted creative suggestions for artists, and provide more accurate exhibition planning for art museums and galleries [5-6]. The literature [7] focuses on consumer behavior and analyzes consumer preferences and responses through a neuromarketing approach. The prospects of the application of neuromarketing methods in marketing are explored, and some suggestions and future research directions are proposed. The literature [8] focuses on the relationship between music preferences and personality traits. These findings can be used in personalized recommendation systems, ad targeting, and other marketing strategies to better meet consumer needs and improve market competitiveness. In this paper, we combine two approaches, neuromarketing approach and big data, to conduct an in-depth study of college students’ music style preferences and to explore the influence of different school types and major types.

## **2. NEUROMARKETING**

### **2.1. RESEARCH VALUE OF NEUROMARKETING ERP**

Neuromarketing ERP research is not only important for advancing existing marketing management theories, but also for promoting marketing practices. In terms of theoretical value, neuromarketing ERP research helps argue, improve and deepen existing marketing management theories, which are reflected in the problem identification, information collection, solution evaluation and post-purchase behavior stages of art lovers' purchase decision process. ERP technology can objectively reflect the neural mechanisms in art lovers' behavior process by directly detecting changes in their brains, and to a certain extent, it can avoid art lovers' bias brought by questionnaire survey methods. The time sensitivity of ERP can help marketing researchers more effectively isolate the dynamic and continuous cognitive processes behind art lovers' behaviors. ERP research can help detect emotions, unconscious behaviors, and other partially unknown areas.

### **2.2. SEVERAL FUTURE TRENDS IN NEUROMARKETING ERP**

#### **2.2.1. FROM “NEUROSCIENCE” TO “NEUROMARKETING”**

Despite the progress made in neuromarketing research, the development of neuromarketing has been hampered by fundamental differences in the research focus of neuroscience and marketing. Neuroscience research is more concerned with the “when” and “where” questions. Neuroscience is concerned with the question of when an individual's consciousness and behavior cause which brain regions to be active. Marketing research, however, is more concerned with the question of “what”. For most marketing researchers, these questions of “when” and “where” are secondary to understanding the processes that occur in the brains of art lovers, but more important are the interconnections between different areas of the cerebral cortex behind consumer decisions and how these connections contribute to marketing theory. Increasingly, researchers are also finding that behavioral phenomena are not linked to one specific brain region alone, but rather arise from the synergistic work of multiple brain regions.

#### **2.2.2. DEVELOPMENT FROM “SINGLE RESEARCH INSTRUMENT” TO “MULTIPLE RESEARCH INSTRUMENTS**

Most of the articles in the field of neuromarketing use only a single experimental research method, but different neuroscience techniques have different advantages. For example, ERP tools have high-frequency resolution but relatively low spatial resolution, making it difficult to precisely brain source distribution, so they do not discriminate well the active regions of marketing stimuli in the cerebral cortex of art enthusiasts. In contrast, functional magnetic resonance imaging techniques have high spatial resolution and can accurately associate marketing stimuli with active regions of the brain, but have lower temporal resolution. In addition, eye-tracking techniques infer the intrinsic cognitive processes of art lovers through eye-related metrics such as gaze, eye jumps and tracking movements. Future studies should combine different research methods while using multiple research instruments to more rigorously investigate the psychological mechanisms of art lovers.

### **3. APPLICATION OF NEUROMARKETING APPROACHES AND BIG DATA IN THE STUDY OF ARTWORK PREFERENCES**

#### **3.1. APPLICATION OF NEUROMARKETING APPROACH IN THE STUDY OF ARTWORK PREFERENCES**

The neuromarketing approach is a marketing method based on the principles of neuroscience and psychology that measures signals from the human brain to reveal how consumers actually respond to a product or service. In artwork preference studies, the neuromarketing approach can help researchers understand aspects of subjects' preferences, emotional responses and cognitive processes to different artworks. The main neuromarketing approaches include: selecting subjects and installing devices such as EEG or fMRI. The subjects are asked to watch or enjoy different types, styles, and subjects of art works, and physiological indicators such as brain waves or blood oxygen levels are recorded. Analyze the data and extract relevant features, such as emotional value, cognitive load, arousal, etc. Assess the popularity and influencing factors of different artworks based on the analysis results and make relevant suggestions.

#### **3.2. APPLICATION OF BIG DATA IN THE STUDY OF ARTWORK PREFERENCES**

Big data is a collection of data of huge size, diverse types, and rapidly growing speed that can be stored, managed, and analyzed through computer technology. In artwork preference research, big data can help researchers understand aspects such as audience preferences, trends and changes in different artworks. The main applications of big data in artwork preference research are: data mining, which analyzes large amounts of data such as web search, social media, and online reviews to discover the popularity, trends and key factors of artworks, etc. Image recognition, which uses computer vision technology to identify and classify the type, style, theme and other characteristics of artworks for more accurate analysis and comparison. Personalized recommendation, based on information such as users' historical behavior and interest preferences, to recommend artworks that match their tastes and improve user experience and satisfaction.

### **4. ANALYSIS OF COLLEGE STUDENTS' MUSIC STYLE PREFERENCES**

#### **4.1. OVERALL ANALYSIS**

This paper investigates which style of music college students like most, and the results are shown in Figure 1. Among them, "pop" is the most popular music style among college students, accounting for 42.03% of the total number of respondents. The next one is "folk music", accounting for 18.01% of the total number of respondents. The next most popular genre was "light music", accounting for 7.61% of all respondents. "Classical music" accounted for 7.18% of the total respondents. Hip-hop & rap" accounted for 5.05%, "rock" for 4.81%, "heavy metal" for 4.25%, and "country" for 4.25%. Country music" accounted for 4.28% and was in the middle of the pack. The last three music styles are "jazz," "traditional folk music," and "electronic music," accounting for 3.9%, 1.17%, and 1.72% of the total number of respondents, respectively, 1.72%.

**Figure 1.** Overall status quo of college students' music style preferences

#### 4.2. MUSIC STYLE PREFERENCES OF DIFFERENT SCHOOL TYPES AND MAJOR TYPES

The music style preferences of college students in different school types are shown in Table 1, and the music style preferences of college students in different major types are shown in Table 2. The proportion of college students who like pop music and folk music is the highest in general colleges and universities, accounting for 42.05% and 20.12% respectively, while the proportion of college students who like country music is significantly higher in 211 and 985 colleges and universities than in general colleges and universities. For the recent popular “electronic music” style, the percentage of students from “211 universities” is the lowest, accounting for only 1.7%. The proportion of students who like “rock music” and “heavy metal” is much higher in “211 universities” than in ordinary universities and “211 and 985 colleges and universities”. Among the students of different majors, the proportion of those who like folk music is relatively small among those who major in “natural science” compared to “humanities” and “social science”. The proportion of those who like “rock music” and “heavy metal” is significantly higher.

**Table 1.** Music style preferences of college students of different school types

Type of school	Classical	Kunle	Light music	Folk song	Country	jazz	popular	Hip hop & Rap	Electronic music	Rock	Heavy metal	Missing value
Ordinary university	9.12%	2.16%	8.53%	20.12%	1.56%	2.18%	42.05%	6.32%	2.17%	3.05%	1.99%	0.75%
211 universities	6.72%	3.27%	6.78%	8.48%	4.25%	5.89%	24.90%	9.06%	1.70%	14.04%	14.12%	0.79%
985 Colleges and universities	6.54%	5.88%	10.41%	14.45%	4.54%	3.60%	33.06%	2.39%	2.35%	9.76%	7.02%	0.00%

**Table 2.** Music style preferences of college students of different major types

Major type	Classical	Kunle	Light music	Folk song	Country	jazz	popular	Hip hop & Rap	Electronic music	Rock	Heavy metal	Missing value
humanities	8.15%	2.09%	9.86%	20.63%	1.24%	3.41%	37.49%	7.16%	2.16%	3.57%	3.56%	0.68%
Natural science	7.13%	2.36%	6.63%	15.04%	2.90%	3.31%	33.19%	6.34%	2.67%	10.09%	9.16%	1.18%
Social sciences	5.84%	2.93%	8.32%	18.96%	2.30%	1.82%	45.54%	5.25%	2.31%	4.33%	1.99%	0.41%

## 5. CONCLUSION

Through the research in this paper, we can find important applications of neuromarketing approaches and big data in the study of artwork preferences. In the analysis of college students' music style preferences. "Pop" is the most popular music style among college students, accounting for 42.03%. The next most popular genre was "folk", accounting for 18.01%. The proportion of college students who like pop music and folk music is the highest in general universities, accounting for 42.05% and 20.12% respectively, while the proportion of college students who like country music is significantly higher in 211 and 985 universities than in general universities. In summary, the neuromarketing approach and big data provide a more comprehensive and in-depth research tool in the study of artwork preference.

## ABSTRACT

This paper explores the interaction between digital technology and vocational education by analyzing the scope of application of “Internet+”. This paper explores the interaction between digital technology and vocational education by analyzing the scope of application of “Internet+”. The use of various digital technologies and applications changes the existing paper-based teaching materials, promotes the digitalization and modernization of teaching materials, and breaks the time and space limitation of teaching materials. By analyzing the direction of vocational education textbooks, strategies related to the construction of vocational education digital textbooks are proposed. The construction of digital teaching materials is regulated by establishing evaluation indexes. The ratio of the best digital teaching materials with the best characteristic knowledge should be 30%. The experience of a good digital textbook students is 60% in good, 37% in average and 3% in poor.

## KEYWORDS

Vocational education; Digital teaching materials; Digital technology; “Internet+”; Evaluation index

## 1. INTRODUCTION

Digital transformation is a key breakthrough for high-quality development of vocational education in the new era, but in the process of transformation, vocational institutions are faced with imperfect resource mechanisms, digital literacy of teachers and students to be improved, and incomplete digital assessment and evaluation criteria [1-3]. Digitization provides the possibility for the integration of resources of the school, government, and industry, and the integration of the industrial chain education chain, talent chain, and innovation chain [4]. An intelligent and interactive vocational education smart education information platform, permanent smart classroom and big data smart education ecosystem are established to provide highly skilled and intelligent talents to support the development of the country's emerging economy [5]. Meanwhile, vocational education digital teaching materials are popularized as well as used by major vocational schools. Teachers have improved the flexibility of the classroom by using digital teaching materials for teaching [6-7].

This paper explores the direction of teaching materials in vocational education by using the technologies related to Internet+ and proposes the construction of digital teaching materials.

## **2. IMPACT ON VOCATIONAL EDUCATION MATERIALS IN THE CONTEXT OF “INTERNET+”**

### **2.1. THE IMPACT OF “INTERNET+” ON EDUCATION**

#### **2.1.1. APPLICATION SCOPE OF “INTERNET+”**

The official definition of the Internet in 2015 is: it can apply Internet technology in daily production, integrate and optimize all elements of production, and always apply the latest technological achievements in the Internet industry to all areas of society, continuously improve the innovation and productivity of the existing real economy, and provide the foundation and development potential for broader economic development through Internet technology. The “Internet+” represents a new economic model and form that can provide infrastructure and various quality tools for social and economic development.

#### **2.1.2. THE IMPACT OF “INTERNET+” ON TEACHING AND LEARNING**

“Internet+” education, also known as “online education”, mainly uses various Internet technologies and applications to change the existing education model, promote education informatization and modernization reforms, and enhance the communication space between teachers and students. Parents and society are paying more attention to teaching and learning, which has led to changes in teaching methods. As a result, in terms of hardware, multimedia classrooms have been popularized in almost all schools to better integrate students into the teaching and learning environment. Not only are developed cities equipped with computers, iPads, 3D printers, etc., but even in less developed towns, multimedia classrooms are equipped with appropriate computers and equipment to play media courseware. The use of Internet technology in teaching is becoming more and more widespread, and students can use the Internet to get better quality teaching courses without the limitation of classroom infrastructure and teachers, thus increasing students' enjoyment of learning, promoting students' active learning through interest education, changing the traditional teaching mode, increasing mutual communication between teachers and students, and allowing students to better experience the charm of vocational education.

### **2.2. THE CHANGING DIRECTION OF “INTERNET+” TEACHING MATERIALS**

#### **2.2.1. “INTERNET+” DIGITAL TEACHING MATERIALS**

Digital teaching materials, as considered in this paper, are the sum of a series of digital teaching resource materials based on certain teaching objectives, digital teaching materials as the content center, and information technology as the teaching support to achieve the deep integration of information technology and teaching. In this paper, the core elements of digital teaching materials proposed by Sun Zhong are integrated and designed, that is, the content of digital resources, learning tools and learning communities are integrated for the construction of digital teaching materials for vocational education centered on teaching activities, and the following are the definitions of these core concepts:

##### **(1) Resource library**

In the database or cloud service system of digital textbooks, we first establish a library of learning resources that are highly focused, personalized and pushed and dynamically updated appropriate to the subject and the school period. Students can browse the learning resources and select them independently for learning.

##### **(2) Activity library**

The activities of digital teaching materials should meet the characteristics of ubiquitous and intelligent learning. Teaching activities and teaching resources should be interrelated, but

teaching resources and teaching activities can be not one-to-one correspondence; one teaching resource can be used for multiple teaching activities, and similarly, one teaching activity can be used for multiple teaching resources.

### 2.2.2. DIGITAL TEACHING MATERIALS WITH DIGITAL TECHNOLOGY

The type of vocational education determines the special nature of its teaching materials. Some researchers believe that vocational education teaching materials have obvious special characteristics, which are closely related to social development, economic operation and technological updates. Combining the theories of vocational education and theories of teaching materials, researchers have found that the books used for daily teaching and practical training in secondary and higher vocational schools are vocational education teaching materials, and they also include auxiliary materials that are an integral part of them. In addition to the function of ideological and moral education that general textbooks have, vocational education textbooks also have the function of vocational guidance. In the screening and selection of the content of textbooks, they highlight practicality and practicability, and take vocational ability as the basis and application as the purpose, and in the content organization structure of textbooks, traditional college textbooks, primary and secondary school textbooks, etc. are strong. The logical system of teaching materials is constructed according to the logical reasoning order of the discipline, which cannot meet the needs of vocational education which is job-oriented and focuses on ability enhancement.

## 3. SUGGESTIONS FOR THE CONSTRUCTION OF DIGITAL TEACHING MATERIALS FOR VOCATIONAL EDUCATION

### 3.1. STRENGTHEN THE CONSTRUCTION OF SPECIAL DIGITAL TEACHING MATERIALS

From the publication status of vocational education digital media teaching materials, at present, digital media teaching materials have not yet blossomed in a hundred different ways. The types and quantity of vocational education digital teaching materials are shown in Table 1, and the types of digital teaching materials are mostly concentrated in the basic theoretical knowledge category as well as the professional knowledge category, and the quantity of vocational education digital teaching materials with characteristic knowledge category is small, only one, accounting for 10%. The ratio of the best digital teaching materials with characteristic knowledge should be 30%. In general, the number and types of featured digital teaching materials are relatively scarce, so the construction of featured teaching materials should be strengthened.

**Table 1.** Types of digital textbooks for vocational education

Types of digital textbooks for vocational education	Basic theoretical knowledge	Professional knowledge	Characteristic knowledge
Number of digital teaching materials	6	3	1
proportion	60%	30%	10%
Optimal proportion	40%	30%	30%

There are also many ways to improve the characteristics of digital teaching materials. Teachers can combine the characteristics of vocational education subjects and the current knowledge level of students to tailor individual lecture materials with the school's professional characteristics. This can solve the problem of difficult textbook choices, or textbooks that do not match the characteristics of the major. Teachers' personal digital media lecture materials not only enable students to learn professional knowledge and increase their enthusiasm for learning, but also improve their professional skills.

### 3.2. STRENGTHENING THE MANAGEMENT OF DIGITAL TEACHING MATERIALS

The management of teaching materials is to regulate them systematically and bring them into a scientific and formalized track, so it is important to strengthen the management of digital media teaching materials. The selection of digital media teaching materials should fully consider the characteristics of digital media majors in different schools and the development needs of students, and the digital media teaching materials selected by different types of schools should be different, and students of different levels should also adopt different categories of digital media teaching materials. The judging criteria of digital teaching materials are shown in Table 2. The main objects of digital teaching materials evaluation are whether the content of digital teaching materials is correct and comprehensive, whether teaching tips are provided in the teaching design, and whether the media design reflects the flexibility of teaching materials, and the minimum percentage of meeting the three is 90%, 85%, and 80%, while the experience of students of a good digital teaching material is 60% in good, 37% in average, and poor was 3%.

**Table 2.** Evaluation criteria for digital teaching materials

Main evaluation object	Textbook content	Textbook design	Media design
requirement	The teaching process is correct and comprehensive	Offer teaching hints	Reflect the flexibility of teaching materials
Minimum satisfied ratio	90%	85%	80%
Classification of student experience	good	In general	poor
Experience ratio	60%	37%	3%

### 4. CONCLUSION

This paper assembles digital-related technologies to study the smart teaching in vocational education, and kinds of analysis on the role of digital teaching materials in vocational education. In the construction of vocational education digital teaching materials should focus on the construction of digital teaching materials with professional characteristics. Most of the kinds of digital teaching materials focus on professional knowledge as well as basic knowledge of science and technology, lacking the characteristics of vocational education, and it is recommended to integrate the characteristics of vocational education into the construction of digital teaching materials. It is also necessary to strengthen the management of digital media teaching materials and set standard indicators for digital construction.

## ABSTRACT

This paper takes constructivism theory and humanism theory as the theoretical basis of the 5E teaching mode, explores the current trend of basketball teaching mode innovation in colleges and universities, constructs a control experiment, and uses big data analysis technology to analyze the changes of students' interests in sports, so as to analyze the applicability of "5E" teaching mode in basketball teaching. The experiment was conducted to analyze the applicability of "5E" teaching mode in basketball teaching. The mean value of students' motivation was 16.62 before the experiment and 22.15 after the experiment, the mean value of negativity was 18.57 before the experiment and 21.28 after the experiment, and the mean value of skill learning was 17.81 before the experiment and 21.02 after the experiment, which showed that the 5E teaching mode as the main way to innovate the basketball teaching mode in colleges and universities met the development needs of students.

## KEYWORDS

5E teaching model; Constructivist theory; Humanistic theory; Innovation trends; College basketball teaching; Big data analysis; Basketball teaching applicability

## 1. INTRODUCTION

The world has now entered the era of big data, and with the emergence of various types of data mining hardware, the amount of data information available to people has increased dramatically [1-2]. In conjunction with cloud computing technologies, the processing and analysis capabilities of data have risen dramatically, and the application areas related to big data technologies are expanding [3-5]. Big data and cloud computing technology, in the process of processing and analyzing data using a comprehensive analysis of various types of data, combined with the work of athlete selection, the various categories of athlete selection indicators for comprehensive processing and analysis, through the support of abundant data [6-7]. The development potential of athletes can be predicted more accurately for the final selection of coaching teams, which has a high reference value [8].

In the development of college basketball teaching work, how to effectively innovate the teaching mode of basketball class and effectively find a more effective teaching way and method is a research focus of the current college basketball teaching activities [9-10]. By reasonably innovating the teaching mode, the whole college basketball teaching can be better supported and developed, and good practical application effects can be obtained. This paper mainly analyzes and discusses the issues related to the innovation of teaching mode in college basketball teaching, and analyzes whether the 5E teaching mode can promote the students' basketball learning performance through big data technology.

## 2. RESEARCH ON INNOVATION OF TEACHING MODE OF BASKETBALL CLASS IN HIGH SCHOOL

### 2.1. THEORETICAL BASIS OF 5E TEACHING MODEL

#### 2.1.1. CONSTRUCTIVIST THEORY

Constructivist theory considers the learning process as the active construction of one's own

understanding of knowledge and new things, or the process of reorganizing and sublimating one's own conceptual understanding of an old thing, which can also be expressed as mutual integration. Social solidarity means that knowledge is not produced out of thin air, it comes from society. Learning is carried out through some social activities, and if this activity is needed here, it is done with the help of the social group, so in this case, learning also has social mutuality. The teacher's main role in the classroom is to be the designer of the classroom content and the facilitator of the teaching process, and our learning should be carried out in a concrete and realistic context that is more profound.

### **2.1.2. HUMANISTIC THEORY**

The prerequisites for creating a good classroom atmosphere: treating each other with sincerity in teaching; paying attention to students and respecting their emotions and ideas; and having empathy. Among them, having empathy means that the teacher should often stand in the students' perspective in the classroom to see the problem, to figure out the students' ideological context. Teachers should not only master teaching techniques in the teaching process, but also have the ability to grasp how to ensure and improve physical and mental health aspects, and appropriately carry out some learning activities that can show students' individuality.

## **2.2. INNOVATION TREND OF BASKETBALL CLASS TEACHING MODE IN HIGH SCHOOL**

### **2.2.1. DEVELOPMENT NEEDS**

The development of basketball teaching activities in colleges and universities should pay attention to the improvement of students' basketball psychology, hobbies, interests and mental health on the basis of the previous practical teaching of basic skills, so that students can not only get basketball skills and knowledge improvement, but also form a good awareness of physical fitness in the process of participating in basketball classes, so that students themselves are willing to participate in basketball learning and maximize the value of basketball.

### **2.2.2. SOCIAL RHYTHM**

Students' own learning pressure is gradually increasing, and sports itself has an important role in releasing pressure, which can effectively relieve students' internal tension, anxiety and other negative psychological state. In the current basketball class, its own leisure and entertainment characteristics appear more obvious. In basketball class teaching, students can learn and master the part they are interested in, help students to better relieve some stress in their future work, study and life, improve the students' physical and mental health state, and let students better enjoy life in the process of sports.

## **3. ANALYSIS OF THE APPLICABILITY OF THE "5E" TEACHING MODEL IN BASKETBALL TEACHING**

### **3.1. ANALYSIS OF BASKETBALL SPECIAL SKILLS PERFORMANCE**
